(h) *Clean Water Act (CWA)* shall mean the Federal Water Pollution Control Act enacted in 1972, by Public Law 92-500, and amended by the Water Quality Act of 1987. The Clean Water Act prohibits the discharge of pollutants to Waters of the United States unless the discharge is in accordance with an NPDES permit.

(i) *Commercial development* shall mean any development on private land that is not heavy industrial or residential. The category includes, without limitation, hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

(j) *Commercial malls* shall mean any development on private land comprised of one or more buildings forming a complex of stores that sells various merchandise, with interconnecting walkways enabling visitors to easily walk from store to store, along with parking area(s). A commercial mall includes, without limitation, mini-malls, strip malls, other retail complexes, and enclosed shopping malls or shopping centers.

(k) *Construction* shall mean any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that result in land disturbance. Construction does not include emergency construction activities required to immediately protect public health and safety or routine maintenance activities required to maintain the integrity of structures by performing minor repair and restoration work, maintain the original line and grade, hydraulic capacity, or original purposes of the facility. See "Routine Maintenance" definition for further explanation. Where clearing, grading or excavating of underlying soil takes place during a repaving operation, State General Construction Permit coverage by the State of California General Permit for Storm Water Discharges Associated with Industrial Activities or for Storm Water Discharges Associated with Construction Activities is required if more than one (1) acre is disturbed or the activities are part of a larger plan.

(l) *Control* shall mean to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

(m) *Development* shall mean any construction, rehabilitation, redevelopment or reconstruction of any: public or private residential project (whether single family, multi-unit or planned unit development); industrial, commercial, retail and other nonresidential projects, including public agency projects; or mass grading for future construction. "Development" does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

(n) *Directly adjacent* shall mean situated within two hundred (200) feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

(o) *Director* shall mean the City Manager or his or her designee.

(p) *Discharge* shall mean when used without qualification the discharge of a pollutant.

(q) *Discharge of a pollutant* shall mean any addition of any pollutant or combination of pollutants to waters of the United States from any point source or, any addition of any pollutant or combination of pollutants to the waters of the contiguous zone or the ocean from any point source other than a vessel or other floating craft that is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff that is collected or channeled by a state, municipality, or other person that do not lead to treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works.

(r) *Discharging directly* shall mean outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

(s) *Discretionary project* is defined in the same manner as Section 15357 of the Guidelines for Implementation of the California Environmental Quality Act contained in Title 14 of the California Code of Regulations, as amended, and means a project that requires the exercise of judgment or deliberation when the City decides to approve or disapprove a particular activity, as distinguished from situations where the City merely has to determine whether there has been conformity with applicable statutes, ordinances or regulations.

(t) *Disturbed area* shall mean an area that is altered as a result of clearing, grading, and/or excavation.

(u) *Environmentally sensitive area (ESA)* shall mean an area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and that would be easily disturbed or degraded by human activities and developments (Cal. Pub. Resources Code, § 30107.5). Areas subject to storm water mitigation requirements are areas designated as Significant Ecological Areas by the County of Los Angeles (Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976) and amendments); an area designated as a Significant Natural Area by the California Department of Fish and Games Significant Natural Areas Program, provided that area has been field verified by the Department of Fish and Game; an area listed in the Basin Plan as supporting the Rare, Threatened, or Endangered Species (RARE) beneficial use; and an area identified by the City as environmentally sensitive.

(v) *Evapotranspiration* shall mean the loss of water from the soil both by evaporation and by transpiration from the plants growing in the soil.

(w) *Flow-through treatment BMPs* shall mean a modular, vault type "high flow biotreatment" devices contained within an impervious vault with an underdrain or designed with an impervious liner and an underdrain.

(x) *Full Capture System* shall mean any single device or series of devices, certified by the Executive Officer, that traps all particles retained by a five millimeter (5 mm) mesh screen and has a design treatment capacity of not less than the peak flow rate Q resulting from a one-year, one-hour storm in the sub-drainage area.

(y) *Good housekeeping practices* shall mean common practices related to the storage, use or cleanup of materials, performed in a manner that minimizes the discharge of pollutants. Examples include, but are not limited to, purchasing only the quantity of materials to be used at a given time, use of alternative and less environmentally harmful products, cleaning up spills and leaks, and storing materials in a manner that will contain any leaks or spills.

(z) *General Construction Activities Storm Water Permit (GCASP)* shall mean the general NPDES permit adopted by the State Board that authorizes the discharge of storm water from construction activities under certain conditions.

(aa) *General Industrial Activities Storm Water Permit (GIASP)* shall mean the general NPDES permit adopted by the State Board that authorizes the discharge of storm water from certain industrial activities under certain conditions.

(bb) *Green roof* shall mean a LID BMP using planter boxes and vegetation to intercept rainfall on the roof surface. Rainfall is intercepted by vegetation leaves and through evapotranspiration. Green roofs may be designed as either a bioretention BMP or as a biofiltration BMP. To receive credit as a bioretention BMP, the green roof system planting medium shall be of sufficient depth to provide capacity within the pore space volume to contain the design storm depth and may not be designed or constructed with an underdrain.

(cc) *Hillside* shall mean property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five (25) percent or greater and where grading contemplates cut or fill slopes.

(dd) *Illicit connection* shall mean any human-made conveyance that is connected to the storm drain system without a permit, excluding gutters, roof-drains and other similar connections. Examples include channels, pipelines, conduits, inlets or outlets that are connected directly to the storm drain system.

(ee) *Illicit discharge* shall mean any discharge to the storm drain system that is prohibited under local, state or federal statutes, ordinances, codes or regulations. This includes all non-storm water discharges except discharges pursuant to a separate NPDES permit and discharges that are exempted or conditionally exempted in accordance with Part III the Municipal NPDES permit.

(ff) *Industrial/Commercial facility* shall mean any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, without limitation, any facility defined by either the Standard Industrial Classifications (SIC) or the North American Industry Classification System (NAICS). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

(gg) *Industrial park* shall mean land development that is set aside for industrial development. Industrial parks are usually located close to transport facilities, especially where more than one transport modalities coincide: highways, railroads, airports, and navigable rivers. It includes office parks, which have offices and light industry.

(hh) *Infiltration BMP* shall mean a LID BMP that reduces storm water runoff by capturing and infiltrating the runoff into in-situ soils or amended onsite soils. Examples of infiltration BMPs include infiltration basins, dry wells, and pervious pavement.

(ii) *Infiltration* shall mean the downward entry of water into the surface of the soil.

(jj) *Low Impact Development (LID)* consists of building and landscape features designed to retain or filter storm water runoff.

(kk) *Material* shall mean any substance including, without limitation: garbage and debris; lawn clippings, leaves, and other vegetation; biological and fecal waste; sediment and sludge; oil and grease; gasoline; paints, solvents, cleaners, and any fluid or solid containing chemicals.

(ll) *Municipal NPDES Permit* shall mean the Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach (Order No. R4-2012-0175), NPDES Permit No. CAS00401), issued by the California Regional Water Quality Control Board—Los Angeles Region, and any successor permit to that permit.

(mm) *Municipal Separate Storm Sewer System (MS4)* shall mean a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

(1) Owned or operated by a state, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(2) Designed or used for collecting or conveying storm water;

(3) Which is not a combined sewer; and

(4) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR Section 122.2.

(nn) *New development* shall mean land-disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

(oo) *Non-storm water* discharge shall mean any discharge to a municipal storm water system that is not composed entirely of storm water.

(pp) *NPDES permit* shall mean any waste discharge requirements issued by the Regional Board or the State Water Resources Control Board in the form of an NPDES permit pursuant to Water Code Section 13370 (other than the Municipal NPDES Permit).

(qq) *Outfall* shall mean a point source as defined by 40 CFR Section 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two (2) municipal separate storm sewers, or pipes, tunnels or other conveyances with connect segments of the same stream or other waters of the United Sates and are used to convey waters of the United States. (40 CFR § 122.26(b)(9).)

(rr) *Parking lot* shall mean land area or a facility for the parking or storage of motor vehicles used for businesses, commerce, industry or personal use with a lot size of five thousand (5,000) square feet or more of surface area, or with twenty-five (25) or more parking spaces.

(ss) *Planning priority projects* shall mean those projects specified in Section 6-7.10(c) of this chapter that are required to incorporate appropriate storm water mitigation measures into the design plan for their respective projects.

(tt) *Pollutant* shall mean those pollutants defined in Section 502(6) of the federal Clean Water Act (33 U.S.C. § 1362(6)), or incorporated into California Water Code Section 13373. Examples of pollutants include, without limitation, the following:

(1) Commercial and industrial waste (such as fuels, solvents, detergents, plastic pellets, hazardous substances, fertilizers, pesticides, slag, ash and sludge);

(2) Metals such as cadmium, lead, zinc, copper, silver, nickel, chromium, and nonmetals such as phosphorus and arsenic;

(3) Petroleum hydrocarbons (such as fuels, lubricants, surfactants, waste oils, solvents, coolants and grease);

(4) Excessive eroded soils, sediment and particulate materials in amounts that may adversely affect the beneficial use of the receiving waters, flora or fauna of the state;

(5) Animal wastes (such as discharge from confinement facilities, kennels, pens, recreational facilities, stables and show facilities); and

(6) Substances having characteristics such as pH less than six or greater than nine, or unusual coloration or turbidity, or excessive levels of fecal coliform, or fecal streptococcus, or enterococcus.

The term "pollutant" shall not include uncontaminated storm water, potable water or reclaimed water generated by a lawfully permitted water treatment facility.

(uu) *Project* shall mean all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (Cal. Pub. Resources Code, § 21065).

(vv) *Rainfall harvest and use* shall means a LID BMP system designed to capture runoff, typically from a roof but can also include runoff capture from elsewhere within the site, and to provide for temporary storage until the harvested water can be used for irrigation or non-potable uses. The harvested water may also be used for potable water uses if the system includes disinfection treatment and is approved for such use by the local building department (Order No. R4-2012-0175).

(ww) *Receiving water* shall mean "water of the United States" into which waste and/or pollutants are or may be discharged.

(xx) *Redevelopment* shall mean land-disturbing activity that result in the creation, addition, or replacement of five thousand (5,000) square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: (1) the expansion of a building footprint; (2) addition or replacement of a structure; (3) replacement of impervious surface area that is not part of routine maintenance activity; and (4) land disturbing activity related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

(yy) *Regional Board* shall mean the California Regional Water Quality Control Board—Los Angeles Region.

(zz) *Restaurant* shall mean a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC Code 5812).

(aaa) *Retail gasoline outlet* shall mean any facility engaged in selling gasoline and lubricating oils.

(bbb) *Routine maintenance* includes, but is not limited to projects conducted to:

(1) Maintain the original line and grade, hydraulic capacity, or original purpose of the facility.

(2) Perform as needed restoration work to preserve the original design grade, integrity and hydraulic capacity of flood control facilities.

(3) Includes road shoulder work, regrading dirt or gravel roadways and shoulders and performing ditch cleanouts.

(4) Update existing lines and facilities, which include replacing existing lines with new materials or pipes, to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.

(5) Repair leaks.

"Routine maintenance" does not include construction of new lines or facilities resulting from compliance with applicable codes, standards and regulations.

(ccc) *Runoff* shall mean any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

(ddd) Significant Ecological Areas (SEAs). An area that is determined to possess an example of biotic resources that cumulatively represent biological diversity, for the purposes of protecting biotic diversity, as part of the Los Angeles County General Plan. Areas are designated as SEAs, if they possess one or more of the following criteria:

(1) The habitat of rare, endangered, and threatened plant and animal species.

(2) Biotic communities, vegetative associations, and habitat of plant and animal speciesthat are either one of a kind, or are restricted in distribution on a regional basis.

(3) Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind or are restricted in distribution in Los Angeles County.

(4) Habitat that at some point in the life cycle of a species or group of species, serves as_a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.

(5) Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.

(6) Areas important as game species habitat or as fisheries.

(7) Areas that would provide for the preservation of relatively undisturbed examples of natural biotic communities in Los Angeles County.

(8) Special areas.

(eee) *Site* shall mean the land or water area where any facility or activity is physically located or conducted, including adjacent land used in connection with the facility or activity.

(fff) *Source control BMP* shall mean any schedule of activities, prohibition of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

(ggg) *Standard urban storm water mitigation plan* or *SUSMP* shall mean a report submitted by an applicant for approval by the Director prior to issuance of a building, grading, planning or similar permit outlining the necessary LID requirements and BMPs that must be incorporated into design plans for development or redevelopment projects.

(hhh) *Storm drain system* shall mean any facility or any parts of the facility, including streets, gutters, conduits, natural or artificial drains, channels and watercourse that are used for the purpose of collecting, storing, transporting or disposing of storm water and are located within the City.

(iii) *Storm water runoff* shall mean that part of precipitation (rainfall) that travels via flow across a surface to the MS4 or receiving waters from impervious, semi-pervious or pervious surfaces. When all other factors are equal, runoff increases as the perviousness of a surface decreases.

(jjj) *Structural BMP* shall mean any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). Structural BMPs may include both treatment control BMPs and source control BMPs.

(kkk) *Treatment* shall mean the application of engineered systems that use physical, chemical or biological processes to remove pollutants. Such processes include, without limitation, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

(lll) *Treatment control BMP* shall mean any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological or chemical process.

(mmm) *Urban runoff* means surface water flow produced by non-storm water resulting from residential, commercial and industrial activities involving the use of potable and nonpotable water.

6-7.04 Construction and Application.

This chapter shall be construed to assure consistency with the requirements of the federal Clean Water Act and acts amendatory or supplementary to the Federal Clean Water Act, applicable implementing regulations, and the Municipal NPDES Permit, and any amendment, revision or reissuance of the Municipal NPDES Permit.

6-7.05 No Taking.

The provisions of this chapter shall not operate to deprive any property owner of substantially all of the market value of such owner's property or otherwise constitute an unconstitutional taking without compensation.

6-7.06 Prohibited Activities.

(a) *Illicit Discharges and Connections*. It is prohibited to commence, establish, use, maintain or continue any illicit connections to the MS4 or any illicit discharges to the MS4. This prohibition against illicit connections applies to the use, maintenance or continuation of any illicit connection, whether that connection was established prior to or after the effective date of this chapter.

(b) *Littering*. No person shall throw, deposit, place, leave, maintain, keep or permit to be thrown, deposited, placed, left or maintained or kept, any refuse, rubbish, garbage, or any other discarded or abandoned objects, articles or accumulations, in or upon any street, alley, sidewalk, storm drain, inlet, catch basin conduit or drainage structure, business place, or upon any or private plot of land in the City, so that the same might be or become a pollutant. No person shall throw or deposit litter in any fountain, pond, lake, stream, or other body of water within the City. This section shall not apply to refuse, rubbish or garbage deposited in containers, bags or other appropriate receptacles that are placed in designated locations for regular solid waste pick-up and disposal.

(c) *Disposal of Landscape Debris*. No person shall dispose of leaves, dirt, or other landscape debris into the municipal separate storm water system.

(d) *Non-Storm Water Discharges*. The following non-storm water discharges into the MS4 are prohibited unless in compliance with a separate NPDES permit or pursuant to a discharge exemption by the Regional Board, the Regional Board's Executive Officer, or the State Water Resources Control Board:

(1) The discharge of untreated wash waters to the MS4 when gas stations, auto repair garages, or other type of automotive service facilities are cleaned;

(2) The discharge of untreated wastewater to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

(3) To the maximum extent practicable, discharges to the MS4 from areas where repair of machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze, is undertaken;

(4) Discharges of untreated runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;

(5) Discharges of commercial/municipal swimming pool filter backwash to the MS4;

(6) Discharges of untreated runoff from the washing of toxic materials from paved or unpaved areas to the MS4; provided, however, that nonindustrial and noncommercial activities that incidentally generate urban runoff, such as the hosing of sidewalks, shall be excluded from this prohibition;

(7) To the maximum extent practicable, discharges to the MS4 from washing impervious surfaces in industrial/commercial areas that results in a discharge of untreated runoff to the MS4, unless specifically required by state law, or the City's Municipal code, or Los Angeles County's Health and Safety Codes, or permitted under a separate NPDES permit;

(8) Discharges from the washing out of concrete trucks into the MS4;

(9) Discharges to the MS4 of any pesticide, fungicide or herbicide, banned by the USEPA or the California Department of Pesticide Regulation; or

(10) The disposal of hazardous wastes into trash containers used for municipal trash disposal where such disposal causes or threatens to cause a direct or indirect discharge to the MS4.

(e) *Car Washing.* No motor vehicle, boat, trailer, or other type of mobile transportation may be washed, other than at a commercial carwash, unless such vehicle is being washed by:

(1) A resident at their residence using a hand-held bucket or a water hose equipped with an automatic shutoff nozzle as long as water does not flow onto streets; or

(2) A business that has an approved car wash facility for its fleet vehicles, provided that water does not flow onto streets.

6-7.07 Exempted Discharges, Conditionally Exempted Discharges, or Designated Discharges.

(a) Discharges from those activities specifically identified in, or pursuant to, Part III.A.1-3 of the Municipal NPDES Permit as being exempted discharges, conditionally exempted discharges or designated discharges shall not be considered a violation of this chapter; provided that, consistent with Part III.A.1-3 of the Municipal NPDES Permit:

(1) Any applicable BMPs developed pursuant to the Municipal NPDES Permit are implemented to minimize any adverse impacts from such identified sources;

(2) The discharger meets all notification, reporting and recordkeeping requirements; and

(3) The discharge has conducted all applicable monitoring requirements.

(b) *Discharges in Violation of the Municipal NPDES Permit.* Any discharge that would result in or contribute to a violation of the Municipal NPDES Permit, either separately or in combination with other discharges, is prohibited. Liability for any such discharge shall be the responsibility of the person(s) causing or responsible for the discharge, and such person(s) shall defend, indemnify and hold harmless the City from all losses, liabilities, claims or causes of actions in any administrative or judicial action relating to such discharge.

6-7.08 Good Housekeeping Provisions.

Owners and occupants of property within the City shall comply with the following requirements:

(a) *Septic Waste.* No person shall leave, deposit, discharge, dump, or otherwise expose any chemical or septic waste to precipitation in an area where a discharge to City streets or MS4 may or does occur.

(b) *Use of Water.* Runoff of water used for irrigation purposes shall be minimized to the maximum extent practicable. Runoff of water from the permitted washing down of paved areas shall be minimized to the maximum extent practicable.

(c) *Storage of Materials, Machinery, and Equipment.* Machinery or equipment that is to be repaired or maintained in areas susceptible to or exposed to storm water, shall be placed in a manner so that leaks, spills and other maintenance-related pollutants are not discharged to the MS4.

(d) *Removal and Disposal of Debris from Industrial/Commercial Motor Vehicle Parking Lots.* Industrial/commercial motor vehicle parking lots with more than twenty-five (25) parking spaces that are located in areas potentially exposed to storm water shall be swept regularly or other equally effective measures shall be utilized to remove debris from such parking lots.

(e) *Food Wastes.* Food wastes generated by nonresidential food service and food distribution sources shall be properly disposed of and in a manner so such wastes are not discharged to the MS4.

(f) *Best Management Practices.* Best management practices shall be used in areas exposed to storm water for the removal and lawful disposal of all fuels, chemicals, fuel and chemical wastes, animal wastes, garbage, batteries, or other materials that have potential adverse impacts on water quality.

(g) *Maintenance of Structural BMPs.* Structural BMPs shall be properly operated and maintained, consistent with the approved SUSMP. Records and documentation of such maintenance shall be provided to the Director upon request.

6-7.09 Requirements for Industrial/Commercial and Construction Activities.

(a) *Industrial/Commercial and Construction Related Dischargers Generally.* Each discharger associated with industrial/commercial activity or construction activity, or other discharger described in any general NPDES permit addressing such discharges, as may be issued by the U.S. Environmental Protection Agency, the State Water Resources Control Board, or the Regional Board shall comply with all requirements of such NPDES permit and the City's development construction program. Each discharger identified in an individual NPDES permit shall comply with and undertake all activities required by such permit. Proof of compliance with any such NPDES permit and the City's development construction program may be required in a form acceptable to the Director prior to the issuance of any grading, building or occupancy permits, or any other type of permit or license issued by the City.

(b) *Industrial/Commercial and Construction Non-Storm Water Discharges.* Non-storm water discharges to the MS4 from industrial, commercial or construction activities in violation of any applicable NPDES permit or the City's development construction program are prohibited.

(c) *Source Control BMPs for Industrial/Commercial Facilities.* Industrial/commercial facilities shall implement the effective source control BMPs listed in Table 10 of Part VI.D.6.f. of the Municipal NPDES Permit, unless a particular pollutant generating activity does not occur on a facility's site.

6-7.10 Standard Urban Storm Water Mitigation Plan (SUSMP) and Low Impact Development (LID) Requirements for New Development and Redevelopment Projects.

(a) *Objective.* Pursuant to Part VI.D.7.b of the Municipal NPDES Permit, the provisions of this section establish requirements for construction activities and facility operations of development and redevelopment projects to comply with the current Municipal NPDES Permit to lessen the water quality impacts of development by using smart growth practices and integrate LID practices and standards for storm water pollution mitigation through means of infiltration, evapotranspiration, biofiltration, and rainfall harvest and use. Except as otherwise provided herein, the City shall administer, implement and enforce the provisions of this section.

(b) *Scope.* This section contains requirements for storm water pollution control measures in development and redevelopment projects and authorizes the City to further define and adopt storm water pollution control measures, and to develop LID principles and requirements, including, without limitation, the objectives and specifications for integration of LID strategies. As specified in this section, certain Planning Priority Projects shall meet the requirements of this section through the preparation and submittal of a standard urban storm water mitigation plan (SUSMP), which shall include the applicable LID requirements set forth in this section as an element of the SUSMP.

(c) *Applicability – Planning Priority Projects.* The following development and redevelopment projects shall be designated as Planning Priority Projects, which are subject to City conditioning and approval for the design and implementation of post-construction controls to mitigate storm water pollution prior to completion of the projects, and shall meet the requirements of this section:

(1) New Development Projects.

(i) All development projects equal to one (1) acre or greater of disturbed area that adds more than ten thousand (10,000) square feet of impervious surface area.

(ii) Industrial parks ten thousand (10,000) square feet or more of surface area.

(iii) Commercial malls ten thousand (10,000) square feet or more of surface area.

(iv) Retail gasoline outlets with five thousand (5,000) square feet or more of surface area.

(v) Restaurants (Standard Industrial Classification (SIC) of 5812) with five thousand (5,000) square feet or more of surface area.

(vi) Parking lots with five thousand (5,000) square feet or more of impervious surface area, or with twenty-five (25) or more parking spaces.

(vii) Streets and roads construction of ten thousand (10,000) square feet or more of impervious surface area. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects.

(viii) Automotive service facilities (Standard Industrial Classification (SIC) of 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) five thousand (5,000) square feet or more of surface area.

(ix) Projects located in or directly adjacent to, or discharging directly to a Significant Ecological Area (SEA), where the development will:

(A) Discharge storm water runoff that is likely to impact a sensitive biological species or habitat; and

(B) Create two thousand five hundred (2,500) square feet or more of impervious surface area.

(x) Single-family hillside homes.

(2) Redevelopment Projects.

(i) Land disturbing activity that results in the creation or addition or replacement of five thousand (5,000) square feet or more of impervious surface area on an already developed site on Planning Priority Project categories.

(ii) Where Redevelopment results in an alteration to more than fifty (50) percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction storm water quality control requirements, the entire project must be mitigated.

(iii) Where Redevelopment results in an alteration of less than fifty (50) percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction storm water quality control requirements, only the alteration must be mitigated, and not the entire development.

(iv) Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways that does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.

(v) Existing single-family dwelling and accessory structures are exempt from the Redevelopment requirements unless such projects create, add, or replace ten thousand (10,000) square feet of impervious surface area.

(d) *Specific Requirements*. The site for every Planning Priority Project shall be designed to control pollutants, pollutant loads, and runoff volume to the maximum extent feasible by minimizing impervious surface area and controlling runoff from impervious surfaces through infiltration, evapotranspiration, bioretention and/or rainfall harvest and use. In addition, the following specific requirements apply:

(1) New Single-Family Hillside Homes. A new single-family hillside home development project shall include mitigation measures to:

(i) Conserve natural areas;

(ii) Protect slopes and channels;

(iii) Provide storm drain system stenciling and signage;

(iv) Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability; and

(v) Direct surface flow to vegetated areas before discharge, unless the diversion would result in slope instability.

(2) Street and Road Construction of Ten Thousand (10,000) Square Feet or More. Street and road construction of ten thousand (10,000) square feet or more of impervious surface shall follow the City's Green Street Manual developed by the Director and approved by City Council resolution. The City's Green Street Manual shall be based on the USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets (December 2008 EPA-833-F-08-009).

(3) Remainder of Planning Priority Projects Require a SUSMP. Except for the projects listed in subparagraphs (1) and (2) of subsection (d) of this section, all other Planning Priority Projects shall prepare and submit to the Director for review and approval a SUSMP that

shall also contain LID requirements consistent with Parts VI.D.7.c and VI.D.7.d(iii) of the Municipal NPDES Permit. In addition, Planning Priority Projects subject to this subparagraph (3) shall do the following:

(i) Incorporate the SUSMP into Project Plans. An applicant for a Planning Priority Project identified in subparagraph (3) of subsection (d) of this section shall incorporate into the applicant's project plans a Storm Water Mitigation Plan (SWMP), which includes those BMPs necessary to control storm water pollution from construction activities and facility operations, as set forth in the SUSMP applicable to the applicant's project. Structural or Treatment Control BMPs (including, as applicable, post-construction treatment control BMPs) set forth in project plans shall meet the design standards set forth in the SUSMP and the current Municipal NPDES Permit.

(ii) Verify Maintenance of BMPs. If a project applicant has included or is required to include structural or treatment control BMPs in project plans, the applicant shall provide verification of maintenance provisions. The verification shall include the applicant's signed statement, as part of its project application, accepting responsibility for all structural and treatment control BMP maintenance until such time, if any, the property is transferred.

(e) *Issuance of Discretionary Permits.* No discretionary permit may be issued for any Planning Priority Project identified in this section until the Director confirms the project plans comply with the applicable requirements of this section.

(f) *Issuance of Certificates of Occupancy.* As a condition for issuing a certificate of occupancy for a Planning Priority Project identified in this section, the Director shall require facility operators and/or owners to build all the storm water pollution control BMPs and structural or treatment control BMPs that are shown on the approved project plans and to submit a signed certification statement stating that the site and all structural or treatment control BMPs will be maintained in compliance with the SUSMP and other applicable regulatory requirements.

(g) *Transfer of Properties Subject to Requirement for Maintenance of Structural and Treatment Control BMPs.*

(1) The transfer or lease of a property subject to a requirement for maintenance of structural and treatment control BMPs shall include conditions requiring the transferee and its successors and assigns to either (i) assume responsibility for maintenance of any existing structural or treatment control BMP or (ii) to replace an existing structural or treatment control BMP with new control measures or BMPs meeting the then current standards of the City and the SUSMP. Such requirement shall be included in any sale or lease agreement or deed for such property. The condition of transfer shall include a provision that the successor property owner or lessee conduct maintenance inspections of all structural or treatment control BMPs at least once a year and retain proof of inspection.

(2) For residential properties where the structural or treatment control BMPs are located within a common area that will be maintained by a homeowners association, language regarding the responsibility for maintenance shall be included in the projects conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what storm water management facilities are present, signs that maintenance is needed, and how the necessary maintenance can be performed. The transfer of this information shall also be required with any subsequent sale of the property.

(3) If structural or treatment control BMPs are located within an area proposed for dedication to a public agency, said BMPs shall be the responsibility of the developer until the dedication is accepted by the public agency.

(h) *CEQA.* Provisions of this section shall be complementary to, and shall not replace, any applicable requirements for storm water mitigation required under the California Environmental Quality Act.

6-7.11 Enforcement.

(a) *Violations Deemed a Public Nuisance.*

(1) The following violations shall be deemed a public nuisance:

(i) Any condition caused or permitted to exist in violation of any of the provisions of this chapter;

(ii) Any failure to comply with any applicable requirement of either the SUSMP or an approved storm water mitigation plan with respect to a property;

(iii) Any false certification or verification, or any failure to comply with a certification or verification provided by a project applicant or the applicant's successor in interest; or

(iv) Any failure to properly operate and maintain any structural or treatment control BMP on a property in accordance with an approved storm water mitigation plan or the SUSMP, is determined to be a threat to the public health, safety and welfare, is declared and deemed a public nuisance, and may be abated or restored by the Director, and a civil or criminal action to abate, enjoin or otherwise compel the cessation of such nuisance may be brought by the City Attorney.

(2) The cost of such abatement and restoration shall be borne by the owner of the property and the cost shall be billed to the owner of the property, as provided by law or ordinance for the recovery of nuisance abatement costs,

(3) If any violation of this chapter constitutes a seasonal and recurrent nuisance, the Director shall so declare. The failure of any person to take appropriate annual precautions to prevent storm water pollution after written notice of a determination under this section shall constitute a public nuisance and a violation of this chapter.

(b) *Concealment.* Causing, permitting, aiding, abetting or concealing a violation of any provision of this chapter shall constitute a violation of such provision.

(c) *Civil Actions.* In addition to any other remedies provided in this chapter, any violation of this chapter may be enforced by civil action brought by the City. In any such action, the City may seek any or all of the following remedies:

(1) A temporary and/or permanent injunction;

(2) Assessment of the violator for the costs of any investigation, inspection or monitoring survey that led to the establishment of the violation, and for the reasonable costs of preparing and bringing legal action under this section;

(3) Costs incurred in removing, correcting or terminating the adverse effects resulting from violation; and

(4) Compensatory damages for loss or destruction to water quality, wildlife, fish and aquatic life.

(d) *Administrative Enforcement Powers.* In addition to the other enforcement powers and remedies established by this chapter, the Director has the authority to utilize the following administrative remedies:

(1) Cease and Desist Orders. When a discharge has taken place or is likely to take place in violation of this chapter, the Director may issue an order to cease and desist such discharge, or practice or operation likely to cause such discharge and direct that those persons not complying shall:

(i) Comply with the requirement;

(ii) Comply with a time schedule for compliance; and

(iii) Take appropriate remedial or preventive action to prevent the violation from recurring.

(2) Notice to Clean. Whenever the Director finds any oil, earth, debris, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or any other material of any kind, in or upon the

sidewalk abutting or adjoining any parcel of land, or upon any parcel of land or grounds, which may result in pollutants entering the MS4 or a non-storm water discharge to the MS4, he or she may give notice to the owner or occupant of the adjacent property to remove such oil earth, debris, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or other material, in any manner that he or she may reasonably provide. The recipient of such notice shall undertake the activities as described in the notice.

(e) *Penalties*. Violation of this chapter shall be punishable as provided in Chapter 2 of Title 1 of this Code. Each day that a violation continues shall constitute a separate offense.

(f) *Permit Revocation*. To the extent the City makes a provision of this chapter or any identified BMP a condition of approval to the issuance of a permit or license, any person in violation of such condition is subject to the permit revocation procedures set forth in this Code.

(g) *Burden of Proof*. In an enforcement action, the burden of proof shall be on the person who is the subject of such action to establish that the reduction or elimination of the discharge to the maximum extent practicable has been accomplished through compliance with the best management practices available, including applicable monitoring, notifications and reporting requirements.

(h) *Remedies*. Remedies under this chapter are in addition to and do not supersede or limit any and all other available remedies, civil or criminal. The remedies provided for in this chapter shall be cumulative and not exclusive.

6-7.12 Fees.

Fees for plan reviews, inspections, violation corrections and tasks associated with this section shall be established by resolution of the City Council."

Section 4. The City Council declares that should any provision, section, paragraph, sentence, or word of this Ordinance be rendered or declared invalid by any final court action in a court of competent jurisdiction, or by reason of any preemptive legislation, the remaining provisions, sections, paragraphs, sentences and words of this Ordinance shall remain in full force and effect.

Section 5. The City Clerk shall certify to the adoption of this Ordinance.

PASSED, APPROVED AND ADOPTED this 12th day of May, 2014.

7.16 Green Streets Best Management Practices

1. **Introduction.** The National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer Systems (MS4) permit for the Los Angeles Region, Order No. R4-2012-0175 (MS4 Permit), adopted November 8, 2012, allows Permittees to participate in a Watershed Management Program (WMP) or Enhanced Watershed Management Program (EWMP). The City has elected to participate in two such programs. As such, the MS4 Permit allows the City to demonstrate 1) there are green streets policies in place and/or 2) commence development of policies that specify the use of green street strategies for significant projects transportation corridors within 60 days of the effective date of the Order, and have a draft policy within 6 months of the effective date of the Order. If greater than 50% of the land area covered by WMP or EWMP meets condition 1 or 2 above, the MS4 Permit allows an additional 6 months for submittal of the draft WMP to the Los Angeles Regional Water Quality Control Board (Regional Board) or submittal of an EWMP to the Regional Board.

2. **Purpose.** This policy fulfills MS4 Permit criteria to implement green streets policies within the Los Cerritos Channel Watershed Management Program and the Lower San Gabriel River Watershed Management Program land areas. The City's Public Works Department shall implement feasible green streets best management practices (BMPs) for new and redevelopment street and roadway projects within transportation corridors. Green streets are defined as right-of-way areas that incorporate infiltration, biofiltration, and/or storage and use BMPs to collect, retain, or detain stormwater runoff as well as a design element that creates attractive streetscapes.

3. **Definitions.**
   a. "New development and/or redevelopment street project" is defined as a public roadway project which 1) adds at least 10,000 square feet of impervious surface or 2) modifies over 10,000 square feet of impervious surface as to line, grade, hydraulic capacity or purpose.
   b. "Transportation corridor" is defined as major arterial streets and highways which provide direct access to freeways and extend continuously from city limit to city limit, providing direct access to adjoining cities.
   c. "Routine maintenance" is defined as slurry seal, repaving, and reconstruction of the road or street where the original line, grade and hydraulic capacity are maintained.

4. **Application.**
   a. The Public Works Department shall require new development and/or redevelopment street and roadway projects within transportation corridors to incorporate feasible green streets BMPs. Routine street maintenance or repair projects and linear utility projects are excluded from these requirements.
   b. This policy shall apply to all street projects for which preliminary engineering design is begun after the effective date of this policy.

5. **Amenities.**
   a. The Public Works Department shall consider opportunities to replenish groundwater, create attractive streetscapes, and provide pedestrian and bicycle accessibility when designing new development and redevelopment of streets and roadway projects.
   b. The Planning and Economic Development Departments shall encourage developers to consider opportunities to replenish groundwater, create attractive streetscapes, and provide pedestrian and bicycle accessibility when designing newly constructed roadways.

6. **Guidance.** The City of Bellflower shall use the USEPA's *Managing Wet Weather with Green Infrastructure Municipal Handbook: Green Streets*, or an equivalent guidance handbook or manual, for analysis of feasible and practicable measures in public and private developments.

7. **Training.** The Public Works Department shall incorporate aspects of green streets into annual MS4 Permit Public Agency Activities staff trainings for staff who participate in street design or approval of street design.

CITY OF BELLFLOWER

ORDINANCE NO. 1277

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF BELLFLOWER AMENDING SECTION 13.20.130 OF THE BELLFLOWER MUNICIPAL CODE TO UPDATE THE CITY'S STORMWATER LOW IMPACT DEVELOPMENT ORDINANCE

WHEREAS, the City is authorized by Article XI, Section 5 and Section 7 of the State Constitution to exercise the police power of the State by adopting regulations to promote public health, public safety, and general prosperity; and

WHEREAS, the federal Clean Water Act and the Regional Water Quality Control Boards establish permit requirements in order to prohibit the discharge of pollutants in stormwater runoff to waters of the United States; and

WHEREAS, the City is a permittee under the California Regional Water Quality Control Board, Los Angeles Region Order No. R4-2012-0175, issued on November 8, 2012, which establishes Waste Discharge Requirements for Municipal Separate Storm Sewer Systems ("MS4") Discharges within the Coastal Watersheds of Los Angeles County, Except those Discharges Originating from the City of Long Beach MS4; and

WHEREAS, Order No. R4-2012-0175 contains requirements for municipalities to establish a Low Impact Development ("LID") Ordinance and a Green Streets Policy in order to participate in a Watershed Management Program; and

WHEREAS, the California Regional Water Quality Control Board, Los Angeles Region has adopted Total Maximum Daily Loads ("TMDLs") for pollutants, which are numerical limits that must be achieved effectively through LID implementation; and

WHEREAS, the City has the authority under the California Water Code to adopt and enforce ordinances imposing conditions, restrictions, and limitations with respect to any activity that might degrade waters of the State; and

WHEREAS, the City is committed to a stormwater management program that protects water quality and water supply by employing watershed-based approaches that balance environmental and economic considerations; and

WHEREAS, the City imposes LID requirements on development and hereby intends to update those requirements in accordance with Order No. R4-2012-0175.

THE CITY COUNCIL OF THE CITY OF BELLFLOWER DOES ORDAIN AS FOLLOWS:

SECTION 1. Section 13.20.130 of the Bellflower Municipal Code is amended to read, in its entirety, as follows:

"13.20.130 Control of Pollutants from New Development/Redevelopment Projects.

A. Prior to the construction of any project that is subject to development planning requirements specified in the MS4 NPDES Permit, such project shall be evaluated by the City for its potential to discharge pollutants to the MS4. Such projects must also comply with the development requirements specified in the Los Cerritos Channel Watershed Management Program, the Lower San Gabriel River Watershed Management Program, or any other Watershed Management Program to which the City is currently a participant. The City's Watershed Management Programs are hereby incorporated by reference and shall be made available for review by the public in the Public Works Department Office.

B. Once a development planning-subject project has been evaluated for its potential to discharge pollutants to the MS4, the City shall require appropriate BMPs, both structural and nonstructural, to be implemented on a post-construction basis, and shall require a maintenance agreement to assure the proper performance of such BMPs."

SECTION 2. This Ordinance shall take effect thirty (30) days after its adoption. The City Clerk, or her duly appointed deputy, shall certify to the adoption of this Ordinance and shall cause this Ordinance to be posted as required by law.

ORDINANCE NO. 1277 HAD ITS FIRST READING ON JUNE 9, 2014, ITS SECOND READING ON JUNE 23, 2014, AND WAS DULY PASSED, APPROVED, AND ADOPTED BY THE CITY COUNCIL OF THE CITY OF BELLFLOWER AT ITS REGULAR MEETING OF JUNE 23, 2014.

CITY OF BELLFLOWER

ORDINANCE NO. 1099

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF BELLFLOWER AMENDING BELLFLOWER MUNICIPAL CODE SECTION 10-4 TO REVISE THE STORMWATER AND RUNOFF POLLUTION CONTROL ORDINANCE

WHEREAS, on December 13, 2001, the California Water Quality Control Board, Los Angeles Region, adopted a municipal National Pollutant Discharge Elimination System (NPDES) Permit for municipal stormwater and urban runoff discharges within the County of Los Angeles, and the incorporated cities therein, except for the City of Long Beach;

WHEREAS, the City of Bellflower (City) is subject to the municipal NPDES Permit;

WHEREAS, on October 14, 2002, the City Council adopted Ordinance No. 1038 amending Bellflower Municipal Code Section 10-4 relative to stormwater and urban runoff pollution controls; and

WHEREAS, the City seeks to fully comply with the provisions of the most current NPDES Permit.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF BELLFLOWER DOES ORDAIN AS FOLLOWS:

SECTION 1. Paragraph a. of Subsection 10-4.3 of the Bellflower Municipal Code is hereby amended to read as follows:

"Prohibiting illicit discharges to the municipal stormwater system."

SECTION 2. Bellflower Municipal Code Subsection 10-4.4 is hereby amended is hereby amended by adding thereto a new definition for "MS4 NPDES Permit" and amending the definitions of "illicit discharge" and "industrial activity" to read as follows:

""Illicit Discharge" means the entry of any material other than stormwater into the MS4 unless such discharge is exempted by Regional Board or under the MS4 NPDES Permit or any other NPDES Permit to which the City may be subject."

""Industrial activity" means any of the 10 classifications of industrial facilities specified in 40 Code of Federal Regulations §122.26 (b)(14), defined by Standard Industrial Classification (SIC) and which is required to obtain a NPDES Permit, not including construction activities that cause the disturbance of one (1) acre of soil by clearing, grading, excavation, or a combination thereof."

""MS4 NPDES Permit" means any municipal NPDES Permit adopted by the California Regional Water Quality Control Board, Los Angeles Region, to which the City is subject."

SECTION 3. Bellflower Municipal Code Subsection 10-4.9 is hereby amended as follows:

"10-4.9 Control of Pollutants from Industrial and Commercial Facilities.

a. Certain categories of commercial facilities specified in the municipal NPDES Permit or identified by the City as being significant contributors of pollution, shall implement BMPs prescribed by the Regional Board or its Executive Officer, through programs or actions made pursuant to the municipal NPDES Permit, or by the City's Director of Public Works, to minimize the discharge of pollutants to the MS4.

b. Certain categories of commercial facilities shall be inspected for pollution issues and BMP compliance in accordance with a schedule called for in the municipal NPDES Permit or as often as necessary as determined by the City."

SECTION 4. Bellflower Municipal Code Subsection 10-4.10 is hereby amended by adding a new paragraph "d" to read as follows:

"d. Any industry, whether or not subject to a NPDES General Industrial Activities Stormwater Permit, may be inspected in accordance with a schedule established by the municipal NPDES Permit or as often as necessary as determined by the City for the purpose of determining compliance with BMP requirements or to abate pollution issues."

SECTION 5. Paragraph a. of Subsection 10-4.11 of the Bellflower Municipal Code is hereby amended to read as follows:

"a. No person shall be granted a grading permit or shall commence or continue any construction activity in the City that causes the disturbance of one (1) acre or more of soil by clearing, grading, and excavating without demonstrating to the City that such person has obtained a NPDES General Construction Activity Stormwater Permit from the SWRCB. NPDES construction activity does not include: (i) routine maintenance to maintain original line and grade, (ii) hydraulic capacity, (iii) the original purpose of the facility, or (iv) emergency construction activities required to immediately protect the public health and safety."

SECTION 6. Bellflower Municipal Code Subsection 10-4.12 is hereby amended to read as follows:

"10-4.12 Control of Pollutants from Other Construction Activities

a. No person shall be granted a grading permit for a construction project that is expected to cause a disturbance of less than one (1) acre of soil by grading, clearing, and/or excavation without consenting to implement BMPs prescribed by the City to reduce pollutant discharges to the MS4 associated with construction activities.

b. No person shall be allowed to commence or continue any construction activity in the City that causes the disturbance of less than one (1) acre of soil by grading, clearing, and/or excavating without implementing BMPs prescribed by the City."

SECTION 7. Bellflower Municipal Code Subsection 10-4.13 is hereby amended to read as follows:

"10-4.13 Control of Pollutants from New Development/Redevelopment Projects

a. Prior to the construction of any project that is subject to development planning requirements specified in the MS4 NPDES Permit, such project shall be evaluated by the City for its potential to discharge pollutants to the MS4.

b. b. Once a development planning-subject project has been evaluated for its potential to discharge pollutants to the MS4, the City shall require appropriate BMPs, both structural and non-structural, to be implemented on a post-construction basis; and shall require a maintenance agreement to assure the proper performance of such BMPs."

SECTION 8. Bellflower Municipal Code Subsection 10-4.15 is hereby amended to read as follows:

10-4.15 Fees.

"The City Council may establish fees to recover costs for complying with the requirements of this Section, including but not limited to plan checking, cleanup and abatement fees, and industrial and commercial inspection fees, which may be fixed and established from time to time by the City Council by resolution."

SECTION 9. Bellflower Municipal Code Section 10-4 is hereby amended by adding thereto a new Subsection 10-4.16 to read as follows:

"10-4.16 Receiving Water Limitation Exceedances

Any person causing a discharge which exceeds a receiving water limitation shall be required to halt the discharge."

SECTION 10. If any section, subsection, subdivision, paragraph, sentence, clause or phrase of this Ordinance is for any reason held to be unconstitutional or invalid or ineffective by any court of competent jurisdiction, such decision shall not affect the validity or effectiveness of the remaining portions of this Ordinance. The City Council hereby declares that it would have passed each section, subsection, subdivision, paragraph, sentence, clause or phrase of this Ordinance irrespective of the fact that one or more sections, subsections, subdivisions, paragraphs, sentences, clauses or phrases be declared unconstitutional or invalid or ineffective.

SECTION 11. This Ordinance shall take effect thirty (30) days after its adoption. The City Clerk, or her duly appointed deputy, shall certify to the adoption of this Ordinance and shall cause this Ordinance to be posted as required by law.

ORDINANCE NO. 1099 HAD ITS FIRST READING ON OCTOBER 10, 2005, ITS SECOND READING ON OCTOBER 24, 2005, AND WAS DULY PASSED, APPROVED, AND ADOPTED BY THE CITY COUNCIL OF THE CITY OF BELLFLOWER AT ITS REGULAR MEETING OF OCTOBER 24, 2005.

CITY OF CERRITOS

RESOLUTION NO. 2014-15

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF CERRITOS APPROVING A GREEN STREETS POLICY

WHEREAS, Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175) was adopted by the California Regional Water Quality Control Board (CRWQCB), Los Angeles Region on November 8, 2012; and

WHEREAS, the City of Cerritos is participating with multiple cities that discharge storm water and urban runoff into the San Gabriel River Watershed and the Los Cerritos Channel Watershed to develop a Watershed Management Program; and

WHEREAS, municipalities electing to prepare a Watershed Management Program under this MS4 Permit are required to demonstrate that Green Street Policies are in place that specify the use of green street strategies for transportation corridors; and

WHEREAS, Green Streets are enhancements to street and road projects to improve the quality of the storm water and urban runoff through the implementation of infiltration, bio-treatment, xeriscaping parkways and tree lined streets.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF CERRITOS DOES RESOLVE AS FOLLOWS:

Section 1. Directs the Director of Public Works to implement Green Streets for publicly owned transportation corridors as described in the City of Cerritos Green Streets Manual Exhibit "A" to the maximum extent practicable.

Section 2. Routine maintenance including but not limited to slurry seals, grind and overlay, and reconstruction to maintain original line are grade are excluded from the Green Streets Policy.

Section 3. The Director of Public Works is authorized to modify the City of Cerritos Green Streets Manual in a manner consist with the requirements of the current MS4 Permit.

Section 4. The City Clerk-Treasurer shall certify to the passage and adoption hereof.

PASSED, APPROVED AND ADOPTED this 12th day of June, 2014.

CITY OF CERRITOS

ORDINANCE NO. 986

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF CERRITOS AMENDING CHAPTER 6.32 OF THE CITY OF CERRITOS MUNICIPAL CODE TO UPDATE THE CITY'S STORM WATER LOW IMPACT DEVELOPMENT ORDINANCE.

WHEREAS, the City is authorized by Article XI, Section 5 and Section 7 of the State Constitution to exercise the police power of the State by adopting regulations to promote public health, public safety, and general prosperity; and

WHEREAS, the federal Clean Water Act and the Regional Water Quality Control Boards establish permit requirements in order to prohibit the discharge of pollutants in storm water runoff to waters of the United States; and

WHEREAS, the City is a permittee under the California Regional Water Quality Control Board, Los Angeles Region Order No. R4-2012-0175, issued on November 8, 2012, which establishes Waste Discharge Requirements for Municipal Separate Storm Sewer Systems ("MS4") Discharges within the Coastal Watersheds of Los Angeles County, Except those Discharges Originating from the City of Long Beach MS4; and

WHEREAS, Order No. R4-2012-0175 contains requirements for municipalities to establish a Low Impact Development ("LID") Ordinance and a Green Streets Policy in order to participate in a Watershed Management Program; and

WHEREAS, the California Regional Water Quality Control Board, Los Angeles Region has adopted Total Maximum Daily Loads ("TMDLs") for pollutants, which are numerical limits that must be achieved effectively through LID implementation; and

WHEREAS, the City has the authority under the California Water Code to adopt and enforce ordinances imposing conditions, restrictions, and limitations with respect to any activity that might degrade waters of the State; and

WHEREAS, the City is committed to a storm water management program that protects water quality and water supply by employing watershed-based approaches that balance environmental and economic considerations; and

WHEREAS, the City imposes LID requirements on development and hereby intends to update those requirements in accordance with Order No. R4-2012-0175.

THE CITY COUNCIL OF THE CITY OF CERRITOS DOES HEREBY ORDAIN AS FOLLOWS:

Section 1. Chapter 6.32 of the Cerritos Municipal Code is hereby amended and shall now read as follows:

Chapter 6.32
STORM WATER AND URBAN RUNOFF POLLUTION PREVENTION CONTROLS[1]

Sections:

6.32.010 **Purpose.**
6.32.020 **Definitions.**
6.32.030 **Illicit discharges and connections.**
6.32.040 **Illicit disposal.**
6.32.050 **Construction sites requiring building permit and/or grading plan.**

6.32.055 New development/redevelopment pollution reduction.
6.32.060 Industrial activity sites.
6.32.070 Fees.
6.32.080 Violation—Penalty.
6.32.090 Disclaimer of liability.

6.32.010 Purpose.

The purpose of this chapter is to protect the health, safety and general welfare of the citizens of the city and state of California by:

(A) Regulating non-storm water discharge to the storm drain system;

(B) Providing for the control of spillage, dumping or disposal of materials into the storm drain system;

(C) Reducing pollutants in storm water and urban runoff to the maximum extent practicable.

6.32.020 Definitions.

As used in this chapter, the following terms have the meanings prescribed:

"Areas susceptible to runoff" means those areas within a real property exposed to rainfall or other precipitations (e.g., sprinkler irrigation) or the flow of any fluid.

"Authorized enforcement officer" means the director of the department of public works of the city, including any person designated by the director to enforce the provisions of this chapter.

"Best management practices (BMPs)" means storm water pollution control practices applicable to existing properties that significantly reduce and control storm water runoff and prevent non-storm water runoff pollution from entering the storm drain system and the Pacific Ocean.

"Biofiltration" means a LID BMP that reduces storm water pollutant discharges by intercepting rainfall on vegetative canopy, and through incidental infiltration and/or evapotranspiration, and filtration. Incidental infiltration is an important factor in achieving the required pollutant load reduction. Therefore, the term "biofiltration" as used in this chapter is defined to include only systems designed to facilitate incidental infiltration or achieve the equivalent pollutant reduction as biofiltration BMPs with an underdrain. Biofiltation BMPs include bioretention systems with an underdrain and bioswales.

"Bioretention" means a LID BMP that reduces storm water runoff by intercepting rainfall on vegetative canopy, and through evapotranspiration and infiltration. The bioretention system typically includes a minimum two-foot top layer of a specified soil and compost mixture underlain by a gravel-filled temporary storage pit dug into the in-situ soil. A bioretention BMP may be designed with an overflow drain, but may not include an underdrain. When a bioretention BMP is designed or constructed with an underdrain it is regulated by the MS4 Permit as biofiltration.

"Bioswale" means a LID BMP consisting of a shallow channel lined with grass or other dense, low-growing vegetation. Bioswales are designed to collect storm water runoff and to achieve a uniform sheet flow through the dense vegetation for a period of several minutes.

"Brownfield Development" means real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant.

"Certificate of occupancy" means the city building official's final construction approval and authorization to use a facility.

"Code" means the Cerritos Municipal Code and the City Charter of the city of Cerritos.

"Development" means construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail, and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Directly Adjacent" means situated within two hundred (200) feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

"Discharge" means any release, spill, leak, pump, flow, escape, dumping, or disposal of any liquid, semi-solid or solid substance.

"Disturbed area" means an area altered as a result of clearing, grading and/or excavation of earth.

"Hazardous waste" means any material defined as hazardous by Chapter 6.95 of the California Health and Safety Code and any substance designated pursuant to 40 CFR 302. This includes unlisted hazardous substances that are solid wastes, as defined in 40 CFR 261.2, that are not excluded from regulation as hazardous wastes under 40 CFR 261.4(b) if they exhibit any of the characteristics identified in 40 CFR 261.20 through 261.24.

"Illicit connection" means any man-made conveyance which is connected to the storm drain system that conveys, or has the potential to convey an illicit discharge.

"Illicit discharge" means any discharge into the storm drain system that is prohibited under local, state, or federal statutes, ordinances, codes or regulations. The term illicit discharge includes any non-storm water discharge, except those discharges pursuant to a separate NPDES permit and discharges that are exempted or conditionally exempted by the current MS4 Permit applicable to the city of Cerritos.

"Infiltration BMP" means a LID BMP that reduces storm water runoff by capturing and infiltrating the runoff into in-situ soils or amended onsite soils. Examples of infiltration BMPs include infiltration basins, dry wells, and pervious pavement.

"LID" means Low Impact Development, which consists of building and landscape features designed to retain or filter storm water runoff.

"Low Impact Development Plan (LID Plan)" means such plan prepared by the project applicant pursuant to section 6.32.055 of this chapter.

"MS4" means the Municipal Separate Storm Sewer System, otherwise referred to as the Storm Drain System.

"Municipal NPDES Permit (MS4 Permit)" means the current, area-wide NPDES permit issued to a government agency or agencies permitting the discharge of storm water from an MS4.

"New development" for the purposes of this chapter means land disturbing activities, structural development (including construction or installation of a building or structure), creation of impervious surfaces, and land subdivision.

"Non-storm water runoff" means the flow of any fluid that is not entirely composed of storm water.

"NPDES" means the National Pollutant Discharge Elimination System.

"NPDES construction permit" means a permit issued by the Regional Water Quality Control Board to owners/developers for construction activity to control sediment and other pollutants from entering the storm drain system.

"NPDES industrial permit" means a permit issued by the Regional Water Quality Control Board to owners/operators of specific categories of industrial facilities identified in federal regulations to discharge storm water into the storm drain system.

"Planning Priority Projects" for the purposes of this chapter means those projects specified in section 6.32.055 that are required to incorporate appropriate storm water mitigation measures into the design plan for their respective projects.

"Rainfall Harvest and Use" means a LID BMP system designed to capture runoff, typically from a roof but can also include runoff capture from elsewhere within the site, and to provide for temporary storage until the harvested water can be used for irrigation or non-potable uses. The harvested water may also be used for potable water uses if the system includes disinfection treatment and is approved for such use by the local building department.

"Redevelopment" for the purposes of this chapter means land-disturbing activity that results in the creation, addition, or replacement of five thousand (5,000) square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of routine maintenance activity; and land disturbing activity related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Storm drain system" means those facilities that convey storm water runoff and suspended solids to the waters of the United States, including streets, alleys, roads, ditches, curbs, gutters, catch basins, conduits, streams, channels, creeks and rivers.

"Storm water" means water that originates from atmospheric moisture (rainfall, hail, snow or snowmelt) and that falls onto land, water or other surfaces.

"Storm water pollution prevention plan (SWPPP)" means the operator/owner-prepared plan that identifies BMPs for implementation and monitors the effectiveness of the BMPs for a specific commercial/industrial facility.

"Storm water runoff" means the surface flow of storm water.

"Urban runoff" means fluid flows originating from precipitation and other sources found in the storm drain system.

6.32.030 Illicit discharges and connections.

(A) No person or business shall cause or allow any illicit discharge from their property of non-storm water runoff to enter the storm drain system, unless such discharge is authorized by an NPDES permit.

(B) No person or business shall construct or use an illicit connection that operates intentionally or unintentionally. Any such connection shall be removed.

(C) The discharge of untreated wash waters to the MS4 when gas stations, auto repair garages, or other types of automotive service facilities are cleaned is prohibited.

(D) The discharge of untreated wastewater to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations is prohibited.

(E) To the maximum extent practicable, discharges to the MS4 from areas where machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze are repaired is prohibited.

(F) The discharge of untreated runoff to the MS4 from storage areas of materials containing grease, oil or other hazardous substances, and uncovered receptacles containing hazardous materials is prohibited.

(G) The discharge or commercial/municipal swimming pool filter backwash to the MS4 is prohibited.

(H) The discharge of untreated runoff from the washing of toxic materials from paved and unpaved areas to the MS4 is prohibited.

(I) The washing of impervious surfaces in industrial/commercial areas that results in a discharge of untreated runoff to the MS4 is prohibited or shall be controlled to the maximum extent practicable unless specifically required by state or local health and safety codes.

(J) The discharge from washing out concrete trucks to the MS4 is prohibited.

(K) Industrial and commercial motor vehicle parking lots with more than twenty-five spaces that are located in areas exposed to storm water shall be regularly swept, or other equally effective measure taken, to remove debris.

(L) The placement of machinery and equipment that are to be repaired or maintained shall be such that leaks, spills and other maintenance related pollutants are not discharged to the MS4.

(M) In order to control spills, dumping or disposal of materials to the MS4, the following are prohibited:

(1) Littering;

(2) Disposal of leaves, dirt or other landscape debris into a storm drain;

(3) The discharge to the MS4 of any pesticide, fungicide, or herbicide banned by the United States Environmental Protection Agency or the California Department of Pesticide Regulation;

(4) The improper disposal of food wastes;

(5) The disposal of hazardous wastes into trash containers for municipal trash disposal so as to cause a discharge to the MS4.

(N) In areas exposed to storm water, the removal and lawful disposal of all fuels, chemicals, fuel and chemical wastes, animal wastes, garbage, batteries, and other materials that may have potential adverse impacts on water quality is required.

(O) The following BMPs shall be adhered to by all persons within the city:

(1) Collection, Storage and Minimization of Runoff.

(a) Water used for irrigation purposes shall not be allowed to run off of a site. In addition, washing down of paved areas shall be prohibited unless necessary for health or safety purposes and is not in violation of any provision of this code.

(b) The uncovered outdoor storage of unsealed containers of building materials such as dirt, wood and wood products, mineral aggregates, liquids, and other building materials containing hazardous materials is prohibited in areas susceptible to runoff.

(2) Maintenance of Equipment.

(a) Objects such as vehicle parts containing grease, oil or other hazardous substances, and unsealed receptacles containing hazardous materials, shall not be in areas susceptible to runoff.

(b) Maintenance of vehicles and equipment in an uncovered outdoor area shall be performed on a pad of absorbent material to contain leaks, spills or discharges.

(3) Removal of Debris and Residue.

(a) Fuel and chemical residue or other types of potentially harmful material, such as animal waste, and refuse, which are located in areas susceptible to runoff, shall be removed immediately and disposed of properly.

(b) Intentional disposal into a storm drain of green waste debris such as landscaping clips, grass, tree branches, and other vegetable materials, is prohibited.

(P) The discharge of gray water to the streets or the storm drains is prohibited. Gray water is water that is discharged from sinks, showers, tubs, washing machines and garbage disposals.

(Q) Any discharge that would result in, or constitute, a violation of NPDES Permit No. CAS614001, available for viewing at the department of public works, or any amendment, revision or reissuance thereof, either separately considered or when combined with other discharges, is prohibited. Liability for any such discharge shall be the responsibility of the person(s) causing or responsible for the discharge and such person(s) shall defend, indemnify and hold harmless the city in any administrative or judicial action relating to such discharge.

(R) Where best management practices, Standard Urban Storm Water Mitigation Plan and/or similar requirements have been duly and legally adopted and imposed by any federal, state of California, regional and/or local regulatory agency with jurisdiction over the city of Cerritos pertaining to any activity, operation or facility that causes or contributes to storm water pollution or illicit discharges to the storm water system, every person undertaking such activity or operation or owning or operating such facility shall comply with such requirements, including obtaining all necessary permits. If the requirements set forth in this chapter are more stringent than the best management practices, Standard Urban Storm Water Mitigation Plan and/or similar requirements duly and legally adopted and imposed by a federal, state of California, regional and/or regulatory agency with jurisdiction over the city of Cerritos, the city engineer may waive the requirements imposed by this chapter upon a finding of good cause.

6.32.040 Illicit disposal.

(A) No person or business shall spill, dump, dispose or place any material, other than storm water runoff, into any storm drain system.

(B) No person or business shall throw, deposit, place, leave, maintain, or permit to be thrown, deposited, placed, any refuse, rubbish, garbage, or any other discarded or abandoned objects, articles or accumulations, in or upon any street, alley, sidewalk, stone drain, inlet, catch basin conduit or drainage structure, or upon any public or private plot of land in the city, so that the same might become a pollutant, except in containers, recycling bags, or other lawfully established waste disposal facilities.

6.32.050 Construction sites requiring building permit and/or grading plan.

(A) Any person or business engaging in construction activity that requires an NPDES construction permit must obtain that permit from the Regional Water Quality Control Board, and must demonstrate possession of such permit before grading and/or building permits can be issued. The NPDES construction permit shall be retained on site and shall be shown to the authorized enforcement officer upon request.

(B) No grading permit shall be issued for developments with a disturbed area of land one acre or greater unless the applicant can show that a notice to comply with the State Construction Activity Storm Water Permit has been filed and a SWPPP has been prepared.

(C) The following BMPs shall apply to all projects under construction in the city at the time of demolition of an existing structure or commencement of new construction, and shall remain in place until receipt of a certificate of occupancy.

(1) Runoff, sediment and construction debris shall not leave the site and enter the storm drain system.

(2) Any sediments or other materials which are tracked off site shall be removed the same day as they are tracked off site. Where determined necessary by the authorized enforcement officer, a temporary sediment barrier shall be installed.

(3) Drainage controls to prevent runoff from leaving the site shall be utilized as needed, depending on the topography of the site and extent of proposed grading. These controls may include but are not limited to the following:

(a) Detention ponds, sediment ponds or infiltration pits;

(b) Dikes, filter berms or ditches;

(c) Down drains, chutes or flumes.

(4) Plastic covering may be utilized to prevent erosion of an otherwise unprotected area, along with runoff devices to intercept and safely convey the runoff.

(5) Excavated soil shall be located on the site in a manner that eliminates the possibility of sediments running off site. Soil piles shall be covered until the soil is either used or removed.

(6) No runoff from washing construction or other industrial vehicles on site shall be permitted to leave the site or enter the storm drain system.

(7) The city may, as a condition of granting a construction permit, set reasonable limits on the clearing of vegetation from construction sites, including but not limited to regulating the length of time during which soil may be bare and, in certain sensitive cases, prohibit bare soil.

6.32.055 New development/redevelopment pollution reduction.

(A) Objective: The provisions of this section establish requirements for construction activities and facility operations of development and redevelopment projects to comply with the current applicable MS4 permit to lessen the water quality impacts of development by using smart growth practices and to integrate LID practices and standards for storm water pollution mitigation through means of infiltration, evapotranspiration, biofiltration, and rainfall harvest and use.

(B) Scope: This section contains requirements for storm water pollution control measures in development and redevelopment projects, and authorizes the city to further define and adopt storm water pollution control measures, and to develop LID principles and requirements, including but not limited to the objectives and specifications for integration of LID strategies. Except as otherwise provided herein, the city shall administer, implement and enforce the provisions of this section.

(C) Applicability. The following development and redevelopment projects shall be designated as Planning Priority Projects, which are subject to city conditioning and approval for the design and implementation of post-construction controls to mitigate storm water pollution prior to completion of the projects, and shall meet the requirements of this section:

(1) Development Projects.

(a) All development projects equal to one acre or greater of disturbed area that adds more than ten thousand (10,000) square feet of impervious surface area.

(b) Industrial parks with ten thousand (10,000) square feet or more of surface area.

(c) Commercial malls with ten thousand (10,000) square feet or more of surface area.

(d) Retail gasoline outlets with five thousand (5,000) square feet or more of surface area.

(e) Restaurants with five thousand (5,000) square feet or more of surface area.

(f) Parking lots with five thousand (5,000) square feet or more of impervious surface area, or with twenty-five (25) or more parking spaces.

(g) Streets and roads construction with ten thousand (10,000) square feet or more of impervious surface area. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects.

(h) Automotive service facilities with five thousand (5,000) square feet or more of surface area.

(i) Projects located in or directly adjacent to, or discharging directly to an environmentally sensitive area, where the development will:

(i) Discharge storm water runoff that is likely to impact a sensitive biological species or habitat; and

(ii) Create two thousand, five hundred (2,500) square feet or more of impervious surface area.

(j) Single-family hillside properties.

(2) Redevelopment Projects.

(a) Land disturbing activity that results in the creation, addition or replacement of five thousand (5,000) square feet or more of impervious surface area on an already developed site of one of the projects identified in this subsection.

(b) Where redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction storm water quality control requirements, the entire project must be mitigated.

(c) Where redevelopment results in an alteration to less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction storm water quality control requirements, only the alteration must be mitigated, and not the entire development.

(d) Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.

(e) Existing single-family dwellings and accessory structures are exempt from the redevelopment requirements unless such projects create, add, or replace ten thousand (10,000) square feet or more of impervious surface area.

(D) Requirements: The site for every Planning Priority Project identified in section 6.32.055(C) shall be designed to control pollutants, pollutant loads, and runoff volume to the maximum extent feasible by minimizing impervious surface area and controlling runoff from impervious surfaces through infiltration, evapotranspiration, bioretention and/or rainfall harvest and use. The project applicant shall prepare a LID Plan which implements set LID standards and practices for storm water pollution mitigation and provides documentation to demonstrate compliance with the MS4 Permit on the plans and permit application submitted to the city. Such a LID Plan shall comply with the following:

(1) A new single-family hillside property development shall prepare a LID Plan to include mitigation measures to:

(a) Conserve natural areas;

(b) Protect slopes and channels;

(c) Provide storm drain system stenciling and signage;

(d) Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability; and

(e) Direct surface flow to vegetated areas before discharge, unless the diversion would result in slope instability.

(2) Street and road construction of ten thousand (10,000) square feet or more of impervious surface shall follow US EPA guidance regarding managing wet weather with the city's most current Green Streets Manual to the maximum extent practicable.

(3) All other Planning Priority Projects identified in section 6.32.055(C) shall prepare an LID Plan to comply with the following:

(a) Retain storm water runoff onsite for the storm water quality design volume (SWQDv) defined as the runoff from:

(i) The 85th percentile 24-hour runoff event as determined from the Los Angeles County 85th percentile precipitation isohyetal map; or

(ii) The volume of runoff produced from a 0.75 inch, 24-hour rain event, whichever is greater.

(b) Minimize hydromodification impacts to natural drainage systems as defined in the current MS4 Permit.

(4) The LID Plan, including related grading and drainage plans, shall be designed in coordination with, and shall be controlled by, the landscape design for the subject property. LID Plan and LID BMP elements shall not displace required landscaping, but rather shall be designed to be integrated into the landscape design. All landscape planting and irrigation plans prepared in coordination with the LID Plan shall be professionally prepared by a landscape architect and shall be subject to the review and approval of the Department of Community Development and the Department of Public Works.

(E) Technical Infeasibility.

(1) To demonstrate technical infeasibility, the project applicant must demonstrate that the project cannot reliably retain 100 percent of the SWQDv on-site, even with the maximum application of green roofs and rainwater harvest and use, and that compliance with the applicable post-construction requirements would be technically infeasible by submitting a site-specific hydrologic and/or design analysis conducted and endorsed by a registered professional engineer, geologist, architect, and/or landscape architect. Technical infeasibility may result from conditions including the following:

(a) The infiltration rate of saturated in-situ soils is less than 0.3 inch per hour and it is not technically feasible to amend the in-situ soils to attain an infiltration rate necessary to achieve reliable performance of infiltration or bioretention BMPs in retaining the SWQDv onsite.

(b) Locations where seasonal high groundwater is within five (5) to ten (10) feet of surface grade;

(c) Locations within one hundred (100) feet of a groundwater well used for drinking water;

(d) Brownfield development sites or other locations where pollutant mobilization is a documented concern;

(e) Locations with potential geotechnical hazards; and

(f) Smart growth and infill or redevelopment locations where the density and/or nature of the project would create significant difficulty for compliance with the onsite volume retention requirement.

(2) If partial or complete onsite retention is technically infeasible, the project site may biofiltrate 1.5 times the portion of the remaining SWQDv that is not reliably retained onsite. Biofiltration BMPs must adhere to the design specifications provided in the current applicable MS4 Permit.

(3) The remaining SWQDv that cannot be retained or biofiltered onsite must be treated onsite to reduce pollutant loading. BMPs must be selected and designed to meet pollutant-specific benchmarks as required by the MS4 Permit. Flow-through BMPs may be used to treat the remaining SWQDv and must be sized based on a rainfall intensity of 0.2

inches per hour, or the one-year, one-hour rainfall intensity as determined from the most recent Los Angeles County isohyetal map, whichever is greater.

(F) BMP Maintenance.

(1) As a condition for issuing a certificate of occupancy for a Planning Priority Project identified in this section, the Director of Public Works shall require facility operators and/or owners to build all the storm water pollution control BMPs and structural or treatment control BMPs that are shown on the approved project plans.

(2) The property owner of each Planning Priority Project shall record with the County Recorder a "Covenant And Agreement Regarding On-site LID BMP Maintenance" to the satisfaction of the Director of Public Works and prior to the clearance of the building permit final inspection, issuance of an occupancy permit or operation of the approved land use on the subject property.

(3) The transfer or lease of a property subject to maintenance requirements for LID BMPs shall include conditions requiring the transferee and its successors and assigns to either: (a) assume responsibility for maintenance of any existing LID BMP, or (b) replace an existing LID BMP with new control measures or BMPs meeting the then current standards of the city and MS4 Permit. Such requirement shall be included in any sale or lease agreement or deed for such property. The condition of transfer shall include a provision that the successor property owner or lessee conduct maintenance inspections of all LID BMPs at least once a year and retain proof of inspection.

(4) For residential properties where the LID BMPs are located within a common area which will be maintained by a homeowners' association, language regarding the responsibility for maintenance shall be included in the project's conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what LID BMPs are present, signs that maintenance is needed, and how the necessary maintenance can be performed. The transfer of this information shall also be required with any subsequent sale of the property.

(5) If LID BMPs are located within an area proposed for dedication to a public agency, they will be the responsibility of the developer until the dedication is accepted.

6.32.060 Industrial activity sites.

(A) All persons or businesses engaged in industrial activity in the city shall acquire an NPDES industrial permit from the Regional Water Quality Control Board, before discharging any non-storm water runoff into the storm drain system. The NPDES industrial permit shall be retained on site and shall be shown to the authorized enforcement officer upon request.

(B) Industrial and commercial facility operators/owners shall prepare and submit to the Regional Water Quality Control Board a storm water pollution prevention plan that incorporates BMPs. To prepare their SWPPP, persons or businesses conducting industrial activities within the city should refer to the latest edition of the California Storm Water Best Management Practices Handbook for industrial/commercial facilities, produced and published by the Storm Water Quality Task Force of the American Public Works Association.

6.32.070 Fees.

Fees to be charged for plan checking, inspection and any other activities carried out by the city under this chapter shall be set by the city council by resolution.

6.32.080 Violation—Penalty.

(A) The violation of any provision of this chapter, or failure to comply with any of the requirements of this chapter, shall constitute a misdemeanor; except that notwithstanding any other provision of this chapter, any such violation constituting a misdemeanor under this chapter may, at the sole discretion of the authorized enforcement officer, by charged and prosecuted as an infraction.

(B) In addition to the penalties provided, any condition caused or permitted to exist in violation of any of the provisions of this chapter is a threat to the public health, safety and welfare, is declared and deemed a nuisance, may be summarily abated and/or restored by the authorized enforcement officer, and/or civil action to abate, enjoin or otherwise compel the cessation of such nuisance.

(1) The cost of such abatement and restoration shall be borne by the owner of the property and the cost thereof shall be invoiced to the owner of the property. If the invoice is not paid with sixty days, a lien may be placed upon and against the property. If the lien is not satisfied within three months, the property may be sold in satisfaction thereof in a like manner as other real property is sold under execution.

(2) If any violation of this chapter constitutes a seasonal recurrent nuisance, the authorized enforcement officer shall so declare. Thereafter such seasonal and recurrent nuisance shall be abated every year without the necessity of any further hearing.

(3) In any administrative or civil proceeding under this chapter in which the city prevails, the city shall be awarded all costs of investigation, administrative overhead, out-of-pocket expenses, costs of suit and reasonable attorney fees.

(C) Penalties for Failure to Comply. The authorized enforcement officer shall enforce this chapter as follows:

(1) For the first failure to comply with any provision of this chapter, the authorized enforcement officer may levy a penalty of five hundred dollars ($500) for residential property violations, and five thousand dollars ($5,000) for commercial or industrial property violations. In addition, the enforcement officer shall issue to the affected person or business a written notice which includes the following information:

(a) A statement specifying the violation committed;

(b) A specified time period within which the affected person or business must correct the failure or file a written notice disputing the notice of failure to comply;

(c) A statement of the penalty for continued noncompliance.

(2) For each subsequent failure to comply with any provision of this chapter, following written notice issued pursuant to subsection (C)(1) of this section, the authorized enforcement officer may levy additional penalties of five hundred dollars ($500) for residential property violations, and five thousand dollars ($5,000) for commercial or industrial property violations each day during which a person or business fails to comply

with the provisions of this chapter. Each calendar day following written notice shall constitute a separate offense.

(D) Whenever necessary to make an inspection to enforce any of the provisions of this chapter, or whenever an authorized enforcement officer has reasonable cause to believe that there exists in any building or upon any premises any condition that constitutes a violation of the provisions of this chapter, the officer may, upon consent or upon obtaining an inspection warrant, enter such building or premises at all reasonable times to inspect the same or perform any duty imposed upon the officer by this chapter.

6.32.090 Disclaimer of liability.

The degree of protection required by this chapter is considered reasonable for regulatory purposes and is based on scientific, engineering and other relevant technical considerations. The standards set forth herein do not imply that compliance will ensure that there will be no unauthorized discharge of pollutants into the waters of the United States. This chapter shall not create liability on the part of the city, any officer or employee thereof, for any damages that result from reliance on this chapter or any administrative decision made thereunder.

1

Prior ordinance history: Ord. 748, 777.

Section 2. Severability. If any section, subsection, subdivision, paragraph, sentence, clause or phrase of this Ordinance, or its application to any person or circumstance, is for any reason held to be invalid or unenforceable, such invalidity or unenforceability shall not affect the validity or enforceability of the remaining sections, subsections, subdivisions, paragraphs, sentences, clauses or phrases of this Ordinance, or its application to any other person or circumstance. The City Council hereby declares that it would have adopted each section, subsection, subdivision, paragraph, sentence, clause or phrase of this Ordinance, irrespective of the fact that any one or more other sections, subsections, subdivisions, paragraphs, sentences, clauses or phrases hereof be declared invalid or unenforceable.

Section 3. Effective Date. This Ordinance shall take effect thirty (30) days after its adoption in accordance with California Government Code section 36937.

Section 4. Certification. The City Clerk shall certify to the passage and adoption of this Ordinance and shall cause the same to be published and/or posted in accordance with applicable law.

PASSED, APPROVED and ADOPTED this 12th day of June, 2014.

Mark E. Pulido, Mayor

ATTEST:

Vida Barone, City Clerk

RESOLUTION NO. 2013- 31

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF DIAMOND BAR, CALIFORNIA, APPROVING A GREEN STREETS MANUAL

The City Council of the City of Diamond Bar, California, does hereby find, resolve, and determine as follows:

Section 1. The Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175) was adopted by the California Regional Water Quality Control Board, Los Angeles Region on November 8, 2012. Municipalities electing to prepare a Watershed Management Program or an Enhanced Watershed Management Program under this Permit are required to demonstrate that Green Street policies/manual are in place to specify the use of green street strategies for transportation corridors.

Section 2. Green streets are enhancements to street and road projects to improve the quality of storm water and urban runoff through the implementation of infiltration, bio-treatment, xeriscaping parkways and tree lined streets.

Section 3. That the City Council of the City of Diamond Bar, California, hereby directs the Director of Public Works to implement Green Streets for transportation corridors as described in the City of Diamond Bar Green Streets Manual. The Green Streets Manual is shown as Exhibit "A", which is attached hereto and incorporated herein by reference.

Section 4. Routine maintenance including but not limited to: slurry seals, grind and overlay and reconstruction to maintain original line and grade are excluded from the Green Streets Manual.

Section 5. At its regular meeting held on October 15, 2013, the City Council determined that the public interest and necessity justify the adoption of the Green Streets Manual.

PASSED, APPROVED, AND ADOPTED this 15th day of October, 2013.

Jack Tanaka, Mayor

I, Tommye Cribbins, City Clerk of the City of Diamond Bar, do hereby certify that the foregoing Resolution was duly introduced, passed, and adopted by the City Council of the City of Diamond Bar, at a regular meeting of the City Council held on the 15th Day of October, 2013 by the following vote:

AYES:	Council Member:	Chang, Tye, MPT/Everett, M/Tanaka
NOES:	Council Member:	None
ABSTAIN:	Council Member:	None
ABSENT:	Council Member:	Herrera

Tommye Cribbins, City Clerk

ORDINANCE NO. 11 (2013)

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF DIAMOND BAR, CALIFORNIA, AMENDING DIVISION 5 OF CHAPTER 8.12 OF THE DIAMOND BAR MUNICIPAL CODE RELATING TO STANDARD URBAN STORM WATER MITIGATION PLAN (SUSMP) REQUIREMENTS BY IMPOSING RAINWATER LOW IMPACT DEVELOPMENT (LID) STRATEGIES ON PROJECTS THAT REQUIRE BUILDING, GRADING AND ENCROACHMENT PERMITS

THE CITY COUNCIL OF THE CITY OF DIAMOND BAR, CALIFORNIA, HEREBY FINDS AND DETERMINES AS FOLLOWS:

A. The federal Clean Water Act establishes Regional Water Quality Control Boards in order to prohibit the discharge of pollutants in stormwater runoff to waters of the United States.

B. The City is a permittee under the permit issued by the California Regional Water Quality Control Board, Los Angeles Region Order No. R4-2012-0175, on November 08, 2012 which permit establishes Waste Discharge Requirements for Municipal Separate Storm Sewer Systems (MS4) Discharges within the Coastal Watersheds of Los Angeles County, except discharges originating from the City of Long Beach MS4.

C. Order No. R4-2012-0175 ("Order") contains requirements for the City to establish a Low Impact Development (LID) Ordinance in order to participate in a Watershed Management Program and/or Enhanced Watershed Management Program.

D. The Regional Board has adopted Total Maximum Daily Loads (TMDLs) for pollutants which are numerical discharge limits that must be achieved effectively through LID implementation.

E. The City has the authority under the California Water Code to adopt and enforce ordinances imposing conditions, restrictions and limitations with respect to activity that might degrade waters of the State.

F. The City has a stormwater management program that protects water quality and water supply by employing watershed-based approaches that balance environmental and economic considerations.

G. Urbanization has led to increased impervious surface areas resulting in increased water runoff and less percolation to groundwater aquifers causing the transport of pollutants to downstream receiving waters.

H. As required by the Order the City is expanding the applicability of the existing LID requirements by providing stormwater and rainwater LID strategies for all projects development and redevelopment projects.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF DIAMOND BAR, CALIFORNIA, DOES HEREBY ORDAIN AS FOLLOWS:

Section 1: Subsection (d) of Section 8.12.1620 entitled "Findings", is deleted in its entirety and replaced with the following:

"(d) The City is a permittee under the permit issued by the California Regional Water Quality Control Board, Los Angeles Region Order No. R4-2012-0175, on November 08, 2012, which permit establishes Waste Discharge Requirements for Municipal Separate Storm Sewer Systems (MS4) Discharges within the Coastal Watersheds of Los Angeles County, except discharges originating from the City of Long Beach MS4 and as a permittee the City is required to implement procedures with respect to the entry of specified water discharges into the municipal storm water system."

Section 2: Section 8.12.1640 entitled "Definitions", is amended to add or replace the following definitions, which definitions shall be placed in alphabetical order along with the existing definitions of Section 8.12.1640. The following existing definitions in Section 8.12.1640 shall be deleted in their entirety: *Automotive service facilities, Best Management Practice, Construction, Discharge, Municipal NPDES Permit, Municipal Separate Storm Sewer System or MS4, Parking lot, Pollutant, Project, Redevelopment, Standard Urban Storm Water Mitigation Plan or SUSMP* and *Urban runoff.* If the definition of any term contained in Section 8.12.1640 conflicts with the definition of the same term in Order No. R4-2012-0175, then the definition contained in Order No. R4-2012-0175 shall govern.

Automotive Service Facility means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) and North American Industry Classification System (NAICS) codes. For inspection purposes, Permittees need not inspect facilities with SIC codes 5013, 5014, 5511, 5541, 7532-7534, and 7536-7539 provided that these facilities have no outside activities or materials that may be exposed to stormwater.

Basin Plan means the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Water Board on June 13, 1994 and subsequent amendments.

Best Management Practice (BMP) means practices or physical devices or systems designed to prevent or reduce pollutant loading from stormwater or non-stormwater discharges to receiving waters, or designed to reduce the volume of stormwater or non-stormwater discharged to the receiving water.

Biofiltration means a LID BMP that reduces stormwater pollutant discharges by intercepting rainfall on vegetative canopy, and through incidental infiltration and/or evapotranspiration, and filtration. Incidental infiltration is an important factor in achieving the required pollutant load reduction. Therefore, the term "biofiltration" as used in this Chapter 8.12 is defined to include only systems designed to facilitate incidental infiltration or achieve the equivalent pollutant reduction as biofiltration BMPs with an underdrain (subject to approval by the Regional Board's

Executive Officer). Biofiltration BMPs include bioretention systems with an underdrain and bioswales.

Bioretention means a LID BMP that reduces stormwater runoff by intercepting rainfall on vegetative canopy, and through evapotranspiration and infiltration. The bioretention system typically includes a minimum 2-foot top layer of a specified soil and compost mixture underlain by a gravel-filled temporary storage pit dug into the in-situ soil. As defined in this Ordinance, a bioretention BMP may be designed with an overflow drain, but may not include an underdrain. When a bioretention BMP is designed or constructed with an underdrain it is regulated by Order No. R4-2012-0175 as biofiltration.

Bioswale means a LID BMP consisting of a shallow channel lined with grass or other dense, low-growing vegetation. Bioswales are designed to collect stormwater runoff and to achieve a uniform sheet flow through the dense vegetation for a period of several minutes.

Commercial Malls means any development on private land comprised of one or more buildings forming a complex of stores which sells various merchandise, with interconnecting walkways enabling visitors to easily walk from store to store, along with parking area(s). A commercial mall includes, but is not limited to: mini-malls, strip malls, other retail complexes, and enclosed shopping malls or shopping centers.

Construction Activity means any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that result in land disturbance. Construction does not include emergency construction activities required to immediately protect public health and safety or routine maintenance activities required to maintain the integrity of structures by performing minor repair and restoration work, maintain the original line and grade, hydraulic capacity, or original purposes of the facility. See "Routine Maintenance" definition for further explanation. Where clearing, grading or excavating of underlying soil takes place during a repaving operation, State General Construction Permit coverage by the State of California General Permit for Storm Water Discharges Associated with Industrial Activities or for Stormwater Discharges Associated with Construction Activities is required if more than one acre is disturbed or the activities are part of a larger plan.

Discharge means any release, spill, leak, pump, flow, escape, dumping, or disposal of any liquid, semi-solid, or solid substance.

Flow-through treatment BMPs means a modular, vault type "high flow biotreatment" devices contained within an impervious vault with an underdrain or designed with an impervious liner and an underdrain.

Full Capture System means any single device or series of devices, certified by the Executive Officer, that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate Q resulting from a one-year, one-hour storm in the sub-drainage area.

General Construction Activities Storm Water Permit (GCASP) means the general NPDES permit adopted by the State Board which authorizes the discharge of stormwater from construction activities under certain conditions.

General Industrial Activities Storm Water Permit (GIASP) means the general NPDES permit adopted by the State Board which authorizes the discharge of stormwater from certain industrial activities under certain conditions.

Green Roof means a LID BMP using planter boxes and vegetation to intercept rainfall on the roof surface. Rainfall is intercepted by vegetation leaves and through evapotranspiration. Green roofs may be designed as either a bioretention BMP or as a biofiltration BMP. To receive credit as a bioretention BMP, the green roof system planting medium shall be of sufficient depth to provide capacity within the pore space volume to contain the design storm depth and may not be designed or constructed with an underdrain.

Industrial/Commercial Facility means any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by either the Standard Industrial Classifications (SIC) or the North American Industry Classification System (NAICS). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition).

Industrial Park means land development that is set aside for industrial development. Industrial parks are usually located close to transport facilities, especially where more than one transport modalities coincide: highways, railroads, airports, and navigable rivers. It includes office parks, which have offices and light industry.

Infiltration BMP means a LID BMP that reduces stormwater runoff by capturing and infiltrating the runoff into in-situ soils or amended onsite soils. Examples of infiltration BMPs include infiltration basins, dry wells, and pervious pavement.

Low Impact Development (LID) consists of building and landscape features designed to retain or filter stormwater runoff.

Municipal Separate Storm Sewer System (MS4) means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, stormwater, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) Designed or used for collecting or conveying stormwater;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR Section 122.2.

(40 CFR Section 122.26(b) (8)).

National Pollutant Discharge Elimination System (NPDES) means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA Section 307, 402, 318, and 405. The term includes an "approved program".

Natural Drainage System means a drainage system that has not been improved (e.g., channelized or armored). The clearing or dredging of a natural drainage system does not cause the system to be classified as an improved drainage system.

Outfall means a point source as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances with connect segments of the same stream or other waters of the United Sates and are used to convey waters of the United States. (40 CFR Section 122.26(b) (9)).

Parking Lot means land area or facility for the parking or storage of motor vehicles used for businesses, commerce, industry, or personal use, with a lot size of 5,000 square feet or more of surface area, or with 25 or more parking spaces.

Pollutant means any "pollutant" defined in Section 502(6) of the Federal Clean Water Act or incorporated into the California Water Code Section 1337.

Project means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (Pub. Resources Code Section 21065).

Rainfall Harvest and Use means a LID BMP system designed to capture runoff, typically from a roof but can also include runoff capture from elsewhere within the site, and to provide for temporary storage until the harvested water can be used for irrigation or non-potable uses. The harvested water may also be used for potable water uses if the system includes disinfection treatment and is approved for such use by the local building department.

Receiving Water means "water of the United States" into which waste and/or pollutants are or may be discharged.

Redevelopment means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of routine maintenance activity; and land disturbing activity related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

Routine Maintenance" includes, but is not limited to projects conducted to:

1. Maintain the original line and grade, hydraulic capacity, or original purpose of the facility.
2. Perform as needed restoration work to preserve the original design grade, integrity and hydraulic capacity of flood control facilities.
3. Includes road shoulder work, regrading dirt or gravel roadways and shoulders and performing ditch cleanouts.
4. Update existing lines* and facilities to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.
5. Repair leaks

Routine maintenance does not include construction of new** lines or facilities resulting from compliance with applicable codes, standards and regulations.

* Update existing lines includes replacing existing lines with new materials or pipes.

** New lines are those that are not associated with existing facilities and are not part of a project to update or replace existing lines.

Significant Ecological Areas (SEAs) means an area that is determined to possess an example of biotic resources that cumulatively represent biological diversity, for the purposes of protecting biotic diversity, as part of the Los Angeles County General Plan. Areas are designated as SEAs, if they possess one or more of the following criteria:

1. The habitat of rare, endangered, and threatened plant and animal species.
2. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind, or are restricted in distribution on a regional basis.
3. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind or are restricted in distribution in Los Angeles County.
4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.
5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.
6. Areas important as game species habitat or as fisheries.
7. Areas that would provide for the preservation of relatively undisturbed examples of natural biotic communities in Los Angeles County.

8. Special areas.

Storm Drain System means any facility or any parts of the facility, including streets, gutters, conduits, natural or artificial drains, channels and watercourse that are used for the purpose of collecting, storing, transporting or disposing of stormwater and are located within the City.

Storm Water or Stormwater means runoff and drainage related to precipitation events (pursuant to 40 CFR Section 122.26(b)(13); 55 Fed. Reg. 47990, 47995 (Nov. 16, 1990)).

Urban Runoff means surface water flow produced by storm and non-storm events. Non-storm events include flow from residential, commercial or industrial activities involving the use of potable and non-potable water."

Section 3: The second sentence of Section 8.12.1690(b) is amended to read as follows:

"The following shall apply to all construction activities within the City not otherwise governed by Section 8.12.1695 of this Code and such construction activities shall be required from the time of land clearing, demolition or commencement of construction until receipt of a certificate of occupancy:"

Section 4: Section 8.12.1695, entitled "Standard Urban Storm Water Mitigation Plan ((SUSMP"), is deleted in its entirety and replaced with the following:

"Section 8.12.1695. – Low Impact Development Measures for New Development and/or Redevelopment Planning and Construction Activities.

(a) *Objective.* The provisions of this Section establish requirements for construction activities and facility operations of Development and Redevelopment projects to comply with the current "Order No. R4-2012-0175," lessen the water quality impacts of development by using smart growth practices, and integrate LID practices and standards for stormwater pollution mitigation through means of infiltration, evapotranspiration, biofiltration, and rainfall harvest and use. LID shall be inclusive of new development and/or redevelopment requirements.

(b) *Scope.* This Section contains requirements for stormwater pollution control measures in Development and Redevelopment projects and authorizes the City to further define and adopt stormwater pollution control measures, and to develop LID principles and requirements, including but not limited to the objectives and specifications for integration of LID strategies, grant waivers from the LID requirements, and collect funds for Projects that are granted waivers. Except as otherwise provided herein, the City shall administer, implement and enforce the provisions of this Section.

(c) *Applicability.* Development projects subject to Permittee conditioning and approval for the design and implementation of post-construction controls to mitigate storm water pollution, prior to completion of the project(s), are:

(1) All development projects equal to 1 acre or greater of disturbed area that adds more than 10,000 square feet of impervious surface area.

(2) Industrial parks 10,000 square feet or more of surface area.

(3) Commercial malls 10,000 square feet or more of surface area.

(4) Retail gasoline outlets with 5,000 square feet or more of surface area.

(5) Restaurants (Standard Industrial Classification (SIC) of 5812) with 5,000 square feet or more of surface area.

(6) Parking lots with 5,000 square feet or more of impervious surface area, or with 25 or more parking spaces.

(7) Streets and roads construction of 10,000 square feet or more of impervious surface area. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects.

(8) Automotive service facilities (Standard Industrial Classification (SIC) of 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) 5,000 square feet or more of surface area.

(9) Projects located in or directly adjacent to, or discharging directly to an Environmentally Sensitive Area (ESA), where the development will:

a. Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and

b. Create 2,500 square feet or more of impervious surface area

(10) Single-family hillside homes.

(11) Redevelopment Projects

a. Land disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site on Planning Priority Project categories.

b. Where Redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, the entire project must be mitigated.

c. Where Redevelopment results in an alteration of less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, only the alteration must be mitigated, and not the entire development.

d. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.

e. Existing single-family dwelling and accessory structures are exempt from the Redevelopment requirements unless such projects create, add, or replace 10,000 square feet of impervious surface area.

(d) *Effective Date.* The Planning and Land Development requirements contained in Section 7 of Order No. R4-2012-0175 shall become effective 90 days from the adoption of the Order (February 6, 2013). This includes Planning Priority Projects that are discretionary permit projects or project phases that have not been deemed complete for processing, or discretionary permit projects without vesting tentative maps that have not requested and received an extension of previously granted approvals within 90 days of adoption of the Order. Projects that have been deemed complete within 90 days of adoption of the Order are not subject to the requirements of Section 7.

(e) *Specific Requirements.* The Site for every Project shall be designed to control pollutants, pollutant loads, and runoff volume to the maximum extent feasible by minimizing impervious surface area and controlling runoff from impervious surfaces through infiltration, evapotranspiration, bioretention and/or rainfall harvest and use.

(1) A new single-family hillside home development shall include mitigation measures to:

a. Conserve natural areas;

b. Protect slopes and channels;

c. Provide storm drain system stenciling and signage;

d. Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability; and

e. Direct surface flow to vegetated areas before discharge, unless the diversion would result in slope instability.

(2) Street and road construction of 10,000 square feet or more of impervious surface shall follow USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets (December 2008 EPA-833-F-08-009) to the maximum extent practicable.

(3) The remainder of Projects shall prepare a LID Plan to comply with the following:

a. Retain stormwater runoff onsite for the Stormwater Quality Design Volume (SWQDv) defined as the runoff from:

i. The 85th percentile 24-hour runoff event as determined from the Los Angeles County 85th percentile precipitation isohyetal map; or

ii. The volume of runoff produced from a 0.75 inch, 24-hour rain event, whichever is greater.

b. Minimize hydromodification impacts to natural drainage systems as defined in Order No. R4-2012-0175.

c. To demonstrate technical infeasibility, the project applicant must demonstrate that the Project cannot reliably retain 100 percent of the SWQDv on-site, even with the maximum application of green roofs and rainwater harvest and use, and that compliance with the applicable post-construction requirements would be technically infeasible by submitting a site-specific hydrologic and/or design analysis conducted and endorsed by a registered professional engineer, geologist, architect, and/or landscape architect. Technical infeasibility may result from conditions including the following:

   i. The infiltration rate of saturated in-situ soils is less than 0.3 inch per hour and it is not technically feasible to amend the in-situ soils to attain an infiltration rate necessary to achieve reliable performance of infiltration or bioretention BMPs in retaining the SWQDv onsite.

   ii. Locations where seasonal high groundwater is within five to ten feet of surface grade;

   iii. Locations within 100 feet of a groundwater well used for drinking water;

   iv. Brownfield development sites or other locations where pollutant mobilization is a documented concern;

   v. Locations with potential geotechnical hazards;

   vi. Smart growth and infill or redevelopment locations where the density and/ or nature of the project would create significant difficulty for compliance with the onsite volume retention requirement.

d. If partial or complete onsite retention is technically infeasible, the project Site may biofiltrate 1.5 times the portion of the remaining SWQDv that is not reliably retained onsite. Biofiltration BMPs must adhere to the design specifications provided in Order No. R4-2012-0175.

   i. Additional alternative compliance options such as offsite infiltration and groundwater replenishment projects may be available to the project Site. The Project Site should contact the City to determine eligibility.

e. The remaining SWQDv that cannot be retained or biofiltered onsite must be treated onsite to reduce pollutant loading. BMPs must be selected and designed to meet pollutant-specific benchmarks as required per Order No. R4-2012-0175. Flow-through BMPs may be used to treat the remaining SWQDv and must be sized based on a rainfall intensity of:

   i. 0.2 inches per hour, or

   ii. The one year, one-hour rainfall intensity as determined from the most recent Los Angeles County isohyetal map, whichever is greater."

<u>**Section 5**</u>: VALIDITY. If any provision of this Ordinance is found to be unconstitutional or otherwise invalid by any court of competent jurisdiction, such invalidity shall not affect

the remaining provisions of this Ordinance which provisions are declared to be severable from those found to be unconstitutional or otherwise invalid.

Section 6: EFFECTIVE DATE. This ordinance shall go into effect and be in full force and operation from and after thirty (30) days after its final passage and adoption.

Section 7: The City Clerk shall certify to the passage and adoption of this Ordinance and shall post a certified copy of this Ordinance, together with the vote for and against the same, in the Office of the City Clerk.

PASSED, APPROVED AND ADOPTED THIS 5th DAY OF November, BY THE CITY COUNCIL OF THE CITY OF DIAMOND BAR.

BY: ______________________

Jack Tanaka, Mayor

I, Tommye Cribbins, City Clerk of the City of Diamond Bar, do hereby certify that the foregoing Ordinance was duly introduced at a regular meeting of the City Council of the City of Diamond Bar held on the 15th day of Oct., 2013 and was finally passed at a regular meeting of the City Council held on the 5th day of Oct, 2013, by the following vote:

AYES:	Council Members:	Chang, Herrera, Tye, MPT/Everett, M/Tanaka
NOES:	Council Members:	None
ABSENT:	Council Members:	None
ABSTAIN:	Council Members:	None

ATTEST: ______________________

Tommye Cribbins, City Clerk
City of Diamond Bar

ORDINANCE NO. 14(2013)

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF DIAMOND BAR CALIFORNIA, AMENDING DIVISION 5 OF CHAPTER 8.12 OF THE DIAMOND BAR MUNICIPAL CODE RELATING TO STANDARD URBAN STORM WATER MITIGATION PLAN (SUMSP) REQUIREMENTS BY IMPOSING RAINWATER LOW IMPACT DEVELOPMENT (LID) STRATEGIES ON PROJECTS THAT REQUIRE BUILDING, GRADING AND ENCROACHMENT PERMITS.

THE CITY COUNCIL OF THE CITY OF DIAMOND BAR, CALIFORNIA, HEREBY FINDS AND DETERMINES AS FOLLOWS:

A. The federal Clean Water Act establishes Regional Water Quality Control Boards in order to prohibit the discharge of pollutants in stormwater runoff to waters of the United States.

B. The City is a permittee under the permit issued by the California Regional Water Quality Control Board, Los Angeles Region Order No. R4-2012-0175, on November 08, 2012 which establishes Waste Discharge Requirements for Municipal Separate Storm Sewer Systems (MS4) Discharges within the Coastal Watersheds of Los Angeles County, except discharges originating from the City of Long Beach MS4.

C. Order No. R4-2012-0175 ("Order") contains requirements for the City to establish a LID Ordinance in order to participate in a Watershed Management Program and/or Enhanced Watershed Management Program.

D. The Regional Board has adopted Total Maximum Daily Loads (TMDLs) for pollutants which are numerical discharge limits that must be achieved effectively through LID implementation.

E. The City has the authority under the California Water Code to adopt and enforce ordinances imposing conditions, restrictions and limitations with respect to activity that might degrade waters of the State.

F. The City has a stormwater management program that protects water quality and water supply by employing watershed-based approaches that balance environmental and economic considerations.

G. Urbanization has led to increased impervious surface areas resulting in increased water runoff and less percolation to groundwater aquifers causing the transport of pollutants to downstream receiving waters.

H. As required by the Order the City is expanding the applicability of the existing LID requirements by providing stormwater and rainwater LID strategies for all projects development and redevelopment projects.

PASSED, APPROVED AND ADOPTED THIS 17th DAY OF DECEMBER, 2013, BY THE CITY COUNCIL OF THE CITY OF DIAMOND BAR.

BY: Carol Herrera
Carol Herrera, Mayor

I, Tommye Cribbins, City Clerk of the City of Diamond Bar, do hereby certify that the foregoing Ordinance was duly introduced at a regular meeting of the City Council of the City of Diamond Bar held on the 3rd day of December, 2013 and was finally passed at a regular meeting of the City Council held on the 17th day of December, 2013, by the following vote:

AYES:	Council Members:	Chang, Lyons, Tanaka, MPT/Tye, M/Herrera
NOES:	Council Members:	None

RB-AR14219

RESOLUTION NO. 14-7485

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF DOWNEY APPROVING AND ADOPTING A GREEN STREETS POLICY AND ASSOCIATED GREEN STREETS MANUAL FOR TRANSPORTATION CORRIDORS

WHEREAS, the Municipal Separate Storm Sewer System (MS4) Permit (Order No. R-2012-0175) was adopted by the California Regional Water Quality Control Board, Los Angeles Region on November 8, 2012 and requires development of Watershed Management Programs (WMPs) or Enhanced Watershed Management Programs (EWMPs) for each watershed to which an agency is tributary to among other requirements; and,

WHEREAS, the City of Downey is participating in three watershed groups, the Lower San Gabriel River, the Lower Los Angeles River, and the Los Cerritos Channel which have all elected to prepare WMPs; and,

WHEREAS, Municipalities electing to prepare a WMP or an EWMP under this Permit are required to demonstrate that Green Street policies are in place that specify the use of green street strategies for transportation corridors; and,

WHEREAS, Green Streets are enhancements to street and road projects to improve the quality of storm water and urban runoff through the implementation of infiltration measures such as bioretention and infiltration trenches and dry wells; bio-treatment/infiltration measures such flow-through planters and vegetated swales; treatment Best Management Practices (BMPs) such as catch basin filters and screens; and implementing and maintaining xeriscaped parkways and tree-lined streets; and,

WHEREAS, prior to February 26, 2013, the development of a draft Green Streets Policy and associated Green Streets Manual had been initiated by the Gateway Water Management Authority of which Downey is a participating member.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF DOWNEY DOES HEREBY RESOLVE AS FOLLOWS:

SECTION 1. The City of Downey Green Streets Policy and associated Green Streets Manual for transportation corridors attached hereto are hereby approved, adopted, and ordered filed with the City Clerk.

SECTION 2. The City Council of the City of Downey, California, hereby authorizes and directs the Director of Public Works to implement the Green Streets Policy for transportation corridors as described in the City of Downey Green Streets Manual.

SECTION 3. The City Council authorizes the Director of Public Works or his/her designee to modify elements of the Green Streets Policy and associated Green Streets Manual from time to time as may be necessary to reflect changing conditions that: (1) facilitate its implementation; and (2) maintain the goal of reducing pollutants in urban runoff; and (3) are consistent with the requirements of the latest MS4 Permit; and (4) and to facilitate the use of the Manual by the City and contractors.

SECTION 4. Routine maintenance of roadways and other activities as provided in the City LID Ordinance including but not limited to: application of seal coats, slurry seals, grind and overlays, and reconstruction to maintain original line and grade, hydraulic capacity, original purpose of the facility, or emergency redevelopment activity required to protect public health and safety are exempt from the Green Streets Policy and associated Green Streets Manual.

SECTION 5. The City Clerk shall certify to the adoption of this Resolution and shall cause the same to be published or posted as required by law.

APPROVED AND ADOPTED this 22nd day of April, 2014.

FERNANDO VASQUEZ, Mayor

ATTEST:

Adria M. Jimenez, CMC

ADRIA M. JIMENEZ, CMC
City Clerk

I HEREBY CERTIFY that the foregoing Resolution was adopted by the City Council of the City of Downey at a Regular Meeting held on the 22nd day of April, 2014, by the following vote, to wit:

AYES:	Council Members:	Brossmer, Guerra, Saab, Marquez, Mayor Vasquez
NOES:	Council Members:	None
ABSENT:	Council Members:	None
ABSTAIN:	Council Members:	None

SECTION 1 - INTRODUCTION

1.1 WHAT ARE GREEN STREETS?

Roads present many opportunities for green infrastructure application. One principle of green infrastructure involves reducing and treating stormwater and urban close to its source. Urban transportation right-of-ways integrated with green techniques are often called "green streets." Green streets provide source controls for stormwater and urban runoff and pollutant loads. In addition, green infrastructure approaches complement street facility upgrades, street aesthetic improvements, and urban tree canopy efforts that also make use of the right-of-way and allow it to achieve multiple goals and benefits. Using the right-of-way for treatment of stormwater and urban runoff links green with grey infrastructure by making use of the engineered conveyance of roads and providing connections to conveyance systems when needed.

Green streets are beneficial for new road construction and retrofits. They can provide substantial economic benefits when used in transportation applications. Coordinating green infrastructure installation with broader transportation improvements can reduce the cost of runoff management by including it within larger infrastructure improvements. A large municipal concern regarding green infrastructure use is maintenance access; using roads and right-of-ways as locations for green infrastructure not only addresses a significant pollutant source, but also alleviates access and maintenance concerns by using public space. Also, right-of-way installations allow for easy public maintenance.

Green streets can incorporate a wide variety of design elements including street trees, permeable pavements, bioretention, and swales. Although the design and appearance of green streets will vary, the functional goals are the same; provide source control of stormwater and urban runoff, limit its transport and pollutant conveyance to the collection system, restore pre-development hydrology to the maximum extent practicable, and provide environmentally enhanced roads. Successful application of green techniques will encourage soil and vegetation contact and infiltration and retention of runoff to help augment local water supplies.

1.2 WHY ARE GREEN STREETS BEING REQUIRED?

This Green Streets Manual provides guidance to comply with the MS4 Permit (Order Number R4-2012-0175) which requires that jurisdictions in Los Angeles County reduce contaminants in runoff to improve water quality in waterways. These requirements stem from the National Pollutant Discharge Elimination System (NPDES) requirements of the Clean Water Act (CWA).

The MS4 Permit requires Green Streets strategies to be implemented for transportation corridors. Transportation corridors represent a large percentage of the impervious area within Los Angeles and therefore generate a substantial amount of runoff from storm events. The altered flow regime from traditional roadways, increased runoff volume, and high runoff peak flows, are damaging to the environment and a risk to property downstream.

Traditionally, street design has focused on removing water from the street as quickly as possible and transferring it to storm drains, channels, and water bodies. Stormwater and urban runoff can contain bacteria and other pollutants, and is thereby regulated at the state and local level (refer to *Table 1* for a list of pollutants typical of roads). Green Streets will help to transform the design of streets from the conventional method of moving water off-site as quickly as possible to a method of storing, treating, and infiltrating water on-site for a cleaner discharge into the waters of the U.S.

Street and road construction applies to major arterials, state routes, highways, or rail lines used for the movement of people or goods by means of bus services, trucks, and vehicles, and transportation corridors within larger projects. Projects which are required to follow this Green Streets Guidance Manual include the following:

1. Street and road construction of 10,000 square feet or more of impervious surface area.
2. Street and road redevelopment resulting in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include repaving, application of seal coats, slurry seals, grind and overlays, or reconstruction of existing roads to maintain original line and grade.
3. Project is designated by the Director of Public Works as an applicable Green Streets project.

Table 1: Examples of Stormwater Pollutants Typical of Roads (*Managing Wet Weather With Green Infrastructure Municipal Handbook: Green Streets, 2008*).

Pollutant	Source	Effects
Trash	Littering	Physical damage to aquatic animals and fish, release of poisonous substances
Sediment/solids	Construction, unpaved areas	Increased turbidity, increased transport of soil bound pollutants, negative effects on aquatic organisms reproduction and function
Metals (Copper, Zinc, Lead, Arsenic)	Vehicle brake pads, vehicle tires, motor oil, vehicle emissions and engines, vehicle emissions, brake linings, automotive fluids	Toxic to aquatic organisms and can accumulate in sediments and fish tissues
Organics associated with petroleum (e.g., PAHs)	Vehicle emissions, automotive fluids, gas stations	Toxic to aquatic organisms
Nutrients	Vehicle emissions, atmospheric deposition	Promotes eutrophication and depleted dissolved oxygen concentrations

1.3 PLANNING AND DEVELOPMENT

Ideally, a site would be designed to capture and use or infiltrate the entire runoff volume of a storm, however site and design constraints make it difficult to achieve that goal. This Green Streets Manual is designed to provide guidance with BMP selection based on site constraints typical to street design. Streetscape geometry, topography, and climate determine the types of controls that can be implemented. The initial step in selecting a stormwater and urban runoff tool is determining the available open space and constraints. Stormwater and urban runoff controls should be selected using the hierarchy represented in *Figure 1*, the site guidelines represented in *Table 2*, and the location opportunities listed in *Table 3*. Note that the BMP type may be selected with the project size, complexity, and cost taken into consideration.

1.3.1 Site Considerations

Specific elements which should be given special consideration in the site assessment process for applicable Green Streets include:

- **Ownership of land adjacent to right of ways.** The opportunity to provide stormwater and urban runoff treatment may depend on the ownership of land adjacent to the right-of-way. Acquisition of additional right-of-way and/or access easements may be more feasible if land bordering the project is owned by relatively few land owners.
- **Location of existing utilities.** The location of existing storm drainage utilities can influence the opportunities for Green Streets infrastructure. For example, stormwater planters can be designed to overflow along the curb-line to an existing storm drain inlet, thereby avoiding the infrastructure costs associated with an additional inlet. The location of other utilities may limit the allowable placement of BMPs to only those areas where a clear pathway to the storm drain exists.
- **Grade differential between road surface and storm drain system.** Some BMPs require more head from inlet to outlet than others; therefore, allowable head drop may be an important consideration in BMP selection. Storm drain elevations may be constrained by a variety of factors in a roadway project (utility crossings, outfall elevations, etc.) that cannot be overcome and may override stormwater and urban runoff management considerations.
- **Longitudinal slope.** The suite of BMPs which may be installed on steeper road sections is more limited. Specifically, permeable pavement and swales are more suitable for gentle grades. Other BMPs may be more readily terraced to be used on steeper slopes.
- **Soil suitability.** Infiltration BMPs require specific types of soil. The site assessment should determine the type of soils on the site and the infiltration rate of the soils if infiltration BMPs are proposed.
- **Potential access opportunities.** A significant concern with installation of BMPs in major right of ways is the ability to safely access the BMPs for maintenance considering traffic hazards. Vehicle travel lanes and specific areas potentially hazardous for maintenance crews should be identified during the site assessment. The Green Streets Plan should provide subsequent steps to avoid placing BMPs in the identified hazardous areas.

1.3.2 Design Considerations

The drainage patterns of the project should be developed so that drainage can be routed to areas with BMP opportunities before entering storm drains. For example, if a median strip is present, a reverse crown should be considered, where allowed, so that stormwater and urban runoff can drain to a median swale. Likewise, standard peak-flow curb inlets should be located downstream of areas with potential for stormwater planters so that water can first flow into the planter, and then overflow to the downstream inlet if capacity of the planter is exceeded. It is more difficult to apply green infrastructure after water has entered the storm drain.

Green Streets projects are not required to treat off-site runoff; however, treatment of comingled off-site runoff may be used to off-set the inability to treat areas within the project for which significant constraints prevent the ability to provide treatment.

Applicable Green Streets projects should apply the following site design measures to the maximum extent practicable and as specified in the local permitting agency's codes:

- Minimize street width where feasible while maintaining traffic flow and public safety.
- Add tree canopy by planting or preserving trees/shrubs.
- Use porous pavement or pavers for low traffic roadways, on-street parking, shoulders or sidewalks.
- Integrate traffic calming measures in the form of bioretention curb extensions.

1.3.3 BMP Sizing for Applicable Green Streets Projects

An 85th percentile standard design storm should be used to determine the appropriate size, slope, and materials of each facility. After identifying the appropriate stormwater facilities for a site, an integrated approach using several BMPs is encouraged. To increase water quality and functional hydrologic benefits, several stormwater management BMPs can be used in succession. This is called a treatment train approach. The control measures should be designed using available topography to take advantage of gravity for conveyance to and through each facility. All Green Streets designs must be based off of a published design standard.

The following steps should be used to size BMPs for applicable Green Streets projects:

1. Delineate drainage areas tributary to BMP locations and compute imperviousness.
2. Look up the recommended sizing method for the BMP selected in each drainage area and calculate target sizing criteria.
3. Design BMPs per a published design standard.
4. Attempt to provide the calculated sizing criteria for the selected BMPs.
5. If sizing criteria cannot be achieved, document the constraints that override the application of BMPs and provide the largest portion of the sizing criteria that can be reasonably provided given constraints. If BMPs cannot be sized to provide the calculated volume for the tributary area, it is still essential to design the BMP inlet, energy dissipation, and overflow capacity for the full tributary area to ensure that flooding and scour is avoided. It is strongly recommended that BMPs which are designed to less than their target design volume be designed to bypass peak flows.

1.3.4 Alternative Compliance Options for Applicable Green Streets Projects

Alternative compliance programs should be considered for applicable Green Streets projects if on-site green infrastructure approaches cannot practicably treat the design volume. The primary alternative compliance option for applicable Green Streets projects is the completion of off-site mitigation projects. The proponent would implement a project to reduce stormwater pollution for other portions of roadway or similar land uses when being reconstructed to the project in the same hydrologic unit, ideally as close to the project as possible and discharging to the same outfall.

1.3.5 Infiltration Considerations

Appropriate soils, infiltration media, and infiltration rates should be used for infiltration BMPs. If infiltration is proposed, a complete geotechnical or soils report should be undertaken to determine infiltration rates, groundwater depth, soil toxicity and stability, and other factors that will affect the ability and the desirability of infiltration. At a minimum, the infiltration capacity of the underlying soils shall be deemed suitable for infiltration (0.3 inches per hour or greater), appropriate media should be used in the BMP itself, the groundwater shall be located at a depth of ten feet or greater.

Table 3: BMP Location Opportunity Summary.

BMP	Location Opportunity Summary
Bioretention	• Adjacent to traveled way and in frontage or furniture sidewalk zones • Can be located in curb extensions, medians, traffic circles, roundabouts, and any other landscaped area • Suitable for constrained locations
Infiltration Trench/Dry Well	• Can be located under sidewalks and in sidewalk planting strips, curb extensions, roundabouts, and medians
Rain Gardens	• Can be integrated medians, islands, circles, street ends, chicanes, and curb extensions • Can be located at the terminus of swales in the landscape
Permeable Pavement	• Suitable for parking or emergency access lanes • Can be located in furniture zones of sidewalks especially adjacent to tree wells • Cannot be placed in areas with large traffic volume or heavy load lanes • Avoid steep streets • Cannot be placed within 20 feet of sub-sidewalk basements • Cannot be within 50 feet of domestic water wells
Flow-Through Planters	• Above-grade planters should be structurally separate from adjacent sidewalks • At-grade planter systems can be installed adjacent to curbs within the frontage and/or furniture zones
Vegetated Swales	• Can be located adjacent to roadways, sidewalks, or parking areas • Can be integrated into traffic calming devices such as chicanes and curb extensions • Can be placed in medians where the street drains to the median • Can be placed alongside streets and pathways • Should be designed to work in conjunction with the street slope
Vegetated Buffer Strips	• Can be located in multi-way boulevards, park edge streets, or sidewalk furniture zones • Can serve as pre-treatment
Treatment BMPs	• Can be located in a catch basin, manhole, or vault • Can be installed on an existing outlet pipe or at the bottom of an existing catch basin with an overflow • Can be placed on existing curbside catch basins and flush grate openings • Can be installed on the existing wall of a catch basin and on the curb side wall of a catch basin • Minimum set-backs from foundations and slopes should be observed if the BMP is not lined
Street Trees	• Can be placed on sidewalks, in furniture zones, and on medians • Adequate spacing must be provided between trees and street lights, pedestrian lights, accessible parking spaces, bus shelters, awnings, canopies, balconies, and signs

SECTION 2 - INFILTRATION

Infiltration systems utilize rock, gravel, and other highly permeable materials for on-site infiltration. In these systems, stormwater and urban runoff is directed to the system and allowed to infiltrate into the soils for on-site retention and groundwater recharge. During small storm events, infiltration systems can result in significant or even complete volume reduction of stormwater runoff.

Infiltration should be used to the maximum extent practicable. Biotreatment BMPs should be considered if infiltration is found to be infeasible due to low infiltration rates, soil instability, high groundwater, or soil contamination.

Infiltration BMPs may become damaged by stormwater carrying high levels of sediment, therefore pre-treatment features should be designed to treat street runoff prior to discharging to infiltration features. Media filters, filter inserts, vortex type units, bioretention devices, sumps, and sedimentation basins are several pre-treatment tools effective at removing sediment.

2.1 INFILTRATION TRENCHES AND DRY WELLS

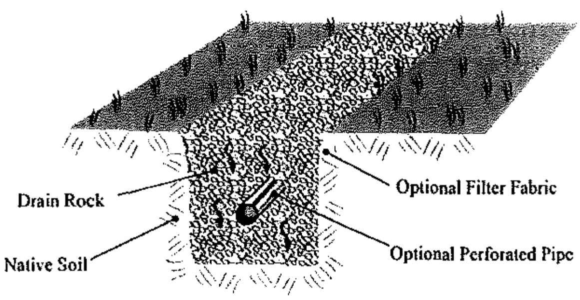

Figure 2: Infiltration Trench ***(Model for Living Streets Design Manual, 2011).***

Description

Infiltration trenches are linear, rock-filled features that promote infiltration by providing a high ratio of sub-surface void space in permeable soils. They provide on-site stormwater retention and may contribute to groundwater recharge. Infiltration trenches may accept stormwater and urban runoff from sheet flow, concentrated flow from a swale or other surface feature, or piped flow from a catch basin. Because they are not flow-through BMPs, infiltration trenches do not have outlets but may have overflow outlets for large storm events.

Dry wells are typically distinguished from infiltration trenches by being deeper than they are wide. They are usually circular, resembling a well, and are backfilled with the same materials as infiltration trenches. Dry wells typically accept concentrated flow from surface features or from pipes and do not have outlets.

Infiltration trenches and dry wells are typically designed to infiltrate all flow they receive. In large storm events, partial infiltration of runoff can be achieved by providing an overflow outlet. In these systems, significant or even complete volume reduction is possible in smaller storm events. During large storm events, these systems may function as detention facilities and provide a limited amount of retention and infiltration.

Location and placement guidelines

Infiltration trenches and dry wells typically have small surface footprints so they are potentially some of the most flexible elements of landscape design. However, because they involve sub-surface excavation, these features may interfere with surrounding structures. Care needs to be taken to ensure that surrounding building foundations, pavement bases, and utilities are not damaged by infiltration features. Once structural soundness is ensured, infiltration features may be located under sidewalks and in sidewalk planting strips, curb extensions, roundabouts, and medians. When located in medians, they are most effective when the street is graded to drain to the median. Dry wells require less surface area than trenches and may be more feasible in densely developed areas.

Infiltration features should be sited on uncompacted soils with acceptable infiltration capacity. They are best used where soil and topography allow for moderate to good infiltration rates (0.3 inches per hour or better) and the depth to groundwater is at least 10 feet. Prior to design of any retention or infiltration system, proper soil investigation and percolation testing shall be conducted to determine appropriate infiltration design rates, depth to groundwater, and if soil will exhibit instability as a result of infiltration. Any site with potential for previous underground contamination shall be investigated. Infiltration trenches and dry wells can be designed as stand-alone systems when water quality is not a concern or may be combined in series with other stormwater tools.

Perforated pipes and piped inlets and outlets may be included in the design of infiltration trenches. Cleanouts should be installed at both ends of any piping and at regular intervals in long sections of piping, to allow access to the system. Access ports are recommended for both trenches and wells and can be combined with clean-outs. If included, the overflow inlet from the infiltration trench should be properly designed for anticipated flows.

2.2 RAIN GARDENS

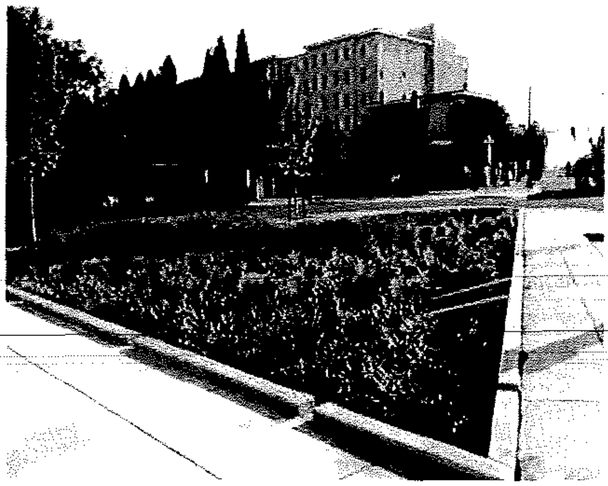

Figure 3: Rain garden (*Model for Living Streets Design Manual, 2011*).

Description

Rain gardens are vegetated depressions in the landscape. They have flat bottoms and gently sloping sides. Rain gardens can be similar in appearance to swales, but their footprints may be any shape. Rain gardens hold water on the surface, like a pond, and have overflow outlets. The detained water is infiltrated through the topsoil and subsurface drain rock unless the volume of water is so large that some must overflow. Rain gardens can reduce or eliminate off-site stormwater and urban runoff discharge while increasing on-site recharge.

Location and Placement Guidelines

Rain gardens may be placed where there is sufficient area in the landscape and where soils are suitable for infiltration. Rain gardens can be integrated with traffic calming measures installed along streets, such as medians, islands, circles, street ends, chicanes, and curb extensions. Rain gardens are often used at the terminus of swales in the landscape.

2.3 PERMEABLE PAVEMENT

Figure 4: Permeable pavement during a storm event (*Model for Living Streets Design Manual, 2011).*

Description

Permeable pavement is a system with the primary purpose of slowing or eliminating direct runoff by absorbing rainfall and other urban runoff and allowing it to infiltrate into the soil. Permeable pavement also filters and cleans pollutants such as petroleum deposits on streets, reduces water volumes for existing overtaxed pipe systems, and decreases the cost of offsite or onsite downstream infrastructure. This BMP is impaired by sediment-laden run-on which diminishes its porosity. Care should be taken to avoid flows from landscaped areas reaching permeable pavement. Permeable pavement is, in certain situations, an alternative to standard pavement. Conventional pavement is designed to move stormwater off-site quickly. Permeable pavement, alternatively, accepts the water where it falls, minimizing the need for management facilities downstream.

Location and Placement Guidelines

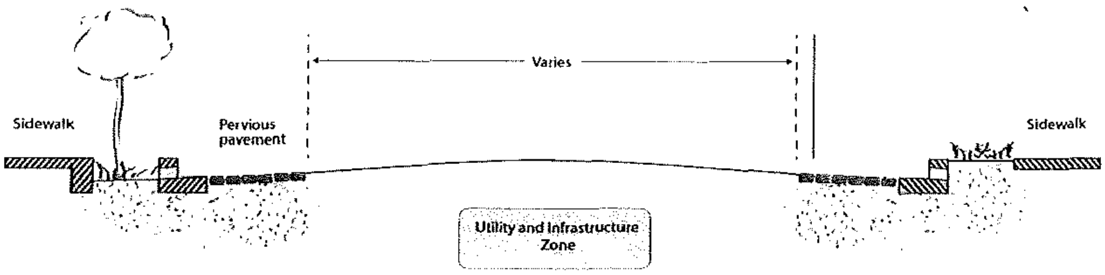

Figure 5: Possible pervious pavement design layout (*Model for Living Streets Design Manual, 2011*).

Conditions where permeable pavement should be encouraged include:

- Sites where there is limited space in the right-of-way for other BMPs;
- Parking or emergency access lanes; and
- Furniture zones of sidewalks especially adjacent to tree wells

Conditions where permeable pavement should be avoided include:

- Large traffic volume or heavy load lanes;
- Where runoff is already being harvested from an impervious surface for direct use, such as irrigation of bioretention landscape areas;
- Steep streets;
- Gas stations, car washes, auto repair, and other sites/sources of possible chemical contamination;
- Areas with shallow groundwater;
- Within 20 feet of sub-sidewalk basements; and
- Within 50 feet of domestic water wells.

Material and Design Guidelines

A soil or geotechnical report should be conducted to provide information about the permeability rate of the soil, load-bearing capacity of the soil, the depth to groundwater (10 feet or more required), and if soil will exhibit instability as a result of implementation. Infiltration rate and load capacity are key factors in the functionality of this BMP. Permeable pavement generally does not have the same load-bearing capacity as conventional pavement, so this BMP may have limited applications depending on the underlying soil strength and pavement use. Permeable pavement should not be used in general traffic lanes due to the possible variety of vehicles weights and heavy volumes of traffic.

When used as a road paving, permeable pavement that carries light traffic loads typically has a thick drain rock base material. Pavers should be concrete as opposed to brick or other light-duty materials. Other possible permeable paving materials include porous concrete and porous asphalt. These surfaces also have specific base materials that detain infiltrated water and provide structure for the road surface. Base material depths should be specified based on design load and the soils report.

Plazas, emergency roads, and other areas of limited vehicular access can also be paved with permeable pavement. Paving materials for these areas may include open cell paver blocks filled with stones or grass and plastic cell systems. Base material specifications may vary depending on the product used, design load, and underlying soils.

When used for pedestrian paths, sidewalks, and shared-use paths, appropriate materials include those listed above as well as rubber pavers and decomposed granite or something similar (washed or pore-clogging fine material). Pedestrian paths may also use broken concrete pavers as long as ADA requirements are met. Paths should drain into adjoining landscapes and should be higher than adjoining landscapes to prevent run-on. Pavement used for sidewalks and pedestrian paths should be ADA compliant, especially smooth, and not exceed a 2 percent slope or have gaps wider than 0.25 inches. In general, tripping hazards should be avoided.

Design considerations for permeable pavement include:

- The location, slope and load-bearing capacity of the street, and the infiltration rate of the soil;
- The amount of storage capacity of the base course;
- The traffic volume and load from heavy vehicles;
- The design storm volume calculations and the quality of water; and
- Drain rock, filter fabrics, and other subsurface materials.

Maintenance Guidelines

Maintenance of permeable pavement systems is essential to their continued functionality. Regular vacuuming and street sweeping should be performed to remove sediment from the pavement surface. The bedding and base material should be selected for long life and sufficient infiltration rates.

SECTION 3 - BIOTREATMENT

Biotreatment BMPs are landscaped, shallow depressions that capture and filter stormwater and urban runoff. These types of BMPs are an increasingly common type of stormwater treatment device that are installed at curb level and filled with a bioretention type soil. They are designed as soil and plant-based filtration devices that remove pollutants through a variety of physical, biological, and chemical treatment processes. They typically consist of a ponding area, mulch layer, planting soils, and plants. Runoff is directed to the system and pollutants are treated as the runoff drains through the planting soil and either infiltrated or collected by an underdrain and directed to a collection system.

Biotreatment should only be used in cases where infiltration has been proven infeasible due to low infiltration rates, soil instability, high groundwater, or soil contamination.

3.1 BIORETENTION

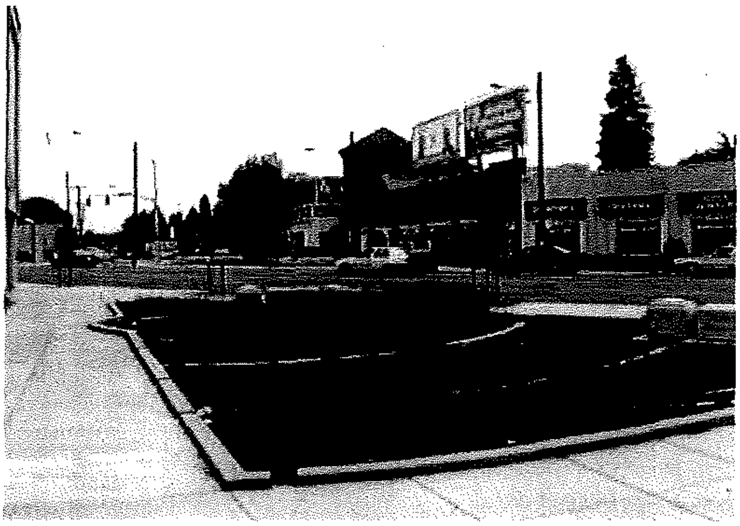

Figure 6: Bioretention system (*Model for Living Streets Design Manual, 2011*).

Description

Bioretention is a stormwater and urban runoff management process that cleans runoff by mimicking natural soil filtration processes as water flows through a bioretention BMP. It incorporates mulch, soil pores, microbes, and vegetation to reduce and remove sediment and pollutants from stormwater. Bioretention is designed to slow, spread, and, subsequently infiltrate water. Each component of the bioretention BMP is designed to assist in retaining water, evapotranspiration, and adsorption of pollutants into the soil matrix. As runoff passes through the vegetation and soil, the combined effects of filtration, absorption, adsorption, and biological uptake of plants remove pollutants.

For areas with low permeability or other soil constraints, bioretention can be designed as a flow-through system with a barrier protecting runoff from native soils. Bioretention areas can be designed with an underdrain system that directs the treated runoff to infiltration areas, cisterns, or the storm drain system, or may treat the water exclusively through surface flow. Examples of bioretention BMPs include swales, planters, and vegetated buffer strips.

Location and Placement Guidelines

Bioretention facilities can be included in the design of all street components; adjacent to the traveled way and in the frontage or furniture sidewalk zones. They can be designed into curb extensions, medians, traffic circles, roundabouts, and any other landscaped area. Depending on the feature, maintenance and access should always be considered in locating the device. Bioretention systems are also appropriate in constrained locations where other stormwater facilities requiring more extensive subsurface materials are not feasible.

If bioretention devices are designed to include infiltration, native soil should have a minimum permeability rate of 0.3 inches per hour and at least 10 feet to the groundwater table. Sites that have more than a 5 percent slope may require other stormwater and urban runoff management approaches or special engineering.

3.2 FLOW-THROUGH PLANTERS

Figure 7: Flow-through planter (*Model for Living Streets Design Manual, 2011).*

Description

Flow-through planters are typically above-grade or at-grade with solid walls and a flow-through bottom. Often, they are contained within an impermeable liner (permeable applications are available where allowed) and use an underdrain to direct treated runoff back to the collection system. Where space permits, buildings can direct roof drains first to building-adjacent planters. Both underdrains and surface overflow drains are typically installed with building-adjacent planters.

At-grade street-adjacent planter boxes are systems designed to take street runoff and/or sidewalk runoff and incorporate bioretention processes to treat runoff. These systems may or may not include underdrains.

Location and Placement Guidelines

Above-grade planters should be structurally separate from adjacent sidewalks to allow for future maintenance and structural stability per the City Department of Public Work standards. At-grade planter systems can be installed adjacent to curbs within the frontage and/or parkway zones.

All planters should be designed to pond water for less than 48 hours after each storm. Flow-through planters designed to detain roof runoff can be integrated into a building's foundation walls, and may be either raised or at grade.

For at-grade planters, small localized depressions may be included in the curb opening to encourage flow into the planter. Following the inlet, a sump (depression) to capture sediment and debris may be integrated into the design to reduce sediment loadings.

3.3 VEGETATED SWALES

Figure 8: Vegetated Swale (*Downey, CA*).

Description

Swales are linear, vegetated depressions that capture rainfall and runoff from adjacent surfaces. The swale bottom should have a gradual slope to convey water along its length. Swales can reduce off-site stormwater and urban runoff discharge and remove pollutants along the way. In a swale, water is slowed by traveling through vegetation on a relatively flat grade. This gives particulates time to settle out of the water while contaminants are removed by the vegetation.

Location and Placement Guidelines

Swales can easily be located adjacent to roadways, sidewalks, or parking areas. Roadway runoff can be directed into swales via flush curbs or small evenly-spaced curb cuts into a raised curb. Swale systems can be integrated into traffic calming devices such as curb extensions.

Swales can be placed in medians where the street drains to the median. Placed alongside streets and pathways, vegetated swales can be landscaped with native plants which filter sediment and pollutants and provide habitat for wildlife. Swales should be designed to work in conjunction with the street slope to maximize filtration and slowing of stormwater and urban runoff.

Swales are designed to allow water to slowly flow through the system. Depending on the landscape and design storm, an overflow or bypass for larger storm events may be needed. Curb openings should be designed to direct flow into the swale. Following the inlet, a sump may be built to capture sediment and debris.

3.4 VEGETATED BUFFER STRIPS

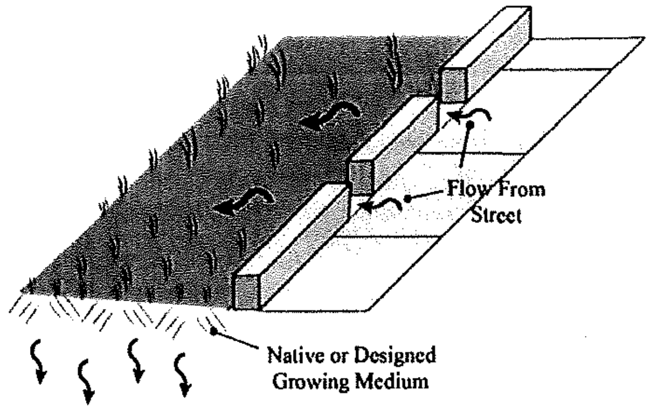

Figure 9: Vegetated buffer strip detail (*Model for Living Streets Design Manual, 2011)*.

Description

Vegetated buffer strips are sloping planted areas designed to treat and absorb sheet flow from adjacent impervious surfaces. These strips are not intended to detain or retain water, only to treat it as a flow-through feature. They should not receive concentrated flow from swales or other surface features, or concentrated flow from pipes.

Location and Placement Guidelines

Vegetated buffer strips are well-suited to treating runoff from roads and highways, small parking lots, and pervious surfaces. They may be commonly used on multi-way boulevards, park edge streets, or sidewalk furniture zones with sufficient space. When selecting potential placement the need for supplemental irrigation should be considered. Vegetated buffers can also be situated so they serve as pre-treatment for another stormwater management feature, such as an infiltration BMP.

SECTION 4 - TREATMENT BMPS

4.1 SAND FILTERS & STORM DRAIN INLET PROTECTIONS

As described in Section 1 of this Green Streets Manual, it may be infeasible for specific projects to apply infiltration or biotreatment BMPs. In these cases, sand filters or filter inserts as treatment BMPs can be considered as an alternative. Sand filters and filter inserts can be designed to prevent particulates, debris, metals, and petroleum-based materials conveyed by runoff from entering the storm drain system. All treatment BMP units should have an overflow system that allows the storm drain to remain functional if the filtration system becomes clogged during rainstorms. All storm drain inlet protections must be of a style and configuration approved by the agency with ownership of the inlet.

Typical maintenance of catch basins includes scheduled trash removal if a screen or other debris capturing device is used. Street sweeping should be performed by vacuum sweepers with occasional weed and large debris removal. Maintenance should include keeping a log of the amount of sediment collected and the data of removal.

The following are examples of acceptable treatment BMPs:

- **Sand Filters:** Sand filters are designed to filter stormwater and urban runoff through a constructed media bed and to an underdrain system. As runoff flows through the media pollutants are filtered out of the water. The filtered water is conveyed through the underdrain to a collection system. Pretreatment is necessary to eliminate significant sediment load or other large particles which would clog the system. Minimum set-backs from foundations and slopes should be observed if the facility is not lined. Filters should be designed and maintained such that ponded water should not persist for longer than 48 hours following a storm event.

- **Cartridge Media Filters:** Cartridge media filters contain multiple modular filters which contain engineered media. The filters can be located in a catch basin, manhole, or vault. The manhole or vault may be divided into multiple chambers so that the first chamber may act as a pre-settling basin for removal of coarse sediment while the next chamber may act as the filter chamber. Cartridge media filters are recommended for drainage areas with limited available surface area or where surface BMPs would restrict uses. Depending on the number of cartridges, maintenance events can have long durations. Locations should be chosen so that maintenance events will not significantly disrupt businesses or traffic. Inlet inserts should be sized to capture all debris and should therefore be selected to match the specific size and shape of each catch basin and inlet. Filter media should be selected to target pollutants of concern. A combination of media may be used to remove a variety of pollutants. Systems with lower maintenance requirements are preferred.

- **Storm Drain Inlet Screens:** Inlet screens are designed to prevent large litter and trash from entering the storm drain system while allowing smaller particles to pass through. The screens function as the first preventive measure in removing pollutants from the storm water system. The City's Public Works Department should be consulted to ensure compliance with local specifications and to schedule regular maintenance. Annual inspection of the screen is recommended to ensure functionality. Note that most LA River drainage areas are already protected using connector pipe screens through collective systems.

- **Storm Drain Pipe Filter Insert:** The storm drain outlet pipe filter is designed to be installed on an existing outlet pipe or at the bottom of an existing catch basin with an overflow. This filter removes debris, particulates, and other pollutants from runoff as it leaves the storm drain system. This BMP is less desirable than a protection system that prevents debris from entering the storm drain system because the system may become clogged with debris. Outlet pipe filters can be placed on existing curbside catch basins and flush grate openings. Regular maintenance is required and inspection should be performed rigorously. Because this filter is located at the outlet of a storm drain system, clogging with debris is not as apparent as with filters at street level. This BMP may be used as a supplemental filter with an inlet screen or inlet insert unit.

SECTION 5 - STREET TREES

5.1 STREET TREES

Figure 10: Street Trees (*Downey, CA).*

Description

Healthy urban trees are powerful stormwater management tools. Leaves and branches catch and slow rain as it falls, helping it to soak into the ground. The plants themselves take up and store large quantities of water that would otherwise contribute to surface runoff. Part of this moisture is then returned to the air through evaporation to further cool the city. As an important element along sidewalks, street trees must be provided with conditions that allow them to thrive, including adequate uncompacted soil, water, and air.

The goal of adding street trees is to increase the canopy cover of the street, the percentage of its surface either covered by or shaded by vegetation. The selection, placement, and management of all elements in the street should enhance the longevity of a city's street trees and healthy, mature plantings should be retained and protected whenever possible.

Benefits to adding street trees include:

- Creation of shade to lower temperatures in a city, reduces energy use, and makes the street a more pleasant place in which to walk and spend time
- Slowing and capture of rainwater, helping it soak into the ground to restore local hydrologic functions and aquifers
- Improving air quality by cooling air, producing oxygen, and absorbing and storing carbon in woody plant tissues

RB-AR14242

SECTION 6 – DEFINITIONS

Best Management Practice (BMP)
Operating methods and/or structural devices used to reduce stormwater volume, peak flows, and/or pollutant concentrations of stormwater runoff through evapotranspiration, infiltration, detention, filtration, and/or biological and chemical treatment.

Bioretention
Soil and plant-based retention practice that captures and biologically degrades pollutants as water infiltrates through sub-surface layers containing microbes that treat pollutants. Treated runoff is then slowly infiltrated and recharges the groundwater.

Conveyance
The process of water moving from one place to another.

Design Storm
A storm whose magnitude, rate, and intensity do not exceed the design load for a storm drainage system or flood protection project.

Detention
Stormwater runoff that is collected at one rate and then released at a controlled rate. The volume difference is held in temporary storage.

Filtration
A treatment process that allows for removal of solid (particulate) matter from water by means of porous media such as sand, soil, vegetation, or a man-made filter. Filtration is used to remove contaminants.

Hardscape
Impermeable surfaces, such as concrete or stone, used in the landscape environment along sidewalks or in other areas used as public space.

Infiltration
The process by which water penetrates into soil from the ground surface.

Parkway Zone
The parkway zone is the area which lies between the curb and City right-of-way line and is intended to house utilities and pedestrian amenities.

Permeability/Impermeability
The quality of a soil or material that enables water to move through it, determining its suitability for infiltration.

Retention
The reduction in total runoff that results when stormwater is diverted and allowed to infiltrate into the ground through existing or engineered soil systems.

Runoff
Water from rainfall that flows over the land surface that is not absorbed into the ground.

Sedimentation
The deposition and/or settling of particles suspended in water as a result of the slowing of the water.

Stormwater
Water runoff from rain or snow resulting from a storm.

Transportation Corridor
A major arterial, state route, highway, or rail line used for the movement of people or goods by means of bus services, trucks, and vehicles.

ORDINANCE NO. 14 -1330

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF DOWNEY AMENDING ARTICLE V, CHAPTER 7 OF THE DOWNEY MUNICIPAL CODE (DMC) AS IT RELATES TO STORM WATER AND URBAN RUNOFF POLLUTION AND CONVEYANCE CONTROLS, TO EXPAND THE APPLICABILITY OF THE EXISTING POLLUTANT SOURCE REDUCTION REQUIREMENTS, BY IMPOSING RUNOFF LOW IMPACT DEVELOPMENT (LID) STRATEGIES ON PROJECTS THAT REQUIRE BUILDING, GRADING, AND CONSTRUCTION PERMITS

WHEREAS, the City of Downey City Council has previously adopted Ordinances 1036, 1095, 1130, and 1142 in response to requirements of prior Municipal Separate Storm Sewer System (MS4 or NPDES or Stormwater) Permits and more recently Ordinance 1320 in response to the latest MS4 Permit that have been issued by the California Regional Water Quality Control Board, Los Angeles Region (LARWQCB); and,

WHEREAS, additional changes to the Downey Municipal Code will be required to comply with the new MS4 Permit requirements (Order No. R4-2012-0175) including but not limited to, enforcement of restrictive water quality criteria, and new regulations directed at achieving receiving water beneficial use objectives, that the City must anticipate shall be more strictly enforced in the immediate future; and,

WHEREAS, the new MS4 Permit includes provisions and measures outlining significant fines and penalties for municipal non-compliance with its requirements; and,

WHEREAS, is it the intent of the City to expand the applicability of the existing Low Impact Development (LID) requirements by providing stormwater and urban runoff LID strategies for all projects for Development and Redevelopment projects as defined under "Applicability"; and,

WHEREAS, adopting this ordinance reduces potential environmental and public health and safety risks for the residential and business communities of the City of Downey; and,

WHEREAS, the specified amendments to this chapter of the Downey Municipal Code will facilitate compliance with the latest MS4 Permit by the City of Downey, its residents and businesses; and,

WHEREAS, the specified amendments to this chapter of the Downey Municipal Code will result in improved staff efficiency in anticipating and complying with these changing water quality initiatives.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF DOWNEY DOES ORDAIN AS FOLLOWS:

SECTION 1. Article V, Chapter 7 of the Downey Municipal Code is hereby amended and changed in its entirety to read as follows:

"Chapter 7 – STORM WATER AND URBAN RUNOFF POLLUTION AND CONVEYANCE CONTROLS

SECTION 5700. DEFINITIONS.

Except as specifically provided herein, any term used in this Chapter shall be defined as provided in the most recent Los Angeles County National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) Permit, as this document may from time to time be amended and submitted to the Los Angeles Regional Water Quality Control Board (LARWQCB). If not defined in the current MS4 Permit, then such term shall be used as defined in the Federal Clean Water Act, as amended, or the regulations promulgated thereunder. If any definition contained in this Chapter conflicts with the same term in the current MS4 Permit, then the definition contained in the current MS4 Permit shall govern. Any term used herein may be extended to include examples or cases identified elsewhere in Chapter 7 or as directed by the LARWQCB.

"Automotive Service Facility" means a facility that is categorized with the Standard Industrial Classification (SIC) of 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539 or equivalent North American Industry Classification System (NAICS) codes.

"Authorized Enforcement Officer" shall mean the "Director" or a City Code Enforcement Officer.

"Basin Plan" means the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Water Board on June 13, 1994 and subsequent amendments.

"Best Management Practices" or "BMPs" shall mean practices or physical devices or systems designed to prevent or reduce pollutant loading from storm water or non-storm water discharges to receiving water, or designed to reduce the volume of storm water or non-storm water discharged to the receiving water.

"Biofiltration" means a LID BMP that reduces stormwater pollutant discharges by intercepting rainfall on vegetative canopy, and through incidental infiltration and/or evapotranspiration, and filtration. Incidental infiltration is an important factor in achieving the required pollutant load reduction. Therefore, the term "biofiltration" as used in this Ordinance is defined to include only systems designed to facilitate incidental infiltration or achieve the equivalent pollutant reduction as biofiltration BMPs with an underdrain (subject to approval by the Regional Board's Executive Officer). Biofiltration BMPs include bioretention systems with an underdrain and bioswales.

"Bioretention" means a LID BMP that reduces stormwater runoff by intercepting rainfall on vegetative canopy, and through evapotranspiration and infiltration. The bioretention system typically includes a minimum 2-foot top layer of a specified soil and compost mixture underlain by a gravel-filled temporary storage pit dug into the in-situ soil. As defined in this Ordinance, a bioretention BMP may be designed with an overflow drain, but may not include an underdrain. When a bioretention BMP is designed or constructed with an underdrain it is regulated by Order No. R4-2012-0175 as biofiltration.

"Bioswale" means a LID BMP consisting of a shallow channel lined with grass or other dense, low-growing vegetation. Bioswales are designed to collect stormwater runoff and to achieve a uniform sheet flow through the dense vegetation for a period of several minutes.

"Clean Water Act (CWA)" means the Federal Water Pollution Control Act enacted in 1972, by Public Law 92-500, and amended by the Water Quality Act of 1987. The Clean Water Act prohibits the discharge of pollutants to Waters of the United States unless the discharge is in accordance with an NPDES permit.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities; mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes (Order No. R4-2012-0175).

"Commercial Malls" means any development on private land comprised of one or more buildings forming a complex of stores which sells various merchandise, with interconnecting walkways enabling visitors to easily walk from store to store, along with parking area(s). A commercial mall includes, but is not limited to: mini-malls, strip malls, other retail complexes, and enclosed shopping malls or shopping centers (Order No. R4-2012-0175).

"Construction Activity" means any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that results in land disturbance. Construction does not include emergency construction activities required to immediately protect public health and safety or routine maintenance activities required to maintain the integrity of structures by performing minor repair and restoration work, maintain the original line and grade, hydraulic capacity, or original purposes of the facility. See "Routine Maintenance" definition for further explanation. Where clearing, grading or excavating of underlying soil takes place during a repaving operation, State General Construction Permit coverage by the State of California General Permit for Storm Water Discharges Associated with Industrial Activities or for Stormwater Discharges Associated with Construction Activities is required if more than one acre is disturbed or the activities are part of a larger plan (Order No. R4-2012-0175).

"Construction/Industrial General Permit" or "CGP/IGP" shall mean the general NPDES permits adopted by the State Board, authorizing the discharge of storm water associated with construction or industrial activities respectively under certain conditions.

"Control" means to minimize, reduce or eliminate by technological, legal, contractual, or other means, the discharge of pollutants from an activity or activities.

"Development" shall mean any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does include it include emergency construction activities required to immediately protect public health and safety.

"Director" shall mean the Director of Public Works or his/her designee(s).

"Directly Adjacent" means situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

"Discharge" means any release, spill, leak, pump, flow, escape, dumping, or disposal of any liquid, semi-solid, or solid substance.

"Discharge ~~of~~ pollutants" shall mean any addition of "pollutant" or combination of pollutants to "waters of the United States" from any "point source" or, any addition of any pollutant or combination of pollutants to the waters of the "contiguous zone" of the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by man; discharges through pipes, sewers, or other conveyances owned by State, municipality, or other person which do not lead to a treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owner treatment works.

"Disturbed Area" means an area that is altered as a result of clearing, grading, and/or excavation (Order No. R4-2012-0175).

"Downey Municipal Codes" or "DMC" shall mean the official governmental record of all regulatory, penal and certain administrative ordinances of the City of Downey, California, as it may be amended.

"Flow-through treatment BMPs" means a modular, vault type "high flow biotreatment" devices contained within an impervious vault with an underdrain or designed with an impervious liner and an underdrain.

"Full Capture System" means any single device or series of devices, certified by the Executive Officer, that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate Q resulting from a one-year, one-hour storm in the sub-drainage area.

"Governmental" shall mean a municipal corporation, county, state, federal, or governmental body, agency or entity.

"Green Roof" means a LID BMP using planter boxes and vegetation to intercept rainfall on the roof surface. Rainfall is intercepted by vegetation leaves and through evapotranspiration. Green roofs may be designed as either a bioretention BMP or as a biofiltration BMP. To receive credit as a bioretention BMP, the green roof system planting medium shall be of sufficient depth to provide capacity within the pore space volume to contain the design storm depth and may not be designed or constructed with an underdrain.

"Hillside" means a property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25% or greater and where grading contemplates cut or fill slopes.

"Illicit Connection" shall mean any man-made conveyance that is connected to the MS4 without a permit, excluding roof drains and other similar types of connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

"Illicit Discharge" shall mean any discharge into the MS4 or from the MS4 into a receiving water that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes any non-storm water discharge, except: authorized non-storm water discharges; conditionally exempt non-storm water discharges; and non-storm water discharges resulting from natural flows specifically identified in Part III.A.1.d of the MS4 Permit.

"Industrial/Commercial Facility" means any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by either the Standard Industrial Classifications (SIC) or the North American Industry Classification System (NAICS). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

"Industrial Park" means land development that is set aside for industrial development. Industrial parks are usually located close to transport facilities, especially where more than one transport modalities coincide: highways, railroads, airports, and navigable rivers. It includes office parks, which have offices and light industry.

"Infiltration BMP" means a LID BMP that reduces stormwater runoff by capturing and infiltrating the runoff into in-situ soils or amended onsite soils. Examples of infiltration BMPs include infiltration basins, dry wells, and pervious pavement.

"California Regional Water Quality Control Board – Los Angeles Region" or "LARWQCB" shall mean the Board members, its Executive Officer, and their staff.

"Low Impact Development (LID)" consists of building and landscape features designed to retain or filter stormwater runoff.

"Maximum Extent Practicable" or "MEP" In selecting BMPs which will achieve MEP, it is important to remember that municipalities will be responsible to reduce the discharge of pollutants in storm water to the maximum extent practicable. This means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive. The following factors may be useful to consider:

(1) Effectiveness: Will the BMP address a pollutant of concern?

(2) Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?

(3) Public acceptance: Does the BMP have public support?

(4) Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?

(5) Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc.?

After selecting a menu of BMPs, it is of course the responsibility of the discharger to insure that all BMPs are implemented.

"MS4 Permit" shall mean the Waste Discharge Requirement for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach issued by the LARWQCB. The provisions of this Ordinance shall be interpreted to provide legal authority to support applicable sections of subsequent LARWQCB MS4 Permit Orders, as they may apply within the City of Downey. Aspects of this Ordinance were developed based on discharge requirements contained in LARWQCB Orders 90-079, 96-054, 01-182, and R4-2012-0175.

"Municipal Separate Storm Sewer System" or "MS4" shall mean a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

(1) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the Clean Water Act that discharges to waters of the United States; and

(2) Designed or used for collecting or conveying storm water; and

(3) Which is not a combined sewer; and

(4) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR § 122.26(b)(8).

"National Pollutant Discharge Elimination System" or "NPDES" shall mean the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under Clean Water Act § 307, 402, 318 and 405, as amended. This term includes an "approved program".

"Natural Drainage System" means a drainage system that has not been improved (e.g., channelized or armored). The clearing or dredging of a natural drainage system does not cause the system to be classified as an improved drainage system.

"New Development" shall mean land disturbing activities, structural development, including construction or installation of a building or structure, creation of impervious surfaces, and land subdivision.

"Non-Stormwater Discharge" means any discharge to a municipal storm drain system that is not composed entirely of stormwater.

"Owner" shall mean the legal owner of a parcel of real property, except when the legal owner of the property is the holder of the mortgage, note, or other such security, in which case it is beneficiary of said real property.

"Outfall" means a point source as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances with connect segments of the same stream or other waters of the United Sates and are used to convey waters of the United States. (40 CFR Section 122.26(b)(9)).

"Parcel" shall mean the smallest lot, unit or plot of land having an owner, boundaries, surface area and Los Angeles County Tax Assessor Number.

"Parking Lot" means land area or facility for the parking or storage of motor vehicles used for businesses, commerce, industry, or personal use, with a lot size of 5,000 square feet or more of surface area, or with 25 or more parking spaces.

"Planning Priority Projects" shall mean those new development and redevelopment projects that are required by the MS4 Permit to incorporate appropriate storm water mitigation measures into their design plan.

"Pollutant(s)" means any "pollutant" defined in Section 502(6) of the Federal Clean Water Act or incorporated into the California Water Code Section 13373.

"Project" means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (Pub. Resources Code Section 21065).

"Rainfall Harvest and Use" means a LID BMP system designed to capture runoff, typically from a roof but can also include runoff capture from elsewhere within the site, and to provide for temporary storage until the harvested water can be used for irrigation or non-potable uses. The harvested water may also be used for potable water uses if the system includes disinfection treatment and is approved for such use by the local building department and other necessary local, state, and federal agencies as required.

"Receiving Water" means "water of the United States" into which waste and/or pollutants are or may be discharged.

"Redevelopment" shall mean any construction activity that results in the creation, addition, or replacement of five thousand (5,000) square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land-disturbing activities related to structural or impervious surfaces. Redevelopment does not include routine maintenance activities to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency construction activities to immediately protect public health and safety.

"Regional Board" means the California Regional Water Quality Control Board, Los Angeles Region.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Routine Maintenance" includes, but is not limited to projects conducted to:

1. Maintain the original line and grade, hydraulic capacity, or original purpose of the facility.
2. Perform as needed restoration work to preserve the original design grade, integrity and hydraulic capacity of flood control facilities.
3. Includes road shoulder work, regrading dirt or gravel roadways and shoulders and performing ditch cleanouts.
4. Update existing lines* and facilities to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.
5. Repair leaks

Routine maintenance does not include construction of new** lines or facilities resulting from compliance with applicable codes, standards and regulations.

* Update existing lines includes replacing existing lines with new materials or pipes.

** New lines are those that are not associated with existing facilities and are not part of a project to update or replace existing lines.

"Runoff" shall mean any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

"Significant Ecological Areas (SEAs)" means an area that is determined to possess an example of biotic resources that cumulatively represent biological diversity, for the purposes of protecting biotic diversity, as part of the Los Angeles County General Plan. Areas are designated as SEAs, if they possess one or more of the following criteria:

1. The habitat of rare, endangered, and threatened plant and animal species.
2. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind, or are restricted in distribution on a regional basis.
3. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind or are restricted in distribution in Los Angeles County.
4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.
5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.

6. Areas important as game species habitat or as fisheries.
7. Areas that would provide for the preservation of relatively undisturbed examples of natural biotic communities in Los Angeles County.
8. Special areas.

"Site" means land or water area where any "facility or activity" is physically located or conducted, including adjacent land used in connection with the facility or activity.

"Standard Industrial Classification" or "SIC" shall mean the four digit code system used to identify business types in the MS4 Permit and Clean Water Act Amendments. The six digit North American Industrial Classification System (NAICS) is supplanting the SIC. Cross-references between SIC and NAICS codes shall follow those of the Economic Classification Policy Committee of the United States Office of Management and Budget, which is distributed by the National Technical Information Service.

"Storm Drain System" means any facility or any parts of the facility, including streets, gutters, conduits, natural or artificial drains, channels and watercourse that are used for the purpose of collecting, storing, transporting or disposing of stormwater and are located within the City.

"Storm Water" shall mean storm water runoff, snow melt runoff, and surface runoff and drainage related to precipitation events.

"Storm Water Pollution Prevention Plan" or "SWPPP" shall mean a plan, as required by the State Construction General and Industrial General Permits identifying potential pollutant sources and describing the design, placement, and implementation of BMPs, to effectively prevent non-stormwater discharges and reduce pollutants in stormwater discharges during activities covered by these permits.

"Structural BMP" shall mean any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution, including source control and treatment control BMPs.

"Treatment Control BMP" shall mean any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological or chemical process.

"Urban Runoff" means surface water flow produced by storm and non-storm events. Non-storm events include flow from residential, commercial or industrial activities involving the use of potable and non-potable water.

"Urban Runoff Mitigation Plan" shall mean an appropriate LID, SUSMP, or Site Specific Mitigation Plan.

"Watershed Management Program" shall mean the City's stormwater program to implement the requirements of the NPDES MS4 permit.

SECTION 5701. WATERSHED MANAGEMENT PROGRAM.

Notwithstanding other provisions in the Downey Municipal Codes, the MS4 Permit requires the City of Downey to implement the Watershed Management Program (WMP) as an enforceable element of the permit. Applicable program elements set forth in the WMP, and any subsequent amendments, are hereby incorporated into this Ordinance by reference.

SECTION 5702. PROHIBITED POLLUTANT(S).

(a) Pollutant(s) prohibited from discharge to the MS4 shall include:

(1) Any water constituent found at concentrations or levels that may potentially cause a beneficial use impairment in a downstream receiving water body that has been nominated or is currently on, a LARWQCB 303(d), Monitoring, Enforceable Limit, or similar list;

(2) Any sediment, settleable, or suspended solid;

(3) Any living or dead animal or their biological waste products;

(4) Any food, food processing or medical waste;

(5) Any thermal, color, conductive, oxygen demanding, growth inducing, corrosive, or radioactive waste;

(6) Any chemical waste, salt, organic compound, pesticide, or metal;

(7) Any hydrocarbon based fuel, oil, lubricant, fluid, or additive; and

(8) Any substance designated as a pollutant by the LARWQCB.

SECTION 5703. ILLICIT CONNECTION AND ILLICIT DISCHARGE PROHIBITION.

(a) No owner, responsible party, or person, shall use, allow, or suffer, an illicit connection to the MS4; and must therefore remove or terminate such illicit connection.

(b) No person or responsible party shall cause, nor contribute, to the exceedance of water quality standards, nor impair attainable beneficial use objectives in receiving waters of the State.

(c) All non-storm water discharges are prohibited unless they're identified in Part III.A of the MS4 Permit. A discharge may be exempt or conditionally exempt if:

(1) It consists entirely of storm water; or

(2) It is authorized by an NPDES permit; or

(3) It is identified in Part III.A of the MS4 Permit; or

(4) It is authorized by the Executive Officer of the LARWQCB.

(d) Illicit Discharges that are prohibited from entering the MS4 shall include, but are not limited to, the following:

(1) The discharge of wash waters to the MS4 from the cleaning of gas stations, auto repair garages, or other automotive service facilities;

(2) The discharge of runoff to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

(3) The discharge of runoff to the MS4 from areas where repair of machinery and equipment, which are visibly leaking oil, fluid or antifreeze, is undertaken;

(4) The discharge of runoff or wash down to the MS4 from paved or unpaved storage areas where materials containing grease, oil, paint, toxic or other hazardous substances, and uncovered receptacles containing hazardous materials are, or have been, located;

(5) The discharge of chlorinated or brominated, swimming pool or spa water and filter backwash or diatomaceous earth to the MS4;

(6) The washing of materials or impervious surfaces that result in discharges to the MS4;

(7) The discharge of concrete or cement laden wash water from concrete trucks, pumps, tools, and equipment to the MS4; and

(8) Dumping or disposal of materials into the MS4, other than storm water, such as:

a. Solid waste as defined in California Public Resources Code, Section 40191;

b. Solid waste, including, but not limited to, trash, litter, food wastes, packaging, paper bags, newspaper, and garbage;

c. Construction or landscape debris, such as leaves, dirt, grass clippings, bark, fertilizer, bags, plant cans or bedding packs;

d. Any governmentally banned or unregistered pesticide, insecticide, fungicide, nematicide, acaricide, or herbicide;

e. Automotive, fuel and chemical wastes including batteries;

f. Animal, biological, food processing, or medical wastes; and

g. Other material that may have an adverse impact on water quality, wildlife, or receiving water habitat value.

SECTION 5704. CONTROL OF POLLUTANTS AND RUNOFF FROM SITES REQUIRING A STORMWATER ACTIVITIES PERMIT.

(a) It shall be a violation of this Chapter for any person or entity, required by governmental law to obtain a NPDES stormwater activities permit, to conduct a construction, commercial, or industrial activity in the City of Downey, without the appropriate Construction General Permit (CGP) or Industrial General Permit (IGP).

(b) Any person or entity, required to have an NPDES Stormwater activities permit for a parcel within the City of Downey, shall retain at said parcel the following evidence of compliance with the CGP or IGP and make said documents available upon request from an Authorized Enforcement Officer: (i) a copy of the submitted Notice of Intent (NOI) to comply with State Stormwater Waste Discharge Requirements or a waste discharge identification (WDID) number issued by the SWRCB; (ii) a SWPPP; and (iii) site specific storm water quality data.

(c) Any person or entity in the City of Downey requiring a CGP or IGP for facilities under their control or operation, shall characterize the adequacy of the facility SWPPP in applying source and treatment control BMPs to at least the MEP standard and comply with the requirements of the SWPPP.

(d) No person or entity shall obfuscate or otherwise attempt to conceal the nature or operation of a construction, commercial, or industrial site, or facility, in order to avoid obtaining the appropriate governmental stormwater permits.

(e) Industrial and construction facilities not subject to the IGP and CGP that are subject to pollution control requirements under the municipal NPDES permit shall implement BMPs prescribed by the regional board or its executive officer, through programs or actions made pursuant to the municipal NPDES permit.

SECTION 5705. BMP REQUIREMENTS FOR URBAN RUNOFF REDUCTION.

The owner, occupant or other person in charge of day-to-day operation or maintenance of each parcel within the City of Downey shall adhere to the following BMP requirements in order to prevent or reduce the discharge of pollutants to achieve water quality standards/receiving water limitations:

(a) For premises exposed to storm water, the owner, occupant or other person in charge of day-to-day operations shall use appropriate BMPs, or other steps to reduce the discharge of pollutants to at least the MEP standard.

(b) No person or entity shall dump, release, spill, leak, pump, pour, emit, empty, discharge, inject, bury or dispose into the environment, any solid or liquid wastes, including any pollutant, in or upon any part of MS4, or upon any public or private premises in the City of Downey.

(c) No person or entity shall cause, suffer, or permit any solid or liquid waste or pollutant, to come to be located upon, in, on, or under any premises in the City of Downey, expect in the original manufacturers container or a governmentally authorized container, waste facility, or treatment works.

(d) No person shall dispose of any hazardous substance or material, into any litter or waste container, without the written authorization of the site or container, owner or operator.

(e) Water used for irrigation purposes shall not be allowed to run off of a site.

(f) Washing down paved areas shall be prohibited unless it conforms to the definition of sidewalk rinsing given in the MS4 Permit. If necessary for health or safety purposes, and not in violation of any other provision of this Code, then washing down paved areas is authorized when all applicable BMP measures are implemented to remove pollutants, or if the resulting wastewater is collected and discharged to a sanitary sewer.

(g) Uncovered outdoor storage of unsealed containers of building materials, lawn and automotive care products, or other substances that may contribute pollutants to the storm water conveyance system, is prohibited.

(h) Commercial tenants, multi-family building managers and industrial owners shall inspect trash receptacles and refuse storage areas on a weekly basis for loose garbage and liquid waste residue and shall not allow such garbage and residue to enter the storm drain system. Trash receptacles shall be maintained with solid unbroken closed covers to prevent the entry of rain, or exit of wind-blown or animal-strewn litter and leaking fluids.

(i) Premises with twenty-five (25) or more motor vehicle parking spaces, or five thousand (5,000) square feet of parking lot area, and upon which runoff water is conveyed, shall be vacuum swept monthly and shall employ other BMPs as may be necessary, to reduce discharges to the MEP.

(j) Premises with between ten (10) and twenty-four (24) motor vehicle parking spaces, and upon which runoff water is conveyed, shall be vacuum swept quarterly and shall employ other BMP's as may be necessary, to reduce discharges to the MEP.

(k) For premises where machinery or other equipment is repaired or maintained, the owner, occupant or other person in charge of the day-to-day operations shall use BMPs or other steps to prevent discharge of maintenance or repair related pollutants to the MS4.

(l) Materials and equipment necessary for pollutant source control activities, that are commensurate with facility operations and materials, shall be maintained and kept readily available and accessible to all employees.

(m) Any BMP, runoff reduction, discharge control structure, or activity must be designed, operated and maintained to prevent the release of odors, or entrance and proliferation of pathogens or their vectors, or other nuisance microbe, invertebrate or vertebrate organisms.

(n) If the Director determines that water quality criteria may be compromised by discharges from a parcel or development, the Director shall have the authority to require BMP implementation until the discharge of runoff or pollutants to the MS4, or receiving water, have been reduced to the MEP.

SECTION 5706. SOURCE CONTROL FOR NEW DEVELOPMENT.

(a) The following pollution source control requirements shall apply to all persons submitting applications for new development or redevelopment projects within the City of Downey.

(1) During application review for new development or redevelopment projects, the applicant shall submit an appropriate project specific Urban Runoff Mitigation Plan to the Director.
(2) Structural and design elements that typically increase infiltration, reduce pollutant conveyance, and decrease runoff include:

a. Using landscaped/vegetated areas, sand filters, swales, infiltration basins, biofilters, and planters to maximize infiltration;
b. Replacing impermeable surfaces with porous materials;
c. Directing impervious surface runoff to permeable areas;
d. Grading the site to encourage runoff to permeable areas;
e. Directing runoff to dry wells, perforated pipes, infiltration trenches, or other source reduction BMPs;
f. Designing curbs and landscaping to facilitate infiltration;
g. Using cisterns or retention basins to store precipitation; and
h. Installing treatment control BMPs to remove pollutants.

(3) All Urban Runoff Mitigation Plans must include a structural and treatment control BMP maintenance schedule, the applicant's signed statement of responsibility for continued BMP maintenance, and plan for continued maintenance responsibilities.
(4) The applicant shall retain responsibility for such maintenance until responsibility is legally transferred in accordance with this chapter.
(5) Applicant, facility operators and/or owners shall also provide, as requested by the Director, any other legally enforceable agreement that assigns responsibility for the maintenance of post-construction structural or treatment control BMPs.
(6) The Urban Runoff Mitigation Plan must indicate that subsequent property transfers, include, as a written condition and are subject to, the transferee assuming full responsibility for maintenance of any structural, treatment and/or source control BMPs.
(7) As a condition for issuing a certificate of occupancy for a new development or redevelopment project, the Director shall require the applicant, facility operators and/or owners, as appropriate, to construct all storm water pollution control BMPs and structural or treatment control BMPs shown on the approved project plans.
(8) As a condition for issuing a certificate of occupancy for a new development or redevelopment project, the Director shall require the applicant, facility operators and/or owners to submit, for review and approval, a BMP maintenance schedule and inspection plan.
(9) As a condition for issuing a certificate of occupancy for a new development or redevelopment project, the Director shall require that the applicant file a signed statement that the project site and all structural or treatment control BMPs shall be maintained in compliance with the Urban Runoff Mitigation Plan.

SECTION 5707. SOURCE CONTROLS FOR SPECIFIC DEVELOPMENT CATEGORIES.

(a) The following design elements shall be required for all new development or redevelopment projects, except single-family residences:

(1) Preparation and Director approval of the Urban Runoff Mitigation Plan, as a condition of Planning or Building Department approval.

(2) Runoff shall not be conveyed to, or through, the following areas:
a. Loading and unloading dock areas;
b. Repair and maintenance bays; and
c. Vehicle and equipment wash and fueling areas

(3) Developments which include outdoor material storage areas that may discharge MS4 pollutants, must include design elements to:
a. Place the materials within enclosures, such as cabinets, sheds, or awnings, which prevent contact with rain, runoff, or other liquids that might flow to the MS4.
b. Liquid handling areas shall use impervious spill containing floors, drains, sumps, vessels, berms, dikes, and curbs to contain materials and eliminate discharges to the MS4.

(4) Waste material bins with a capacity greater than 1/4 cubic yard (or fifty (50) gallons) must be stored in a covered area to prevent rainfall or roof drainage, from any structure, through the waste.

(5) Any project including down spouts, roof gutters or subsurface drainage shall utilize perforated pipe in approved infiltration areas, infiltration trenches, "French Drain" or similar systems, unless prohibited by the Director.

(6) Each Urban Runoff Management Plan shall be individually evaluated to ascertain whether the proposed project and site characteristics meet governmental standards.

(7) The Urban Runoff Mitigation Plan must demonstrate to the Director's satisfaction that proposed BMPs, numeric design criteria, or design elements meet the requirements of this chapter.

(8) The Director shall approve or disapprove of any proposed project plans. If the plans are disapproved, the developer may request a written explanation for the disapproval. No city grading or building permit shall be issued until the Director has approved an Urban Runoff Mitigation Plan.

(b) Development projects subject to Permittee permitting and approval for the design and implementation of post-construction controls to mitigate storm water pollution, prior to completion of the project(s), are:.

(1) All development projects equal to 1 acre or greater of disturbed area that adds more than 10,000 square feet of impervious surface area.
(2) Industrial parks 10,000 square feet or more of surface area.
(3) Commercial malls 10,000 square feet or more of surface area.
(4) Retail gasoline outlets with 5,000 square feet or more of surface area.
(5) Restaurants (Standard Industrial Classification (SIC) of 5812) with 5,000 square feet or more of surface area.
(6) Parking lots with 5,000 square feet or more of impervious surface area, or with 25 or more parking spaces.
(7) Streets and roads construction of 10,000 square feet or more of impervious surface area. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects. Specific requirements in Subsection (c)(2).

(8) Automotive service facilities (Standard Industrial Classification (SIC) of 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) 5,000 square feet or more of surface area.
(9) Projects located in or directly adjacent to, or discharging directly to an Environmentally Sensitive Area (ESA), where the development will:
  a. Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and
  b. Create 2,500 square feet or more of impervious surface area
(10) Single-family hillside homes.
(11) Redevelopment Projects
  a. Land disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site on Planning Priority Project categories.
  b. Where Redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, the entire project must be mitigated.
  c. Where Redevelopment results in an alteration of less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, only the alteration must be mitigated, and not the entire development.
  d. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.

Existing single-family dwelling and accessory structures are exempt from the Redevelopment requirements unless such projects create, add, or replace 10,000 square feet or more of impervious surface area.

(c) **Specific Requirements.** The Site for every Planning Priority Project shall be designed to control pollutants, pollutant loads, and runoff volume to the maximum extent feasible by minimizing impervious surface area and controlling runoff from impervious surfaces through infiltration, evapotranspiration, bioretention and/or rainfall harvest and use.

(1) A new single-family hillside home development shall include mitigation measures to:
  a. Conserve natural areas;
  b. Protect slopes and channels;
  c. Provide storm drain system stenciling and signage;
  d. Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability; and
  e. Direct surface flow to vegetated areas before discharge, unless the diversion would result in slope instability.
(2) Street and road construction of 10,000 square feet or more of impervious surface shall follow USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets (December 2008 EPA-833-F-08-009) or similar guidance manual to the maximum extent practicable.

(3) The remainder of Planning Priority Projects shall prepare a LID Plan to comply with the following:

a. Retain stormwater runoff onsite for the Stormwater Quality Design Volume (SWQDv) defined as the runoff from:
   i. The 85th percentile 24-hour runoff event as determined from the Los Angeles County 85th percentile precipitation isohyetal map; or
   ii. The volume of runoff produced from a 0.75 inch, 24-hour rain event, whichever is greater.

b. Minimize hydromodification impacts to natural drainage systems as defined in Order No. R4-2012-0175.

c. To demonstrate technical infeasibility, the project applicant must demonstrate that the project cannot reliably retain 100 percent of the SWQDv on-site, even with the maximum application of green roofs and rainwater harvest and use, and that compliance with the applicable post-construction requirements would be technically infeasible by submitting a site-specific hydrologic and/or design analysis conducted and endorsed by a registered professional engineer, geologist, architect, and/or landscape architect. Technical infeasibility may result from conditions including the following:
   i. The infiltration rate of saturated in-situ soils is less than 0.3 inch per hour and it is not technically feasible to amend the in-situ soils to attain an infiltration rate necessary to achieve reliable performance of infiltration or bioretention BMPs in retaining the SWQDv onsite.
   ii. Locations where seasonal high groundwater is within five to ten feet of surface grade;
   iii. Locations within 100 feet of a groundwater well used for drinking water;
   iv. Brownfield development sites or other locations where pollutant mobilization is a documented concern;
   v. Locations with potential geotechnical hazards;
   vi. Smart growth and infill or redevelopment locations where the density and/ or nature of the project would create significant difficulty for compliance with the onsite volume retention requirement.

d. If partial or complete onsite retention is technically infeasible, the project Site may biofiltrate 1.5 times the portion of the remaining SWQDv that is not reliably retained onsite. Biofiltration BMPs must adhere to the design specifications provided in Order No. R4-2012-0175.
   i. Additional alternative compliance options such as offsite infiltration and groundwater replenishment projects may be available to the project Site. The project Site should contact the Department of Public Works to determine eligibility.

e. The remaining SWQDv that cannot be retained or biofiltered onsite must be treated onsite to reduce pollutant loading. BMPs must be selected and designed to meet pollutant-specific benchmarks as required per Order No. R4-2012-0175. Flow-through BMPs may be used to treat the remaining SWQDv and must be sized based on a rainfall intensity of:
   i. 0.2 inches per hour, or
   ii. The one year, one-hour rainfall intensity as determined from the most recent Los Angeles County isohyetal map, whichever is greater.

(d) Additional Requirements. The site for projects not classified with general applicability listed in Section 5707(b)of this Ordinance, but resulting in the creation or addition or replacement of 800 square feet or more of impervious surface area shall be designed to control pollutants, pollutant loads, and runoff volume as approved by the city.

SECTION 5707.5 STANDARD URBAN STORM WATER MITIGATION PLAN (SUSMP) – DEVELOPMENT PROJECTS.

(Added by Ord. 1095, adopted 01-23-01; amended by Ord. 1130, adopted 08-27-02; repealed by Ord. 1142, adopted 02-11-03)

SECTION 5708. URBAN RUNOFF REDUCTION REQUIREMENTS.

The following urban runoff reduction requirements shall apply to all persons submitting applications for new development or redevelopment projects within the City of Downey:

(a) New development and redevelopment projects within the City of Downey are required to prepare current condition and post proposed development hydrology studies based on current Los Angeles County Department of Public Works Design Storm and Hydrology methods.

(b) Where proposed development is expected to generate higher peak runoff flows, as compared to that which currently exists, the Director shall require reasonable drainage improvements within the lot, or public right-of-way, to accommodate the potential effect of such additional water flows.

(c) Where such proposed development may affect the existing flow of water, the flow of water in natural drainage courses, or within streets or other public rights-of-way, the Director shall require reasonable drainage improvements within the lot, water course, or public right-of-way, to accommodate the potential effect of such additional water flows.

SECTION 5709. TRANSFER OF PROPERTIES SUBJECT TO BMP MAINTENANCE REQUIREMENTS.

The transfer, sale, deed, or lease of a parcel, which is subject to a requirement for maintenance of structural and treatment control BMPs shall include conditions requiring and assigning the transferee, and its successors, to:

(a) Assume responsibility for maintenance and operation of any existing structural or treatment control BMP to at least MEP standard; or

(b) Replace any degraded structural or treatment control BMP with new control measures or BMPs meeting, the then current, standards of the City.

(c) Conduct BMP maintenance and inspections as required in the approved Low Impact Development (LID) Plan, Urban Runoff Mitigation-Plan, or the LID ordinance.

(d) Insure that all structural or treatment control BMPs are inspected at least yearly and retain proof of such inspections for at least three (3) years.

(e) For conditions, covenants and restrictions for properties which include structural or treatment control BMPs that are to be maintained by a homeowner's association, such conditions, covenants and restrictions shall provide for maintenance of the BMPs by the association.

(f) BMPs that are to be maintained by individual property owners, shall include a written explanation of the maintenance responsibilities with any deed transferring title to said property, as well as being attached to any property conditions, covenants and restrictions.

(g) If property, on which structural or treatment control BMPs are located, is to be dedicated to a governmental agency, the transferor shall remain responsible for the BMPs until the agency provides a signed assumption of responsibility and conformation that they meet agency design standards.

(h) All structural BMPs are required to be properly operated and maintained according to product specifications and site characteristics to maintain effectiveness in reducing the discharge of pollutants. Documentation on operation and maintenance activities shall be retained onsite at all times, and made available upon request by an authorized enforcement officer.

SECTION 5710. ENFORCEMENT.

Persons, and entities, discharging runoff or pollutants are made accountable for their actions through the mechanisms in this Section.

(a) Discharges to the MS4 are required to comply with the provisions and conditions of this Chapter and applicable Federal, State or LARWQCB permits, orders, contracts, model programs, or plans.

(b) Each of the following is hereby determined to be a threat to the public health, safety and welfare, and is declared and deemed a public nuisance, which may be abated or restored by any Authorized Enforcement Officer. A civil or criminal action to abate, enjoin or otherwise compel the cessation of such nuisance may be brought by the City Attorney, pursuant to the City's authority to abate nuisances:

(1) Any condition caused or permitted to exist in violation of any of the provisions of this Chapter; or

(2) Any failure to comply with applicable requirements of an approved LID Plan, Urban Runoff Mitigation Plan, or LID ordinance with respect to a property; or

(3) Any failure to comply with any applicable requirement of a contract to which the City is a party; or

(4) Any failure to comply with any applicable order or notice issued pursuant to this Section; or

(5) Any false certification or verification; or

(6) Any failure to comply with a certification or verification provided by a project applicant or the applicant's successor in interest; or

(7) Any failure to properly operate and maintain any structural or treatment control BMP in accordance with an approved LID Plan, Urban Runoff Mitigation Plan, or LID ordinance.

(c) The cost of nuisance abatement as provided in subsection (b), shall be borne by the property owner from which the discharge originated and the cost shall be assessed to that owner, pursuant to the procedure for cost recovery set forth in Chapter 2 of Article V of the DMC.

(d) If any violation of this Chapter constitutes a seasonal or recurrent nuisance, the Director shall so declare. The failure of any person to take appropriate annual precautions to prevent such pollution, after written notice of a determination under this subsection, shall constitute a public nuisance and a violation of this Chapter.

(e) Causing, permitting, aiding, abetting, or concealing a violation of any provision of this Chapter shall constitute a violation of this Chapter.

(f) In addition to other remedies in this Section, violations of this Chapter may be enforced by civil action brought by the City. During such action, the City many seek, as appropriate, any or all of the following remedies:

(1) A temporary or permanent injunction;

(2) Assessment upon the owner or violator of any investigation, inspection, or monitoring costs, which led to the establishment of the violation, and for the reasonable costs of preparing and bringing legal action under this subsection;

(3) Costs incurred in removing, correcting, or terminating the adverse effects resulting from violation;

(4) Compensatory damages for loss or destruction to water quality, wildlife, fish and aquatic life.

(g) When an Authorized Enforcement Officer finds that a discharge has taken or may take place in violation of this Chapter, the officer may issue an order to cease and desist said practice or operation causing, or likely to cause, such discharge. The Authorized Enforcement Officer may then direct that those persons not complying shall:

(1) Comply with the requirement;

(2) Comply with a time schedule for compliance, and

(3) Take appropriate remedial or preventive action to prevent the violation from recurring.

(h) Whenever an Authorized Enforcement Officer finds any pollutant upon any right of way, land, or ground adjoining an adjacent parcel, the officer may give notice to the owner of the adjacent property to remove such pollutant in any reasonable manner. The recipient of such notice shall undertake the activities as described in the notice.

(i) Violation of this Chapter shall be punishable as a misdemeanor as provided in Chapter 2 of Article 1 of this Code. Each day that a violation continues shall constitute a separate offense.

(j) To the extent the City makes compliance with this Chapter, or any provision of this Chapter, a condition of approval to the issuance of a permit or license, any person in violation of such condition is subject to the permit revocation procedures set forth elsewhere in this Code.

(k) Remedies contained within this Chapter are in addition to, and do not supersede or limit, any and all other remedies, whether they be civil or criminal. The remedies provided for in this Chapter shall be cumulative and not exclusive.

(l) Whenever necessary, interagency coordination will be employed to enforce the provisions of this chapter.

SECTION 5711. INSPECTIONS, SEARCHES, AND REPORT ACCESS.

Whenever necessary to make an inspection to enforce any provisions of this Chapter, an Authorized Enforcement Officer may enter any property in the City of Downey in a manner authorized by State law. The inspection authority pursuant to this Section shall include the authority to enter, sample, inspect, review records, copy records, and require regular reports from industrial, commercial and construction facilities and sites, with the potential to discharge pollution to the MS4.

SECTION 5712. FEES.

The City Council may establish fees for the services provided under this Chapter and such fees may be adjusted from time to time by City Council Resolution.

SECTION 2. The City Council finds, pursuant to State CEQA Guidelines Section 15378(a), that this Ordinance is exempt from the requirements of the California Environmental Quality Act (CEQA) in that it is not a "Project" as defined by CEQA. This Ordinance is further exempt from environmental review pursuant to the "general rule" at State CEQA Guidelines Section 15061(b)(3) because it can be seen with certainty that there is no possibility that it may have a significant effect on the environment.

SECTION 3. If any section, subsection, paragraph, sentence, clause or phrase of this Ordinance is declared by a court of competent jurisdiction to be unconstitutional or otherwise invalid, such decision shall not affect the validity of the remaining portions of this Ordinance. The City Council declares that it would have adopted this Ordinance, and each section, subsection, sentence, clause, phrase or portion thereof, irrespective of the fact that any one or more sections, subsections, phrases, or portions be declared invalid or unconstitutional.

SECTION 4. The City Clerk shall certify to the adoption of this Ordinance and cause the same to be published and posted in the manner required by law.

APPROVED AND ADOPTED this 22nd day of April, 2014.

FERNANDO VASQUEZ, Mayor

ATTEST:

ADRIA M. JIMENEZ, CMC
City Clerk

STATE OF CALIFORNIA)
COUNTY OF LOS ANGELES) ss.
CITY OF DOWNEY)

I HEREBY CERTIFY that the foregoing Ordinance No. 14 -1330 was introduced at a Regular Meeting of the City Council of the City of Downey held on the 8th day of April, 2014 and adopted at a Regular Meeting of the City Council of the City of Downey held on the 22nd day of April, 2014 by the following vote, to wit:

AYES:	Council Members:	Guerra, Saab, Marquez, Mayor Vasquez
NOES:	Council Member:	None
ABSENT:	Council Member:	None
ABSTAIN:	Council Member:	Brossmer.

I FURTHER CERTIFY that a Summary of the foregoing Ordinance No. 14 -1330, was published in a newspaper of general circulation in the City of Downey, on April 10, 2014 (after introduction), and on April 24, 2014 (after adoption, including the vote thereon). It was also posted in the regular posting places in the City of Downey on the same dates.

ADRIA M. JIMENEZ, CMC
City Clerk

RESOLUTION NO. 051-2013

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF HAWAIIAN GARDENS, COUNTY OF LOS ANGELES, STATE OF CALIFORNIA, APPROVING A GREEN STREET POLICY

WHEREAS, The Municipal Separate Storm Sewer System (MS4) Permit (Order No. R-2012-0175) was adopted by the California Regional Water Quality Control Board, Los Angeles Region on November 8, 2012; and

WHEREAS, Municipalities electing to prepare a Watershed Management Program or an Enhanced Watershed Management Program under this Permit are required to demonstrate that Green Street policies are in place that specify the use of green street strategies for transportation corridors; and

WHEREAS, the City is a Permittee under the California Regional Water Quality Control Board, Los Angeles Region Order No. R4-2012-0175, issued on November 08, 2012 which establishes Waste Discharge Requirements for Municipal Separate Storm Sewer Systems (MS4) Discharges within the Coastal Watersheds of Los Angeles County; and

WHEREAS, Green Streets are enhancements to streets and road projects to improve the quality of storm water and urban runoff through the implementation of infiltration, bio-treatment, xeriscaping parkways and tree lined streets; and

WHEREAS, routine maintenance including but not limited to slurry seals, grind and overlay and reconstruction to maintain original line and grade are excluded from the Green Street Policy;

NOW, THEREFORE, BE IT RESOLVED BY THE CITY COUNCIL OF THE CITY OF HAWAIIAN GARDENS AS FOLLOWS:

Section 1. That the City Council hereby approves the Green Streets Policy and directs Community Development Director to implement Green Streets for transportation corridor for publicly owned streets and road projects that add more than 10,000 square feet or more of impervious areas.

Section 2. The Mayor or his/her presiding officer is hereby authorized to affix his/her signature to this resolution signifying its passage and adoption by the City Council of the City of Hawaiian Gardens.

Section 3. The City Clerk, or her duly appointed Deputy, is directed to attest thereto and forward a certified copy of this resolution to Gateway Water Management Authority.

Section 4. The City Clerk or his/her designee shall attest and shall certify to the adoption of the Resolution and shall cause this Resolution and his/her certification to be entered into the Book of Resolutions of the City of Hawaiian Gardens.

PASSED, APPROVED, AND ADOPTED BY THE CITY COUNCIL OF THE CITY OF HAWAIIAN GARDENS ON THIS 9th DAY OF JULY 2013.

Victor Farfan, Mayor

ATTEST:

Suzanne Underwood

City Clerk

CITY OF HAWAIIAN GARDENS
CITY CLERK'S OFFICE
CERTIFICATION

STATE OF CALIFORNIA)
COUNTY OF LOS ANGELES) SS
CITY OF HAWAIIAN GARDENS)

I, SUZANNE UNDERWOOD, City Clerk/Records Manager of the City of Hawaiian Gardens, do hereby certify that **Resolution No. 051-2013**, was duly and regularly passed and adopted by the City Council of the City of Hawaiian Gardens at its meeting on this **9th day of JULY 2013**, by the following votes as the same appears on file and of record in the Office of the City Clerk.

AYES: OYAMA-CANADA, RODRIGUEZ, BRUCE, FARFAN
NOES: NONE
ABSENT: GOMEZ
ABSTAIN: NONE

Suzanne Underwood
SUZANNE UNDERWOOD
CITY CLERK/RECORDS MANAGER

ORDINANCE NO. 545

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF HAWAIIAN GARDENS, CALIFORNIA, ADDING CHAPTER 13.20 TO TITLE 13 OF THE HAWAIIAN GARDENS MUNICIPAL CODE ESTABLISHING STORMWATER LOW IMPACT DEVELOPMENT STANDARDS FOR DEVELOPMENT PROJECTS.

WHEREAS, the federal Clean Water Act establishes prohibits the discharge of pollutants in stormwater runoff to waters of the United States unless the discharge is in accordance with an National Pollutant Discharge Elimination System permit; and

WHEREAS, the California Porter Cologne Act established Regional Water Quality Control Boards to implement the mandates of the Clean Water Act, including the issuance of NPDES permits by said Regional Boards; and

WHEREAS, the City is a Permittee under the California Regional Water Quality Control Board, Los Angeles Region National Pollutant Discharge Elimination System (NPDES) Permit No. CAS004001 adopted per Order No. R4-2012-0175, issued on November 08, 2012, which establishes Waste Discharge Requirements for Municipal Separate Storm Sewer Systems (MS4) Discharges within the Coastal Watersheds of Los Angeles County, except those Discharges Originating from the City of Long Beach MS4 (the NPDES Permit); and

WHEREAS, the NPDES Permit requires municipalities to establish regulations and policies applicable to development and redevelopment to prevent pollutants from being washed onto watersheds during rain events, including Low Impact Development (LID) standards that may be formulated through participation in a Watershed Management Program and/or Enhanced Watershed Management Program; and

WHEREAS, the Regional Board has adopted Total Maximum Daily Loads (TMDLs) for pollutants which are numerical limits of the amount of such pollutants allowed in a watershed that must be achieved effectively through LID implementation; and

WHEREAS, urbanization has led to increased impervious surface areas resulting in increased water runoff and less percolation to groundwater aquifers causing the transport of pollutants to downstream receiving waters; and

WHEREAS, the City is committed to a stormwater management program that protects water quality and water supply by employing watershed-based approaches that balance environmental and economic considerations.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF HAWAIIAN GARDENS, CALIFORNIA, DOES HEREBY ORDAIN AS FOLLOWS:

SECTION 1. Chapter 13.20 (Low Impact Development Standards) is hereby added to Title 13 (Utilities) of the Hawaiian Gardens Municipal Code to read as follows:

CHAPTER 13.20

LOW IMPACT DEVELOPMENT STANDARDS

Sections:
13.20.010 Purpose
13.20.020 Definitions
13.20.030 Application
13.20.040 Low Impact Development Standards for Development and Redevelopment Planning and Construction Activities
13.20.050 Effective Date

13.20.010 Purpose.

The provisions of this Chapter establish requirements for development and redevelopment to comply with the latest NPDES Permit to lessen water quality impacts by using smart growth practices, and integrate Low Impact Development (LID) practices and standards for stormwater pollution mitigation through means of infiltration, evapotranspiration, bioretention, biofiltration, and rainfall harvest and use.

13.20.020 Definitions.

For purposes of this Chapter, the following terms shall be defined as follows. If the definition of any term contained in this Chapter conflicts with the definition of the same term in the latest NPDES permit, then the definition contained in the NPDES permit shall apply.

"Automotive Service Facility" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) and North American Industry Classification System (NAICS) codes: 5013, 5014, 5511, 5541, 7532-7534, and 7536-7539.

"Best Management Practice" or "BMP" means practices or physical devices or systems designed to prevent or reduce pollutant loading from stormwater or non-stormwater discharges to receiving waters, or designed to reduce the volume of stormwater or non-stormwater discharged to the receiving water.

"Biofiltration" means a LID BMP that reduces stormwater pollutant discharges by intercepting rainfall on vegetative canopy, and through incidental infiltration and/or evapotranspiration, and filtration. Incidental infiltration is an important factor in achieving the required pollutant load reduction. Therefore, the term "biofiltration" as used in this Chapter is defined to include only systems designed to facilitate incidental infiltration or achieve the equivalent pollutant reduction as biofiltration BMPs with an underdrain (subject to approval by the Regional Board's Executive Officer). Biofiltration BMPs include bioretention systems with an under-drain and bio-swales.

"Bioretention" means a LID BMP that reduces stormwater runoff by intercepting rainfall on vegetative canopy, and through evapotranspiration and infiltration. The bioretention system typically includes a minimum 2-foot top layer of a specified soil and compost mixture underlain by a gravel-filled temporary storage pit dug into the in-situ soil. As defined in this Ordinance, a bioretention BMP may be designed with an overflow drain, but may not include an underdrain. When a bioretention BMP is designed or constructed with an underdrain it is regulated by the NPDES permit as biofiltration.

"Bio-swale" means a LID BMP consisting of a shallow channel lined with grass or other dense, low-growing vegetation. Bioswales are designed to collect stormwater runoff and to achieve a uniform sheet flow through the dense vegetation for a period of several minutes.

"City" means the City of Hawaiian Gardens.

"Clean Water Act" or "CWA" means the Federal Water Pollution Control Act enacted in 1972, by Public Law 92-500, and amended by the Water Quality Act of 1987. The Clean Water Act prohibits the discharge of pollutants to Waters of the United States unless the discharge is in accordance with an NPDES permit.

"Commercial Malls" means any development on private land comprised of one or more buildings forming a complex of stores which sells various merchandise, with interconnecting walkways enabling visitors to easily walk from store to store, along with parking area(s). A commercial mall includes, but is not limited to: mini-malls, strip malls, other retail complexes, and enclosed shopping malls or shopping centers.

"Development" means construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail, and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Directly Adjacent" means situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of the significant ecological area.

"Discharge" means any release, spill, leak, pump, flow, escape, dumping, or disposal of any liquid, semi-solid, or solid substance.

"Disturbed Area" means an area that is altered as a result of clearing, grading, and/or excavation.

"Flow-through treatment BMPs" means a modular, vault type "high flow biotreatment" devices contained within an impervious vault with an underdrain or designed with an impervious liner and an underdrain.

"Green Roof" means a LID BMP using planter boxes and vegetation to intercept rainfall on the roof surface. Rainfall is intercepted by vegetation leaves and through evapotranspiration. Green roofs may be designed as either a bioretention BMP or as a biofiltration BMP. To receive credit as a bioretention BMP, the green roof system planting medium shall be of sufficient depth to provide capacity within the pore space volume to contain the design storm depth and may not be designed or constructed with an underdrain.

"Industrial Park" means land development that is set aside for industrial development. Industrial parks are usually located close to transport facilities, especially where more than one transport modalities coincide: highways, railroads, airports, and navigable rivers. It includes office parks, which have offices and light industry.

"Infiltration" means a LID BMP that reduces stormwater runoff by capturing and infiltrating the runoff into in-situ soils or amended onsite soils. Examples of infiltration BMPs include infiltration basins, dry wells, and pervious pavement.

"Low Impact Development (LID)" consists of building and landscape features designed to retain or filter stormwater runoff.

"Municipal Separate Storm Sewer System" or "MS4" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

1. Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, stormwater, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

2. Designed or used for collecting or conveying stormwater;

3. Which is not a combined sewer; and

4. Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR § 122.2 (40 CFR § 122.26(b) (8)).

"National Pollutant Discharge Elimination System or "NPDES" means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA Section 307, 402, 318, and 405. The term includes an "approved program."

"Natural Drainage System" means a drainage system that has not been improved (e.g., channelized or armored). The clearing or dredging of a natural drainage system does not cause the system to be classified as an improved drainage system.

"Non-Stormwater Discharge" means any discharge to a municipal storm drain system that is not composed entirely of stormwater.

"Parking Lot" means land area or facility for the parking or storage of motor vehicles used for businesses, commerce, industry, or personal use, with a lot size of 5,000 square feet or more of surface area, or with 25 or more parking spaces.

"Pollutant" means any "pollutant" defined in Section 502(6) of the Federal Clean Water Act or incorporated into the California Water Code Section 13373.

"Project" means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (Pub. Resources Code Section 21065).

"Rainfall Harvest and Use" means a LID BMP system designed to capture runoff, typically from a roof but can also include runoff capture from elsewhere within the site, and to provide for temporary storage until the harvested water can be used for irrigation or non-potable uses. The harvested water may also be used for potable water uses if the system includes disinfection treatment and is approved for such use by the local building department.

"Receiving Water" means "water of the United States" into which waste and/or pollutants are or may be discharged.

"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of routine maintenance activity; and land disturbing activity related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Regional Board" means the California Regional Water Quality Control Board, Los Angeles Region.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Routine Maintenance" includes, but is not limited to projects conducted to:

1. Maintain the original line and grade, hydraulic capacity, or original purpose of the facility.

2. Perform as needed restoration work to preserve the original design grade, integrity and hydraulic capacity of flood control facilities.

3. Includes road shoulder work, re-grading dirt or gravel roadways and shoulders and performing ditch cleanouts.

4. Update existing lines* and facilities to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.

5. Repair leaks.

6. Routine maintenance does not include construction of new** lines or facilities resulting from compliance with applicable codes, standards and regulations.

* Update existing lines includes replacing existing lines with new materials or pipes.

** New lines are those that are not associated with existing facilities and are not part of a project to update or replace existing lines.

"Significant Ecological Areas (SEAs)" means an area that is determined to possess an example of biotic resources that cumulatively represent biological diversity, for the purposes of protecting biotic diversity, as part of the Los Angeles County General Plan. Areas are designated as SEAs, if they possess one or more of the following criteria:

1. The habitat of rare, endangered, and threatened plant and animal species.
2. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind, or are restricted in distribution on a regional basis.

3. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind or are restricted in distribution in Los Angeles County.

4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.

5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.

6. Areas important as game species habitat or as fisheries.

7. Areas that would provide for the preservation of relatively undisturbed examples of natural biotic communities in Los Angeles County.

8. Special areas.

"Site" means land or water area where any facility or activity is physically located or conducted, including adjacent land used in connection with the facility or activity.

"Storm Drain System" means any facility or any parts of the facility, including streets, gutters, conduits, natural or artificial drains, channels and watercourse that are used for the purpose of collecting, storing, transporting or disposing of stormwater and are located within the City.

"Storm Water or Stormwater" means runoff and drainage related to precipitation events (pursuant to 40 CFR § 122.26(b) (13); 55 Fed. Reg. 47990, 47995 (Nov. 16, 1990)).

13.20.030 Application.

A. The provisions of this Chapter shall apply to the following development and redevelopment:

1. All development projects equal to 1 acre or greater of disturbed area that adds more than 10,000 square feet of impervious surface area.

2. Industrial parks 10,000 square feet or more of surface area.

3. Commercial malls 10,000 square feet or more of surface area.

4. Retail gasoline outlets with 5,000 square feet or more of surface area.

5. Restaurants (Standard Industrial Classification 5812) with 5,000 square feet or more of surface area.

6. Parking lots with 5,000 square feet or more of impervious surface area, or with 25 or more parking spaces.

7. Streets and roads construction of 10,000 square feet or more of impervious surface area. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects.

8. Automotive service facilities (Standard Industrial Classification 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) 5,000 square feet or more of surface area.

9. Projects located in or directly adjacent to, or discharging directly to a significant ecological area, where the development will:

a. Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and

b. Create 2,500 square feet or more of impervious surface area.

10. The following redevelopment projects, subject to the following conditions and exemptions:

a. Land disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site.

b. Where redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, the entire project must be mitigated.

c. Where redevelopment results in an alteration of less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, only the alteration must be mitigated, and not the entire development.

d. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.

e. Existing single-family dwelling and accessory structures are exempt from the redevelopment requirements unless such projects create, add, or replace 10,000 square feet of impervious surface area.

13.20.040 Low Impact Development Standards for Development and Redevelopment Planning and Construction Activities.

Each development and redevelopment subject to the provisions of this Chapter shall be designed to control pollutants, pollutant loads, and runoff volume to the maximum extent feasible by minimizing impervious surface area and controlling runoff from impervious surfaces through infiltration, evapotranspiration, bioretention and/or rainfall harvest and use. The minimum required standards shall be as follows:

A. Street and road construction of 10,000 square feet or more of impervious surface shall follow USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets (December 2008 EPA-833-F-08-009), to the maximum extent practicable.

B. All other projects shall prepare a LID Plan to comply with the following:

1. Retain stormwater runoff onsite for the Stormwater Quality Design Volume (SWQDv) defined as the runoff from:

a. The 85th percentile 24-hour runoff event as determined from the Los Angeles County 85th percentile precipitation isohyetal map; or

b. The volume of runoff produced from a 0.75 inch, 24-hour rain event, whichever is greater.

2. Minimize hydromodification impacts to natural drainage systems as defined in the NPDES permit.

3. To demonstrate technical infeasibility, the project applicant must demonstrate that the project cannot reliably retain 100 percent of the SWQDv on-site, even with the maximum application of green roofs and rainwater harvest and use, and that compliance with the applicable post-construction requirements would be technically infeasible by submitting a site-specific hydrologic and/or design analysis conducted

and endorsed by a registered professional engineer, geologist, architect, and/or landscape architect. Technical infeasibility may result from conditions including the following:

a. The infiltration rate of saturated in-situ soils is less than 0.3 inch per hour and it is not technically feasible to amend the in-situ soils to attain an infiltration rate necessary to achieve reliable performance of infiltration or bioretention BMPs in retaining the SWQDv onsite.

b. Locations where seasonal high groundwater is within five to ten feet of surface grade;

c. Locations within 100 feet of a groundwater well used for drinking water;

d. Brownfield development sites or other locations where pollutant mobilization is a documented concern;

e. Locations with potential geotechnical hazards;

f. Smart growth and infill or redevelopment locations where the density and/ or nature of the project would create significant difficulty for compliance with the onsite volume retention requirement.

4. If partial or complete onsite retention is technically infeasible, the project site may biofiltrate 1.5 times the portion of the remaining SWQDv that is not reliably retained onsite. Biofiltration BMPs must adhere to the design specifications provided in the NPDES permit.

a. Additional alternative compliance options such as offsite infiltration and groundwater replenishment projects may be available to the project site. The project applicant should contact the City to determine eligibility.

5. The remaining SWQDv that cannot be retained or biofiltered onsite must be treated onsite to reduce pollutant loading. BMPs must be selected and designed to meet pollutant-specific benchmarks as required per the NPDES permit. Flow-through treatment BMPs may be used to treat the remaining SWQDv and must be sized based on a rainfall intensity of:

a. 0.2 inches per hour, or

b. The one year, one-hour rainfall intensity as determined from the most recent Los Angeles County isohyetal map, whichever is greater.

13.20.050 Effective Date.

The requirements of this Chapter shall become effective on August 12, 2013. This includes projects subject to discretionary permits or project phases that have not been deemed complete for processing or discretionary permit projects without vesting tentative maps that have not requested and received an extension of previously granted approvals.

SECTION 2. Ordinance Severability. If any section, subsection, subdivision, paragraph, sentence, clause or phrase in this Ordinance or any part thereof is for any reason, held to be unconstitutional or invalid, or ineffective by any court of competent jurisdiction such decision shall not affect the validity of effectiveness of the remaining portions of this Ordinance or any part thereof. The City Council hereby declares that it would have passed this Ordinance and each section, subsection, subdivision, sentence, clause and phrase thereof, irrespective of the fact that any one or more sections, subsections, subdivisions, sentences, clauses or phrases be declared unconstitutional.

SECTION 3. Effective Date. This Ordinance shall take effect thirty days after its adoption. The City Clerk or the City Clerk's duly appointed deputy shall certify to the adoption of this Ordinance and shall cause this Ordinance to be published as required by law.

PASSED, APPROVED, AND ADOPTED at a regular meeting of the City Council of the City of Hawaiian Gardens, California, on this 9th day of July 2013.

Victor Farfan, Mayor

CITY CLERK/RECORDS MANAGER

RESOLUTION NO. 2013-50

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF LAKEWOOD ADOPTING A GREEN STREETS POLICY

WHEREAS, the Municipal Separate Storm Sewer System (MS4) Permit (Order No. R-2012-0175) was adopted by the California Regional Water Quality Control Board, Los Angeles Region on November 8, 2012. Municipalities electing to prepare a Watershed Management Program under this Permit are required to demonstrate that Green Streets Policies are in place that specify the use of green street strategies for transportation corridors.; and

WHEREAS, Green Streets are enhancements to street and road projects to improve the quality of storm water and urban runoff through the implementation of infiltration, bio-treatment, xeriscaping parkways and tree lined streets.; and

WHEREAS, the City initiated the development of a Green Streets Policy and a corresponding Green Streets Manual prior to February 26, 2013.

THE CITY COUNCIL OF THE CITY OF LAKEWOOD DOES HEREBY RESOLVE AS FOLLOWS:

SECTION 1. The City Council of the City of Lakewood, hereby adopts the Green Street Policy as required by the Municipal Separate Storm Sewer System (MS4) Permit (Order No. R-2012-0175) and as set forth in the City of Lakewood's Green Streets Manual.

SECTION 1. The Director of Public Works is hereby directed to implement the Green Streets policy for transportation corridors as described in the City of Lakewood's Green Streets Manual. Routine maintenance, including but not limited to: slurry seals, grind and overlay, and reconstruction to maintain original line grade, are excluded from the Green Streets Policy.

SECTION 2. The Director of Public Works is authorized to modify the City of Lakewood's Green Streets Manual from time to time to maintain consistency with the latest MS4 permit and developments in technology.

ADOPTED AND APPROVED THIS 8TH DAY OF OCTOBER, 2013.

Mayor

ATTEST:

City Clerk

ORDINANCE NO. 2013-7

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF LAKEWOOD, CALIFORNIA, AMENDING THE LAKEWOOD MUNICIPAL CODE PERTAINING TO LOW IMPACT DEVELOPMENT

THE CITY COUNCIL OF THE CITY OF LAKEWOOD DOES FIND AND ORDAIN AS FOLLOWS:

SECTION 1. FINDINGS.

A. The City of Lakewood is authorized by Article XI, §5 and §7 of the State Constitution to exercise the police power of the State by adopting regulations to promote public health, public safety and general prosperity.

B. The City of Lakewood has authority under the California Water Code to adopt and enforce ordinances imposing conditions, restrictions and limitations with respect to any activity which might degrade the quality of waters of the State.

C. The City is a permittee under the "Waste Discharge Requirements for Municipal Separate Storm Sewer System (MS4) Discharges within the Coastal Watersheds of Los Angeles County, Except those Discharges Originating from the City of Long Beach MS4," issued by the California Regional Water Quality Control Board-Los Angeles Region," (Order No. R4-2012-0175) which also serves as a National Pollutant Discharge Elimination System (NPDES) Permit under the Federal Clean Water Act (NPDES No. CAS004001), as well as Waste Discharge Requirements under California law (the "Municipal NPDES permit"). In order to participate in a Watershed Management Program and/or Enhanced Watershed Management Program, the Municipal NPDES permit requires permittees to develop and implement a Low Impact Development (LID) Ordinance.

D. The City of Lakewood is committed to a stormwater management program that protects water quality and water supply by employing watershed-based approaches that balance environmental, social, and economic considerations.

E. Urbanization has led to increased impervious surface areas resulting in increased water runoff and less percolation to groundwater aquifers causing the transport of pollutants to downstream receiving waters.

F. The City of Lakewood needs to take a new approach to managing rainwater and urban runoff while mitigating the negative impacts of development and urbanization.

G. LID is widely recognized as a sensible approach to managing the quantity and quality of stormwater runoff by setting standards and practices to maintain or restore the natural hydrologic character of a development site, reduce off-site runoff, improve water quality, and provide groundwater recharge.

H. It is the intent of the City of Lakewood to replace the existing Standard Urban Stormwater Mitigation Plan (SUSMP) requirements by providing stormwater and rainwater LID strategies for Development and Redevelopment projects as defined under "Applicability." Where there are conflicts between this Ordinance and previously adopted SUSMP and/or LID standards, the standards in this Ordinance shall prevail.

I. The proposed LID Ordinance qualifies for a Class 8 California Exemption under the provisions of the California Environmental Quality Act (CEQA) Section 15308. Class 8 exempts actions taken by regulatory agencies as authorized by State or local ordinance to assure the maintenance, restoration, enhancement or protection of the environment where the regulatory process involves procedures for protection of the environment.

SECTION 2. Chapter 8 of Article V of the Lakewood Municipal Code pertaining to Stormwater and Runoff Pollution Control is hereby amended to repeal and delete Sections 5810 through 5832 and to add Section 5802 to read as follows:

5802. LOW IMPACT DEVELOPMENT. Provisions regarding the requirements for stormwater controls on private property are specified in Section 9379 et. seq. of the Lakewood Municipal Code.

SECTION 3. LOW IMPACT DEVELOPMENT ORDINANCE. Part 7 of Chapter 3 of Article IX of the Lakewood Municipal Code pertaining to General Provisions Relating to Uses is hereby amended by adding the following:

9379. LOW IMPACT DEVELOPMENT - DEFINITIONS.
For the purposes of this Section, the following definitions apply:

A. AUTOMOTIVE SERVICE FACILITY. Automotive Service Facility means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) and North American Industry Classification System (NAICS) codes. For inspection purposes, Permittees need not inspect facilities with SIC codes 5013, 5014, 5541, 5511, provided that these facilities have no outside activities or materials that may be exposed to stormwater (Source: Order No. R4-2012-0175).

B. BASIN PLAN. Basin Plan means the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Water Board on June 13, 1994 and subsequent amendments (Source: Order No. R4-2012-0175).

C. BEST MANAGEMENT PRACTICE (BMP). BMP means practices or physical devices or systems designed to prevent or reduce pollutant loading from stormwater or non-stormwater discharges to receiving waters, or designed to reduce the volume of stormwater or non-stormwater discharged to the receiving water (Source: Order No. R4-2012-0175).

D. BIOFILTRATION. Biofiltration means a LID BMP that reduces stormwater pollutant discharges by intercepting rainfall on vegetative canopy, and through incidental infiltration and/or evapotranspiration, and filtration. Incidental infiltration is an important factor in achieving the required pollutant load reduction. Therefore, the term "biofiltration" as used in this Ordinance is defined to include only systems designed to facilitate incidental infiltration or achieve the equivalent pollutant reduction as biofiltration BMPs with an underdrain (subject to approval by the Regional Board's Executive Officer). Biofiltration BMPs include bioretention systems with an underdrain and bioswales (Modified from: Order No. R4-2012-0175).

E. **BIORETENTION.** Bioretention means a LID BMP that reduces stormwater runoff by intercepting rainfall on vegetative canopy, and through evapotranspiration and infiltration. The bioretention system typically includes a minimum 2-foot top layer of a specified soil and compost mixture underlain by a gravel-filled temporary storage pit dug into the in-situ soil. As defined in the Municipal NPDES permit, a bioretention BMP may be designed with an overflow drain, but may not include an underdrain. When a bioretention BMP is designed or constructed with an underdrain it is regulated by the Municipal NPDES permit as biofiltration (Modified from: Order No. R4-2012-0175).

F. **BIOSWALE.** Bioswale means a LID BMP consisting of a shallow channel lined with grass or other dense, low-growing vegetation. Bioswales are designed to collect stormwater runoff and to achieve a uniform sheet flow through the dense vegetation for a period of several minutes (Source: Order No. R4-2012-0175).

G. **CITY.** City means the City of Lakewood.

H. **CLEAN WATER ACT (CWA).** CWA means the Federal Water Pollution Control Act enacted in 1972, by Public Law 92-500, and amended by the Water Quality Act of 1987. The Clean Water Act prohibits the discharge of pollutants to Waters of the United States unless the discharge is in accordance with an NPDES permit.

I. **COMMERCIAL DEVELOPMENT.** Commercial Development means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities; mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes (Order No. R4-2012-0175).

J. **COMMERCIAL MALLS.** Commercial Malls means any development on private land comprised of one or more buildings forming a complex of stores which sells various merchandise, with interconnecting walkways enabling visitors to easily walk from store to store, along with parking area(s). A commercial mall includes, but is not limited to: mini-malls, strip malls, other retail complexes, and enclosed shopping malls or shopping centers (Source: Order No. R4-2012-0175).

K. **CONSTRUCTION ACTIVITY.** Construction Activity means any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that result in land disturbance. Construction does not include emergency construction activities required to immediately protect public health and safety or routine maintenance activities required to maintain the integrity of structures by performing minor repair and restoration work, maintain the original line and grade, hydraulic capacity, or original purposes of the facility. See "Routine Maintenance" definition for further explanation. Where clearing, grading or excavating of underlying soil takes place during a repaving operation, State General Construction Permit coverage by the State of California General Permit for Storm Water Discharges Associated with Industrial Activities or for Stormwater Discharges Associated with Construction Activities is required if more than one acre is disturbed or the activities are part of a larger plan (Source: Order No. R4-2012-0175).

L. CONTROL. Control means to minimize, reduce or eliminate by technological, legal, contractual, or other means, the discharge of pollutants from an activity or activities (Source: Order No. R4-2012-0175).

M. DEVELOPMENT. Development means construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail, and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety (Source: Order No. R4-2012-0175).

N. DIRECTLY ADJACENT. Directly Adjacent means situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area (Source: Order No. R4-2012-0175).

O. DISCHARGE. Discharge means any release, spill, leak, pump, flow, escape, dumping, or disposal of any liquid, semi-solid, or solid substance.

P. DISTRUBED AREA. Disturbed Area means an area that is altered as a result of clearing, grading, and/or excavation (Source: Order No. R4-2012-0175).

Q. FLOW-THROUGH BMPS. Flow-through BMPs means modular, vault type "high flow biotreatment" devices contained within an impervious vault with an underdrain or designed with an impervious liner and an underdrain (Modified from: Order No. R4-2012-0175).

R. FULL CAPTURE SYSTEM. Full Capture System means any single device or series of devices, certified by the Executive Officer, that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate Q resulting from a one-year, one-hour storm in the sub-drainage area (Order No. R4-2012-0175).

S. GENERAL CONSTRUCTION ACTIVITIES STORM WATER PERMIT (GCASP). GCASP means the general NPDES permit adopted by the State Board which authorizes the discharge of stormwater from construction activities under certain conditions.

T. GENERAL INDUSTRIAL ACTIVITIES STORM WATER PERMIT (GIASP) GIASP means the general NPDES permit adopted by the State Board which authorizes the discharge of stormwater from certain industrial activities under certain conditions.

U. GREEN ROOF. Green Roof means a LID BMP using planter boxes and vegetation to intercept rainfall on the roof surface. Rainfall is intercepted by vegetation leaves and through evapotranspiration. Green roofs may be designed as either a bioretention BMP or as a biofiltration BMP. To receive credit as a bioretention BMP, the green roof system planting medium shall be of sufficient depth to provide capacity within the pore space volume to contain the design storm depth and may not be designed or constructed with an underdrain (Source: Order No. R4-2012-0175).

V. HAZARDOUS MATERIAL(S). Hazardous Material(s) means any material(s) defined as hazardous by Division 20, Chapter 6.95 of the California Health and Safety Code.

W. HILLSIDE. Hillside means a property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25% or greater and where grading contemplates cut or fill slopes (Source: Order No. R4-2012-0175).

X. IMPREVIOUS SURFACE. Impervious Surface means any man-made or modified surface that prevents or significantly reduces the entry of water into the underlying soil, resulting in runoff from the surface in greater quantities and/or at an increased rate, when compared to natural conditions prior to development. Examples of places that commonly exhibit impervious surfaces include parking lots, driveways, roadways, storage areas, and rooftops. The imperviousness of these areas commonly results from paving, compacted gravel, compacted earth, and oiled earth.

Y. INDUSTRIAL/COMMERCIAL FACILITY. Industrial/Commercial Facility means any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by either the Standard Industrial Classifications (SIC) or the North American Industry Classification System (NAICS). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition (Order No. R4-2012-0175).

Z. INDUSTRIAL PARK. Industrial Park means land development that is set aside for industrial development. Industrial parks are usually located close to transport facilities, especially where more than one transport modalities coincide: highways, railroads, airports, and navigable rivers. It includes office parks, which have offices and light industry (Source: Order No. R4-2012-0175).

AA. INFILTRATION BMP. Infiltration BMP means a LID BMP that reduces stormwater runoff by capturing and infiltrating the runoff into in-situ soils or amended onsite soils. Examples of infiltration BMPs include infiltration basins, dry wells, and pervious pavement (Source: Order No. R4-2012-0175).

BB. LOW IMPACT DEVELOPMENT (LID). LID consists of building and landscape features designed to retain or filter stormwater runoff (Source: Order No. R4-2012-0175).

CC. MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4). The MS4 is a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

1. Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, stormwater, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;
2. Designed or used for collecting or conveying stormwater;
3. Which is not a combined sewer; and
4. Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR §122.2. (40 CFR § 122.26(b)(8)) (Source: Order No. R4-2012-0175)

DD. NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES). NPDES means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA §307, 402, 318, and 405. The term includes an "approved program" (Source: Order No. R4-2012-0175).

EE. NATURAL DRAINAGE SYSTEM. Natural Drainage System means a drainage system that has not been improved (e.g., channelized or armored). The clearing or dredging of a natural drainage system does not cause the system to be classified as an improved drainage system (Source: Order No. R4-2012-0175).

FF. NEW DEVELOPMENT. New Development means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision (Source: Order No. R4-2012-0175).

GG. NON-STORMWATER DISCHARGE. Non-Stormwater Discharge means any discharge to a municipal storm drain system that is not composed entirely of stormwater (Source: Order No. R4-2012-0175).

HH. OUTFALL. Outfall means a point source as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances with connect segments of the same stream or other waters of the United Sates and are used to convey waters of the United States. (40 CFR Section 122.26(b)(9)) (Order No. R4-2012-0175).

II. PARKING LOT. Parking Lot means land area or facility for the parking or storage of motor vehicles used for businesses, commerce, industry, or personal use, with a lot size of 5,000 square feet or more of surface area, or with 25 or more parking spaces (Source: Order No. R4-2012-0175).

JJ. PERSON. Person means any individual, partnership, co-partnership, firm, company, corporation, association, joint stock company, trust, state, governmental entity or any other legal entity, or their legal representatives, agents or assigns. The masculine gender shall include the feminine and the singular shall include the plural where indicated by the context.

KK. PLANNING PRIORITY PROJECTS. Planning Priority Projects means development projects subject to Permittee conditioning and approval for the design and implementation of post-construction controls to mitigate stormwater pollution, prior to completion of the project(s) (Modified from: Order No. R4-2012-0175).

LL. POLLUTANT. Pollutant means any "pollutant" defined in Section 502(6) of the Federal Clean Water Act or incorporated into the California Water Code Sec. 13373. Pollutants may include, but are not limited to the following:

1. Commercial and industrial waste (such as fuels, solvents, detergents, plastic pellets, hazardous substances, fertilizers, pesticides, slag, ash, and sludge).
2. Metals (such as cadmium, lead, zinc, copper, silver, nickel, chromium, and non- metals such as phosphorus and arsenic).
3. Petroleum hydrocarbons (such as fuels, lubricants, surfactants, waste oils, solvents, coolants, and grease).
4. Excessive eroded soil, sediment, and particulate materials in amounts that may adversely affect the beneficial use of the receiving waters, flora, or fauna of the State.
5. Animal wastes (such as discharge from confinement facilities, kennels, pens, recreational facilities, stables, and show facilities).
6. Substances having characteristics such as pH less than 6 or greater than 9, or unusual coloration or turbidity, or excessive levels of fecal coliform, or fecal streptococcus, or enterococcus.

MM. PROJECT. Project means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (Pub. Resources Code §21065) (Source: Order No. R4-2012-0175).

NN. RAINFALL HARVEST AND USE. Rainfall Harvest and Use means a LID BMP system designed to capture runoff, typically from a roof but can also include runoff capture from elsewhere within the site, and to provide for temporary storage until the harvested water can be used for irrigation or non-potable uses. The harvested water may also be used for potable water uses if the system includes disinfection treatment and is approved for such use by the local building department (Source: Order No. R4-2012-0175).

OO. RECEIVEING WATER. Receiving Water means "water of the United States" into which waste and/or pollutants are or may be discharged (Source: Order No. R4-2012-0175).

PP. REDEVELOPMENT. Redevelopment means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of routine maintenance activity; and land disturbing activity related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety (Source: Order No. R4-2012-0175).

QQ. REGIONAL BOARD. Regional Board means the California Regional Water Quality Control Board, Los Angeles Region.

RR. RESTAURANT. Restaurant means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812) (Source: Order No. R4-2012-0175).

SS. RETAIL GASOLINE OUTLET. Retail Gasoline Outlet means any facility engaged in selling gasoline and lubricating oils (Source: Order No. R4-2012-0175).

TT. ROUTINE MAINTENANCE. Routine Maintenance projects include, but are not limited to projects conducted to:

1. Maintain the original line and grade, hydraulic capacity, or original purpose of the facility.

2. Perform as needed restoration work to preserve the original design grade, integrity and hydraulic capacity of flood control facilities.

3. Includes road shoulder work, regrading dirt or gravel roadways and shoulders and performing ditch cleanouts.

4. Update existing lines[1] and facilities to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.

5. Repair leaks

Routine maintenance does not include construction of new[2] lines or facilities resulting from compliance with applicable codes, standards and regulations.

UU. SIGNIFICANT ECOLOGICAL AREAS (SEAs). SEAs means an area that is determined to possess an example of biotic resources that cumulatively represent

---

[1] Update existing lines includes replacing existing lines with new materials or pipes.

[2] New lines are those that are not associated with existing facilities and are not part of a project to update or replace existing lines (Source: Order No. R4-2012-0175).

biological diversity, for the purposes of protecting biotic diversity, as part of the Los Angeles County General Plan. Areas are designated as SEAs, if they possess one or more of the following criteria:

1. The habitat of rare, endangered, and threatened plant and animal species.
2. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind, or are restricted in distribution on a regional basis.
3. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind or are restricted in distribution in Los Angeles County.
4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.
5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.
6. Areas important as game species habitat or as fisheries.
7. Areas that would provide for the preservation of relatively undisturbed examples of natural biotic communities in Los Angeles County.
8. Special areas (Source: Order No. R4-2012-0175).

VV. SITE. Site means land or water area where any "facility or activity" is physically located or conducted, including adjacent land used in connection with the facility or activity (Source: Order No. R4-2012-0175).

WW. STORM DRAIN SYSTEM. Storm Drain System means any facilities or any part of those facilities, including streets, gutters, conduits, natural or artificial drains, channels, and watercourses that are used for the purpose of collecting, storing, transporting or disposing of stormwater and are located within the City of Lakewood.

XX. STORM WATER OR STORMWATER. Storm Water or Stormwater means water that originates from atmospheric moisture (rain or snow) and that falls onto land, water, or other surfaces. Without any change in its meaning, this term may be spelled or written as one word or two separate words.

YY. STORMWATER RUNOFF. Stormwater Runoff means that part of precipitation (rainfall or snowmelt) which travels across a surface to the storm drain system or receiving waters.

ZZ. SUSMP. SUSMP means the Los Angeles Countywide Standard Urban Stormwater Mitigation Plan. The SUSMP was required as part of the previous Municipal NPDES Permit (Order No. 01-182, NPDES No. CAS004001) and required plans that designate best management practices (BMPs) that must be used in specified categories of development projects.

AAA. URBAN RUNOFF. Urban Runoff means surface water flow produced by storm and non-storm events. Non-storm events include flow from residential, commercial, or industrial activities involving the use of potable and non-potable water.

9379.1. STORMWATER POLLUTION CONTROL MEASURES FOR DEVELOPMENT PLANNING AND CONSTRUCTION ACTIVITIES

A. OBJECTIVE. The provisions of this Section establish requirements for construction activities and facility operations of Development and Redevelopment projects to comply with the current "Order No. R4-2012-0175," lessen the water quality impacts of development by using smart growth practices, and integrate LID practices and standards for stormwater pollution mitigation through means of infiltration, evapotranspiration, biofiltration, and rainfall harvest and use. LID shall be inclusive of new development and/or redevelopment requirements.

B. SCOPE. This Section contains requirements for stormwater pollution control measures in Development and Redevelopment projects and authorizes the City of Lakewood to further define and adopt stormwater pollution control measures, develop LID principles and requirements, including but not limited to the objectives and specifications for integration of LID strategies, grant waivers from the requirements of the LID requirements, and collect funds for projects that are granted waivers. Except as otherwise provided herein, the City of Lakewood shall administer, implement and enforce the provisions of this Section.

C. APPLICABILITY. The following Development and Redevelopment projects, termed "Planning Priority Projects," shall comply with the requirements of Article IX, Section 9379 et seq. The design of any required BMP's shall be subject to plan check by Building and Safety prior to the issuance of building permits for the project.

1. <u>**Development Projects.**</u>

(a) All development projects equal to 1 acre or greater of disturbed area that adds more than 10,000 square feet of impervious surface area.

(b) Industrial parks 10,000 square feet or more of impervious surface area.

(c) Commercial malls 10,000 square feet or more of impervious surface area.

(d) Retail gasoline outlets with 5,000 square feet or more of impervious surface area.

(e) Restaurants (Standard Industrial Classification (SIC) of 5812) with 5,000 square feet or more of impervious surface area.

(f) Parking lots with 5,000 square feet or more of impervious surface area, or with 25 or more parking spaces.

(g) Streets and roads construction of 10,000 square feet or more of impervious surface area.

(h) Automotive service facilities (Standard Industrial Classification (SIC) of 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) 5,000 square feet or more of surface area.

(i) Projects located in or directly adjacent to, or discharging directly to an Environmentally Sensitive Area (ESA), where the development will:

1) Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and

2) Create 2,500 square feet or more of impervious surface area.

(j) New single-family dwelling and accessory structures are exempt from the Development Project requirements, as are any projects approved subject to a previously approved Vesting Tentative Map.

2. **Redevelopment Projects.**

(a) Land disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site on Planning Priority Project categories.

(b) Where Redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, the entire project must be mitigated.

(c) Where redevelopment results in an alteration of less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, only the alteration must be mitigated, and not the entire development.

(d) Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety.

(e) Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity.

(f) Redevelopment does not include the repaving of existing roads to maintain original line and grade.

(g) Existing single-family dwelling and accessory structures are exempt from the Redevelopment requirements.

D. STORMWATER POLLUTION CONTROL REQUIREMENTS. The Site for every Planning Priority Project shall be designed in conformance with the City of Lakewood's "Low Impact Development (LID) Best Management Practices (BMP) Design Manual" to control pollutants, pollutant loads, and runoff volume to the maximum extent feasible by minimizing impervious surface area and controlling runoff from impervious surfaces through infiltration, evapotranspiration, bioretention and/or rainfall harvest and use.

1. Street and road construction of 10,000 square feet or more of impervious surface shall follow the "City of Lakewood's Green Street Policy and Guidelines".

2. The remainder of Planning Priority Projects shall prepare a LID Plan to comply with the following:

(a) Retain stormwater runoff onsite for the Stormwater Quality Design Volume (SWQDv) defined as the runoff from:

(1) The 85th percentile 24-hour runoff event as determined from the Los Angeles County 85th percentile precipitation isohyetal map; or

(2) The volume of runoff produced from a 0.75 inch, 24-hour rain event, whichever is greater.

(b) Minimize hydromodification impacts to natural drainage systems as defined in order NO. R4-2012-0175.

(c) When, as determined by the Approving Agency, 100 percent onsite retention of the SWQDv is technically infeasible, partially or fully, the infeasibility shall be demonstrated in the submitted LID Plan. The technical infeasibility may result from conditions that may include, but are not limited to:

(1) The infiltration rate of saturated in-situ soils is less than 0.3 inch per hour and it is not technically feasible to amend the in-situ soils to attain an infiltration rate necessary to achieve reliable performance of infiltration or bioretention BMPs in retaining the SWQDv onsite;

(2) Locations where seasonal high groundwater is within five to ten feet of surface grade;

(3) Locations within 100 feet of a groundwater well used for drinking water;

(4) Brownfield development sites or other locations where pollutant mobilization is a documented concern;

(5) Locations with potential geotechnical hazards;

(6) Smart growth and infill or redevelopment locations where the density and/ or nature of the project would create significant difficulty for compliance with the onsite volume retention requirement.

(d) If partial or complete onsite retention is technically infeasible, the project Site may biofiltrate 1.5 times the portion of the remaining SWQDv that is not reliably retained onsite. Biofiltration BMPs must adhere to the design specifications provided in the Municipal NPDES Permit.

(1) Additional alternative compliance options such as offsite infiltration may be available to the project Site.

(2) The project Site should contact the Approving Agency to determine eligibility. Alternative compliance options are further specified in CASQA's Post-Construction BMP Handbook.

(e) The remaining SWQDv that cannot be retained or biofiltered onsite must be treated onsite to reduce pollutant loading. BMPs must be selected and designed to meet pollutant-specific benchmarks as required per the Municipal NPDES Permit. Flow-through BMPs may be used to treat the remaining SWQDv and must be sized based on a rainfall intensity of:

(1) 0.2 inches per hour, or

(2) The one year, one-hour rainfall intensity as determined from the most recent Los Angeles County isohyetal map, whichever is greater.

(f) A Multi-Phased Project may comply with the standards and requirements of this section for all of its phases by:

(1) Designing a system acceptable to the Approving Agency to satisfy these standards and requirements for the entire Site during the first phase, and

(2) Implementing these standards and requirements for each phase of Development or Redevelopment of the Site during the first phase or prior to commencement of construction of a later phase, to the extent necessary to treat the stormwater from such later phase. For purposes of this section, "Multi-Phased Project" shall mean any Planning Priority Project implemented over more than one phase and the Site of a Multi-Phased Project shall include any land and water area designed and used to store, treat

or manage stormwater runoff in connection with the Development or Redevelopment, including any tracts, lots, or parcels of real property, whether Developed or not, associated with, functionally connected to, or under common ownership or control with such Development or Redevelopment.

E. BIENNIAL STORMWATER FACILITY PERMIT AND INSPECTION. Each Planning Priority Project shall obtain and maintain a valid Biennial Stormwater Facility Permit issued by the Lakewood Public Works Department.

1. The Biennial Stormwater Facility Permit shall be obtained prior to clearance of the building permit final inspection.
2. Once every two years, or more often as need, an inspection shall be conducted to confirm that the BMP's are being maintained and are operating properly.
3. The property owner shall correct any deficiency in the BMP's within 14 days of a notice of maintenance failure or other deficiency.
4. The property owner shall pay the appropriate fees as established by separate resolution for the biennial permits and/or any special BMP inspections required for enforcement of the provisions of this Section.

F. COVENANT AND AGREEMENT. The property owner of each Planning Priority Project shall record with the County Recorder a "Covenant And Agreement Regarding On-site LID BMP Maintenance", to the satisfaction of the Public Works Director and prior to the clearance of the building permit final inspection, issuance of an occupancy permit or operation of the approved land use on the subject property.

1. The transfer or lease of a property subject to maintenance requirements for LID BMPs shall include conditions requiring the transferee and its successors and assigns to either:

- **(a)** Assume responsibility for maintenance of any existing LID BMP, or
- **(b)** Replace an existing LID BMP with new control measures or BMPs meeting the then current standards of the City and MS4 Permit.
- **(c)** Such requirement shall be included in any sale or lease agreement or deed for such property.

2. The condition of transfer shall include a provision that the successor property owner or lessee conduct maintenance inspections of all LID BMPs at least once every two years and retain proof of inspection

SECTION 4. OTHER AGENCIES OF THE CITY. All City departments, offices, entities and agencies, shall establish administrative procedures necessary to implement the provisions of this Article on their development projects and report their activities annually to the Public Works Department.

SECTION 5. SEVERABLITY. The City Council hereby declares it would have passed this Ordinance sentence by sentence, paragraph by paragraph and section by section, and does hereby declare the provisions of this Ordinance are severable, and if for any reason any section of this Ordinance should be held invalid, such decision shall not affect the validity of the remaining parts of this Ordinance.

SECTION 6. The City Clerk shall certify to the adoption of this Ordinance. The City Council hereby finds and determines there are no newspapers of general circulation both published and circulated within the City and, in compliance with Section 36933 of the Government Code, directs the City Clerk to cause said Ordinance within fifteen (15) days after its passage to be posted in at least three (3) public places within the City as established by ordinance.

SECTION 7. This Ordinance shall become effective thirty (30) calendar days from and after its adoption.

ADOPTED AND APPROVED THIS 12TH DAY OF NOVEMBER, 2013, BY THE FOLLOWING ROLL CALL VOTE:

	AYES	NAYS	ABSENT

ATTEST:

City Clerk

I, DENISE R. HAYWARD, do hereby certify that I am the City Clerk of the City of Lakewood, and the foregoing Ordinance was adopted and approved by the City Council of the City of Lakewood voting for and against the Ordinance as above set forth at a regular meeting thereof on the 12th day of November, 2013.

City Clerk

RESOLUTION NO. 14-12

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF LA MIRADA ESTABLISHING A GREEN STREETS POLICY

A. Recitals.

(i) The Municipal Separate Storm Sewer System (MS4) Permit (Order No. R-2012-0175) was adopted by the California Regional Water Quality Control Board, Los Angeles Region, on November 8, 2012. Municipalities electing to prepare a Watershed Management Plan under this permit are required to demonstrate that Green Streets policies are in place that specify the use of green street strategies for transportation corridors.

(ii) Green Streets are enhancements to street and road projects to improve the quality of storm water and urban runoff through the implementation of infiltration, bio-treatment, xeriscaping parkways, and tree lined streets.

(iii) The City has worked in conjunction with the Gateway Water Management Authority for the development of its Green Streets Policy.

B. Resolution.

NOW, THEREFORE, BE IT FOUND, DETERMINED AND RESOLVED as follows:

1. The City Council hereby adopts as its Green Streets Policy the Green Streets Manual as shown in Exhibit "A," attached hereto and incorporated herein by this reference.

2. The Director of Public Works will implement Green Streets for City-owned transportation corridors and road projects that add 10,000 square feet or more of impervious area following the City of La Mirada's Green Streets Manual as shown in Exhibit "A" which is based on the USEPA's Wet Weather with Green Infrastructure guidance (December 2008 EPA-833-F-08-009).

3. Routine maintenance including, but not limited to slurry seals, grind and overlay, and reconstruction to maintain original line of grade are excluded from the Green Streets Policy.

4. The Director of Public Works is authorized to make non-substantive changes to the City of La Mirada's Green Streets Manual consistent with the requirements of the MS4 Permit.

5. This Resolution has been reviewed with respect to the applicability of the California Environmental Quality Act (Public Resources Code Section 21000 et seq.) ("CEQA"). Pursuant to the State CEQA Guidelines (14 Cal Code Regs 15000 et seq.) (the "Guidelines"), the City Council has determined that the Green Streets Manual will not have a significant effect on the environment and is listed under the City of La Mirada local CEQA Guidelines as a Class 8 Categorical Exemption from the requirements of the California Environmental Quality Act. Staff is hereby directed to prepare and post a notice of exemption pursuant to Guidelines Section 15062.

6. At its regular meeting held on June 10, 2014, after holding a duly noticed Public Hearing and passing on all protests, the City Council determined that the public interest and necessity justify the adoption of the Green Streets Policy.

APPROVED AND ADOPTED this 10th day of June 2014.

Lawrence P. Mowles, Mayor

ATTEST:
I, Anne Haraksin, City Clerk of the City of La Mirada, do hereby certify the foregoing Resolution No. 14-12 was duly adopted at a regular meeting of the City Council of the City of La Mirada held on the 10th day of June 2014 by the following roll call vote:

AYES:	**Councilmembers Jones, Sarega, Mayor Pro Tem Deal, Mayor Mowles**
NOES:	**None**
ABSENT:	**Councilmember De Ruse**
ABSTAIN:	**None**

Anne Haraksin, City Clerk

RB-AR14298

CITY OF LA MIRADA
AFFIDAVIT OF POSTING

I, Anne Haraksin, certify that I caused to be posted the following document in the areas designated for posting on May 28, 2014:

ORDINANCE NO. 671

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF LA MIRADA AMENDING IN ITS ENTIRETY CHAPTER 13.12 (URBAN RUNOFF) OF THE LA MIRADA MUNICIPAL CODE AND MAKING A DETERMINATION OF EXEMPTION UNDER CEQA

Anne Haraksin, City Clerk

NOTICE OF ADOPTION OF ORDINANCE NO. 671 OF THE CITY COUNCIL OF THE CITY OF LA MIRADA AMENDING IN ITS ENTIRETY CHAPTER 13.12 (URBAN RUNOFF) OF THE LA MIRADA MUNICIPAL CODE AND MAKING A DETERMINATION OF EXEMPTION UNDER CEQA

PLEASE TAKE NOTICE that on May 27, 2014, the City Council of the City of La Mirada adopted Ordinance No. 671 entitled "An Ordinance of the City Council of the City of La Mirada Amending in its Entirety Chapter 13.12 (Urban Runoff) of the La Mirada Municipal Code and Making a Determination of Exemption Under CEQA." A summary of that Ordinance is as follows:

Summary of Ordinance No. 671

The Ordinance amends in its entirety Chapter 13.12, relating to the regulation of municipal stormwater, of the La Mirada Municipal Code to be consistent with the current Municipal Separate Storm Sewer System ("MS4") Permit, issued by the Los Angeles Regional Quality Control Board. The Ordinance further expands the existing stormwater ordinance to be consistent with the current MS4 Permit, and will assist the City in regulating and enforcing illegal discharge as required by federal law. The purpose of the Ordinance is to: (a) reduce pollutants in stormwater discharges to the maximum extent practicable; (b) regulate illicit connections and illicit discharges and reduce the level of contamination of stormwater and urban runoff in the municipal stormwater system; (c) regulate non-stormwater discharges to the municipal stormwater system; and (d) protect and enhance water quality.

Section 13.12.110 of the Ordinance constitutes the low impact development ("LID") ordinance component of the City's overall stormwater ordinance. The LID provisions of the Ordinance will reduce the impacts of development by using smart growth practices and will integrate LID practices and standards for storm water pollution mitigation for new development and redevelopment projects. Projects that are required to incorporate appropriate storm water mitigation measures into their design plans are set forth in Section 13.12.110 of the Ordinance.

A certified copy of the entirety of the text of Ordinance No.671 is available in the office of the City Clerk in City Hall and is open for public inspection during regular business hours at that location.

Dated: May 28, 2014

Anne Haraksin, City Clerk
City of La Mirada

ORDINANCE NO. 671

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF LA MIRADA AMENDING IN ITS ENTIRETY CHAPTER 13.12 (URBAN RUNOFF) OF THE LA MIRADA MUNICIPAL CODE AND MAKING A DETERMINATION OF EXEMPTION UNDER CEQA

WHEREAS, the federal Clean Water Act provides for the regulation and reduction of pollutants discharged into the waters of the United States by extending National Pollutant Discharge Elimination System ("NPDES") requirements to stormwater and urban runoff discharged into municipal storm drain systems.

WHEREAS, the City of La Mirada (the "City") is a co-permittee under the "Waste Discharge Requirements for Municipal Separate Storm Sewer System (MS4) Discharges within the Coastal Watersheds of Los Angeles County, Except those Discharges Originating from the City of Long Beach MS4, Order No. R4-2012-0175, NPDES Permit No. CAS00401" ("MS4 Permit") issued by the California Regional Water Quality Control Board—Los Angeles Region, and, as a co-permittee under the MS4 Permit, the City is required to adopt ordinances and implement procedures with respect to discharges into the municipal separate storm sewer system ("MS4").

WHEREAS, the City has previously adopted ordinances to ensure that it possesses the legal authority necessary to control discharges to and from those portions of the MS4 over which it has jurisdiction, in order to comply with the MS4 Permit, and to specifically prohibit certain discharges identified in the MS4 Permit.

WHEREAS, Chapter 13.12 of the La Mirada Municipal Code is being revised in order to comply with the current MS4 Permit.

NOW, THEREFORE, the City Council of the City of La Mirada does hereby ordain as follows:

Section 1. Chapter 13.12 (Urban Runoff) of Title 13 (Health and Safety) of the La Mirada Municipal Code is hereby amended in its entirety to read as follows:

"Chapter 13.12 URBAN RUNOFF

13.12.010 Title.

This chapter shall be known as the City of La Mirada Stormwater Management and Discharge Control Ordinance.

13.12.020 Findings.

A. The federal Clean Water Act (33 U.S.C. Section 1251, *et seq.*,) provides for the regulation and reduction of pollutants discharged into the waters of the United States by extending National Pollutant Discharge Elimination System ("NPDES") requirements to stormwater and urban runoff discharge into municipal storm drain systems;

B. Stormwater and urban runoff flows from individual properties onto streets, then through storm drains passing through the City and finally into the waters of the United States;

C. The City is a co-permittee under the "Waste Discharge Requirements for Municipal Separate Storm Sewer System ("MS4") discharges within the Coastal Watersheds of Los Angeles County, except those discharges originating from the City of Long Beach MS4, which also serves as a NPDES Permit under the federal Clean Water Act (NPDES No. CAS614001), as well as waste discharge requirements under California law (the "Municipal NPDES Permit") and, as a co-permittee under the Municipal NPDES Permit, the City is required to adopt ordinances and implement procedures with respect to the entry of non-stormwater discharges into the municipal stormwater system;

D. Part III, Section A of the Municipal NPDES Permit requires the City to effectively prohibit non-stormwater discharges from within its boundaries, into that portion of the MS4 which it owns or operates and into watercourses, except where such discharges are: (1) in compliance with a separate individual or general NPDES permit, or (2) identified and in compliance with Part III.A (non-stormwater discharges) of the Municipal NPDES Permit, or (3) originate from federal, state or other facilities which the City is preempted from regulating, and further provides that compliance with the terms of the Municipal NPDES Permit through the development and implementation of the programs described in the Municipal NPDES Permit will constitute compliance with the discharge prohibition in the Municipal NPDES Permit;

E. Part VI, Section A.2 of the Municipal NPDES Permit requires the City to establish and maintain the legal authority necessary to control discharges to and from those portions of the MS4 over which it has jurisdiction, so as to comply with the Municipal NPDES Permit and to specifically prohibit certain discharges identified in the Municipal NPDES Permit;

F. The Municipal NPDES Permit contemplates the development of a Watershed Management Program in which the City will participate, which will in turn require the development and the implementation of programs for, among other things, the elimination of illicit connections and illicit discharges, development planning, development construction, and public information and education requirements, and which may require the later adoption of additional legal authority to implement such programs as they are developed by the permittees and approved by the Regional Board;

G. In order to control, in a cost-effective manner, the quantity and quality of stormwater and urban runoff to the maximum extent practicable, the adoption of the ordinance codified in this chapter is essential.

13.12.030 Purpose and intent.

A. The purpose of this chapter is to ensure the future health, safety and general welfare of the citizens of the City and the water quality of the receiving waters of the County of Los Angeles and surrounding coastal areas by:

1. Reducing pollutants in stormwater discharges to the maximum extent practicable;
2. Regulating illicit connections and illicit discharges and reducing the level of contamination of stormwater and urban runoff in the municipal stormwater system; and
3. Regulating non-stormwater discharges to the municipal stormwater system.

B. The intent of this chapter is to protect and enhance the quality of watercourses, water bodies, and wetlands within the City in a manner consistent with the federal Clean Water Act, the California Porter-Cologne Water Quality Control Act and the Municipal NPDES Permit.

C. This chapter is also intended to provide the City with the legal authority necessary to control discharges to and from those portions of the municipal stormwater system over which it has jurisdiction as required by the Municipal NPDES Permit, and fully and timely comply with the terms of the Municipal NPDES Permit while the Watershed Management Program is being developed by the permittees under the Municipal NPDES Permit, and in contemplation of the subsequent amendment of this chapter or adoption by the City of additional provisions of this chapter to implement the subsequently adopted Watershed Management Program, or other programs developed under the Municipal NPDES Permit.

D. This chapter also sets forth requirements for the construction and operation of certain commercial development, new development and redevelopment and other projects (as further defined herein) which are intended to ensure compliance with the stormwater mitigation measures prescribed in the current MS4 Permit This chapter authorizes the Director to define and adopt applicable best management practices and other stormwater pollution control measures, as provided herein, to carry out all inspections including entering entities discharging to the MS4, conduct surveillance, conduct monitoring, cite infractions and to impose fines pursuant to this chapter. Except as otherwise provided herein, the Director shall administer, implement and enforce the provisions of this section.

E. The City Council shall approve and enter into interagency agreements as deemed necessary by the City Council to control the contribution of pollutants of the shared MS4.

13.12.040 Definitions.

Except as specifically provided herein, any term used in this chapter shall be defined as that term is defined in the current Municipal NPDES Permit, or if it is not specifically defined in the Municipal NPDES Permit, then as such term is defined in the Federal Clean Water Act, as amended, or the regulations promulgated thereunder. If the definition of any term contained in this section conflicts with the definition of the same term in the current Municipal NPDES Permit, then the definition contained in the Municipal NPDES Permit shall govern. The following words and phrases shall have the following meanings when used in this chapter:

"Area susceptible to runoff" means any surface directly exposed to precipitation or in the path of runoff caused by precipitation which path leads off the parcel on which the surface is located.

"Automotive service facilities" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) and North American Industry Classification System (NAICS) codes. For inspection purposes, Permittees need not inspect facilities with SIC codes 5013, 5014, 5511, 5541, 7532-7534, and 7536-7539 provided that these facilities have no outside activities or materials that may be exposed to stormwater

"Best Management Practices (BMPs)" means practices or physical devices or systems designed to prevent or reduce pollutant loading from stormwater or non-stormwater discharges to receiving waters, or designed to reduce the volume of stormwater or non-stormwater discharged to the receiving water. Examples of BMPs may include public education and outreach, proper planning of development projects, proper cleaning of catch basin inlets, and proper sludge- or waste-handling and disposal, among others.

"Biofiltration" means a LID BMP that reduces stormwater pollutant discharges by intercepting rainfall on vegetative canopy, and through incidental infiltration and/or evapotranspiration, and filtration. Incidental infiltration is an important factor in achieving the required pollutant load reduction. Therefore, the term "biofiltration" as used in this chapter is defined to include only systems designed to facilitate incidental infiltration or achieve the equivalent pollutant reduction as biofiltration BMPs with an underdrain (subject to approval by the Regional Board's Executive Officer). Biofiltration BMPs include bioretention systems with an underdrain and bioswales.

"Bioretention" means a LID BMP that reduces stormwater runoff by intercepting rainfall on vegetative canopy, and through evapotranspiration and infiltration. The bioretention system typically includes a minimum 2-foot top layer of a specified soil and compost mixture underlain by a gravel-filled temporary storage pit dug into the in-situ soil. As defined in this Ordinance, a bioretention BMP may be designed with an overflow drain, but may not include an underdrain. When a bioretention BMP is designed or constructed with an underdrain it is regulated by the Municipal NPDES Permit as biofiltration.

"Bioswale" means a LID BMP consisting of a shallow channel lined with grass or other dense, low-growing vegetation. Bioswales are designed to collect stormwater runoff and to achieve a uniform sheet flow through the dense vegetation for a period of several minutes.

"City" means the City of La Mirada, California.

"Clean Water Act (CWA)" means the Federal Water Pollution Control Act enacted in 1972, by Public Law 92-500, and amended by the Water Quality Act of 1987. The Clean Water Act prohibits the discharge of pollutants to Waters of the United States unless the discharge is in accordance with an NPDES permit.

"Commercial development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Commercial Malls" means any development on private land comprised of one or more buildings forming a complex of stores which sells various merchandise, with interconnecting walkways enabling visitors to easily walk from store to store, along with parking area(s). A commercial mall includes, but is not limited to: mini-malls, strip malls, other retail complexes, and enclosed shopping malls or shopping centers

"Construction" means any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that result in land disturbance. Construction does not include emergency construction activities required to immediately protect public health and safety or routine maintenance activities required to maintain the integrity of structures by performing minor repair and restoration work, maintain the original line and grade, hydraulic capacity, or original purposes of the facility. See

"Routine Maintenance" definition for further explanation. Where clearing, grading or excavating of underlying soil takes place during a repaving operation, State General Construction Permit coverage by the State of California General Permit for Storm Water Discharges Associated with Industrial Activities or for Stormwater Discharges Associated with Construction Activities is required if more than one acre is disturbed or the activities are part of a larger plan

"Control" means to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

"Development" means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single family, multi-unit or planned unit development); industrial, commercial, retail and other nonresidential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Directly adjacent" means situated within two hundred (200) feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

"Director" means the City's Director of Community Development or his or her designee.

"Discharge" means when used without qualification the discharge of a pollutant.

"Discharge of a pollutant" means any addition of any pollutant or combination of pollutants to waters of the United States from any point source or, any addition of any pollutant or combination of pollutants to the waters of the contiguous zone or the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by a state, municipality, or other person which do not lead to treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works.

"Discharging" directly means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

"Discretionary project" is defined in the same manner as Section 15357 of the Guidelines for Implementation of the California Environmental Quality Act contained in Title 14 of the California Code of Regulations, as amended, and means a project which requires the exercise of judgment or deliberation when the City decides to approve or disapprove a particular activity, as distinguished from situations where the City merely has to determine whether there has been conformity with applicable statutes, ordinances or regulations.

"Disturbed area" means an area that is altered as a result of clearing, grading, and/or excavation.

"Environmentally sensitive area (ESA)" means an area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments (California Public Resources Code § 30107.5). Areas subject to storm water mitigation requirements are areas designated as Significant Ecological Areas by the County of Los Angeles (Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976) and amendments); an area designated as a Significant Natural Area by the California Department of Fish and Games Significant Natural Areas Program, provided that area has been field verified by the Department of Fish and Game; an area listed in the Basin Plan as supporting the Rare, Threatened, or Endangered Species (RARE) beneficial use; and an area identified by the City as environmentally sensitive.

"Flow-through treatment BMPs" means a modular, vault type "high flow biotreatment" devices contained within an impervious vault with an underdrain or designed with an impervious liner and an underdrain.

"Full Capture System" means any single device or series of devices, certified by the Executive Officer, that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate Q resulting from a one-year, one-hour storm in the sub-drainage area.

"Good housekeeping practices" means common practices related to the storage, use or cleanup of materials, performed in a manner that minimizes the discharge of pollutants. Examples include, but are not limited to, purchasing only the quantity of materials to be used at a given time, use of alternative and less environmentally harmful products, cleaning up spills and leaks, and storing materials in a manner that will contain any leaks or spills.

"General Construction Activities Storm Water Permit (GCASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of stormwater from construction activities under certain conditions.

"General Industrial Activities Storm Water Permit (GIASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of stormwater from certain industrial activities under certain conditions.

"Green Roof" means a LID BMP using planter boxes and vegetation to intercept rainfall on the roof surface. Rainfall is intercepted by vegetation leaves and through evapotranspiration. Green roofs may be designed as either a bioretention BMP or as a biofiltration BMP. To receive credit as a bioretention BMP, the green roof system planting medium shall be of sufficient depth to provide capacity within the pore space volume to contain the design storm depth and may not be designed or constructed with an underdrain.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent (25%) or greater and where grading contemplates cut or fill slopes.

"Illicit connection" means any human-made conveyance that is connected to the storm drain system without a permit, excluding gutters, roof-drains and other similar connections. Examples include channels, pipelines, conduits, inlets or outlets that are connected directly to the storm drain system.

"Illicit discharge" means any discharge to the. storm drain system that is prohibited under local, state or federal statutes, ordinances, codes or regulations. This includes all non-stormwater discharges except discharges pursuant to a separate NPDES permit and discharges that are exempted or conditionally exempted in accordance with Part III the Municipal NPDES permit.

"Industrial/Commercial Facility" means any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by either the Standard Industrial Classifications (SIC) or the North American Industry Classification System (NAICS). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

"Industrial Park" means land development that is set aside for industrial development. Industrial parks are usually located close to transport facilities, especially where more than one transport modalities coincide: highways, railroads, airports, and navigable rivers. It includes office parks, which have offices and light industry.

"Infiltration BMP" means a LID BMP that reduces stormwater runoff by capturing and infiltrating the runoff into in-situ soils or amended onsite soils. Examples of infiltration BMPs include infiltration basins, dry wells, and pervious pavement.

"Infiltration" means the downward entry of water into the surface of the soil.

"Low Impact Development (LID)" consists of building and landscape features designed to retain or filter stormwater runoff.

"Material" means any substance including, but not limited to: garbage and debris; lawn clippings, leaves, and other vegetation; biological and fecal waste; sediment and sludge; oil and grease; gasoline; paints, solvents, cleaners, and any fluid or solid containing chemicals.

"Municipal NPDES Permit" means the Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach, Order No. R4-2012-0175, NPDES Permit No. CAS00401, issued by the California Regional Water Quality Control Board—Los Angeles Region, and any successor permit to that permit.

"Municipal Separate Storm Sewer System (MS4)" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

1. Owned or operated by a state, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, stormwater, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

2. Designed or used for collecting or conveying stormwater;

3. Which is not a combined sewer; and

4. Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR Section 122.2.

"New development" means land-disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Non-stormwater discharge" means any discharge to a municipal stormwater system that is not composed entirely of stormwater.

"NPDES permit" means any waste discharge requirements issued by the Regional Board or the State Water Resources Control Board in the form of an NPDES permit pursuant to Water Code Section 13370 (other than the Municipal NPDES Permit).

"Outfall" means a point source as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances with connect segments of the same stream or other waters of the United Sates and are used to convey waters of the United States. (40 CFR Section 122.26(b)(9))

"Parking lot" means land area or a facility for the parking or storage of motor vehicles used for businesses, commerce, industry or personal use with a lot size of five thousand (5,000) square feet or more of surface area, or with twenty-five (25) or more parking spaces.

"Planning priority projects" means those projects specified in Section 13.12.110.C of this chapter that are required to incorporate appropriate storm water mitigation measures into the design plan for their respective projects.

"Pollutant" means those pollutants defined in Section 502(6) of the federal Clean Water Act (33 U.S.C. Section 1362(6)), or incorporated into California Water Code Section 13373. Examples of pollutants include, but are not limited to the following:

1. Commercial and industrial waste (such as fuels, solvents, detergents, plastic pellets, hazardous substances, fertilizers, pesticides, slag, ash and sludge);

2. Metals such as cadmium, lead, zinc, copper, silver, nickel, chromium, and nonmetals such as phosphorus and arsenic;

3. Petroleum hydrocarbons (such as fuels, lubricants, surfactants, waste oils, solvents, coolants and grease);

4. Excessive eroded soils, sediment and particulate materials in amounts which may adversely affect the beneficial use of the receiving waters, flora or fauna of the state;

5. Animal wastes (such as discharge from confinement facilities, kennels, pens, recreational facilities, stables and show facilities);

6. Substances having characteristics such as pH less than six or greater than nine, or unusual coloration or turbidity, or excessive levels of fecal coliform, or fecal streptococcus, or enterococcus;

The term "pollutant" shall not include uncontaminated stormwater, potable water or reclaimed water generated by a lawfully permitted water treatment facility.

"Project" means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (California Public Resources Code Section 21065).

"Rainfall Harvest and Use" means a LID BMP system designed to capture runoff, typically from a roof but can also include runoff capture from elsewhere within the site, and to provide for temporary storage until the harvested water can be used for irrigation or non-potable uses. The harvested water may also be used for potable water uses if the system includes disinfection treatment and is approved for such use by the local building department (Order No. R4-2012-0175).

"Receiving Water" means "water of the United States" into which waste and/or pollutants are or may be discharged.

"Redevelopment" means land-disturbing activity that result in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of routine maintenance activity; and land disturbing activity related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Regional Board" means the California Regional Water Quality Control Board—Los Angeles Region.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC Code 5812).

"Retail gasoline outlet" means any facility engaged in selling gasoline and lubricating oils.

"Routine Maintenance" includes, but is not limited to projects conducted to:

1. Maintain the original line and grade, hydraulic capacity, or original purpose of the facility.

2. Perform as needed restoration work to preserve the original design grade, integrity and hydraulic capacity of flood control facilities.

3. Includes road shoulder work, regrading dirt or gravel roadways and shoulders and performing ditch cleanouts.

4. Update existing lines and facilities, which include replacing existing lines with new materials or pipes, to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.

5. Repair leaks.

Routine maintenance does not include construction of new lines or facilities resulting from compliance with applicable codes, standards and regulations.

"Runoff" means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

"Site" means the land or water area where any facility or activity is physically located or conducted, including adjacent land used in connection with the facility or activity.

"Source control BMP" means any schedule of activities, prohibition of practices, maintenance procedures, managerial practices or operational practices that aim to prevent stormwater pollution by reducing the potential for contamination at the source of pollution.

"Standard urban stormwater mitigation plan" or "SUSMP" means a report submitted by an applicant for approval by the Director prior to issuance of a building, grading, planning or similar permit outlining the necessary LID requirements and BMPs which must be incorporated into design plans for development or redevelopment projects.

"Storm Drain System" means any facility or any parts of the facility, including streets, gutters, conduits, natural or artificial drains, channels and watercourse that are used for the purpose of collecting, storing, transporting or disposing of stormwater and are located within the City.

"Stormwater runoff" means that part of precipitation (rainfall) which travels via flow across a surface to the MS4 or receiving waters from impervious, semi-pervious or pervious surfaces. When all other factors are equal, runoff increases as the perviousness of a surface decreases.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of stormwater and urban runoff pollution (e.g. canopy, structural enclosure). Structural BMPs may include both treatment control BMPs and source control BMPs.

"Treatment" means the application of engineered systems that use physical, chemical or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological or chemical process.

"Urban runoff" means surface water flow produced by non-stormwater resulting from residential, commercial and industrial activities involving the use of potable and nonpotable water.

13.12.050 Construction and application.

This chapter shall be construed to assure consistency with the requirements of the federal Clean Water Act and acts amendatory or supplementary to the Federal Clean Water Act, applicable implementing regulations, and the Municipal NPDES Permit, and any amendment, revision or reissuance of the Municipal NPDES Permit.

13.12.060 No taking.

The provisions of this chapter shall not operate to deprive any property owner of substantially all of the market value of such owner's property or otherwise constitute an unconstitutional taking without compensation.

13.12.070 Prohibited activities.

A. Illicit Discharges and Connections. It is prohibited to commence, establish, use, maintain or continue any illicit connections to the MS4 or any illicit discharges to the MS4. This prohibition against illicit connections applies to the use, maintenance or continuation of any illicit connection, whether that connection was established prior to or after the effective date of this chapter.

B. Littering. No person shall throw, deposit, place, leave, maintain, keep or permit to be thrown, deposited, placed, left or maintained or kept, any refuse, rubbish, garbage, or any other discarded or abandoned objects, articles or accumulations, in or upon any street, alley, sidewalk, storm drain, inlet, catch basin conduit or drainage structure, business place, or upon any or private plot of land in the City, so that the same might be or become a pollutant. No person shall throw or deposit litter in any fountain, pond, lake, stream, or other body of water within the City. This section shall not apply to refuse, rubbish or garbage deposited in containers, bags or other appropriate receptacles which are placed in designated locations for regular solid waste pick-up and disposal.

C. Disposal of Landscape Debris. No person shall dispose of leaves, dirt, or other landscape debris into the municipal separate stormwater system.

D. Non-stormwater Discharges. The following non-stormwater discharges into the MS4 are prohibited unless in compliance with a separate NPDES permit or pursuant to a discharge exemption by the Regional Board, the Regional Board's Executive Officer, or the State Water Resources Control Board:

1. The discharge of untreated wash waters to the MS4 when gas stations, auto repair garages, or other type of automotive service facilities are cleaned;

2. The discharge of untreated wastewater to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

3. To the maximum extent practicable, discharges to the MS4 from areas where repair of machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze, is undertaken;

4. Discharges of untreated runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;

5. Discharges of commercial/municipal swimming pool filter backwash to the MS4;

6. Discharges of untreated runoff from the washing of toxic materials from paved or unpaved areas to the MS4; provided, however, that nonindustrial and noncommercial activities which incidentally generate urban runoff, such as the hosing of sidewalks, shall be excluded from this prohibition;

7. To the maximum extent practicable, discharges to the MS4 from washing impervious surfaces in industrial/commercial areas which results in a discharge of untreated runoff to the MS4, unless specifically required by state law, or the City's Municipal code, or Los Angeles County's Health and Safety Codes, or permitted under a separate NPDES permit;

8. Discharges from the washing out of concrete trucks into the MS4;

9. Discharges to the MS4 of any pesticide, fungicide or herbicide, banned by the USEPA or the California Department of Pesticide Regulation; or

10. The disposal of hazardous wastes into trash containers used for municipal trash disposal where such disposal causes or threatens to cause a direct or indirect discharge to the MS4.

E. Car Washing. No motor vehicle, boat, trailer, or other type of mobile transportation may be washed, other than at a commercial carwash, unless such vehicle is being washed by:

1. A resident at their residence using a hand-held bucket or a water hose equipped with an automatic shutoff nozzle as long as water does not flow onto streets; or

2. A business that has an approved car wash facility for its fleet vehicles, provided that water does not flow onto streets.

13.12.080 Exempted discharges, conditionally exempted discharges or designated discharges.

A. Discharges from those activities specifically identified in, or pursuant to, Part III.A.1-3 of the Municipal NPDES Permit as being exempted discharges, conditionally exempted discharges or designated discharges shall not be considered a violation of this chapter; provided that, consistent with Part III.A.1-3 of the Municipal NPDES Permit:

1. Any applicable BMPs developed pursuant to the Municipal NPDES Permit are implemented to minimize any adverse impacts from such identified sources;

2. The discharger meets all notification, reporting and recordkeeping requirements; and

3. The discharge has conducted all applicable monitoring requirements.

B. Discharges in Violation of the Municipal NPDES Permit. Any discharge that would result in or contribute to a violation of the Municipal NPDES Permit, either separately or in combination with other discharges, is prohibited. Liability for any such discharge shall be the responsibility of the person(s) causing or responsible for the discharge, and such person(s) shall defend, indemnify and hold harmless the City from all losses, liabilities, claims or causes of actions in any administrative or judicial action relating to such discharge.

13.12.090 Good housekeeping provisions.

Owners and occupants of property within the City shall comply with the following requirements:

A. Septic Waste. No person shall leave, deposit, discharge, dump, or otherwise expose any chemical or septic waste to precipitation in an area where a discharge to City streets or MS4 may or does occur.

B. Use of Water. Runoff of water used for irrigation purposes shall be minimized to the maximum extent practicable. Runoff of water from the permitted washing down of paved areas shall be minimized to the maximum extent practicable.

C. Storage of Materials, Machinery and Equipment. Machinery or equipment that is to be repaired or maintained in areas susceptible to or exposed to stormwater, shall be placed in a manner so that leaks, spills and other maintenance-related pollutants are not discharged to the MS4.

D. Removal and Disposal of Debris from Industrial/Commercial Motor Vehicle Parking Lots. Industrial/commercial motor vehicle parking lots with more than twenty-five (25) parking spaces that are located in areas potentially exposed to stormwater shall be swept regularly or other equally effective measures shall be utilized to remove debris from such parking lots.

E. Food Wastes. Food wastes generated by nonresidential food service and food distribution sources shall be properly disposed of and in a manner so such wastes are not discharged to the MS4.

F. Best Management Practices. Best management practices shall be used in areas exposed to stormwater for the removal and lawful disposal of all fuels, chemicals, fuel and chemical wastes, animal wastes, garbage, batteries, or other materials which have potential adverse impacts on water quality.

G. Maintenance of Structural BMPs. Structural BMPs shall be properly operated and maintained, consistent with the approved SUSMP. Records and documentation of such maintenance shall be provided to the Director upon request.

13.12.100 Requirements for industrial/commercial and construction activities.

A. Industrial/Commercial and Construction Related Dischargers Generally. Each discharger associated with industrial/commercial activity or construction activity, or other discharger described in any general NPDES permit addressing such discharges, as may be issued by the U.S. Environmental Protection Agency, the State Water

Resources Control Board, or the Regional Board shall comply with all requirements of such NPDES permit and the City's development construction program. Each discharger identified in an individual NPDES permit shall comply with and undertake all activities required by such permit. Proof of compliance with any such NPDES permit and the City's development construction program may be required in a form acceptable to the Director prior to the issuance of any grading, building or occupancy permits, or any other type of permit or license issued by the City.

B. Industrial/Commercial and Construction Related Non-Storm Water Discharges. Non-storm water discharges to the MS4 from industrial, commercial or construction activities in violation of any applicable NPDES permit or the City's development construction program are prohibited.

C. Source Control BMPs for Industrial/Commercial Facilities. Industrial/commercial facilities shall implement the effective source control BMPs listed in Table 10 of Part VI.D.6.f. of the Municipal NPDES Permit, unless a particular pollutant generating activity does not occur on a facility's site.

13.12.110 Standard urban stormwater mitigation plan (SUSMP) and low impact development (LID) requirements for new development and redevelopment projects.

A. Objective. Pursuant to Part VI.D.7.b of the Municipal NPDES Permit, the provisions of this section establish requirements for construction activities and facility operations of development and redevelopment projects to comply with the current Municipal NPDES Permit to lessen the water quality impacts of development by using smart growth practices and integrate LID practices and standards for stormwater pollution mitigation through means of infiltration, evapotranspiration, biofiltration, and rainfall harvest and use. Except as otherwise provided herein, the City shall administer, implement and enforce the provisions of this section.

B. . Scope. This section contains requirements for stormwater pollution control measures in development and redevelopment projects and authorizes the City to further define and adopt stormwater pollution control measures, and to develop LID principles and requirements, including but not limited to the objectives and specifications for integration of LID strategies. As specified in this section, certain Planning Priority Projects shall meet the requirements of this section through the preparation and submittal of a standard urban stormwater mitigation plan (SUSMP), which shall include the applicable LID requirements set forth in this section as an element of the SUSMP.

C. Applicability – Planning Priority Projects. The following development and redevelopment projects shall be designated as Planning Priority Projects, which are subject to City conditioning and approval for the design and implementation of post-construction controls to mitigate storm water pollution prior to completion of the projects, and shall meet the requirements of this section:

(1) New Development Projects.

a. All development projects equal to one (1) acre or greater of disturbed area that adds more than 10,000 square feet of impervious surface area.

b. Industrial parks 10,000 square feet or more of surface area.

c. Commercial malls 10,000 square feet or more of surface area.

d. Retail gasoline outlets with 5,000 square feet or more of surface area.

e. Restaurants (Standard Industrial Classification (SIC) of 5812) with 5,000 square feet or more of surface area.

f. Parking lots with 5,000 square feet or more of impervious surface area, or with 25 or more parking spaces.

g. Streets and roads construction of 10,000 square feet or more of impervious surface area. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects.

h. Automotive service facilities (Standard Industrial Classification (SIC) of 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) 5,000 square feet or more of surface area.

i. Projects located in or directly adjacent to, or discharging directly to an Environmentally Sensitive Area (ESA), where the development will:

(i) Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and

(ii) Create 2,500 square feet or more of impervious surface area.

j. Single-family hillside homes.

(2) Redevelopment Projects

a. Land disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site on Planning Priority Project categories.

b. Where Redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, the entire project must be mitigated.

c. Where Redevelopment results in an alteration of less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, only the alteration must be mitigated, and not the entire development.

d. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.

e. Existing single-family dwelling and accessory structures are exempt from the Redevelopment requirements unless such projects create, add, or replace 10,000 square feet of impervious surface area.

D. Specific Requirements. The site for every Planning Priority Project shall be designed to control pollutants, pollutant loads, and runoff volume to the maximum extent feasible by minimizing impervious surface area and controlling runoff from impervious surfaces through infiltration, evapotranspiration, bioretention and/or rainfall harvest and use. In addition, the following specific requirements apply:

(1) New Single-Family Hillside Homes. A new single-family hillside home development project shall include mitigation measures to:

a. Conserve natural areas;

b. Protect slopes and channels;

c. Provide storm drain system stenciling and signage;

d. Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability; and

e. Direct surface flow to vegetated areas before discharge, unless the diversion would result in slope instability.

(2) Street and Road Construction of 10,000 square feet or more. Street and road construction of 10,000 square feet or more of impervious surface shall follow the City's Green Street Manual developed by the Director and approved by City Council resolution. The City's Green Street Manual shall be based on the USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets (December 2008 EPA-833-F-08-009).

(3) Remainder of Planning Priority Projects Require a SUSMP. Except for the projects listed in paragraphs (1) and (2) of subsection D of this section, all other Planning Priority Projects shall prepare and submit to the Director for review and approval a SUSMP which shall also contain LID requirements consistent with Parts

VI.D.7.c and VI.D.7.d(iii) of the Municipal NPDES Permit. In addition, Planning Priority Projects subject to this paragraph (3) shall do the following:

a. Incorporate the SUSMP into Project Plans. An applicant for a Planning Priority Project identified in paragraph (3) of subsection D of this section shall incorporate into the applicant's project plans a Storm Water Mitigation Plan (SWMP), which includes those BMPs necessary to control storm water pollution from construction activities and facility operations, as set forth in the SUSMP applicable to the applicant's project. Structural or Treatment Control BMPs (including, as applicable, post-construction treatment control BMPs) set forth in project plans shall meet the design standards set forth in the SUSMP and the current Municipal NPDES Permit.

b. Verify Maintenance of BMPs. If a project applicant has included or is required to include structural or treatment control BMPs in project plans, the applicant shall provide verification of maintenance provisions. The verification shall include the applicant's signed statement, as part of its project application, accepting responsibility for all structural and treatment control BMP maintenance until such time, if any, the property is transferred.

E. Issuance of Discretionary Permits. No discretionary permit may be issued for any Planning Priority Project identified in this section until the Director confirms the project plans comply with the applicable requirements of this section.

F. Issuance of Certificates of Occupancy. As a condition for issuing a certificate of occupancy for a Planning Priority Project identified in this section, the Director shall require facility operators and/or owners to build all the stormwater pollution control BMPs and structural or treatment control BMPs that are shown on the approved project plans and to submit a signed certification statement stating that the site and all structural or treatment control BMPs will be maintained in compliance with the SUSMP and other applicable regulatory requirements.

G. Transfer of Properties Subject to Requirement for Maintenance of Structural and Treatment Control BMPs.

1. The transfer or lease of a property subject to a requirement for maintenance of structural and treatment control BMPs shall include conditions requiring the transferee and its successors and assigns to either (a) assume responsibility for maintenance of any existing structural or treatment control BMP or (b) to replace an existing structural or treatment control BMP with new control measures or BMPs meeting the then current standards of the City and the SUSMP. Such requirement shall be included in any sale or lease agreement or deed for such property. The condition of transfer shall include a provision that the successor property owner or lessee conduct maintenance inspections of all structural or treatment control BMPs at least once a year and retain proof of inspection.

2. For residential properties where the structural or treatment control BMPs are located within a common area which will be maintained by a homeowners association, language regarding the responsibility for maintenance shall be included in the projects conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what stormwater management facilities are present, signs that maintenance is needed, and how the necessary maintenance can be performed. The transfer of this information shall also be required with any subsequent sale of the property.

3. If structural or treatment control BMPs are located within an area proposed for dedication to a public agency, said BMPs shall be the responsibility of the developer until the dedication is accepted by the public agency.

H. CEQA. Provisions of this section shall be complementary to, and shall not replace, any applicable requirements for stormwater mitigation required under the California Environmental Quality Act.

13.12.120 Enforcement.

A. Violations Deemed a Public Nuisance.

1. The following violations shall be deemed a public nuisance:

a. Any condition caused or permitted to exist in violation of any of the provisions of this chapter; or

b. Any failure to comply with any applicable requirement of either the SUSMP or an approved stormwater mitigation plan with respect to a property; or

c. Any false certification or verification, or any failure to comply with a certification or verification provided by a project applicant or the applicant's successor in interest; or

d. Any failure to properly operate and maintain any structural or treatment control BMP on a property in accordance with an approved stormwater mitigation plan or the SUSMP, is determined to be a threat to the public health, safety and welfare, is declared and deemed a public nuisance, and may be abated or restored by any Director, and a civil or criminal action to abate, enjoin or otherwise compel the cessation of such nuisance may be brought by the City Attorney.

2. The cost of such abatement and restoration shall be borne by the owner of the property and the cost shall be billed to the owner of the property, as provided by law or ordinance for the recovery of nuisance abatement costs,

3. If any violation of this chapter constitutes a seasonal and recurrent nuisance, the Director shall so declare. The failure of any person to take appropriate annual precautions to prevent stormwater pollution after written notice of a determination under this section shall constitute a public nuisance and a violation of this chapter.

B. Concealment. Causing, permitting, aiding, abetting or concealing a violation of any provision of this chapter shall constitute a violation of such provision.

C. Civil Actions. In addition to any other remedies provided in this chapter, any violation of this chapter may be enforced by civil action brought by the City. In any such action, the City may seek any or all of the following remedies:

1. A temporary and/or permanent injunction;

2. Assessment of the violator for the costs of any investigation, inspection or monitoring survey which led to the establishment of the violation, and for the reasonable costs of preparing and bringing legal action under this section;

3. Costs incurred in removing, correcting or terminating the adverse effects resulting from the violation;

4. Compensatory damages for loss or destruction to water quality, wildlife, fish and aquatic life.

D. Administrative Enforcement Powers. In addition to the other enforcement powers and remedies established by this chapter, the Director has the authority to utilize the following administrative remedies:

1. Cease and Desist Orders. When a discharge has taken place or is likely to take place in violation of this chapter, the Director may issue an order to cease and desist such discharge, or practice or operation likely to cause such discharge and direct that those persons not complying shall: (a) comply with the requirement; (b) comply with a time schedule for compliance; and (c) take appropriate remedial or preventive action to prevent the violation from recurring.

2. Notice to Clean. Whenever the Director finds any oil, earth, debris, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or any other material of any kind, in or upon the sidewalk abutting or adjoining any parcel of land, or upon any parcel

of land or grounds, which may result in pollutants entering the MS4 or a non-stormwater discharge to the MS4, he or she may give notice to the owner or occupant of the adjacent property to remove such oil earth, debris, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or other material, in any manner that he or she may reasonably provide. The recipient of such notice shall undertake the activities as described in the notice.

E. Penalties. Violation of this chapter shall be punishable as provided in Chapter 1.08 of this code. Each day that a violation continues shall constitute a separate offense.

F. Permit Revocation. To the extent the City makes a provision of this chapter or any identified BMP a condition of approval to the issuance of a permit or license, any person in violation of such condition is subject to the permit revocation procedures set forth in this code.

G. Burden of Proof. In an enforcement action, the burden of proof shall be on the person who is the subject of such action to establish that the reduction or elimination of the discharge to the maximum extent practicable has been accomplished through compliance with the best management practices available, including applicable monitoring, notifications and reporting requirements.

H Remedies. Remedies under this chapter are in addition to and do not supersede or limit any and all other available remedies, civil or criminal. The remedies provided for in this chapter shall be cumulative and not exclusive."

Section 2. **<u>Severability</u>**. If any section, subsection, sentence, clause, phrase or portion of this ordinance for any reason is held to be invalid or unconstitutional by any court of competent jurisdiction, such decision shall not affect the validity or the remaining portions of this ordinance. The City Council of the City of La Mirada hereby declares that it would have adopted this ordinance and each section, subsection, sentence, clause, phrase or portion thereof irrespective of the fact that any one or more sections, subsections, sentences, clauses, phrases or portions were to be declared invalid or unconstitutional.

Section 3. **<u>CEQA</u>.** The City Council hereby finds, in the exercise of its independent judgment and analysis, that this ordinance is exempt from the California Environmental Quality Act ("CEQA") because this ordinance is an administrative and enforcement activity of the City that will not result any direct or indirect physical changes in the environment pursuant to CEQA Guidelines Section 15378(b)(5). Additionally, the adoption of this ordinance is also exempt from CEQA because the adoption of this Ordinance and the timing thereof is mandated by the action of the Los Angeles Regional Water Quality Control Board ("LARWQCB"). In this case, the City is acting at the direction of the LARWQCB and federal law to protect, maintain, restore and enhance natural resources and the environment. To comply with the requirements of the LARWQCB, the City Council finds that the adoption of this Ordinance is categorically exempt from the requirements of the California Environmental Quality Act ("CEQA") pursuant to CEQA Guidelines Sections 15307 and 15308.

Section 4. **Publication.** The City Clerk shall certify to the adoption of this Ordinance and shall cause the same to be published or posted in the manner prescribed by law.

APPROVED and ADOPTED this 27th day of May, 2014.

Lawrence P. Mowles, Mayor

Attest:
I, Anne Haraksin, City Clerk of the City of La Mirada, do hereby certify that the foregoing Ordinance was introduced at a regular meeting of the City Council of the City of La Mirada held on the 13th day of May 2014, and was finally passed at a regular meeting of the City Council of the City of La Mirada held on the 27th day of May, 2014, by the following vote:

AYES:	**Councilmembers De Ruse, Jones, Sarega, Mayor Pro Tem Deal, Mayor Mowles**
NOES:	**None**
ABSENT:	**None**
ABSTAIN:	**None**

Anne Haraksin, City Clerk

ORDINANCE NO. ORD-13-0024

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF LONG BEACH AMENDING THE LONG BEACH MUNICIPAL CODE BY AMENDING AND RESTATING TITLE 18 IN ITS ENTIRETY; AND BY REPEALING CHAPTER 21.65, ALL RELATING TO THE ADOPTION AND AMENDMENTS TO THE 2013 EDITION OF THE CALIFORNIA BUILDING STANDARDS CODES AND THE 1997 EDITION OF THE UNIFORM HOUSING CODE TO BE KNOWN AS THE LONG BEACH BUILDING STANDARDS CODE

OFFICE OF THE CITY ATTORNEY
CHARLES PARKIN, City Attorney
333 West Ocean Boulevard, 11th Floor
Long Beach, CA 90802-4664

The City Council of the City of Long Beach ordains as follows:

Section 1. Title 18 of the Long Beach Municipal Code is hereby amended in its entirety and restated as shown on Exhibit "A", which is attached hereto and incorporated herein by this reference as if set forth in full.

Section 2. Chapter 21.65 of the Long Beach Municipal Code is hereby repealed.

Section 3. The City Clerk shall certify to the passage of this ordinance by the City Council and cause it to be posted in three (3) conspicuous places in the City of Long Beach, and it shall take effect on the thirty-first (31st) day after it is approved by the Mayor, but in no event prior to January 1, 2014, with the exception that the "Low Impact Development Standards" codified in Chapter 18.74 shall become effective in accordance with Long Beach City Charter Section 210; and that the provisions of Chapter 18.76 relating to "Water Submeters" shall not become effective unless and until the City Council considers the adoption of "Consumer Protection Standards" relating to water

MJM:kjm A13-01772 10/22/13; 11/6/13

submetering.

I hereby certify that the foregoing ordinance was adopted by the City Council of the City of Long Beach at its meeting of November 12, 2013 by the following vote:

Ayes:	Councilmembers:	Lowenthal, DeLong, O'Donnell, Andrews, Johnson, Austin, Neal.
Noes:	Councilmembers:	None.
Absent:	Councilmembers:	Garcia, Schipske.

Lg Herrera

City Clerk

Approved: 11/14/13
(Date)

Mayor

CHAPTER 18.74 LOW IMPACT DEVELOPMENT STANDARDS

18.74.010 – Purpose.
18.74.020 – Definitions.
18.74.030 – LID requirements and applicability.
18.74.040 – LID plan review.
18.74.050 – LID plan review, permit and Offsite Runoff Mitigation fees.
18.74.060 – LID Best Management Practices Manual.
18.74.070 – Hardship determination.

CHAPTER 18.74
LOW IMPACT DEVELOPMENT STANDARDS

18.74.010 – Purpose.

The purpose of this chapter is to require the use of low impact development (LID) standards in the planning and construction of development projects. LID standards promote the goal of environmental sustainability by helping improve the quality of receiving waters, protecting the Los Angeles and San Gabriel River watersheds, maintaining natural drainage paths, and protecting potable water supplies within the City. The LID objective of controlling and maintaining flow rate is addressed through land development and stormwater management techniques that imitate the natural hydrology (or movement of water) found on the site. Using site design and best management practices that allow for storage and retention, infiltration, filtering, and flowrate adjustments achieve the goals of LID, advances sustainability and reduces the overall cost of stormwater management. The use of engineered systems, structural devices, and vegetated natural designs distributes stormwater and urban runoff across a development site maximizing the effectiveness of LID.

18.74.020 – Definitions.

"Brownfield" means a piece of industrial or commercial property that is abandoned or underused and often environmentally contaminated, especially one considered as a potential site for redevelopment.

"Development" means any constructionto build any new public or private residential projects (whether single-family, multi unit or planned unit development); new industrial, commercial, retail and other non-residential projects, including public agency projects; new impervious surface area; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"LID Best Management Practices Manual" means a manual of LID standards and practices for stormwater pollution mitigation, including technical feasibility and implementation parameters, alternative compliance for technical infeasibility, as well as other rules, requirements and procedures as the City deems necessary, for implementing the provisions of this section of the Long Beach Municipal Code.

"Multi-Phased Project" shall mean any Development or Redevelopment implemented over more than one phase and the Site of a Multi-Phased Project shall include any land and water area designed and being used to store, treat or manage stormwater runoff in connection with the Development or Redevelopment, including any tracts, lots, or parcels of real property, whether Developed or not, associated with, functionally connected to, or under common ownership or control with such Development or Redevelopment.

"Offsite Runoff Mitigation Fee" means fee paid to the City for the management of storm water runoff generated from the 0.75-inch water quality storm in excess of the storm water runoff that is infiltrated, evapotranspired and/or stored for use. The Offsite Runoff Mitigation Fee shall be used by the City to construct or apply towards the construction of an offsite mitigation project within the same sub-watershed that will achieve at least the same level of water quality protection as if all of the runoff was retained on site.

"Redevelopment" means land-disturbing activities that result in the replacement of more than fifty percent (50%) of an existing building, structure or impervious surface area on an already developed site. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety or grinding/overlaying and replacement of existing parking lots.

"Site" means the land or water area where any "facility or activity" is physically located or conducted, including adjacent land use in connection with the facility or activity.

18.74.030 – LID requirements and applicability.

A. The provisions of this section set forth the requirements for and shall apply to all new Development and Redevelopment projects in the City of Long Beach. The following Development or Redevelopment projects are exempt from the requirements of this chapter:

   1. Any Development or Redevelopment projects that creates, adds or replaces less than five hundred (500) square feet of impervious surface area;

   2. Any Development or Redevelopment projects involving emergency construction activities required to immediately protect public health and safety;

   3. Any Development or Redevelopment projects involving the grinding/overlaying and replacement of existing parking lots;

   4. Any Development or Redevelopment projects where land disturbing activities result in the replacement of fifty percent (50%) or less of an existing building, structure or impervious surface area; or

   5. Any Development or Redevelopment projects that are technically infeasible pursuant to Subsection 18.74.040.B; or

   6. Any Development or Redevelopment projects that do not require a building permit.

B. LID requirements for new Development or Redevelopment projects:

   1. Residential Development of 4 units or less

      a. For new Development less than one (1) acre, or if Redevelopment alters more than fifty percent (50%) of existing buildings, structures or impervious surfaces of an existing developed site, comply with the standards and requirements of this chapter and implement at least two (2) adequately sized LID BMP alternatives from the LID Best Management Practices Manual.

      b. For new Development that is one (1) acre and greater, the entire Site shall comply with the standards and requirements of this chapter and the LID Best Management Practices Manual.

   2. Residential Developments of 5 units or more and nonresidential Developments

      For new Development, or if Redevelopment alters more than fifty percent (50%) of existing buildings, structures or impervious surfaces of an existing developed site, the entire Site shall comply with the standards and requirements of this chapter and of the LID Best Management Practices Manual.

   3. Nonresidential Developments in the Port of Long Beach Harbor District

      For new Development or Redevelopment projects located in the Port of Long Beach Harbor District as designated in Title 21 Zoning Regulations, the site shall comply with the LID BMP alternatives set forth in the Port of Long Beach Post-Construction Design Guidance Manual and in the LID Best Management Practices Manual.

C. This chapter shall not apply to those projects for which a building permit application has been filed for and deemed complete by the Building Official prior to February 19, 2013.

18.74.040 – LID plan review.

A. Compliance with the LID standards of this chapter shall be demonstrated through a LID plan review. Permit applicant shall be required to submit a LID plan for review to the Building Official. The LID plan shall demonstrate how the project will meet the standards and requirements of this chapter and of the LID Best Management Practices Manual. A submitted LID plan shall indicate compliance with the following standards:

   1. Stormwater runoff will be infiltrated, captured and reused, evapotranspired, and/or treated onsite through stormwater best management practices allowed in the LID Best Management Practices Manual.

   2. The onsite stormwater management techniques must be properly sized, at a minimum, to infiltrate, evapotranspire, and/or store for use without any storm water runoff leaving the site to the maximum extent feasible, for at least the volume of water produced by a storm event that results from:

      a. The volume of runoff produced from a 0.75 inch storm event; or

      b. The eighty-fifth (85^{th}) percentile twenty-four (24) hour runoff event determined as the maximized capture stormwater volume for the area using a fourty-eight (48) to seventy-two (72) hour draw down time, from the formula recommended in Urban Runoff Quality Management, WEF Manual of Practice No. 23/ASCE Manual of Practice No. 87, (1998); or

      c. The volume of annual runoff based on unit basin storage water quality volume, to achieve eighty percent (80%) or more volume treatment by the method recommended in the California Stormwater Best Management Practices Handbook – Industrial/Commercial, (2003).

B. When the onsite LID requirements are technically infeasible, the infeasibility shall be demonstrated in the submitted LID plan and shall be reviewed in consultation with the Building Official. The technical infeasibility may result from conditions that may include, but are not limited to:

   1. Locations where seasonal high groundwater is within ten (10) feet of surface grade;

   2. Locations within one hundred (100) feet of a groundwater well used for drinking water;

   3. Brownfield Development sites or other locations where pollutant mobilization is a documented concern;

   4. Locations with potential geotechnical hazards; or

   5. Locations with impermeable soil type as indicated in applicable soils and geotechnical reports.

C. If complete onsite compliance of any type is technically infeasible, a Development or Redevelopment project shall be required to comply with, at a minimum, all applicable Standard Urban Stormwater Mitigation Plan (SUSMP) requirements of Chapter 18.61 in order to maximize onsite compliance. For the remaining runoff that cannot feasibly be managed onsite, one or a combination of the following shall be required:

   1. An Offsite Runoff Mitigation Fee pursuant to Subsection 18.74.050.B shall be paid to the City of Long Beach's Stormwater Pollution Abatement Fund for offsite mitigation, as described in the LID Best Management Practices Manual. The funding will be applied towards the construction of an offsite mitigation project(s) within the same sub-watershed that will achieve

at least the same level of water quality protection as if all of the runoff was retained onsite.

2. To provide an incentive for onsite management of storm water runoff, Development and Redevelopment projects will receive the following reduction in the Offsite Runoff Mitigation Fee based on the percentages of storm water runoff that is managed on site through infiltration, evapotranspiration, and/or capture and use:

Stormwater Runoff Managed Onsite	Fee Reduction
Between 90% and 99%	75%
Between 75% and 89%	50%
Between 50% and 74%	25%

3. A Multi-Phased Project must design a system acceptable to satisfy these standards and requirements for the entire Site during the first phase and will implement these standards and requirements for each phase of Development or Redevelopment projects of the Site during the first phase or prior to commencement of construction of a later phase, to the extent necessary to treat the stormwater from such later phase.

18.74.050 – LID plan review, permit, and Offsite Runoff Mitigation fees.

A. Permit applicants who seeks to engage in new Development or Redevelopment as defined in this chapter by obtaining a building permit shall pay the required plan examination and permit fees as set forth in Chapter 18.06.

B. Permit applicants who seeks to engage in new Development or Redevelopment as defined in this chapter by obtaining a building permit and does not demonstrate complete onsite compliance as described in the LID Best Management Practices Manual are required to pay an Offsite Runoff Mitigation Fee in the manner and amount as set forth in the schedule of fees and charges established by City Council resolution.

C. Any Development or Redevelopment projects that are exempted from this chapter shall have the option to voluntarily opt in and incorporate into the project the LID requirements of this chapter. In such case, the LID plan review, permit and Offsite Runoff Mitigation fees associated with the project shall be waived.

18.74.060 – Best Management Practices Manual.

A. The Building Official shall prepare, maintain, and update, as deemed necessary and appropriate, the LID Best Management Practices Manual to include LID standards and practices and standards for stormwater pollution mitigation. The LID Best Management Practices Manual shall also include technical feasibility and implementation parameters, alternative compliance for technical infeasibility, as well as other rules, requirements and procedures as the City deems necessary, for implementing the provisions of this chapter.

B. The Building Official shall develop, as deemed necessary and appropriate, in cooperation with other City departments and stakeholders, informational bulletins, training manuals and educational materials to assist in the implementation of the LID requirements.

18.74.070 – Hardship determination.

Whenever there are practical difficulties involved in carrying out the provisions of this chapter, the Director shall have the authority to grant modifications to the provisions of this chapter for individual cases, provided the Director shall first find that special individual reason makes the strict letter of this chapter impractical and the modification is in compliance with the intent and purpose of this chapter and that such modification does not lessen the goals of LID, sustainability or increase the overall cost of stormwater management.

RESOLUTION NO. 14-21

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF NORWALK APPROVING A GREEN STREETS POLICY

WHEREAS, the Municipal Separate Storm Sewer System (MS4) Permit (Order No. R-2012-0175) was adopted by the California Regional Water Quality Control Board, Los Angeles Region on November 8, 2012. Municipalities electing to prepare a Watershed Management Program or an Enhanced Watershed Management Program under this Permit are required to demonstrate that Green Street policies are in place that specify the use of green street strategies for transportation corridors; and

WHEREAS, Green Streets are enhancements to street and road projects to improve the quality of storm water and urban runoff through the implementation of infiltration, bio-treatment, xeriscaping parkways and tree lined streets; and

WHEREAS, that since February 26, 2012, the City has worked in conjunction with the Gateway Water Management Authority for the development of a Green Street Policy.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF NORWALK HEREBY DETERMINES, FINDS, AND RESOLVES AS FOLLOWS:

Section 1. Directs the Director of Community Development to implement Green Streets for city-owned transportation corridors and road projects that add 10,000 square feet or more of impervious area following the City of Norwalk's Green Streets Manual as shown in Exhibit A which is based on the USEPA's Wet Weather with Green Infrastructure guidance (December 2008 EPA-833-F-08-009).

Section 2. Routine maintenance including but not limited to: slurry seals, grind and overlay and reconstruction to maintain original line are grade are excluded from the Green Street Policy.

Section 3. The Director of Community Development is authorized to make non-substantive changes to the City of Norwalk's Green Streets manual consistent with the requirements of the MS4 Permit.

Section 4. This Resolution has been reviewed with respect to the applicability of the California Environmental Quality Act (Public Resources Code Section 21000 et seq.) ("CEQA"). Pursuant to the State CEQA Guidelines (14 Cal Code Regs 15000 et seq.) (the "Guidelines"), the City Council has determined that the Green Streets Manual will not have a significant effect on the environment and is listed under the City of Norwalk Local CEQA Guidelines as a Class 8 Categorical Exemption from the requirements of the California Environmental Quality Act. Staff is hereby directed to prepare and post a notice of exemption pursuant to Guidelines Section 15062.

Section 5. At its regular meeting held on April 15, 2014, the City Council determined that the public interest and necessity justify the adoption of the Green Street Policy.

Section 6. This Resolution shall become effective on the effective date of Ordinance No. 14-1641 of the City Council, entitled "An Ordinance of The City of Norwalk Amending Norwalk Municipal Code Title 18 by repealing and replacing Chapter 18.04 to establish Low Impact Development (LID) requirements for new development and redevelopment projects."

Section 7. The Mayor, or presiding officer, is hereby authorized to affix his signature to this Resolution signifying its adoption by the City Council of the City of Norwalk and the City Clerk, or her duly appointed assistant, is directed to attest thereto.

APPROVED AND ADOPTED on this 15th day of April 2014.

MARCEL RODARTE
MAYOR

ATTEST:

I, **Theresa Devoy**, City Clerk of the City of Norwalk, California **DO HEREBY CERTIFY** that the foregoing Resolution, being **Resolution No. 14-21** has been duly signed by the Mayor and attested by the City Clerk, all at a regular meeting of the Norwalk City Council, held April 15, 2014, and that the same was approved and adopted by the following vote to wit:

AYES: **Councilmember Kelley, Vice Mayor Shryock, and Mayor Rodarte**
NOES: **None**
ABSENT: **Councilmembers Mendez and Vernola**

SECTION 1 – INTRODUCTION

1.1 WHAT ARE GREEN STREETS?

Roads present many opportunities for green infrastructure application. One principle of green infrastructure involves reducing and treating stormwater close to its source. Urban transportation right-of-ways integrated with green techniques are often called "green streets." Green streets provide source controls for stormwater runoff and pollutant loads. In addition, green infrastructure approaches complement street facility upgrades, street aesthetic improvements, and urban tree canopy efforts that also make use of the right-of-way and allow it to achieve multiple goals and benefits. Using the right-of-way for treatment of stormwater runoff links green with grey infrastructure by making use of the engineered conveyance of roads and providing connections to conveyance systems when needed.

Green streets are beneficial for new road construction and retrofits. They can provide substantial economic benefits when used in transportation applications. Coordinating green infrastructure installation with broader transportation improvements can reduce the cost of stormwater management by including it within larger infrastructure improvements. A large municipal concern regarding green infrastructure use is maintenance access; using roads and right-of-ways as locations for green infrastructure not only addresses a significant pollutant source, but also alleviates access and maintenance concerns by using public space. Also, right-of-way installations allow for easy public maintenance.

Green streets can incorporate a wide variety of design elements including street trees, permeable pavements, bioretention, and swales. Although the design and appearance of green streets will vary, the functional goals are the same; provide source control of stormwater, limit its transport and pollutant conveyance to the collection system, restore pre-development hydrology to the maximum extent practicable, and provide environmentally enhanced roads. Successful application of green techniques will encourage soil and vegetation contact and infiltration and retention of stormwater.

1.2 WHY ARE GREEN STREETS BEING REQUIRED?

This Green Streets Manual provides guidance to comply with the Municipal Separate Storm Sewer System (MS4) Permit (Order Number R4-2012-0175) which requires that jurisdictions in Los Angeles County reduce contaminants in runoff to improve water quality in waterways. These requirements stem from the National Pollutant Discharge Elimination System (NPDES) requirements of the Clean Water Act (CWA).

The MS4 Permit requires Green Streets strategies to be implemented for transportation corridors. Transportation corridors represent a large percentage of the impervious area within Los Angeles and therefore generate a substantial amount of runoff from storm events. The altered flow regime from traditional roadways, increased runoff volume, and high runoff peak flows, are damaging to the environment and a risk to property downstream.

Traditionally, street design has focused on removing water from the street as quickly as possible and transferring it to storm drains, channels, and water bodies. Stormwater runoff can contain bacteria and other pollutants, and is thereby regulated at the state and local level (refer to *Table 1* for a list of pollutants typical of roads). Green Streets will help to transform the design of streets from the conventional method of moving water off-site as quickly as possible to a method of storing and treating water on-site for a cleaner discharge into the waters of the U.S.

Street and road construction applies to major arterials, state routes, highways, or rail lines used for the movement of people or goods by means of bus services, trucks, and vehicles, and transportation corridors within larger projects. Projects which are required to follow this Green Streets Guidance Manual include the following:

1. Street and road construction of 10,000 square feet or more of impervious surface area.
2. Street and road redevelopment resulting in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.
3. Project is designated by the Director of Community Development as a Green Streets project in order to meet Waste Load Allocations of the Lower San Gabriel River Watershed.

Table 1: Examples of Stormwater Pollutants Typical of Roads (*Managing Wet Weather With Green Infrastructure Municipal Handbook: Green Streets, 2008*).

Pollutant	Source	Effects
Trash	Littering	Physical damage to aquatic animals and fish, release of poisonous substances
Sediment/solids	Construction, unpaved areas	Increased turbidity, increased transport of soil bound pollutants, negative effects on aquatic organisms reproduction and function
Metals (Copper, Zinc, Lead, Arsenic)	Vehicle brake pads, vehicle tires, motor oil, vehicle emissions and engines, vehicle emissions, brake linings, automotive fluids	Toxic to aquatic organisms and can accumulate in sediments and fish tissues
Organics associated with petroleum (e.g., PAHs)	Vehicle emissions, automotive fluids, gas stations	Toxic to aquatic organisms
Nutrients	Vehicle emissions, atmospheric deposition	Promotes eutrophication and depleted dissolved oxygen concentrations

1.3 PLANNING AND DEVELOPMENT

Ideally, a site would be designed to capture and use or infiltrate the entire runoff volume of a storm, however site and design constraints make it difficult to achieve that goal. This Green Streets Manual is designed to provide guidance with Best Management Practice (BMP) selection based on site constraints typical to street design. Streetscape geometry, topography, and climate determine the types of controls that can be implemented. The initial step in selecting a stormwater tool is determining the available open space and constraints. Stormwater controls should be selected using the hierarchy represented in *Figure 1*, the site guidelines represented in *Table 2*, and the location opportunities listed in *Table 3*. Note that the BMP type may be selected with the project size, complexity, and cost taken into consideration.

1.3.1 Site Considerations

Specific elements which should be given special consideration in the site assessment process for applicable Green Streets include:

- **Ownership of land adjacent to right of ways.** The opportunity to provide stormwater treatment may depend on the ownership of land adjacent to the right-of-way. Acquisition of additional right-of-way and/or access easements may be more feasible if land bordering the project is owned by relatively few land owners.
- **Location of existing utilities.** The location of existing storm drainage utilities can influence the opportunities for Green Streets infrastructure. For example, stormwater planters can be designed to overflow along the curb-line to an existing storm drain inlet, thereby avoiding the infrastructure costs associated with an additional inlet. The location of other utilities may limit the allowable placement of BMPs to only those areas where a clear pathway to the storm drain exists.
- **Grade differential between road surface and storm drain system.** Some BMPs require more head from inlet to outlet than others; therefore, allowable head drop may be an important consideration in BMP selection. Storm drain elevations may be constrained by a variety of factors in a roadway project (utility crossings, outfall elevations, etc.) that cannot be overcome and may override stormwater management considerations.
- **Longitudinal slope.** The suite of BMPs which may be installed on steeper road sections is more limited. Specifically, permeable pavement and swales are more suitable for gentle grades. Other BMPs may be more readily terraced to be used on steeper slopes.
- **Soil suitability.** Infiltration BMPs require specific types of soil. The site assessment should determine the type of soils on the site and the infiltration rate of the soils if infiltration BMPs are proposed.
- **Potential access opportunities.** A significant concern with installation of BMPs in major right of ways is the ability to safely access the BMPs for maintenance considering traffic hazards. Vehicle travel lanes and specific areas potentially hazardous for maintenance crews should be identified during the site assessment. The Green Streets Water Quality Management Plan (WQMP) should provide subsequent steps to avoid placing BMPs in the identified hazardous areas.

1.3.2 Design Considerations

The drainage patterns of the project should be developed so that drainage can be routed to areas with BMP opportunities before entering storm drains. For example, if a median strip is present, a reverse crown should be considered, where allowed, so that stormwater can drain to a median swale. Likewise, standard peak-flow curb inlets should be located downstream of areas with potential for stormwater planters so that water can first flow into the planter, and then overflow to the downstream inlet if capacity of the planter is exceeded. It is more difficult to apply green infrastructure after water has entered the storm drain.

Green Streets projects are not required to treat off-site runoff; however, treatment of comingled off-site runoff may be used to off-set the inability to treat areas within the project for which significant constraints prevent the ability to provide treatment.

Applicable Green Streets projects should apply the following site design measures to the maximum extent practicable and as specified in the local permitting agency's codes:

- Minimize street width where feasible while maintaining traffic flow and public safety.
- Add tree canopy by planting or preserving trees/shrubs.

- Use porous pavement or pavers for low traffic roadways, on-street parking, shoulders or sidewalks.
- Integrate traffic calming measures in the form of bioretention curb extensions.

1.3.3 BMP Sizing for Applicable Green Streets Projects

An 85th percentile standard design storm should be used to determine the appropriate size, slope, and materials of each facility. After identifying the appropriate stormwater facilities for a site, an integrated approach using several BMPs is encouraged. To increase water quality and functional hydrologic benefits, several stormwater management BMPs can be used in succession. This is called a treatment train approach. The control measures should be designed using available topography to take advantage of gravity for conveyance to and through each facility. All Green Streets designs must be based off of a published design standard.

The following steps should be used to size BMPs for applicable Green Streets projects:

1. Delineate drainage areas tributary to BMP locations and compute imperviousness.
2. Look up the recommended sizing method for the BMP selected in each drainage area and calculate target sizing criteria.
3. Design BMPs per a published design standard.
4. Attempt to provide the calculated sizing criteria for the selected BMPs.
5. If sizing criteria cannot be achieved, document the constraints that override the application of BMPs and provide the largest portion of the sizing criteria that can be reasonably provided given constraints. If BMPs cannot be sized to provide the calculated volume for the tributary area, it is still essential to design the BMP inlet, energy dissipation, and overflow capacity for the full tributary area to ensure that flooding and scour is avoided. It is strongly recommended that BMPs which are designed to less than their target design volume be designed to bypass peak flows.

1.3.4 Alternative Compliance Options for Applicable Green Streets Projects

Alternative compliance programs should be considered for applicable Green Streets projects if on-site green infrastructure approaches cannot practicably treat the design volume. The primary alternative compliance option for applicable Green Streets projects is the completion of off-site mitigation projects. The proponent would implement a project to reduce stormwater pollution for other portions of roadway or similar land uses when being reconstructed to the project in the same hydrologic unit, ideally as close to the project as possible and discharging to the same outfall.

1.3.5 Infiltration Considerations

Appropriate soils, infiltration media, and infiltration rates should be used for infiltration BMPs. If infiltration is proposed, a complete geotechnical or soils report should be undertaken to determine infiltration rates, groundwater depth, soil toxicity and stability, and other factors that will affect the ability and the desirability of infiltration. At a minimum, the infiltration capacity of the underlying soils shall be deemed suitable for infiltration (0.3 inches per hour or greater), appropriate media should be used in the BMP itself, the groundwater shall be located at a depth of ten feet or greater.

Table 3: BMP Location Opportunity Summary.

BMP	Location Opportunity Summary
Bioretention	• Adjacent to traveled way and in frontage or furniture sidewalk zones • Can be located in curb extensions, medians, traffic circles, roundabouts, and any other landscaped area • Suitable for constrained locations
Infiltration Trench/Dry Well	• Can be located under sidewalks and in sidewalk planting strips, curb extensions, roundabouts, and medians
Rain Gardens	• Can be integrated medians, islands, circles, street ends, chicanes, and curb extensions • Can be located at the terminus of swales in the landscape
Permeable Pavement	• Suitable for parking or emergency access lanes • Can be located in furniture zones of sidewalks especially adjacent to tree wells • Cannot be placed in areas with large traffic volume or heavy load lanes • Avoid steep streets • Cannot be placed within 20 feet of sub-sidewalk basements • Cannot be within 50 feet of domestic water wells
Flow-Through Planters	• Above-grade planters should be structurally separate from adjacent sidewalks • At-grade planter systems can be installed adjacent to curbs within the frontage and/or furniture zones
Vegetated Swales	• Can be located adjacent to roadways, sidewalks, or parking areas • Can be integrated into traffic calming devices such as chicanes and curb extensions • Can be placed in medians where the street drains to the median • Can be placed alongside streets and pathways • Should be designed to work in conjunction with the street slope
Vegetated Buffer Strips	• Can be located in multi-way boulevards, park edge streets, or sidewalk furniture zones • Can serve as pre-treatment
Treatment BMPs	• Can be located in a catch basin, manhole, or vault • Can be installed on an existing outlet pipe or at the bottom of an existing catch basin with an overflow • Can be placed on existing curbside catch basins and flush grate openings • Can be installed on the existing wall of a catch basin and on the curb side wall of a catch basin • Minimum set-backs from foundations and slopes should be observed if the BMP is not lined
Street Trees	• Can be placed on sidewalks, in furniture zones, and on medians • Adequate spacing must be provided between trees and street lights, pedestrian lights, accessible parking spaces, bus shelters, awnings, canopies, balconies, and signs

SECTION 2 – INFILTRATION

Infiltration systems utilize rock, gravel, and other highly permeable materials for on-site infiltration. In these systems, stormwater runoff is directed to the system and allowed to infiltrate into the soils for on-site retention and groundwater recharge. During small storm events, infiltration systems can result in significant or even complete volume reduction of stormwater runoff.

Infiltration should be used to the maximum extent practicable. Biotreatment BMPs should be considered if infiltration is found to be infeasible due to low infiltration rates, soil instability, high groundwater, or soil contamination.

Infiltration BMPs may become damaged by stormwater carrying high levels of sediment, therefore pre-treatment features should be designed to treat street runoff prior to discharging to infiltration features. Media filters, filter inserts, vortex type units, bioretention devices, sumps, and sedimentation basins are several pre-treatment tools effective at removing sediment.

2.1 INFILTRATION TRENCHES AND DRY WELLS

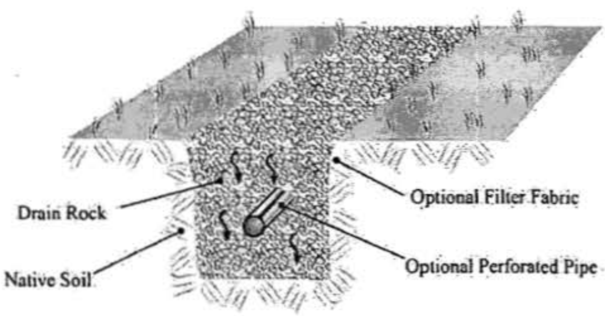

Figure 2: Infiltration Trench (*Model for Living Streets Design Manual, 2011*).

Description

Infiltration trenches are linear, rock-filled features that promote infiltration by providing a high ratio of sub-surface void space in permeable soils. They provide on-site stormwater retention and may contribute to groundwater recharge. Infiltration trenches may accept stormwater from sheet flow, concentrated flow from a swale or other surface feature, or piped flow from a catch basin. Because they are not flow-through BMPs, infiltration trenches do not have outlets but may have overflow outlets for large storm events.

Dry wells are typically distinguished from infiltration trenches by being deeper than they are wide. They are usually circular, resembling a well, and are backfilled with the same materials as infiltration trenches. Dry wells typically accept concentrated flow from surface features or from pipes and do not have outlets.

Infiltration trenches and dry wells are typically designed to infiltrate all flow they receive. In large storm events, partial infiltration of runoff can be achieved by providing an overflow outlet. In these systems, significant or even complete volume reduction is possible in smaller storm events. During large storm events, these systems may function as detention facilities and provide a limited amount of retention and infiltration.

Location and placement guidelines

Infiltration trenches and dry wells typically have small surface footprints so they are potentially some of the most flexible elements of landscape design. However, because they involve sub-surface excavation, these features may interfere with surrounding structures. Care needs to be taken to ensure that surrounding building foundations, pavement bases, and utilities are not damaged by infiltration features. Once structural soundness is ensured, infiltration features may be located under sidewalks and in sidewalk planting strips, curb extensions, roundabouts, and medians. When located in medians, they are most effective when the street is graded to drain to the median. Dry wells require less surface area than trenches and may be more feasible in densely developed areas.

Infiltration features should be sited on uncompacted soils with acceptable infiltration capacity. They are best used where soil and topography allow for moderate to good infiltration rates (0.3 inches per hour or better) and the depth to groundwater is at least 10 feet. Prior to design of any retention or infiltration system, proper soil investigation and percolation testing shall be conducted to determine appropriate infiltration design rates, depth to groundwater, and if soil will exhibit instability as a result of infiltration. Any site with potential for previous underground contamination shall be investigated. Infiltration trenches and dry wells can be designed as stand-alone systems when water quality is not a concern or may be combined in series with other stormwater tools.

Perforated pipes and piped inlets and outlets may be included in the design of infiltration trenches. Cleanouts should be installed at both ends of any piping and at regular intervals in long sections of piping, to allow access to the system. Access ports are recommended for both trenches and wells and can be combined with clean-outs. If included, the overflow inlet from the infiltration trench should be properly designed for anticipated flows.

2.2 RAIN GARDENS

Figure 3: Rain garden (*Model for Living Streets Design Manual, 2011)*.

Description

Rain gardens are vegetated depressions in the landscape. They have flat bottoms and gently sloping sides. Rain gardens can be similar in appearance to swales, but their footprints may be any shape. Rain gardens hold water on the surface, like a pond, and have overflow outlets. The detained water is infiltrated through the topsoil and subsurface drain rock unless the volume of water is so large that some must overflow. Rain gardens can reduce or eliminate off-site stormwater discharge while increasing on-site recharge.

Location and Placement Guidelines

Rain gardens may be placed where there is sufficient area in the landscape and where soils are suitable for infiltration. Rain gardens can be integrated with traffic calming measures installed along streets, such as medians, islands, circles, street ends, chicanes, and curb extensions. Rain gardens are often used at the terminus of swales in the landscape.

2.3 PERMEABLE PAVEMENT

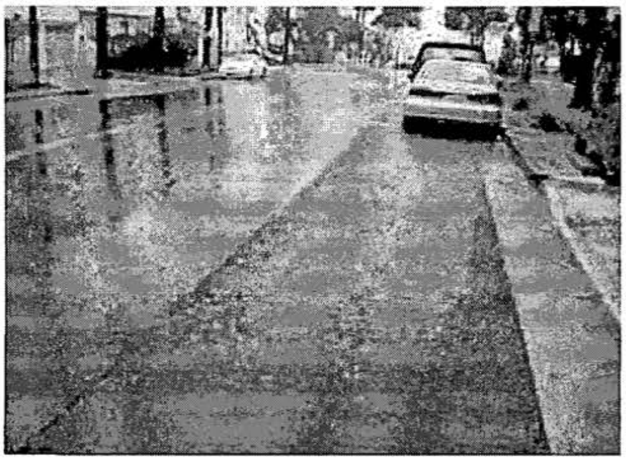

Figure 4: Permeable pavement during a storm event (*Model for Living Streets Design Manual, 2011*).

Description

Permeable pavement is a system with the primary purpose of slowing or eliminating direct runoff by absorbing rainfall and allowing it to infiltrate into the soil. Permeable pavement also filters and cleans pollutants such as petroleum deposits on streets, reduces water volumes for existing overtaxed pipe systems, and decreases the cost of offsite or onsite downstream infrastructure. This BMP is impaired by sediment-laden run-on which diminishes its porosity. Care should be taken to avoid flows from landscaped areas reaching permeable pavement. Permeable pavement is, in certain situations, an alternative to standard pavement. Conventional pavement is designed to move stormwater off-site quickly. Permeable pavement, alternatively, accepts the water where it falls, minimizing the need for management facilities downstream.

Location and Placement Guidelines

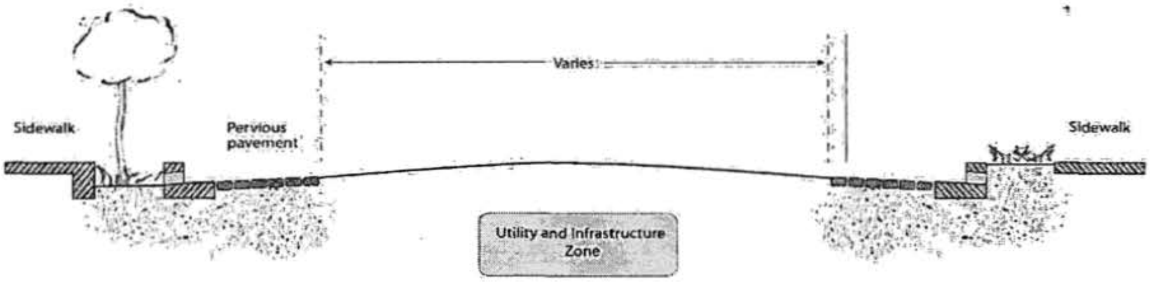

Figure 5: Possible pervious pavement design layout (*Model for Living Streets Design Manual, 2011*).

Conditions where permeable pavement should be encouraged include:

- Sites where there is limited space in the right-of-way for other BMPs;
- Parking or emergency access lanes; and
- Furniture zones of sidewalks especially adjacent to tree wells

Conditions where permeable pavement should be avoided include:

- Large traffic volume or heavy load lanes;
- Where runoff is already being harvested from an impervious surface for direct use, such as irrigation of bioretention landscape areas;
- Steep streets;
- Gas stations, car washes, auto repair, and other sites/sources of possible chemical contamination;
- Areas with shallow groundwater;
- Within 20 feet of sub-sidewalk basements; and
- Within 50 feet of domestic water wells.

Material and Design Guidelines

A soil or geotechnical report should be conducted to provide information about the permeability rate of the soil, load-bearing capacity of the soil, the depth to groundwater (10 feet or more required), and if soil will exhibit instability as a result of implementation. Infiltration rate and load capacity are key factors in the functionality of this BMP. Permeable pavement generally does not have the same load-bearing capacity as conventional pavement, so this BMP may have limited applications depending on the underlying soil strength and pavement use. Permeable pavement should not be used in general traffic lanes due to the possible variety of vehicles weights and heavy volumes of traffic.

When used as a road paving, permeable pavement that carries light traffic loads typically has a thick drain rock base material. Pavers should be concrete as opposed to brick or other light-duty materials. Other possible permeable paving materials include porous concrete and porous asphalt. These surfaces also have specific base materials that detain infiltrated water and provide structure for the road surface. Base material depths should be specified based on design load and the soils report.

Plazas, emergency roads, and other areas of limited vehicular access can also be paved with permeable pavement. Paving materials for these areas may include open cell paver blocks filled with stones or grass and plastic cell systems. Base material specifications may vary depending on the product used, design load, and underlying soils.

When used for pedestrian paths, sidewalks, and shared-use paths, appropriate materials include those listed above as well as rubber pavers and decomposed granite or something similar (washed or pore-clogging fine material). Pedestrian paths may also use broken concrete pavers as long as ADA requirements are met. Paths should drain into adjoining landscapes and should be higher than adjoining landscapes to prevent run-on. Pavement used for sidewalks and pedestrian paths should be ADA compliant, especially smooth, and not exceed a 2 percent slope or have gaps wider than 0.25 inches. In general, tripping hazards should be avoided.

Design considerations for permeable pavement include:

- The location, slope and load-bearing capacity of the street, and the infiltration rate of the soil;
- The amount of storage capacity of the base course;
- The traffic volume and load from heavy vehicles;
- The design storm volume calculations and the quality of water; and
- Drain rock, filter fabrics, and other subsurface materials.

Maintenance Guidelines

Maintenance of permeable pavement systems is essential to their continued functionality. Regular vacuuming and street sweeping should be performed to remove sediment from the pavement surface. The bedding and base material should be selected for long life and sufficient infiltration rates.

SECTION 3 – BIOTREATMENT

Biotreatment BMPs are landscaped, shallow depressions that capture and filter stormwater runoff. These types of BMPs are an increasingly common type of stormwater treatment device that are installed at curb level and filled with a bioretention type soil. They are designed as soil and plant-based filtration devices that remove pollutants through a variety of physical, biological, and chemical treatment processes. They typically consist of a ponding area, mulch layer, planting soils, and plants. Stormwater is directed to the system and pollutants are treated as the stormwater drains through the planting soil and either infiltrated or collected by an underdrain and directed to a collection system.

Biotreatment should only be used in cases where infiltration has been proven infeasible due to low infiltration rates, soil instability, high groundwater, or soil contamination.

3.1 BIORETENTION

Figure 6: Bioretention system (*Model for Living Streets Design Manual, 2011*).

Description

Bioretention is a stormwater management process that cleans stormwater by mimicking natural soil filtration processes as water flows through a bioretention BMP. It incorporates mulch, soil pores, microbes, and vegetation to reduce and remove sediment and pollutants from stormwater. Bioretention is designed to slow, spread, and, to some extent, infiltrate water. Each component of the bioretention BMP is designed to assist in retaining water, evapotranspiration, and adsorption of pollutants into the soil matrix. As runoff passes through the vegetation and soil, the combined effects of filtration, absorption, adsorption, and biological uptake of plants remove pollutants.

For areas with low permeability or other soil constraints, bioretention can be designed as a flow-through system with a barrier protecting stormwater from native soils. Bioretention areas can be designed with an underdrain system that directs the treated runoff to infiltration areas, cisterns, or the storm drain system, or may treat the water exclusively through surface flow. Examples of bioretention BMPs include swales, planters, and vegetated buffer strips.

Location and Placement Guidelines

Bioretention facilities can be included in the design of all street components; adjacent to the traveled way and in the frontage or furniture sidewalk zones. They can be designed into curb extensions, medians, traffic circles, roundabouts, and any other landscaped area. Depending on the feature, maintenance and access should always be considered in locating the device. Bioretention systems are also appropriate in constrained locations where other stormwater facilities requiring more extensive subsurface materials are not feasible.

If bioretention devices are designed to include infiltration, native soil should have a minimum permeability rate of 0.3 inches per hour and at least 10 feet to the groundwater table. Sites that have more than a 5 percent slope may require other stormwater management approaches or special engineering.

3.2 FLOW-THROUGH PLANTERS

Figure 7: Flow-through planter (*Model for Living Streets Design Manual, 2011*).

Description

Flow-through planters are typically above-grade or at-grade with solid walls and a flow-through bottom. They are contained within an impermeable liner and use an underdrain to direct treated runoff back to the collection system. Where space permits, buildings can direct roof drains first to building-adjacent planters. Both underdrains and surface overflow drains are typically installed with building-adjacent planters.

At-grade street-adjacent planter boxes are systems designed to take street runoff and/or sidewalk runoff and incorporate bioretention processes to treat stormwater. These systems may or may not include underdrains.

Location and Placement Guidelines

Above-grade planters should be structurally separate from adjacent sidewalks to allow for future maintenance and structural stability per local department of public works' standards. At-grade planter systems can be installed adjacent to curbs within the frontage and/or furniture zones.

All planters should be designed to pond water for less than 48 hours after each storm. Flow-through planters designed to detain roof runoff can be integrated into a building's foundation walls, and may be either raised or at grade.

For at-grade planters, small localized depressions may be included in the curb opening to encourage flow into the planter. Following the inlet, a sump (depression) to capture sediment and debris may be integrated into the design to reduce sediment loadings.

3.3 VEGETATED SWALES

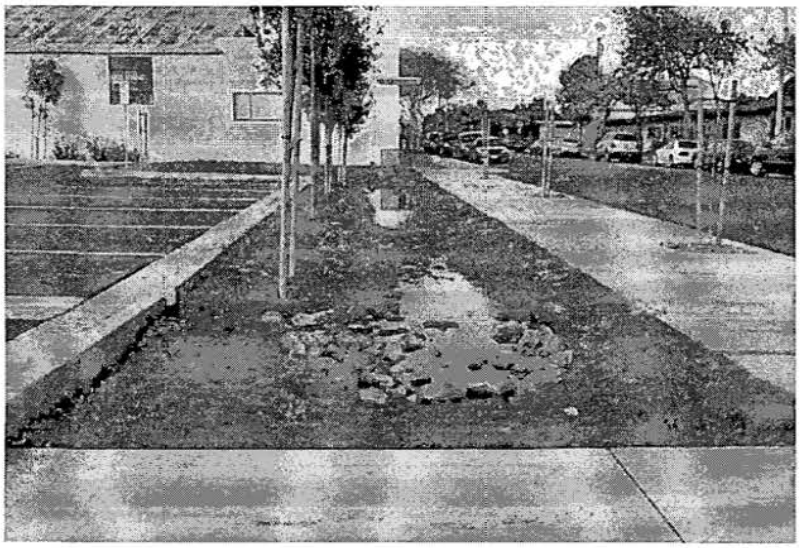

Figure 8: Vegetated swale (*Signal hill, CA*).

Description

Swales are linear, vegetated depressions that capture rainfall and runoff from adjacent surfaces. The swale bottom should have a gradual slope to convey water along its length. Swales can reduce off-site stormwater discharge and remove pollutants along the way. In a swale, water is slowed by traveling through vegetation on a relatively flat grade. This gives particulates time to settle out of the water while contaminants are removed by the vegetation.

Location and Placement Guidelines

Swales can easily be located adjacent to roadways, sidewalks, or parking areas. Roadway runoff can be directed into swales via flush curbs or small evenly-spaced curb cuts into a raised curb. Swale systems can be integrated into traffic calming devices such as curb extensions.

Swales can be placed in medians where the street drains to the median. Placed alongside streets and pathways, vegetated swales can be landscaped with native plants which filter sediment and pollutants and provide habitat for wildlife. Swales should be designed to work in conjunction with the street slope to maximize filtration and slowing of stormwater.

Swales are designed to allow water to slowly flow through the system. Depending on the landscape and design storm, an overflow or bypass for larger storm events may be needed. Curb openings should be designed to direct flow into the swale. Following the inlet, a sump may be built to capture sediment and debris.

3.4 VEGETATED BUFFER STRIPS

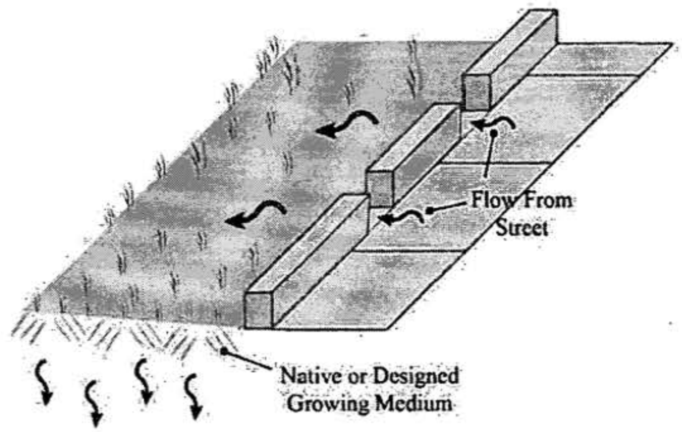

Figure 9: Vegetated buffer strip detail (*Model for Living Streets Design Manual, 2011*).

Description

Vegetated buffer strips are sloping planted areas designed to treat and absorb sheet flow from adjacent impervious surfaces. These strips are not intended to detain or retain water, only to treat it as a flow-through feature. They should not receive concentrated flow from swales or other surface features, or concentrated flow from pipes.

Location and Placement Guidelines

Vegetated buffer strips are well-suited to treating runoff from roads and highways, small parking lots, and pervious surfaces. They may be commonly used on multi-way boulevards, park edge streets, or sidewalk furniture zones with sufficient space. When selecting potential placement the need for supplemental irrigation should be considered. Vegetated buffers can also be situated so they serve as pre-treatment for another stormwater management feature, such as an infiltration BMP.

SECTION 4 – TREATMENT BMPS

4.1 SAND FILTERS & STORM DRAIN INLET PROTECTIONS

As described in Section 1 of this Green Streets Manual, it may be infeasible for specific projects to apply infiltration or biotreatment BMPs. In these cases, sand filters or filter inserts as treatment BMPs can be considered as an alternative. Sand filters and filter inserts can be designed to prevent particulates, debris, metals, and petroleum-based materials conveyed by stormwater from entering the storm drain system. All treatment BMP units should have an overflow system that allows the storm drain to remain functional if the filtration system becomes clogged during rainstorms. All storm drain inlet protections must be of a style and configuration approved by the agency with ownership of the inlet.

Typical maintenance of catch basins includes scheduled trash removal if a screen or other debris capturing device is used. Street sweeping should be performed by vacuum sweepers with occasional weed and large debris removal. Maintenance should include keeping a log of the amount of sediment collected and the data of removal.

The following are examples of acceptable treatment BMPs:

- **Sand Filters:** Sand filters are designed to filter stormwater through a constructed media bed and to an underdrain system. As stormwater flows through the media pollutants are filtered out of the water. The filtered water is conveyed through the underdrain to a collection system. Pretreatment is necessary to eliminate significant sediment load or other large particles which would clog the system. Minimum set-backs from foundations and slopes should be observed if the facility is not lined. Filters should be designed and maintained such that ponded water should not persist for longer than 48 hours following a storm event.

- **Cartridge Media Filters:** Cartridge media filters contain multiple modular filters which contain engineered media. The filters can be located in a catch basin, manhole, or vault. The manhole or vault may be divided into multiple chambers so that the first chamber may act as a pre-settling basin for removal of coarse sediment while the next chamber may act as the filter chamber. Cartridge media filters are recommended for drainage areas with limited available surface area or where surface BMPs would restrict uses. Depending on the number of cartridges, maintenance events can have long durations. Locations should be chosen so that maintenance events will not significantly disrupt businesses or traffic. Inlet inserts should be sized to capture all debris and should therefore be selected to match the specific size and shape of each catch basin and inlet. Filter media should be selected to target pollutants of concern. A combination of media may be used to remove a variety of pollutants. Systems with lower maintenance requirements are preferred.

- **Storm Drain Inlet Screens:** Inlet screens are designed to prevent large litter and trash from entering the storm drain system while allowing smaller particles to pass through. The screens function as the first preventive measure in removing pollutants from the storm water system. The city's street sweeping department should be consulted to ensure compliance with local specifications and to schedule regular maintenance. Annual inspection of the screen is recommended to ensure functionality. Note that most LA River drainage areas are already protected using connector pipe screens through collective systems.

- **Storm Drain Pipe Filter Insert:** The storm drain outlet pipe filter is designed to be installed on an existing outlet pipe or at the bottom of an existing catch basin with an overflow. This filter removes debris, particulates, and other pollutants from stormwater as it leaves the storm drain system. This BMP is less desirable than a protection system that prevents debris from entering the storm drain system because the system may become clogged with debris. Outlet pipe filters can be placed on existing curbside catch basins and flush grate openings. Regular maintenance is required and inspection should be performed rigorously. Because this filter is located at the outlet of a storm drain system, clogging with debris is not as apparent as with filters at street level. This BMP may be used as a supplemental filter with an inlet screen or inlet insert unit.

Section 5 – Street Trees

5.1 STREET TREES

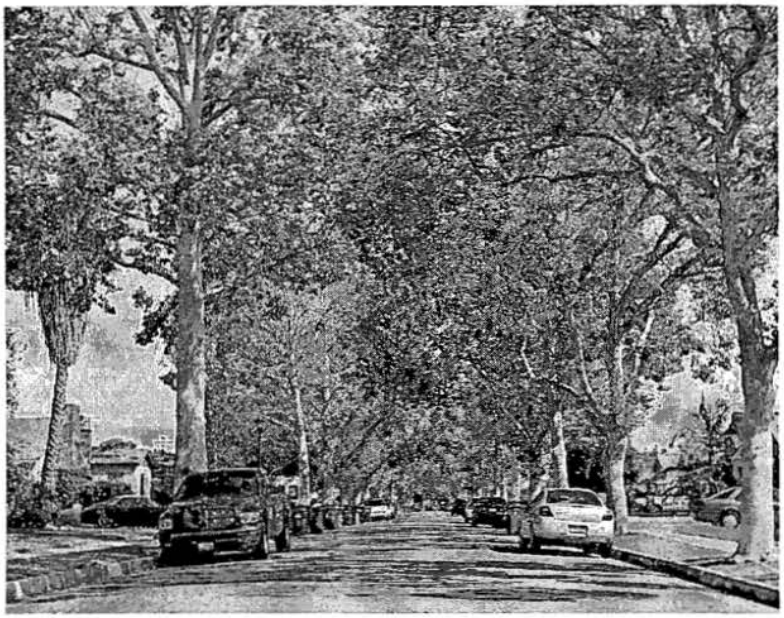

Figure 10: Street trees (*Norwalk, CA*).

Description

Healthy urban trees are powerful stormwater management tools. Leaves and branches catch and slow rain as it falls, helping it to soak into the ground. The plants themselves take up and store large quantities of water that would otherwise contribute to surface runoff. Part of this moisture is then returned to the air through evaporation to further cool the city. As an important element along sidewalks, street trees must be provided with conditions that allow them to thrive, including adequate uncompacted soil, water, and air.

The goal of adding street trees is to increase the canopy cover of the street, the percentage of its surface either covered by or shaded by vegetation. The selection, placement, and management of all elements in the street should enhance the longevity of a city's street trees and healthy, mature plantings should be retained and protected whenever possible.

Benefits to adding street trees include:

- Creation of shade to lower temperatures in a city, reduces energy use, and makes the street a more pleasant place in which to walk and spend time
- Slowing and capture of rainwater, helping it soak into the ground to restore local hydrologic functions and aquifers
- Improving air quality by cooling air, producing oxygen, and absorbing and storing carbon in woody plant tissues

SECTION 6 – DEFINITIONS

Best Management Practice (BMP)
Operating methods and/or structural devices used to reduce stormwater volume, peak flows, and/or pollutant concentrations of stormwater runoff through evapotranspiration, infiltration, detention, filtration, and/or biological and chemical treatment.

Bioretention
Soil and plant-based retention practice that captures and biologically degrades pollutants as water infiltrates through sub-surface layers containing microbes that treat pollutants. Treated runoff is then slowly infiltrated and recharges the groundwater.

Conveyance
The process of water moving from one place to another.

Design Storm
A storm whose magnitude, rate, and intensity do not exceed the design load for a storm drainage system or flood protection project.

Detention
Stormwater runoff that is collected at one rate and then released at a controlled rate. The volume difference is held in temporary storage.

Filtration
A treatment process that allows for removal of solid (particulate) matter from water by means of porous media such as sand, soil, vegetation, or a man-made filter. Filtration is used to remove contaminants.

Furniture Zone
The furniture zone is the area which lies between the curb and pedestrian zones and is intended to house utilities and pedestrian amenities.

Hardscape
Impermeable surfaces, such as concrete or stone, used in the landscape environment along sidewalks or in other areas used as public space.

Infiltration
The process by which water penetrates into soil from the ground surface.

Permeability/Impermeability
The quality of a soil or material that enables water to move through it, determining its suitability for infiltration.

Retention
The reduction in total runoff that results when stormwater is diverted and allowed to infiltrate into the ground through existing or engineered soil systems.

Runoff
Water from rainfall that flows over the land surface that is not absorbed into the ground.

Sedimentation
The deposition and/or settling of particles suspended in water as a result of the slowing of the water.

Stormwater
Water runoff from rain or snow resulting from a storm.

Transportation Corridor
A major arterial, state route, highway, or rail line used for the movement of people or goods by means of bus services, trucks, and vehicles.

January 24, 2014.

ORDINANCE NO. 14-1651

AN ORDINANCE OF THE CITY OF NORWALK AMENDING NORWALK MUNICIPAL CODE TITLE 18 BY REPEALING AND REPLACING CHAPTER 18.04 TO ESTABLISH LOW IMPACT DEVELOPMENT (LID) REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT PROJECTS

WHEREAS, the Municipal Separate Storm Sewer System (MS4) Permit (Order No. R-2012-0175) was adopted by the California Regional Water Quality Control Board, Los Angeles Region on November 8, 2012. Municipalities electing to prepare a Watershed Management Program or an Enhanced Watershed Management Program under this Permit are required to establish a LID Ordinance to lessen the impacts of development by using smart growth practices and to integrate LID practices and standards for storm water pollution mitigation for new development and redevelopment projects; and

WHEREAS, LID consists of building and landscape features designed to retain or filter storm water runoff; and

WHEREAS, that since February 26, 2012, the City has worked in conjunction with the Gateway Water Management Authority for the development of a LID Ordinance.

THE CITY COUNCIL OF THE CITY OF NORWALK DOES ORDAIN AS FOLLOWS:

Section 1. Chapter 18.04 of Title 18 of the Norwalk Municipal code is hereby repealed, provided, however, that such repeal shall not affect or excuse any violation thereof occurring prior to the effective date of this Ordinance. A new Chapter 18.04 is hereby added to read as shown in Exhibit "A," attached hereto and incorporated herein by this reference.

Section 2. This Ordinance has been reviewed with respect to the applicability of the California Environmental Quality Act (Public Resources Code Section 21000 et seq.) ("CEQA"). Pursuant to the State CEQA Guidelines (14 Cal Code Regs 15000 et seq.) (the "Guidelines"), the City Council has determined that the Low Impact Development requirements for new development and redevelopment projects will not have a significant effect on the environment and is listed under the City of Norwalk Local CEQA Guidelines as a Class 8 Categorical Exemption from the requirements of the California Environmental Quality Act. Staff is hereby directed to prepare and post a notice of exemption pursuant to Guidelines Section 15062.

Section 3. This Ordinance shall take affect thirty (30) days after its adoption. The City Clerk is directed to certify to the enactment of this Ordinance and to cause this ordinance to be published and/or posted as required by law.

PASSED, APPROVED, AND ADOPTED this 20th day of May 2014.

MARCEL RODARTE
MAYOR

ATTEST:

I, **Theresa Devoy**, City Clerk of the City of Norwalk, **DO HEREBY CERTIFY** that the foregoing Ordinance was introduced at a regular meeting of the City Council held April 15, 2014 and adopted as **Ordinance No. 14-1651** of the City of Norwalk at a regular meeting of the City Council held on May 20, 2014 and said Ordinance has been duly signed by the Mayor and attested by the City Clerk and that the same was approved and adopted by the following vote to wit:

AYES:	**Councilmembers Kelley, Mendez, and Vernola; Vice Mayor Shryock and Mayor Rodarte**
NOES:	**None**
ABSENT:	**None**

Theresa Devoy

THERESA DEVOY
CITY CLERK

EXHIBIT "A"

"18.04.010 Title.

This chapter shall be known as the City of Norwalk Stormwater Management and Discharge Control ordinance.

18.04.020 Findings.

A. The federal Clean Water Act (33 U.S.C. Section 1251, *et seq*.,) provides for the regulation and reduction of pollutants discharged into the waters of the United States by extending National Pollutant Discharge Elimination System ("NPDES") requirements to stormwater and urban runoff discharge into municipal storm drain systems.

B. Stormwater and urban runoff flows from individual properties onto streets, then through storm drains passing through the City and finally into the waters of the United States.

C. The City is a co-permittee under the "Waste Discharge Requirements for Municipal Separate Storm Sewer System ("MS4") discharges within the Coastal Watersheds of Los Angeles County, except those discharges originating from the City of Long Beach MS4, which also serves as a NPDES Permit under the federal Clean Water Act (NPDES No. CAS614001), as well as waste discharge requirements under California law (the Municipal NPDES Permit") and, as a co-permittee under the Municipal NPDES Permit, the City is required to adopt ordinances and implement procedures with respect to the entry of non-stormwater discharges into the municipal stormwater system.

D. Part III, Section A of the Municipal NPDES Permit requires the City to effectively prohibit non-stormwater discharges from within its boundaries, into that portion of the MS4 which it owns or operates and into watercourses, except where such discharges are: (1) in compliance with a separate individual or general NPDES permit, or (2) identified and in compliance with Part III.A (non-stormwater discharges) of the Municipal NPDES Permit, or (3) originate from federal, state or other facilities which the City is preempted from regulating, and further provides that compliance with the terms of the Municipal NPDES Permit through the development and implementation of the programs described in the Municipal NPDES Permit will constitute compliance with the discharge prohibition in the Municipal NPDES Permit.

E. Part VI, Section A.2 of the Municipal NPDES Permit requires the City to establish and maintain the legal authority necessary to control discharges to and from those portions of the MS4 over which it has jurisdiction, so as to comply with the Municipal NPDES Permit and to specifically prohibit certain discharges identified in the Municipal NPDES Permit.

F. The Municipal NPDES Permit contemplates the development of a Watershed Management Program in which the City will participate, which will in turn require the development and the implementation of programs for, among other things, the elimination of illicit connections and illicit discharges, development planning, development construction, and public information and education requirements, and which may require the later adoption of additional legal authority to implement such programs as they are developed by the permittees and approved by the Regional Board.

G. In order to control, in a cost-effective manner, the quantity and quality of stormwater and urban runoff to the maximum extent practicable, the adoption of the ordinance codified in this chapter is essential.

18.04.030 Purpose and intent.

A. The purpose of this chapter is to ensure the future health, safety and general welfare of the citizens of the City and the water quality of the receiving waters of the County of Los Angeles and surrounding coastal areas by:

1. Reducing pollutants in stormwater discharges to the maximum extent practicable;

2. Regulating illicit connections and illicit discharges and reducing the level of contamination of stormwater and urban runoff in the municipal stormwater system; and

3. Regulating non-stormwater discharges to the municipal stormwater system.

B. The intent of this chapter is to protect and enhance the quality of watercourses, water bodies, and wetlands within the City in a manner consistent with the federal Clean Water Act, the California Porter-Cologne Water Quality Control Act and the Municipal NPDES Permit.

C. This chapter is also intended to provide the City with the legal authority necessary to control discharges to and from those portions of the municipal stormwater system over which it has jurisdiction as required by the Municipal NPDES Permit, and fully and timely comply with the terms of the Municipal NPDES Permit while the Watershed Management Program is being developed by the permittees under the Municipal NPDES Permit, and in contemplation of the subsequent amendment of this chapter or adoption by the City of additional provisions of this chapter to implement the subsequently adopted Watershed Management Program, or other programs developed under the Municipal NPDES Permit.

D. This chapter also sets forth requirements for the construction and operation of certain commercial development, new development and redevelopment and other projects (as further defined herein) which are intended to ensure compliance with the stormwater mitigation measures prescribed in the current MS4 Permit This chapter authorizes the Director to define and adopt applicable best management practices and other stormwater pollution control measures, as provided herein, to carry out all inspections including entering entities discharging to the MS4, conduct surveillance, conduct monitoring, cite infractions and to impose fines pursuant to this chapter. Except as otherwise provided herein, the Director shall administer, implement and enforce the provisions of this section.

E. The City Council shall approve and enter into interagency agreements as deemed necessary by the City Council to control the contribution of pollutants of the shared MS4.

18.04.040 Definitions.

Except as specifically provided herein, any term used in this chapter shall be defined as that term is defined in the current Municipal NPDES Permit, or if it is not specifically defined in the Municipal NPDES Permit, then as such term is defined in the Federal Clean Water Act, as amended, or the regulations promulgated thereunder. If the definition of any term contained in this section conflicts with the definition of the same term in the current Municipal NPDES Permit, then the definition contained in the Municipal NPDES Permit shall govern. The following words and phrases shall have the following meanings when used in this chapter:

"Area susceptible to runoff" means any surface directly exposed to precipitation or in the path of runoff caused by precipitation which path leads off the parcel on which the surface is located.

"Automotive service facilities" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) and North American Industry Classification System (NAICS) codes. For inspection purposes, Permittees need not inspect facilities with SIC codes 5013, 5014, 5511, 5541, 7532-7534, and 7536-7539 provided that these facilities have no outside activities or materials that may be exposed to stormwater

"Best Management Practices (BMPs)" means practices or physical devices or systems designed to prevent or reduce pollutant loading from stormwater or non-stormwater discharges to receiving waters, or designed to reduce the volume of stormwater or non-stormwater discharged to the receiving water. Examples of BMPs may include public education and outreach, proper planning of development projects, proper cleaning of catch basin inlets, and proper sludge- or waste-handling and disposal, among others.

"Biofiltration" means a LID BMP that reduces stormwater pollutant discharges by intercepting rainfall on vegetative canopy, and through incidental infiltration and/or evapotranspiration, and filtration. Incidental infiltration is an important factor in achieving the required pollutant load reduction. Therefore, the term "biofiltration" as used in this chapter is defined to include only systems designed to facilitate incidental infiltration or achieve the equivalent pollutant reduction as biofiltration BMPs with an underdrain (subject to approval by the Regional Board's Executive Officer). Biofiltration BMPs include bioretention systems with an underdrain and bioswales.

"Bioretention" means a LID BMP that reduces stormwater runoff by intercepting rainfall on vegetative canopy, and through evapotranspiration and infiltration. The bioretention system typically includes a minimum 2-foot top layer of a specified soil and compost mixture underlain by a gravel-filled temporary storage pit dug into the in-situ soil. As defined in this Ordinance, a bioretention BMP may be designed with an overflow drain, but may not include an underdrain. When a bioretention BMP is designed or constructed with an underdrain it is regulated by the Municipal NPDES Permit as biofiltration.

"Bioswale" means a LID BMP consisting of a shallow channel lined with grass or other dense, low-growing vegetation. Bioswales are designed to collect stormwater runoff and to achieve a uniform sheet flow through the dense vegetation for a period of several minutes.

"City" means the City of Norwalk, California.

"Clean Water Act (CWA)" means the Federal Water Pollution Control Act enacted in 1972, by Public Law 92-500, and amended by the Water Quality Act of 1987. The Clean Water Act prohibits the discharge of pollutants to Waters of the United States unless the discharge is in accordance with an NPDES permit.

"Commercial development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Commercial Malls" means any development on private land comprised of one or more buildings forming a complex of stores which sells various merchandise, with interconnecting walkways enabling visitors to easily walk from store to store, along with parking area(s). A commercial mall includes, but is not limited to: mini-malls, strip malls, other retail complexes, and enclosed shopping malls or shopping centers

"Construction" means any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that result in land disturbance. Construction does not include emergency construction activities required to immediately protect public health and safety or routine maintenance activities required to maintain the integrity of structures by performing minor repair and restoration work, maintain the original line and grade, hydraulic capacity, or original purposes of the facility. See "Routine Maintenance" definition for further explanation. Where clearing, grading or excavating of underlying soil takes place during a repaving operation, State General Construction Permit coverage by the State of California General Permit for Storm Water

Discharges Associated with Industrial Activities or for Stormwater Discharges Associated with Construction Activities is required if more than one acre is disturbed or the activities are part of a larger plan

"Control" means to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

"Development" means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single family, multi-unit or planned unit development); industrial, commercial, retail and other nonresidential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Directly adjacent" means situated within two hundred (200) feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

"Director" means the City's Director of Community Development or his or her designee.

"Discharge" means when used without qualification the discharge of a pollutant.

"Discharge of a pollutant" means any addition of any pollutant or combination of pollutants to waters of the United States from any point source or, any addition of any pollutant or combination of pollutants to the waters of the contiguous zone or the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by a state, municipality, or other person which do not lead to treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works.

"Discharging" directly means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

"Discretionary project" is defined in the same manner as Section 15357 of the Guidelines for Implementation of the California Environmental Quality Act contained in Title 14 of the California Code of Regulations, as amended, and means a project which requires the exercise of judgment or deliberation when the City decides to approve or disapprove a particular activity, as distinguished from situations where the City merely has to determine whether there has been conformity with applicable statutes, ordinances or regulations.

"Disturbed area" means an area that is altered as a result of clearing, grading, and/or excavation.

"Environmentally sensitive area (ESA)" means an area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments (California Public Resources Code § 30107.5). Areas subject to storm water mitigation requirements are areas designated as Significant Ecological Areas by the County of Los Angeles (Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976) and amendments); an area designated as a Significant Natural Area by the California Department of Fish and Games Significant Natural Areas Program, provided that area has been field verified by the Department of Fish and Game; an area listed in the Basin Plan as supporting the Rare, Threatened, or Endangered Species (RARE) beneficial use; and an area identified by the City as environmentally sensitive.

"Flow-through treatment BMPs" means a modular, vault type "high flow biotreatment" devices contained within an impervious vault with an underdrain or designed with an impervious liner and an underdrain.

"Full Capture System" means any single device or series of devices, certified by the Executive Officer, that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate Q resulting from a one-year, one-hour storm in the sub-drainage area.

"Good housekeeping practices" means common practices related to the storage, use or cleanup of materials, performed in a manner that minimizes the discharge of pollutants. Examples include, but are not limited to, purchasing only the quantity of materials to be used at a given time, use of alternative and less environmentally harmful products, cleaning up spills and leaks, and storing materials in a manner that will contain any leaks or spills.

"General Construction Activities Storm Water Permit (GCASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of stormwater from construction activities under certain conditions.

"General Industrial Activities Storm Water Permit (GIASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of stormwater from certain industrial activities under certain conditions.

"Green Roof" means a LID BMP using planter boxes and vegetation to intercept rainfall on the roof surface. Rainfall is intercepted by vegetation leaves and through evapotranspiration. Green roofs may be designed as either a bioretention BMP or as a biofiltration BMP. To receive credit as a bioretention BMP, the green roof system planting medium shall be of sufficient depth to provide capacity within the pore space volume to contain the design storm depth and may not be designed or constructed with an underdrain.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent (25%) or greater and where grading contemplates cut or fill slopes.

"Illicit connection" means any human-made conveyance that is connected to the storm drain system without a permit, excluding gutters, roof-drains and other similar connections. Examples include channels, pipelines, conduits, inlets or outlets that are connected directly to the storm drain system.

"Illicit discharge" means any discharge to the storm drain system that is prohibited under local, state or federal statutes, ordinances, codes or regulations. This includes all non-stormwater discharges except discharges pursuant to a separate NPDES permit and discharges that are exempted or conditionally exempted in accordance with Part III the Municipal NPDES permit.

"Industrial/Commercial Facility" means any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by either the Standard Industrial Classifications (SIC) or the North American Industry Classification System (NAICS). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

"Industrial Park" means land development that is set aside for industrial development. Industrial parks are usually located close to transport facilities, especially where more than one transport modalities coincide: highways, railroads, airports, and navigable rivers. It includes office parks, which have offices and light industry.

"Infiltration BMP" means a LID BMP that reduces stormwater runoff by capturing and infiltrating the runoff into in-situ soils or amended onsite soils. Examples of infiltration BMPs include infiltration basins, dry wells, and pervious pavement.

"Infiltration" means the downward entry of water into the surface of the soil.

"Low Impact Development (LID)" consists of building and landscape features designed to retain or filter stormwater runoff.

"Material" means any substance including, but not limited to: garbage and debris; lawn clippings, leaves, and other vegetation; biological and fecal waste; sediment and sludge; oil and grease; gasoline; paints, solvents, cleaners, and any fluid or solid containing chemicals.

"Municipal NPDES Permit" means the Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach (Order No. R4-

2012-0175), NPDES Permit No. CAS00401), issued by the California Regional Water Quality Control Board—Los Angeles Region, and any successor permit to that permit.

"Municipal Separate Storm Sewer System (MS4)" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

1. Owned or operated by a state, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, stormwater, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

2. Designed or used for collecting or conveying stormwater;

3. Which is not a combined sewer; and

4. Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR Section 122.2.

"New development" means land-disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Non-stormwater discharge" means any discharge to a municipal stormwater system that is not composed entirely of stormwater.

"NPDES permit" means any waste discharge requirements issued by the Regional Board or the State Water Resources Control Board in the form of an NPDES permit pursuant to Water Code Section 13370 (other than the Municipal NPDES Permit).

"Outfall" means a point source as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances with connect segments of the same stream or other waters of the United Sates and are used to convey waters of the United States. (40 CFR Section 122.26(b)(9))

"Parking lot" means land area or a facility for the parking or storage of motor vehicles used for businesses, commerce, industry or personal use with a lot size of five thousand (5,000) square feet or more of surface area, or with twenty-five (25) or more parking spaces.

"Planning priority projects" means those projects specified in Section 18.04.105.C of this chapter that are required to incorporate appropriate storm water mitigation measures into the design plan for their respective projects.

"Pollutant" means those pollutants defined in Section 502(6) of the federal Clean Water Act (33 U.S.C. Section 1362(6)), or incorporated into California Water Code Section 13373. Examples of pollutants include, but are not limited to the following:

1. Commercial and industrial waste (such as fuels, solvents, detergents, plastic pellets, hazardous substances, fertilizers, pesticides, slag, ash and sludge);

2. Metals such as cadmium, lead, zinc, copper, silver, nickel, chromium, and nonmetals such as phosphorus and arsenic;

3. Petroleum hydrocarbons (such as fuels, lubricants, surfactants, waste oils, solvents, coolants and grease);

4. Excessive eroded soils, sediment and particulate materials in amounts which may adversely affect the beneficial use of the receiving waters, flora or fauna of the state;

5. Animal wastes (such as discharge from confinement facilities, kennels, pens, recreational facilities, stables and show facilities); and

6. Substances having characteristics such as pH less than six or greater than nine, or unusual coloration or turbidity, or excessive levels of fecal coliform, or fecal streptococcus, or enterococcus.

The term "pollutant" shall not include uncontaminated stormwater, potable water or reclaimed water generated by a lawfully permitted water treatment facility.

"Project" means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (California Public Resources Code Section 21065).

"Rainfall Harvest and Use" means a LID BMP system designed to capture runoff, typically from a roof but can also include runoff capture from elsewhere within the site, and to provide for temporary storage until the harvested water can be used for irrigation or non-potable uses. The harvested water may also be used for potable water uses if the system includes disinfection treatment and is approved for such use by the local building department (Order No. R4-2012-0175).

"Receiving Water" means "water of the United States" into which waste and/or pollutants are or may be discharged.

"Redevelopment" means land-disturbing activity that result in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of routine maintenance activity; and land disturbing activity related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Regional Board" means the California Regional Water Quality Control Board—Los Angeles Region.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC Code 5812).

"Retail gasoline outlet" means any facility engaged in selling gasoline and lubricating oils.

"Routine Maintenance" includes, but is not limited to projects conducted to:

1. Maintain the original line and grade, hydraulic capacity, or original purpose of the facility;

2. Perform as needed restoration work to preserve the original design grade, integrity and hydraulic capacity of flood control facilities;

3. Includes road shoulder work, regrading dirt or gravel roadways and shoulders and performing ditch cleanouts;

4. Update existing lines and facilities, which include replacing existing lines with new materials or pipes, to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity; and

5. Repair leaks.

Routine maintenance does not include construction of new lines or facilities resulting from compliance with applicable codes, standards and regulations.

"Runoff" means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

"Site" means the land or water area where any facility or activity is physically located or conducted, including adjacent land used in connection with the facility or activity.

"Source control BMP" means any schedule of activities, prohibition of practices, maintenance procedures, managerial practices or operational practices that aim to prevent stormwater pollution by reducing the potential for contamination at the source of pollution.

"Standard urban stormwater mitigation plan" or "SUSMP" means a report submitted by an applicant for approval by the Director prior to issuance of a building, grading, planning or similar permit outlining the necessary LID requirements and BMPs which must be incorporated into design plans for development or redevelopment projects.

"Storm Drain System" means any facility or any parts of the facility, including streets, gutters, conduits, natural or artificial drains, channels and watercourse that are used for the purpose of collecting, storing, transporting or disposing of stormwater and are located within the City.

"Stormwater runoff" means that part of precipitation (rainfall) which travels via flow across a surface to the MS4 or receiving waters from impervious, semi-pervious or pervious surfaces. When all other factors are equal, runoff increases as the perviousness of a surface decreases.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of stormwater and urban runoff pollution (e.g. canopy, structural enclosure). Structural BMPs may include both treatment control BMPs and source control BMPs.

"Treatment" means the application of engineered systems that use physical, chemical or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological or chemical process.

"Urban runoff" means surface water flow produced by non-stormwater resulting from residential, commercial and industrial activities involving the use of potable and nonpotable water.

18.04.050 Construction and application.

This chapter shall be construed to assure consistency with the requirements of the federal Clean Water Act and acts amendatory or supplementary to the Federal Clean Water Act, applicable implementing regulations, and the Municipal NPDES Permit, and any amendment, revision or reissuance of the Municipal NPDES Permit.

18.04.060 No taking.

The provisions of this chapter shall not operate to deprive any property owner of substantially all of the market value of such owner's property or otherwise constitute an unconstitutional taking without compensation.

18.04.070 Prohibited activities.

A. Illicit Discharges and Connections. It is prohibited to commence, establish, use, maintain or continue any illicit connections to the MS4 or any illicit discharges to the MS4. This prohibition against illicit connections applies to the use, maintenance or continuation of any illicit connection, whether that connection was established prior to or after the effective date of this chapter.

B. Littering. No person shall throw, deposit, place, leave, maintain, keep or permit to be thrown, deposited, placed, left or maintained or kept, any refuse, rubbish, garbage, or any other discarded or abandoned objects, articles or accumulations, in or upon any street, alley, sidewalk, storm drain, inlet, catch basin conduit or drainage structure, business place, or upon any or private plot of land in the City, so that the same might be or become a pollutant. No person shall throw or deposit litter in any fountain, pond, lake, stream, or other body of water within the City. This section shall not apply to refuse, rubbish or garbage deposited in containers, bags or other appropriate receptacles which are placed in designated locations for regular solid waste pick-up and disposal.

C. Disposal of Landscape Debris. No person shall dispose of leaves, dirt, or other landscape debris into the municipal separate stormwater system.

D. Non-stormwater Discharges. The following non-stormwater discharges into the MS4 are prohibited unless in compliance with a separate NPDES permit or pursuant to a discharge exemption by the Regional Board, the Regional Board's Executive Officer, or the State Water Resources Control Board:

1. The discharge of untreated wash waters to the MS4 when gas stations, auto repair garages, or other type of automotive service facilities are cleaned;

2. The discharge of untreated wastewater to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;

3. To the maximum extent practicable, discharges to the MS4 from areas where repair of machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze, is undertaken;

4. Discharges of untreated runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;

5. Discharges of commercial/municipal swimming pool filter backwash to the MS4;

6. Discharges of untreated runoff from the washing of toxic materials from paved or unpaved areas to the MS4; provided, however, that nonindustrial and noncommercial activities which incidentally generate urban runoff, such as the hosing of sidewalks, shall be excluded from this prohibition;

7. To the maximum extent practicable, discharges to the MS4 from washing impervious surfaces in industrial/commercial areas which results in a discharge of untreated runoff to the MS4, unless specifically required by state law, or the City's Municipal code, or Los Angeles County's Health and Safety Codes, or permitted under a separate NPDES permit;

8. Discharges from the washing out of concrete trucks into the MS4;

9. Discharges to the MS4 of any pesticide, fungicide or herbicide, banned by the USEPA or the California Department of Pesticide Regulation; or

10. The disposal of hazardous wastes into trash containers used for municipal trash disposal where such disposal causes or threatens to cause a direct or indirect discharge to the MS4.

E. Car Washing. No motor vehicle, boat, trailer, or other type of mobile transportation may be washed, other than at a commercial carwash, unless such vehicle is being washed by:

1. A resident at their residence using a hand-held bucket or a water hose equipped with an automatic shutoff nozzle as long as water does not flow onto streets; or

2. A business that has an approved car wash facility for its fleet vehicles, provided that water does not flow onto streets.

18.04.080 Exempted discharges, conditionally exempted discharges or designated discharges.

A. Discharges from those activities specifically identified in, or pursuant to, Part III.A.1-3 of the Municipal NPDES Permit as being exempted discharges, conditionally exempted discharges or designated discharges shall not be considered a violation of this chapter; provided that, consistent with Part III.A.1-3 of the Municipal NPDES Permit:

1. Any applicable BMPs developed pursuant to the Municipal NPDES Permit are implemented to minimize any adverse impacts from such identified sources;

2. The discharger meets all notification, reporting and recordkeeping requirements; and

3. The discharge has conducted all applicable monitoring requirements.

B. Discharges in Violation of the Municipal NPDES Permit. Any discharge that would result in or contribute to a violation of the Municipal NPDES Permit, either separately or in combination with other discharges, is prohibited. Liability for any such discharge shall be the responsibility of the person(s) causing or responsible for the discharge, and such person(s) shall defend, indemnify and hold harmless the City from all losses, liabilities, claims or causes of actions in any administrative or judicial action relating to such discharge.

18.04.090 Good housekeeping provisions.

Owners and occupants of property within the City shall comply with the following requirements:

A. Septic Waste. No person shall leave, deposit, discharge, dump, or otherwise expose any chemical or septic waste to precipitation in an area where a discharge to City streets or MS4 may or does occur.

B. Use of Water. Runoff of water used for irrigation purposes shall be minimized to the maximum extent practicable. Runoff of water from the permitted washing down of paved areas shall be minimized to the maximum extent practicable.

C. Storage of Materials, Machinery and Equipment. Machinery or equipment that is to be repaired or maintained in areas susceptible to or exposed to stormwater, shall be placed in a manner so that leaks, spills and other maintenance-related pollutants are not discharged to the MS4.

D. Removal and Disposal of Debris from Industrial/Commercial Motor Vehicle Parking Lots. Industrial/commercial motor vehicle parking lots with more than twenty-five (25) parking spaces that are located in areas potentially exposed to stormwater shall be swept regularly or other equally effective measures shall be utilized to remove debris from such parking lots.

E. Food Wastes. Food wastes generated by nonresidential food service and food distribution sources shall be properly disposed of and in a manner so such wastes are not discharged to the MS4.

F. Best Management Practices. Best management practices shall be used in areas exposed to stormwater for the removal and lawful disposal of all fuels, chemicals, fuel and chemical wastes, animal wastes, garbage, batteries, or other materials which have potential adverse impacts on water quality.

G. Maintenance of Structural BMPs. Structural BMPs shall be properly operated and maintained, consistent with the approved SUSMP. Records and documentation of such maintenance shall be provided to the Director upon request.

18.04.100 Requirements for industrial/commercial and construction activities.

A. Industrial/Commercial and Construction Related Dischargers Generally. Each discharger associated with industrial/commercial activity or construction activity, or other discharger described in any general NPDES permit addressing such discharges, as may be issued by the U.S. Environmental Protection Agency, the State Water Resources Control Board, or the Regional Board shall comply with all requirements of such NPDES permit and the City's development construction program. Each discharger identified in an individual NPDES permit shall comply with and undertake all activities required by such permit. Proof of compliance with any such NPDES permit and the City's development construction program may be required in a form acceptable to the Director prior to the issuance of any grading, building or occupancy permits, or any other type of permit or license issued by the City.

B. Source Control BMPs for Industrial/Commercial Facilities. Industrial/commercial facilities shall implement the effective source control BMPs listed in Table 10 of Part VI.D.6.f. of the Municipal NPDES Permit, unless a particular pollutant generating activity does not occur on a facility's site.

18.04.105 Standard urban stormwater mitigation plan (SUSMP) and low impact development (LID) requirements for new development and redevelopment projects.

A. Objective. Pursuant to Part VI.D.7.b of the Municipal NPDES Permit, the provisions of this section establish requirements for construction activities and facility operations of development and redevelopment projects to comply with the current Municipal NPDES Permit to lessen the water quality impacts of development by using smart growth practices and integrate LID practices and standards for stormwater pollution mitigation through means of infiltration, evapotranspiration, biofiltration, and rainfall harvest and use. Except as otherwise provided herein, the City shall administer, implement and enforce the provisions of this section.

B. Scope. This section contains requirements for stormwater pollution control measures in development and redevelopment projects and authorizes the City to further define and adopt stormwater pollution control measures, and to develop LID principles and requirements, including but not limited to the objectives and specifications for integration of LID strategies. As specified in this section, certain Planning Priority Projects shall meet the requirements of this section through the preparation and submittal of a standard urban stormwater mitigation plan (SUSMP), which shall include the applicable LID requirements set forth in this section as an element of the SUSMP.

C. Applicability – Planning Priority Projects. The following development and redevelopment projects shall be designated as Planning Priority Projects, which are subject to City conditioning and approval for the design and implementation of post-construction controls to mitigate storm water pollution prior to completion of the projects, and shall meet the requirements of this section:

1. New Development Projects.

a. All development projects equal to one (1) acre or greater of disturbed area that adds more than 10,000 square feet of impervious surface area.

b. Industrial parks 10,000 square feet or more of surface area.

c. Commercial malls 10,000 square feet or more of surface area.

d. Retail gasoline outlets with 5,000 square feet or more of surface area.

e. Restaurants (Standard Industrial Classification (SIC) of 5812) with 5,000 square feet or more of surface area.

f. Parking lots with 5,000 square feet or more of impervious surface area, or with 25 or more parking spaces.

g. Streets and roads construction of 10,000 square feet or more of impervious surface area. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects.

h. Automotive service facilities (Standard Industrial Classification (SIC) of 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) 5,000 square feet or more of surface area.

i. Projects located in or directly adjacent to, or discharging directly to an Environmentally Sensitive Area (ESA), where the development will:

i. Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and

ii. Create 2,500 square feet or more of impervious surface area.

j. Single-family hillside homes.

2. Redevelopment Projects

a. Land disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site on Planning Priority Project categories.

b. Where Redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, the entire project must be mitigated.

c. Where Redevelopment results in an alteration of less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, only the alteration must be mitigated, and not the entire development.

d. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.

e. Existing single-family dwelling and accessory structures are exempt from the Redevelopment requirements unless such projects create, add, or replace 10,000 square feet of impervious surface area.

f. Specific Requirements. The site for every Planning Priority Project shall be designed to control pollutants, pollutant loads, and runoff volume to the maximum extent feasible by minimizing impervious surface area and controlling runoff from impervious surfaces through infiltration, evapotranspiration, bioretention and/or rainfall harvest and use. In addition, the following specific requirements apply:

i. New Single-Family Hillside Homes. A new single-family hillside home development project shall include mitigation measures to:

a) Conserve natural areas;

b) Protect slopes and channels;

c) Provide storm drain system stenciling and signage;

d) Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability; and

e) Direct surface flow to vegetated areas before discharge, unless the diversion would result in slope instability.

ii. Street and Road Construction of 10,000 square feet or more. Street and road construction of 10,000 square feet or more of impervious surface shall follow the City's Green Street Manual developed by the Director and approved by City Council resolution. The City's Green Street Manual shall be based on the USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets (December 2008 EPA-833-F-08-009).

iii. Remainder of Planning Priority Projects Require a SUSMP. Except for the projects listed in paragraphs (1) and (2) of subsection D of this section, all other Planning Priority Projects shall prepare and submit to the Director for review and approval a SUSMP which shall also contain LID requirements consistent with Parts VI.D.7.c and VI.D.7.d(iii) of the Municipal NPDES Permit. In addition, Planning Priority Projects subject to this paragraph (3) shall do the following:

a) Incorporate the SUSMP into Project Plans. An applicant for a Planning Priority Project identified in paragraph (3) of subsection D of this section shall incorporate into the applicant's project plans a Storm Water Mitigation Plan (SWMP), which includes those BMPs necessary to control storm water pollution from construction activities and facility operations, as set forth in the SUSMP applicable to the applicant's project. Structural or Treatment Control BMPs (including, as applicable, post-construction treatment control BMPs) set forth in project plans shall meet the design standards set forth in the SUSMP and the current Municipal NPDES Permit.

b) Verify Maintenance of BMPs. If a project applicant has included or is required to include structural or treatment control BMPs in project plans, the applicant shall provide verification of maintenance provisions. The verification shall include the applicant's signed statement, as part of its project application, accepting responsibility for all structural and treatment control BMP maintenance until such time, if any, the property is transferred.

D. Issuance of Discretionary Permits. No discretionary permit may be issued for any Planning Priority Project identified in this section until the Director confirms the project plans comply with the applicable requirements of this section.

E. Issuance of Certificates of Occupancy. As a condition for issuing a certificate of occupancy for a Planning Priority Project identified in this section, the Director shall require facility operators and/or owners to build all the stormwater pollution control BMPs and structural or treatment control BMPs that are shown on the approved project plans and to submit a signed certification statement stating that the site and all structural or treatment control BMPs will be maintained in compliance with the SUSMP and other applicable regulatory requirements.

F. Transfer of Properties Subject to Requirement for Maintenance of Structural and Treatment Control BMPs.

1. The transfer or lease of a property subject to a requirement for maintenance of structural and treatment control BMPs shall include conditions requiring the transferee and its successors and assigns to either (a) assume responsibility for maintenance of any existing structural or treatment control BMP or (b) to replace an existing structural or treatment control BMP with new control measures or BMPs meeting the then current standards of the City and the SUSMP. Such requirement shall be included in any sale or lease agreement or deed for such property. The condition of transfer shall include a provision that the successor property owner or lessee conduct maintenance inspections of all structural or treatment control BMPs at least once a year and retain proof of inspection.

2. For residential properties where the structural or treatment control BMPs are located within a common area which will be maintained by a homeowners

association, language regarding the responsibility for maintenance shall be included in the projects conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what stormwater management facilities are present, signs that maintenance is needed, and how the necessary maintenance can be performed. The transfer of this information shall also be required with any subsequent sale of the property.

3. If structural or treatment control BMPs are located within an area proposed for dedication to a public agency, said BMPs shall be the responsibility of the developer until the dedication is accepted by the public agency.

G. CEQA. Provisions of this section shall be complementary to, and shall not replace, any applicable requirements for stormwater mitigation required under the California Environmental Quality Act.

18.04.110 Enforcement.

A. Violations Deemed a Public Nuisance.

1. The following violations shall be deemed a public nuisance:

a. Any condition caused or permitted to exist in violation of any of the provisions of this chapter; or

b. Any failure to comply with any applicable requirement of either the SUSMP or an approved stormwater mitigation plan with respect to a property; or

c. Any false certification or verification, or any failure to comply with a certification or verification provided by a project applicant or the applicant's successor in interest; or

d. Any failure to properly operate and maintain any structural or treatment control BMP on a property in accordance with an approved stormwater mitigation plan or the SUSMP, is determined to be a threat to the public health, safety and welfare, is declared and deemed a public nuisance, and may be abated or restored by any Director, and a civil or criminal action to abate, enjoin or otherwise compel the cessation of such nuisance may be brought by the City Attorney.

2. The cost of such abatement and restoration shall be borne by the owner of the property and the cost shall be billed to the owner of the property, as provided by law or ordinance for the recovery of nuisance abatement costs,

3. If any violation of this chapter constitutes a seasonal and recurrent nuisance, the Director shall so declare. The failure of any person to take appropriate annual precautions to prevent stormwater pollution after written notice of a determination under this section shall constitute a public nuisance and a violation of this chapter.

B. Concealment. Causing, permitting, aiding, abetting or concealing a violation of any provision of this chapter shall constitute a violation of such provision.

C. Civil Actions. In addition to any other remedies provided in this chapter, any violation of this chapter may be enforced by civil action brought by the City. In any such action, the City may seek any or all of the following remedies:

1. A temporary and/or permanent injunction;

2. Assessment of the violator for the costs of any investigation, inspection or monitoring survey which led to the establishment of the violation, and for the reasonable costs of preparing and bringing legal action under this section;

3. Costs incurred in removing, correcting or terminating the adverse effects resulting from violation;

4. Compensatory damages for loss or destruction to water quality, wildlife, fish and aquatic life.

D. Administrative Enforcement Powers. In addition to the other enforcement powers and remedies established by this chapter, the Director has the authority to utilize the following administrative remedies:

1. Cease and Desist Orders. When a discharge has taken place or is likely to take place in violation of this chapter, the Director may issue an order to cease and desist such discharge, or practice or operation likely to cause such discharge and direct that those persons not complying shall: (a) comply with the requirement; (b) comply with a time schedule for compliance; and (c) take appropriate remedial or preventive action to prevent the violation from recurring.

2. Notice to Clean. Whenever the Director finds any oil, earth, debris, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or any other material of any kind, in or upon the sidewalk abutting or adjoining any parcel of land, or upon any parcel of land or grounds, which may result in pollutants entering the MS4 or a non-stormwater discharge to the MS4, he or she may give notice to the owner or occupant of the adjacent property to remove such oil earth, debris, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or other material, in any manner that he or she may reasonably provide. The recipient of such notice shall undertake the activities as described in the notice.

E. Penalties. Violation of this chapter shall be punishable as provided in Chapter 1.16 of this code. Each day that a violation continues shall constitute a separate offense.

F. Permit Revocation. To the extent the City makes a provision of this chapter or any identified BMP a condition of approval to the issuance of a permit or license, any person in violation of such condition is subject to the permit revocation procedures set forth in this code.

G. Burden of Proof. In an enforcement action, the burden of proof shall be on the person who is the subject of such action to establish that the reduction or elimination of the discharge to the maximum extent practicable has been accomplished through compliance with the best management practices available, including applicable monitoring, notifications and reporting requirements.

H. Remedies. Remedies under this chapter are in addition to and do not supersede or limit any and all other available remedies, civil or criminal. The remedies provided for in this chapter shall be cumulative and not exclusive.

18.04.120 Fees

A. Fees for Plan Reviews, Inspections, Violations Corrections and tasks associated with this Section shall be established by Resolution of the City Council.

RESOLUTION NO. 6758

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF PICO RIVERA, CALIFORNIA, APPROVING A GREEN STREETS POLICY

WHEREAS, on November 8, 2012, the California Regional Water Quality Control Board, Los Angeles Region (hereinafter "Regional Board") adopted Order No. R4-2012-0175, NPDES Permit No. CAS 004001, the Municipal Separate Storm Sewer Permit for Los Angeles County (hereinafter "MS4 Permit"); and

WHEREAS, among other things, the MS4 Permit requires the City of Pico Rivera (hereinafter "City") and other subject MS4 permittees to establish a "Green Streets" policy to reduce stormwater runoff discharges from municipal and private streets to receiving waters; and

WHEREAS, by this resolution, the City intends to implement a Green Streets program in accordance with USEPA and other applicable guidelines through: (1) the Planning and Land Development/Standard Urban Stormwater Mitigation Plan (SUSMP) program that will require Low Impact Development (LID) controls for private developments that call for the construction of new streets 10,000 square feet or more; and (2) its public agency program for public street projects that exceed this threshold; and

WHEREAS, Green Street LID techniques shall be incorporated into the City's Planning and Land Use Development/SUSMP program and triggered by: 1) residential, commercial, or industrial developments that include streets 10,000 square feet or more in area; or 2) street and road redevelopment resulting in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already redeveloped site; and

WHEREAS, Green Street LID techniques shall also apply to the construction of any new public street or roadway, as a capital improvement project, triggered by the 10,000 square foot threshold, and

WHEREAS, the City's selection of LID techniques shall generally include but not be limited to bio-swales, bio-retention curb extensions and sidewalk planters, and permeable unit pavers—the selection of which shall depend on project location, soil conditions, average daily traffic, and cost;

WHEREAS, green controls for streets and roadways shall be designed to infiltrate, or treat if infiltration is infeasible, reduce the volume of runoff resulting from a 85th percentile 24 hour storm event, to the maximum extent practicable.

NOW, THEREFORE, THE CITY COUNCIL OF PICO RIVERA DOES HEREBY RESOLVE THE FOLLOWING:

SECTION 1. Direct the Director of Public Works to implement Green Street for publicly owned street and road projects that add 10,000 square feet or more of impervious area following the USEPA's Wet Weather With Green Infrastructure guidance (December 2008 EPA- F-08-009) and City of Pico Rivera Green Street Manual to the maximum extent practicable.

SECTION 2. Directs the Director of Public Works to implement Green Streets for transportation corridors as described in the City of Pico Rivera's Green Streets Manual.

SECTION 3. Routine maintenance including, but not limited to, slurry seals, grind and overlay, chip seal, and reconstruction to maintain original line grade are exempt from the Green Streets Policy.

SECTION 4. The Director of Public Works is authorized to modify the City of Pico Rivera's Green Streets Manual from time to time to maintain consistency with the most current MS4 permit.

SECTION 5. The City Clerk shall certify to the passage and adoption of this resolution and hereafter the same shall be in full force and effect.

APPROVED AND ADOPTED this 22nd day of April, 2014.

Brent A. Tercero, Mayor

ATTEST:

Anna M. Jerome, City Clerk

Arnold M. Alvarez-Glasman, City Attorney

ABSTAIN: Tercero

ORDINANCE NO. 1086

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF PICO RIVERA, CALIFORNIA, AMENDING PICO RIVERA MUNICIPAL CODE CHAPTER 16.04, STORM WATER AND URBAN RUNOFF POLLUTION PREVENTION

WHEREAS, the City is authorized by Article XI, Section 5 and Section 7 of the State Constitution to exercise the police power of the State by adopting regulations to promote public health, public safety and general prosperity; and

WHEREAS, the City is a permittee under the California Regional Water Quality Control Board, Los Angeles Region Order No. R4-2012-0175, issued on November 08, 2012 which establishes Waste Discharge Requirements for Municipal Separate Storm Sewer Systems (MS4) Discharges within the Coastal Watersheds of Los Angeles County, except those discharges originating from the City of Pico Rivera; and

WHEREAS, the MS4 Permit requires the adoption of an Low Impact Development (LID) ordinances; and

WHEREAS, City Staff, a technical consultant and the City attorney have reviewed the requirements and prepared the following recommended revisions to the Pico Rivera Municipal Code to bring it into conformance with the MS4 Permit

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF PICO RIVERA, CALIFORNIA, DOES HEREBY ORDAIN AS FOLLOWS:

SECTION 1. Chapter 16.04 Storm Water and Urban Runoff Pollution Prevention of Title 16 (Environment) of the Pico Rivera Municipal Code is hereby repealed and replaced in entirety with the following text:

Chapter 16.04 STORM WATER AND URBAN RUNOFF POLLUTION PREVENTION

16.04.010 Purpose and intent.

The purpose of this chapter is to protect and improve water quality of receiving waters by:

1. Reducing illicit discharges to the municipal storm water system to the maximum extent practicable;
2. Eliminating illicit connections to the municipal storm water system;
3. Eliminating spillage, dumping, and disposal of pollutant materials into the municipal storm water system; and
4. Reducing pollutant loads in storm water and urban runoff, from land uses and activities identified in the municipal NPDES permit.
5. Reducing the contribution of pollutants to the MS4 through interagency coordination.

The provisions of this chapter are adopted pursuant to the Federal Water Pollution Control Act, also known as the "Clean Water Act," codified and amended at 33 U.S.C. 1251 et seq. The intent of this chapter is to enhance and protect the water quality of the receiving waters of the United States in a manner that is consistent with the Clean Water Act and acts amendatory thereof or supplementary thereto; applicable implementing regulations; the Municipal NPDES permit, and any amendment, revision, or re-issuance thereof. (Ord. 989 § 1 (part), 2002)

16.04.020 Definitions.

For the purpose of the provisions of this chapter concerning water quality hereinafter set forth, the following words and phrases shall be construed to have the meanings set forth, unless it is apparent from the context that a different meaning is intended:

"Automotive Service Facility" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) and North American Industry Classification System (NAICS) codes. For inspection purposes, Permittees need not inspect facilities with SIC codes 5013, 5014, 5511, 5541, 7532-7534, and 7536-7539 provided that these facilities have no outside activities or materials that may be exposed to storm water.

"Basin Plan" means the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Water Board on June 13, 1994 and subsequent amendments.

"Best management practices" or "BMPs" are practices, physical devices, or systems designed to prevent or reduce pollutant loading from storm water or non-storm water discharges to receiving waters, or designed to reduce the volume of storm water or non-storm water discharged to the receiving water.

"Clean Water Act" means the Federal Water Pollution Control Act as amended, 33 U.S.C. 1251, et seq.

"Commercial facility" means any development on private land that is not industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities; mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes, restaurants, automotive service facilities, automotive dealerships, and retail gasoline station outlets or any other definition provided in the municipal NPDES permit or Storm Water Quality Management Plan.

"Discharge" means any release, spill, leak, pump, flow, escape, dumping, or disposal of any liquid, semi-solid, or solid substance.

"Disturbed Area" means an area that is altered as a result of clearing, grading, and/or excavation.

"Executive officer" means executive officer of the California Regional Water Quality Control Board, Los Angeles.

"Illicit connection" means any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

"Illicit discharge" means any discharge into the MS4, or from the MS4 into a receiving water, that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes any non-storm water discharge, except authorized non-storm water discharges; conditionally exempt non-storm water discharges; and non-storm water discharges resulting from natural flows specifically identified in Part III.A.1.d.

"Industrial activity" means any of the ten classifications of industrial facilities specified in 40 Code of Federal Regulations § 122.26(b)(14), defined by Standard Industrial Classification (SIC) and which is required to obtain a NPDES permit, not including construction activities.

"Low Impact Development (LID)" consists of building and landscape features designed to retain or filter stormwater runoff.

"Maximum extent practicable" or "MEP" means the extent to which the City can reduce the discharge of pollutants in stormwater runoff. MEP requires selecting and implementing effective BMPs, and rejecting applicable BMPs only where: (i) other effective BMPs will serve the same purpose; (ii) the BMPs would not be technically feasible; or (iii) the cost would be prohibitive. Factors considered include, but are not limited to:

(i) Effectiveness: Whether the BMP addresses a pollutant of concern
(ii) Regulatory Compliance: Whether the BMP complies with storm water regulations, as well as other environmental regulations
(iii) Public acceptance: Whether the BMP has public support
(iv) Cost: Whether the cost of implementing the BMP has a reasonable relationship to the pollution control benefits achieved
(v) Technical Feasibility: Whether the BMP is technically feasible, considering soils, geography, and water resources

"Municipal NPDES permit" means California Regional Water Quality Control Board, Los Angeles Region, Order No. R4-2012-0175, NPDES Permit No. CAS004001 Waste Discharge Requirements For Municipal Separate Storm Sewer System (MS4) Discharge Within the Coastal Watersheds of Los Angeles County, Except Those Discharges Originating From the City of Long Beach MS4, and any amendment thereto or re-issuance thereof.

"Municipal separate storm sewer system" (referred to herein as "MS4"), means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, stormwater, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) Designed or used for collecting or conveying stormwater;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined in 40 CFR Section 122.2.(40 CFR Section 122.26(b)(8)).

"Non-storm water discharge" means any fluid discharge to the storm drain system and/or receiving waters that is not composed entirely of storm water but may not necessarily be an illicit discharge.

"NPDES" or "National Pollutant Discharge Elimination System" means the national permitting program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under Clean Water Act (CWA) §307, 402, 318, and 405. The term includes an "approved program."

Mandated by Congress under the Clean Water Act, the NPDES Stormwater Program is a comprehensive two-phased national program for addressing the non-agricultural sources of stormwater discharges which adversely affect the quality of our nation's waters. The program uses the National Pollutant Discharge Elimination System (NPDES) permitting mechanism to require the implementation of controls designed to prevent harmful pollutants from being washed by stormwater runoff into local water bodies.

"Outfall" means a point source as defined in the Code of Federal Regulations (CFR) at 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States, and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances with connect segments of the same stream or other waters of the United Sates, and are used to convey waters of the United States (40 CFR Section 122.26(b)(9)) (Order No. R4-2012-0175).

"Owner" as applied to a building or real property, means any part owner, joint owner, tenant in common, tenant in partnership, joint tenant or tenant by the entirety of the whole or of a part of such building or real property.

"Person" means, within the context of this chapter, any natural person, firm, association, organization, partnership, business trust, corporation, or company.

"Pollutant" or "Pollutants" means those "pollutants" defined in CWA §502(6) (33.U.S.C.§1362(6)), and incorporated by reference into California Water Code §13373, and may include, but is not limited to, garbage, debris, lawn clippings, leaves, fecal waste, biological waste, sediment, sludge, manure, fertilizers, pesticides, oil, grease, gasoline, paints, solvents, cleaners, and any fluid or solid containing toxic or non-toxic chemicals, metals, including batteries.

"Public works director" means the Director of Public Works of the City of Pico Rivera.

"Receiving waters" means rivers, lakes, oceans, or other bodies of water that receive runoff.

"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of five thousand (5000) square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint, addition or replacement of a structure, replacement of impervious surface area that is not part of a routine maintenance activity, and land disturbing activities related to structural or impervious surfaces. Redevelopment does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Regional Board" means the appointed members of the California Regional Water Quality Control Board, Los Angeles Region.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils .

"Runoff" means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

"State Board" means the State Water Resources Control Board of the California Environmental Protection Agency (hereinafter "SWRCB").

"Storm water runoff" means any surface water flow produced by rain or snow melt.

"Standard Urban storm water mitigation program" means the Los Angeles Countywide Storm Water Quality Management Program which includes descriptions of programs, collectively developed by the permitees in accordance with provisions of the NPDES permit, to comply with applicable federal and state law, as the same is amended from time to time. (Ord. 989 § 1 (part), 2002)

16.04.030 Illicit discharges, dumping, and non-storm water discharges.

A. No person shall cause or allow an illicit discharge to enter the municipal storm water system.

B. No person shall place, dump, dispose, litter, accumulate, maintain, discharge, or cause to enter into the MS4, any pollutant or any foreign object such as batteries, tires, waste receptacles, yard debris, refuse, rubbish, food waste, chemicals, animal waste or oil cans, which are also considered illicit discharges.

C. Any person causing an illicit discharge to the MS4 may be required to pay for the cost of clean-up and remediation.

D. Any owner of any private property from which a non-storm water discharge is observed may be required to pay for the cost of collecting and analyzing the discharge to determine if it is an illicit discharge.

E. Discharges identified in Part III.A of the 2012 NPDES MS4 permit are considered exempt or conditionally exempt illicit discharges.

16.04.040 Illicit connections.

A. No person shall maintain or intentionally use a connection that operates to convey an illicit discharge to the municipal storm water system.

B. Upon discovery of an illicit connection, the person owning or operating such connection shall either remove it or render it incapable of conveying an illicit discharge.

C. If any person fails to eliminate an illicit connection after being called upon by the city to do so, the city administrator or the Director of Public Works or his/her designee(s), shall impose appropriate measures to remove or disable the illicit connection and may recover the costs from the owner of such illicit connection. (Ord. 989 § 1 (part), 2002)

16.04.050 Reduction of pollutants in runoff.

No person shall cause, or threaten to cause, the discharge of pollutants to the MS4 by exposing such pollutants to storm water runoff. (Ord. 989 § 1 (part), 2002)

16.04.060 Control of pollutants from commercial facilities.

Subject commercial facilities shall implement BMPs prescribed by the Regional Board or its executive officer, through programs or actions made pursuant to the municipal NPDES permit, as called for more particularly in the city's storm water quality management program, or any revisions made thereto. (Ord. 989 § 1 (part), 2002)

16.04.070 Control of pollutants from industrial activities.

A. It shall be a violation of this chapter for any industry in the city that is subject to waste discharge requirements specified in the SWRCB Water Quality —Control Board's Industrial General Permit (IGP), or any revision or re-issuance thereof, to operate without a general industrial activities stormwater NPDES permit.

B. Industries that require a NPDES IGP permit shall retain on-site the following documents: (i) a copy of the notice of intent for general permit to discharge storm water associated with industrial activity; (ii) a waste discharge identification number issued by the SWRCB; and/or (iii) a storm water pollution prevention plan and monitoring program plan.; (4) any storm_water quality data; and (5) evidence of facility self-inspection.

C. Any industry in the city requiring a NPDES IGP permit shall, upon reasonable request from a duly authorized officer of the Cty, provide any of the documents described in subsection B of this section. (Ord. 989 § 1 (part), 2002)

D. Industrial facilities not subject to the NPDES Industrial General permit that are subject to pollution control requirements under the municipal NPDES permit, shall implement BMPs prescribed by the ;Regional bBoard or its executive officer, through programs or actions made pursuant to the Municipal NPDES permit.

16.04.080 Control of pollutants from other industrial facilities.

Industrial facilities not subject to the general industrial activities storm water NPDES permit but subject to pollution control requirements under the municipal NPDES permit, shall implement BMPs prescribed by the regional board or its executive officer, through programs or actions made pursuant to the municipal NPDES permit. (Ord. 989 § 1 (part), 2002)

16.04.090 Control of pollutants from state permitted construction activities.

A. No person shall commence or continue any construction activity in the city that causes the disturbance of one acre or more of soil by clearing, grading, and excavating without demonstrating to the city that such person has obtained a NPDES Construction General Permit from the SWRCB. The NPDES Construction General Permit does not apply to the following construction activity:

(1) Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility;
(2) Disturbances to land surfaces solely related to agricultural operations such as disking, harrowing, terracing and leveling, and soil preparation;
(3) Construction activity covered by an individual NPDES Permit for storm water discharges;
(4) Landfill construction activity that is subject to the Industrial General Permit; or
(5) Construction activity that discharges to Combined Sewer Systems.

In the case of a public emergency that requires immediate construction activities, a discharger shall submit a brief description of the emergency construction activity within five days of the onset of construction, and then shall submit all PRDs within thirty days.

B. Any person engaged in a construction activity requiring a general construction activity storm water NPDES permit shall retain at the construction site the following documents: (i) a copy of the notice of intent to comply with terms of the general permit to discharge water associated with construction activity; (ii) a waste discharge identification number issued by the SWRCB; (iii) a storm water pollution prevention plan and monitoring program plan for the construction activity requiring the construction permit; and (iv) records of all inspections, compliance and non-compliance reports, evidence of self-inspection and good housekeeping practices.

C. Any person engaged in a construction activity in the city requiring an NPDES general construction storm water activity permit shall, upon reasonable request from a duly authorized officer of the city, provide any of the documents specified in subsection B of this section and shall retain said documents for at least three years after completion of construction. (Ord. 989 § 1 (part), 2002)

D. Construction activity not subject to the NPDES Industrial General permit that are subject to pollution control requirements under the Municipal NPDES Permit, shall implement BMP's prescribed by the Regional Board or its executive officer, through programs or actions made pursuant to the Municipal NPDES Permit.

16.04.100 Control of pollutants from other construction activities.

Any person engaged in a construction activity that is not subject to the general construction storm water activity NPDES permit, but is subject to the municipal NPDES permit, shall comply with all requirements specified in the storm water management quality program, including any revisions made thereto. (Ord. 989 § 1 (part), 2002)

16.04.110 Control of pollutants from new developments/redevelopment projects.

A. Standard Urban Storm Water Mitigation Program (SUSMP) - Subject new development and redevelopment projects are required to comply with SUSMP conditions assigned by the City that shall consist of: (1) low impact development ("LID") structural and non-structural best management practices ("BMPs"); (2) source control BMPs; and (3) structural and non-structural BMPs for specific types of uses. LID controls effectively reduce the amount of impervious area of a completed project site and promote the use of infiltration and other controls that reduce runoff. Source control BMPs prevent runoff contact with pollutant materials that would otherwise be discharged to the MS4. Specific structural controls are also required to address pollutant discharges from certain uses including but not limited to developments, retail gasoline outlets, automotive service facilities, restaurants, and industrial and commercial facilities where pollutant materials are disposed, stored, or handled.

B. Standard Urban Storm Water Mitigation Plan Review and Approval - An applicant for a subject new development or a redevelopment project shall incorporate into the applicant's project plans into a SUSMP plan subject to City review and approval.

C. California Environmental Quality Act ("CEQA") - Any project subject to CEQA review but is not specified in a redevelopment or development project category may be required to comply with any of the SUSMP requirements at the City's discretion.

D. Storm Water Management/Watershed Management Program - The City's stormwater management program ("SWMP") plan or watershed management program ("WMP") plan, whichever is in effect at the time of review, shall contain specific conditions and procedures for meeting Planning Land Development and SUSMP requirements. The program plans shall contain guidance documents to facilitate compliance including but not limited to an updated SUSMP guidance manual, a Low Impact Development (LID) Guidance Manual, and Green Street Manual referencing the USEPA's guidance regarding Managing Wet Weather with Green Infrastructure Manual.

E. Certificate of Occupancy - As a condition for issuing a Certificate of Occupancy for new development or redevelopment project, the authorized enforcement officer shall require facility operators and/or owners to build all the storm water pollution control Best Management Practices and structural or treatment control BMPs that are shown on the approved project plans and to submit a signed certification statement stating that the site and all structural or treatment control BMPs will be maintained in compliance with the SUSMP and other applicable regulatory requirements.

F. Transfer of Properties- The transfer or lease of a property subject to a requirement for maintenance of structural and treatment control BMPs shall include conditions requiring the transferee and its successors and assigns to either: (i) assume responsibility for maintenance of any existing structural or treatment control BMP, or (ii) to replace existing structural or treatment control BMPs with new control measures or BMPs meeting the then current standards of the City and the SUSMP. Such requirement shall be included in any sale or lease agreement or deed for such property. The condition of transfer shall include a provision that the successor property owner or lessee conduct maintenance inspections of all structural or treatment control BMPs at least once a year and retain proof of inspection.

1. For residential properties where the structural or treatment control BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance shall be included in the project's conditions, covenants and restrictions (CC&Rs). Printed educational material will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what storm water management facilities are present, signs that maintenance is needed, and how the necessary maintenance can be performed. The transfer of this information shall also be required with any subsequent sale of the property.

2. If structural or treatment control BMPs are located within an area proposed for dedication to a public agency, they will be the responsibility of the developer until the dedication is accepted.

16.04.120 Enforcement—Authority.

A. The Director of Public Works, the City Engineer, and duly authorized representatives thereof, are hereby authorized and directed to enforce all provisions of this chapter.

B. Nothing in this chapter precludes a local authority from using regular full-time employees to enforce this chapter. This authority shall be in addition to the authority granted to police and code enforcement officers.

C. Fees to be charged for plan checking, inspection, enforcement and any other activities carried out by the city shall be specified by resolution of the city council. (Ord. 989 § 1 (part), 2002)

16.04.130 Enforcement—Right of entry and inspection.

A. The Director of Public Works, City Engineer, or duly authorized designee thereof, may, on twenty-four hours' oral or written notice, unless exigent circumstances justify a shorter time period, enter upon and inspect any private premises for the purposes of verifying compliance with the terms of this chapter and perform any duty imposed upon the officer by this chapter, provided that:

1. If such building or premises is occupied, he or she shall first present proper credentials and request entry.

2. If such building or premises is unoccupied, he or she shall first make a reasonable effort to locate the owner or occupant of the building or premises and request entry. In the event

that a request for entry is refused, the officer is hereby empowered to seek assistance from any court of competent jurisdiction in obtaining such entry.

B. Such inspection may include, but is not limited to:

1. Identifying products produced, processes conducted, chemicals and materials used, stored or maintained on the subject premises;

2. Identifying points of discharge of all waste water, non-stormwater, processed water system and pollutants;

3. Investigating the natural slope of the premises, including drainage patterns and man-made conveyance systems;

4. Establishing location of all points of discharge from the premises, whether by surface runoff or through a storm drain system;

5. Locating any illicit connection or illicit discharge;

6. Inspecting a vehicle, truck, trailer, tank or other mobile equipment;

7. Inspecting all records of the owner or occupant of public or private property relating to chemicals or processes presently or previously stored or occurring on the property, including material and/or chemical inventories, facilities maps or schematics and diagrams, material safety data sheets, hazardous waste manifests, business plans, pollution prevention plans, pollution prevention plans, state general permits, storm water pollution prevention plans, state general permits, storm water pollution prevention plans, and any and all records relating to illicit connections, illicit discharges, or any other source of contribution or potential contribution of pollutants to the municipal storm drain system;

8. Inspecting, sampling and testing any area runoff, soils area (including groundwater testing), process discharge, materials with any waste storage area (including any container contents), and/or treatment system discharges for the purpose of determining the potential for contribution of pollutants to the municipal storm drain system;

9. Inspecting the integrity of all storm drain and sanitary sewer systems any connection to other pipelines on the property, including the use of dye and smoke tests, video surveys, photographs or videotapes, and the taking of measurements, drawings, or any other records reasonably necessary to document conditions as they exist on the premises;

10. Installing and maintaining of monitoring devices for the purpose of measuring any discharge or potential source of discharge to the municipal storm drain system; or

11. Evaluating compliance with this chapter or the Clean Water Act. (Ord. 989 § 1 (part), 2002)

16.04.140 Enforcement—Violations and penalties.

A. The Director of Public Works, City Engineer, or duly authorized representatives may serve notice of violation upon a person owning or occupying a premises, describing the violations and requiring prompt correction thereof, when:

1. Pollutants or potential pollutants are being maintained, discharged or deposited in such a manner as to create, or if allowed to continue will create, any one or more of the following conditions: (a) a public nuisance, (b) a menace to the public safety, (c) pollution of underground or surface waters, (d) damage to any public sewer, municipal storm sewer system, or public or private property.

2. The person has failed to respond or comply with a previous notice of violation within the time period specified in the notice.

B. Failure to comply with a duly served notice of violation shall constitute a willful violation of this chapter.

C. The City Manager, Director of Public Works, or duly authorized representatives may serve a cease and desist order upon a person owning or occupying a premises, requiring the person to immediately:

1. Discontinue any illicit discharge, including process water, wastewater or pollutant discharge to the MS4;
2. Block or divert any flow of water from the property, where the flow is occurring in violation of any provision of this chapter; and
3. Discontinue any other violation of this chapter.

The cease and desist order may contain terms and conditions or other provisions to ensure compliance with this chapter.

D. Any person violating any provision of this chapter is guilty of a misdemeanor, and upon conviction is punishable by fine not exceeding one thousand dollars or by imprisonment in the county jail for a period not exceeding six months, or by both such fine and imprisonment. As a part of any sentence or other penalty imposed, or the award of any damage, the court may also order that restitution be paid to the city or any injured person, or, in the case of a violator who is a minor, by the minor's parent or lawfully designated guardian or custodian. Restitution may include the amount of any reward.

E. The City Attorney is also authorized to file in a court of competent jurisdiction a civil action seeking an injunction against any violation or threatened or continuing violation of this chapter. Any temporary, preliminary or permanent injunction issued pursuant hereto may include an order for reimbursement to the city for all costs incurred in enforcing this chapter, including costs of inspection, investigation, monitoring, treatment, abatement, removal or remediation undertaken by or at the expense of the city, and may include all legal expenses and fees and any or all costs incurred relating to the restoration or remediation of the environment.

F. Each separate discharge in violation of this chapter and each day a violation described in this chapter exists, without correction, shall constitute a new and separate violation punishable as a separate criminal offense and/or civil violation.

G. Any person who violates any provision of this chapter, any provision of any permit issued pursuant to this chapter, or who discharges waste or wastewater which causes pollution, or who violates any cease and desist order, prohibition, or effluent limitation, also may be in violation of the Federal Clean Water Act and/or Porter-Cologne Act and may be subject to the sanctions of those acts, including civil and criminal penalties. In addition, the City Attorney is authorized to file a citizen's suit pursuant to the Clean Water Act, seeking penalties, damages and orders compelling compliance and appropriate relief.

H. The penalties and remedies established by this chapter shall be cumulative.

I. Any person violating the provisions of this chapter shall reimburse the city for any and all costs incurred by the city in responding to, investigating, assessing, monitoring, treating, cleaning, removing, or remediating any illicit discharge or pollutant from the municipal storm drain system; rectifying any illicit connection; or remediating any violation of this chapter. Such costs to be paid to the City include all administrative expenses and all legal expenses, including costs and attorneys' fees, in obtaining compliance, and in litigation including all costs and attorneys' fees on any appeal. The costs to be recovered pursuant to this section shall be recoverable from any and all persons violating this chapter.

J. The City shall have full power and authority to take any necessary precautions including, but not limited to, decontamination, storm drain closure, packaging, diking, and transportation of materials, in order to protect life, protect property, or prevent an imminent hazard to the public's health, safety or welfare. In the event any violation of this chapter constitutes an imminent danger to public health, safety, or the environment, the Director of Public Works, City Engineer or any authorized agent thereof, may enter upon the premises from which the violation emanates, abate the violation and danger created to the public safety or the environment, and restore any premises affected by the alleged violation, without notice to or consent from the owner or occupant of the premises. An imminent danger shall include, but is not limited to, exigent circumstances created by the discharge of pollutants, where such discharge presents a significant and immediate threat to the public health or safety, or the environment.

K. Notwithstanding any other provisions herein, violations of this chapter may further be deemed to be a public nuisance, which may be abated by administrative or civil or criminal action in accordance with the terms and provisions of this code and state law. All costs and fees incurred by the city as a result of any violation of this chapter which constitute a nuisance, including all administrative fees and expenses and legal fees and expenses, shall become a lien against the subject premises from which the nuisance emanated and a personal obligation against the owner, in accordance with Government Code Sections 38773.1 and 38773.5. The owner of record of the premises subject to any lien shall receive notice of the lien prior to recording, as required by Government Code Section 38773.1. The City Attorney is authorized to collect nuisance abatement costs and enforce a nuisance lien in an action brought for money judgment, or by delivery to the county assessor of a special assessment against the premises in accordance with the conditions and requirements of Government Code Section 38773.5.

L. Any remedies provided to the City in this chapter are not exclusive, and the City may utilize any and all other remedies as otherwise provided by law.

M. Compliance by any person or entity with the provisions of this chapter shall not relieve any such person or entity from complying with other applicable local, state or federal statutory or regulatory requirements. (Ord. 989 § 1 (part), 2002)

SECTION 2. Any provision of the City of Pico Rivera Municipal Code or appendices thereto inconsistent with the provisions of the Ordinance, to the extent of such inconsistencies and no further, are repealed or modified to that extent necessary to affect the provisions of this Ordinance.

SECTION 3. If any section, subsection, sentence, clause, phrase, or portion of this Ordinance is for any reason held to be invalid or unconstitutional by the decision of any court of competent jurisdiction, such decision shall not affect the validity of the remaining portions of this ordinance. The City Council of the City of Pico Rivera hereby declares that it would have adopted this Ordinance and each section, subsection, sentence, clause, phrase or portion thereof irrespective of the fact that any one or more sections, subsections, sentences, clauses, phrases, or portions be declared invalid or unconstitutional.

SECTION 4. The Mayor shall sign and the City Clerk shall attest to the passage of this Ordinance. The City Clerk shall cause the same to be published once in the Ordinance official newspaper within 15 days after its adoption. This Ordinance shall become effective 30 days from its adoption.

APPROVED AND ADOPTED this 13th day of May, 2014.

STATE OF CALIFORNIA
COUNTY OF LOS ANGELES
CITY OF PICO RIVERA

I, Anna M. Jerome, City Clerk of the City of Pico Rivera, California, hereby certify that Ordinance No. 1086 was introduced at a regular meeting of the City Council of the City of Pico Rivera held on the 22nd of April 2014, and thereafter was adopted by the City Council at a regular meeting held on the 13th of May, 2014, and that the same was adopted by the following roll call vote:

AYES: Archuleta, Armenta, Camacho, Salcido, Tercero

RESOLUTION NO. 9441

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF SANTA FE SPRINGS APPROVING A GREEN STREETS POLICY

WHEREAS, the Municipal Separate Storm Sewer System (MS4) Permit (Order No. R-2012-0175) was adopted by the Los Angeles Region of the California Regional Water Quality Control Board on November 8, 2012; and

WHEREAS, cities electing to prepare a Watershed Management Program or an Enhanced Watershed Management Program pursuant to said Permit are required to demonstrate that "green street" policies which specify the use of green street strategies for transportation corridors are in place; and

WHEREAS, green streets are enhancements to street and road projects intended to improve the quality of storm water and urban runoff through the implementation of infiltration, bio-treatment, xeriscaping parkways and tree-lined streets; and

WHEREAS, since February 26, 2012, the City has worked in conjunction with the Gateway Water Management Authority to develop a Green Streets Policy,

NOW, THERFORE, THE CITY COUNCIL OF THE CITY OF SANTA FE SPRINGS HEREBY FINDS, DETERMINES AND RESOLVES AS FOLLOWS:

SECTION 1. The City Council hereby adopts as its Green Streets Policy the Green Streets Manual attached hereto as Exhibit "A", which exhibit is incorporated by reference herein.

SECTION 2. The City Manager or his designees are directed to implement the requirements of the Green Streets Manual for City-owned transportation corridors and road projects that add 10,000 square feet or more of impervious area, based on the USEPA's Wet Weather with Green Infrastructure guidance (December 2008 EPA-833-F-08-009).

SECTION 3. Routine maintenance, including but not limited to slurry seals, grand and overlay and reconstruction to maintain original line at grade are excluded from the requirements to comply with the Green Streets Manual.

SECTION 4. The City Manager or his designees are authorized to make non-substantive changes to the City's Green Streets Manual consistent with the requirements of the MS4 Permit.

SECTION 5. The City has determined that the adoption of the Green Streets Manual will not have a significant effect on the environment. Such action is therefore categorically exempt from CEQA requirements, pursuant to Section 15061 of the CEQA Guidelines. Staff is hereby directed to prepare and post a notice of exemption pursuant to Section 15062 of the CEQA Guidelines.

SECTION 6. This Resolution shall become effective on the effective date of the City's Ordinance No. 1055, which Ordinance establishes Low Impact Development requirements.

SECTION 7. If any section, subsection, subdivision, paragraph, sentence, clause or phrase in this Resolution, or any part hereof, is held invalid or unconstitutional, such decision shall not affect the validity of the remaining sections or portions of this Resolution. The City Council hereby declares that it would have adopted each section, subsection, subdivision, paragraph, sentence, clause or phrase in this Resolution irrespective of the fact that any one or more sections, subsections, subdivisions, paragraphs, sentences, clauses or phrases may be declared invalid or unconstitutional.

SECTION 8. The Deputy City Clerk shall certify to the adoption of this Resolution.

PASSED AND ADOPTED THIS 8TH day of May, 2014.

Juanita Trujillo, MAYOR

ATTEST:

Anita Jimenez, DEPUTY CITY CLERK

ORDINANCE NO. 1055

AN ORDINANCE OF THE CITY OF SANTA FE SPRINGS AMENDING TITLE 5 OF THE CITY CODE BY REPEALING AND REPLACING CHAPTER 52 TO ESTABLISH LOW IMPACT DEVELOPMENT REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT PROJECTS

WHEREAS, the Municipal Separate Storm Sewer System (MS4) Permit (Order No. R-2012-0175) was adopted by the Los Angeles Region of the California Regional Water Quality Control Board on November 8, 2012; and

WHEREAS, cities electing to prepare a Watershed Management Program or an Enhanced Watershed Management Program pursuant to said Permit are required to adopt a Low Impact Development ("LID") Ordinance to lessen the impacts on surface water from development by using smart growth practices, and are required to integrate LID practices and standards for storm water pollution mitigation for new development and redevelopment projects; and

WHEREAS, LID consists of building and landscape features designed to retain or filter storm water runoff; and

WHEREAS, since February 26, 2012, the City has worked in conjunction with the Gateway Water Management Authority on the development of a LID Ordinance,

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF SANTA FE SPRINGS DOES HEREBY ORDAIN AS FOLLOWS:

SECTION 1. Chapter 52 of the City Code is hereby repealed, provided, however, that such repeal shall not affect or excuse any violation of Chapter 52 occurring prior to the effective date of this Ordinance. A new Chapter 52 is hereby added to read as set forth in Exhibit "A", attached hereto, which exhibit is incorporated by reference herein.

SECTION 2. The City has determined that the adoption of this Ordinance will not have a significant effect on the environment. Such action is therefore categorically exempt from CEQA requirements, pursuant to Section 15061 of the CEQA Guidelines. Staff is hereby directed to prepare and post a notice of exemption pursuant to Section 15062 of the CEQA Guidelines.

SECTION 3. If any section, subsection, subdivision, paragraph, sentence, clause or phrase in this Ordinance, or any part hereof, is held invalid or unconstitutional, such decision shall not affect the validity of the remaining sections or portions of this Ordinance, or any part thereof. The City Council hereby declares that it would have adopted each section, subsection, subdivision, paragraph, sentence, clause or phrase in this Ordinance irrespective of the fact that any one or more sections, subsections, subdivisions, paragraphs, sentences, clauses or phrases may be declared invalid or unconstitutional.

SECTION 4. The Deputy City Clerk shall certify to the adoption of this Ordinance, and shall cause the same to be posted in at least three (3) public places in the City, such posting to be completed no later than fifteen (15) days after passage hereof.

PASSED, APPROVED, and ADOPTED THIS 22nd day of May 2014.

EXHIBIT "A"

52.01 Title.

This chapter shall be known as the City's Stormwater Management and Discharge Control ordinance.

52.02 Findings.

A. The federal Clean Water Act (33 U.S.C. Section 1251, *et seq*.,) provides for the regulation and reduction of pollutants discharged into the waters of the United States by extending National Pollutant Discharge Elimination System ("NPDES") requirements to stormwater and urban runoff discharge into municipal storm drain systems;

B. Stormwater and urban runoff flows from individual properties onto streets, then through storm drains passing through the City and finally into the waters of the United States;

C. The City of Santa Fe Springs is a co-permittee under the "Waste Discharge Requirements for Municipal Separate Storm Sewer System ("MS4") discharges within the Coastal Watersheds of Los Angeles County, except those discharges originating from the City of Long Beach MS4, which also serves as a NPDES Permit under the federal Clean Water Act (NPDES No. CAS614001), as well as waste discharge requirements under California law (the Municipal NPDES Permit") and, as a co-permittee under the Municipal NPDES Permit, the City is required to adopt ordinances and implement procedures with respect to the entry of non-stormwater discharges into the municipal stormwater system;

D. Part III, Section A of the Municipal NPDES Permit requires the City to effectively prohibit non-stormwater discharges from within its boundaries, into that portion of the MS4 which it owns or operates and into watercourses, except where such discharges are: (1) in compliance with a separate individual or general NPDES permit, or (2) identified and in compliance with Part III.A (non-stormwater discharges) of the Municipal NPDES Permit, or (3) originate from federal, state or other facilities which the City is preempted from regulating, and further provides that compliance with the terms of the Municipal NPDES Permit through the development and implementation of the programs described in the Municipal NPDES Permit will constitute compliance with the discharge prohibition in the Municipal NPDES Permit;

E. Part VI, Section A.2 of the Municipal NPDES Permit requires the City to establish and maintain the legal authority necessary to control discharges to and from those portions of the MS4 over which it has jurisdiction, so as to comply with the Municipal NPDES Permit and to specifically prohibit certain discharges identified in the Municipal NPDES Permit;

F. The Municipal NPDES Permit contemplates the development of a Watershed Management Program in which the City will participate, which will in turn require the development and the implementation of programs for, among other things, the elimination of illicit connections and illicit discharges, development planning, development construction, and public information and education requirements, and which may require the later adoption of additional legal authority to implement such programs as they are developed by the permittees and approved by the Regional Board;

G. In order to control, in a cost-effective manner, the quantity and quality of stormwater and urban runoff to the maximum extent practicable, the adoption of the ordinance codified in this chapter is essential.

52.03 Purpose and intent.

A. The purpose of this chapter is to ensure the future health, safety and general welfare of the citizens of the City and the water quality of the receiving waters of the County of Los Angeles and surrounding coastal areas by:

1. Reducing pollutants in stormwater discharges to the maximum extent practicable;

2. Regulating illicit connections and illicit discharges and reducing the level of contamination of stormwater and urban runoff in the municipal stormwater system; and system.

3 . Regulating non-stormwater discharges to the municipal stormwater

B. The intent of this chapter is to protect and enhance the quality of watercourses, water bodies, and wetlands within the City in a manner consistent with the federal Clean Water Act, the California Porter-Cologne Water Quality Control Act and the Municipal NPDES Permit.

C. This chapter is also intended to provide the City with the legal authority necessary to control discharges to and from those portions of the municipal stormwater system over which it has jurisdiction as required by the Municipal NPDES Permit, and fully and timely comply with the terms of the Municipal NPDES Permit while the Watershed Management Program is being developed by the permittees under the Municipal NPDES Permit, and in contemplation of the subsequent amendment of this chapter or adoption by the City of additional provisions of this chapter to implement the subsequently adopted Watershed Management Program, or other programs developed under the Municipal NPDES Permit.

D. This chapter also sets forth requirements for the construction and operation of certain commercial development, new development and redevelopment and other projects (as further defined herein) which are intended to ensure compliance with the stormwater mitigation measures prescribed in the current MS4 Permit This chapter authorizes the Director to define and adopt applicable best management practices and other stormwater pollution control measures, as provided herein, to carry out all inspections including entering entities discharging to the MS4, conduct surveillance, conduct monitoring, cite infractions and to impose fines pursuant to this chapter. Except as otherwise provided herein, the Director shall administer, implement and enforce the provisions of this section.

E. The City Council shall approve and enter into interagency agreements as deemed necessary by the City Council to control the contribution of pollutants of the shared MS4.

52.04 Definitions.

Except as specifically provided herein, any term used in this chapter shall be defined as that term is defined in the current Municipal NPDES Permit, or if it is not specifically defined in the Municipal NPDES Permit, then as such term is defined in the Federal Clean Water Act, as amended, or the regulations promulgated thereunder. If the definition of any term contained in this section conflicts with the definition of the same term in the current Municipal NPDES Permit, then the definition contained in the Municipal NPDES Permit shall govern. The following words and phrases shall have the following meanings when used in this chapter:

“Area susceptible to runoff” means any surface directly exposed to precipitation or in the path of runoff caused by precipitation which path leads off the parcel on which the surface is located.

“Automotive service facilities” means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) and North American Industry Classification System (NAICS) codes. For inspection purposes, Permittees need not inspect facilities with SIC codes 5013, 5014, 5511, 5541, 7532-7534, and 7536-7539 provided that these facilities have no outside activities or materials that may be exposed to stormwater

“Best Management Practices (BMPs)” means practices or physical devices or systems designed to prevent or reduce pollutant loading from stormwater or non-stormwater discharges to receiving waters, or designed to reduce the volume of stormwater or non-stormwater discharged to the receiving water. Examples of BMPs may include public education and outreach, proper planning of development projects, proper cleaning of catch basin inlets, and proper sludge- or waste-handling and disposal, among others.

“Biofiltration” means a LID BMP that reduces stormwater pollutant discharges by intercepting rainfall on vegetative canopy, and through incidental infiltration and/or evapotranspiration, and filtration. Incidental infiltration is an important factor in achieving the required pollutant load reduction. Therefore, the term “biofiltration” as used in this chapter is defined to include only systems designed to facilitate incidental infiltration or achieve the equivalent pollutant reduction as biofiltration BMPs with an underdrain (subject to approval by the Regional Board’s Executive Officer). Biofiltration BMPs include bioretention systems with an underdrain and bioswales.

“Bioretention” means a LID BMP that reduces stormwater runoff by intercepting rainfall on vegetative canopy, and through evapotranspiration and infiltration. The bioretention system typically includes a minimum 2-foot top layer of a specified soil and compost mixture underlain by a gravel-filled temporary storage pit dug into the in-situ soil. As defined in this Ordinance, a bioretention BMP may be designed with an overflow drain, but may not include an underdrain. When a bioretention BMP is designed or constructed with an underdrain it is regulated by the Municipal NPDES Permit as biofiltration.

“Bioswale” means a LID BMP consisting of a shallow channel lined with grass or other dense, low-growing vegetation. Bioswales are designed to collect stormwater runoff and to achieve a uniform sheet flow through the dense vegetation for a period of several minutes.

“City” means the City of Santa Fe Springs, California.

“Clean Water Act (CWA)” means the Federal Water Pollution Control Act enacted in 1972, by Public Law 92-500, and amended by the Water Quality Act of 1987. The Clean Water Act prohibits the discharge of pollutants to Waters of the United States unless the discharge is in accordance with an NPDES permit.

“Commercial development” means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

“Commercial Malls” means any development on private land comprised of one or more buildings forming a complex of stores which sells various merchandise, with interconnecting walkways enabling visitors to easily walk from store to store, along with parking area(s). A commercial mall includes, but is not limited to: mini-malls, strip malls, other retail complexes, and enclosed shopping malls or shopping centers

“Construction” means any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that result in land disturbance. Construction does not include emergency construction activities required to immediately protect public health and safety or routine maintenance activities required to maintain the integrity of structures by performing minor repair and restoration work, maintain the original line and grade, hydraulic capacity, or original purposes of the facility. See “Routine Maintenance” definition for further explanation. Where clearing, grading or excavating of underlying soil takes place during a repaving operation, State General Construction Permit coverage by the State of California General Permit for Storm Water Discharges Associated with Industrial Activities or for Stormwater Discharges Associated with Construction Activities is required if more than one acre is disturbed or the activities are part of a larger plan

“Control” means to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

“Development” means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single family, multi- unit or planned unit development); industrial, commercial, retail and other nonresidential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

“Directly adjacent” means situated within two hundred (200) feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

“Director” means the City’s City Manager or his or her designee.

“Discharge” means when used without qualification the discharge of a pollutant. “Discharge of a pollutant” means any addition of any pollutant or combination of pollutants to waters of the United States from any point source or, any addition of any pollutant or combination of pollutants to the waters of the contiguous zone or the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by a state, municipality, or other person which do not lead to treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works.

“Discharging” directly means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

“Discretionary project” is defined in the same manner as Section 15357 of the Guidelines for Implementation of the California Environmental Quality Act contained in Title 14 of the California Code of Regulations, as amended, and means a project which requires the exercise of judgment or deliberation when the City decides to approve or disapprove a particular activity, as distinguished from situations where the City merely has to determine whether there has been conformity with applicable statutes, ordinances or regulations.

“Disturbed area” means an area that is altered as a result of clearing, grading, and/or excavation.

“Environmentally sensitive area (ESA)” means an area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments (California Public Resources Code § 30107.5). Areas subject to storm water mitigation requirements are areas designated as Significant Ecological Areas by the County of Los Angeles (Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976) and amendments); an area designated as a Significant Natural Area by the California Department of Fish and Games Significant Natural Areas Program, provided that area has been field verified by the Department of Fish and Game; an area listed in the Basin Plan as supporting the Rare, Threatened, or Endangered Species (RARE) beneficial use; and an area identified by the City as environmentally sensitive.

"Flow-through treatment BMPs" means a modular, vault type "high flow biotreatment" devices contained within an impervious vault with an underdrain or designed with an impervious liner and an underdrain.

"Full Capture System" means any single device or series of devices, certified by the Executive Officer, that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate Q resulting from a one- year, one-hour storm in the sub-drainage area.

"Good housekeeping practices" means common practices related to the storage, use or cleanup of materials, performed in a manner that minimizes the discharge of pollutants. Examples include, but are not limited to, purchasing only the quantity of materials to be used at a given time, use of alternative and less environmentally harmful products, cleaning up spills and leaks, and storing materials in a manner that will contain any leaks or spills.

"General Construction Activities Storm Water Permit (GCASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of stormwater from construction activities under certain conditions.

"General Industrial Activities Storm Water Permit (GIASP**)"** means the general NPDES permit adopted by the State Board which authorizes the discharge of stormwater from certain industrial activities under certain conditions.

"Green Roof" means a LID BMP using planter boxes and vegetation to intercept rainfall on the roof surface. Rainfall is intercepted by vegetation leaves and through evapotranspiration. Green roofs may be designed as either a bioretention BMP or as a biofiltration BMP. To receive credit as a bioretention BMP, the green roof system planting medium shall be of sufficient depth to provide capacity within the pore space volume to contain the design storm depth and may not be designed or constructed with an underdrain.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent (25%) or greater and where grading contemplates cut or fill slopes.

"Illicit connection" means any human-made conveyance that is connected to the storm drain system without a permit, excluding gutters, roof-drains and other similar connections. Examples include channels, pipelines, conduits, inlets or outlets that are connected directly to the storm drain system.

"Illicit discharge" means any discharge to the storm drain system that is prohibited under local, state or federal statutes, ordinances, codes or regulations. This includes all non-stormwater discharges except discharges pursuant to a separate NPDES permit and discharges that are exempted or conditionally exempted in accordance with Part III the Municipal NPDES permit.

"Industrial/Commercial Facility" means any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by either the Standard Industrial Classifications (SIC) or the North American Industry Classification System (NAICS). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

"Industrial Park" means land development that is set aside for industrial development. Industrial parks are usually located close to transport facilities, especially where more than one transport modalities coincide: highways, railroads, airports, and navigable rivers. It includes office parks, which have offices and light industry.

"Infiltration BMP" means a LID BMP that reduces stormwater runoff by capturing and infiltrating the runoff into in-situ soils or amended onsite soils. Examples of infiltration BMPs include infiltration basins, dry wells, and pervious pavement.

"Infiltration" means the downward entry of water into the surface of the soil.

"Low Impact Development (LID)" consists of building and landscape features designed to retain or filter stormwater runoff.

"Material" means any substance including, but not limited to: garbage and debris; lawn clippings, leaves, and other vegetation; biological and fecal waste; sediment and sludge; oil and grease; gasoline; paints, solvents, cleaners, and any fluid or solid containing chemicals.

"Municipal NPDES Permit" means the Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach (Order No. R4-2012-0175), NPDES Permit No. CAS00401), issued by the California Regional Water Quality Control Board—Los Angeles Region, and any successor permit to that permit.

"Municipal Separate Storm Sewer System (MS4)" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

1. Owned or operated by a state, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, stormwater, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

2. Designed or used for collecting or conveying stormwater;

3. Which is not a combined sewer; and

4. Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR Section 122.2.

"New development" means land-disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Non-stormwater discharge" means any discharge to a municipal stormwater system that is not composed entirely of stormwater.

"NPDES permit" means any waste discharge requirements issued by the Regional Board or the State Water Resources Control Board in the form of an NPDES permit pursuant to Water Code Section 13370 (other than the Municipal NPDES Permit).

"Outfall" means a point source as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances with connect segments of the same stream or other waters of the United Sates and are used to convey waters of the United States. (40 CFR Section 122.26(b)(9))

"Parking lot" means land area or a facility for the parking or storage of motor vehicles used for businesses, commerce, industry or personal use with a lot size of five thousand (5,000) square feet or more of surface area, or with twenty-five (25) or more parking spaces.

"Planning priority projects" means those projects specified in Section 52-11 of this chapter that are required to incorporate appropriate storm water mitigation measures into the design plan for their respective projects.

"Pollutant" means those pollutants defined in Section 502(6) of the federal Clean Water Act (33 U.S.C. Section 1362(6)), or incorporated into California Water Code Section 13373. Examples of pollutants include, but are not limited to the following:

1. Commercial and industrial waste (such as fuels, solvents, detergents, plastic pellets, hazardous substances, fertilizers, pesticides, slag, ash and sludge);

2. Metals such as cadmium, lead, zinc, copper, silver, nickel, chromium, and nonmetals such as phosphorus and arsenic;

3. Petroleum hydrocarbons (such as fuels, lubricants, surfactants, waste oils, solvents, coolants and grease);

4. Excessive eroded soils, sediment and particulate materials in amounts which may adversely affect the beneficial use of the receiving waters, flora or fauna of the state;

5. Animal wastes (such as discharge from confinement facilities, kennels, pens, recreational facilities, stables and show facilities);

6. Substances having characteristics such as pH less than six or greater than nine, or unusual coloration or turbidity, or excessive levels of fecal coliform, or fecal streptococcus, or enterococcus;

The term “pollutant” shall not include uncontaminated stormwater, potable water or reclaimed water generated by a lawfully permitted water treatment facility.

“Project” means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (California Public Resources Code Section 21065).

“Rainfall Harvest and Use” means a LID BMP system designed to capture runoff, typically from a roof but can also include runoff capture from elsewhere within the site, and to provide for temporary storage until the harvested water can be used for irrigation or non-potable uses. The harvested water may also be used for potable water uses if the system includes disinfection treatment and is approved for such use by the local building department (Order No. R4-2012-0175).

“Receiving Water**”** means “water of the United States” into which waste and/or pollutants are or may be discharged.

“Redevelopment” means land-disturbing activity that result in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of routine maintenance activity; and land disturbing activity related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

“Regional Board” means the California Regional Water Quality Control Board—Los Angeles Region.

“Restaurant” means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC Code 5812).

“Retail gasoline outlet” means any facility engaged in selling gasoline and lubricating oils.

“Routine Maintenance” includes, but is not limited to projects conducted to:

1. Maintain the original line and grade, hydraulic capacity, or original purpose of the facility.

2. Perform as needed restoration work to preserve the original design grade, integrity and hydraulic capacity of flood control facilities.

3. Includes road shoulder work, regrading dirt or gravel roadways and shoulders and performing ditch cleanouts.

4. Update existing lines and facilities, which include replacing existing lines with new materials or pipes, to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.

5. Repair leaks.

Routine maintenance does not include construction of new lines or facilities resulting from compliance with applicable codes, standards and regulations.

“Runoff” means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

“Site” means the land or water area where any facility or activity is physically located or conducted, including adjacent land used in connection with the facility or activity.

“Source control BMP” means any schedule of activities, prohibition of practices, maintenance procedures, managerial practices or operational practices that aim to prevent stormwater pollution by reducing the potential for contamination at the source of pollution.

“Standard urban stormwater mitigation plan” or “SUSMP” means a report submitted by an applicant for approval by the Director prior to issuance of a building, grading, planning or similar permit outlining the necessary LID requirements and BMPs which must be incorporated into design plans for development or redevelopment projects.

“Storm Drain System” means any facility or any parts of the facility, including streets, gutters, conduits, natural or artificial drains, channels and watercourse that are used for the purpose of collecting, storing, transporting or disposing of stormwater and are located within the City.

“Stormwater runoff” means that part of precipitation (rainfall) which travels via flow across a surface to the MS4 or receiving waters from impervious, semi-pervious or pervious surfaces. When all other factors are equal, runoff increases as the perviousness of a surface decreases.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of stormwater and urban runoff pollution (e.g. canopy, structural enclosure). Structural BMPs may include both treatment control BMPs and source control BMPs.

"Treatment" means the application of engineered systems that use physical, chemical or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological or chemical process.

"Urban runoff" means surface water flow produced by non-stormwater resulting from residential, commercial and industrial activities involving the use of potable and nonpotable water.

52.05 Construction and application.

This chapter shall be construed to assure consistency with the requirements of the federal Clean Water Act and acts amendatory or supplementary to the Federal Clean Water Act, applicable implementing regulations, and the Municipal NPDES Permit, and any amendment, revision or reissuance of the Municipal NPDES Permit.

52.06 No taking.

The provisions of this chapter shall not operate to deprive any property owner of substantially all of the market value of such owner's property or otherwise constitute an unconstitutional taking without compensation.

52.07 Prohibited activities.

A. Illicit Discharges and Connections. It is prohibited to commence, establish, use, maintain or continue any illicit connections to the MS4 or any illicit discharges to the MS4. This prohibition against illicit connections applies to the use, maintenance or continuation of any illicit connection, whether that connection was established prior to or after the effective date of this chapter.

B. Littering. No person shall throw, deposit, place, leave, maintain, keep or permit to be thrown, deposited, placed, left or maintained or kept, any refuse, rubbish, garbage, or any other discarded or abandoned objects, articles or accumulations, in or upon any street, alley, sidewalk, storm drain, inlet, catch basin conduit or drainage structure, business place, or upon any or private plot of land in the City, so that the same might be or become a pollutant. No person shall throw or deposit litter in any fountain, pond, lake, stream, or other body of water within the City. This section shall not apply to refuse, rubbish or garbage deposited in containers, bags or other appropriate receptacles which are placed in designated locations for regular solid waste pick-up and disposal.

C. Disposal of Landscape Debris. No person shall dispose of leaves, dirt, or other landscape debris into the municipal separate stormwater system.

D. Non-stormwater Discharges. The following non-stormwater discharges into the MS4 are prohibited unless in compliance with a separate NPDES permit or pursuant to a discharge exemption by the Regional Board, the Regional Board's Executive Officer, or the State Water Resources Control Board:

1. The discharge of untreated wash waters to the MS4 when gas stations, auto repair garages, or other type of automotive service facilities are cleaned;
2. The discharge of untreated wastewater to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;
3. To the maximum extent practicable, discharges to the MS4 from areas where repair of machinery and equipment, including motor vehicles, which are visibly leaking oil, fluid or antifreeze, is undertaken;
4. Discharges of untreated runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;
5. Discharges of commercial/municipal swimming pool filter backwash to the MS4;
6. Discharges of untreated runoff from the washing of toxic materials from paved or unpaved areas to the MS4; provided, however, that nonindustrial and noncommercial activities which incidentally generate urban runoff, such as the hosing of sidewalks, shall be excluded from this prohibition;
7. To the maximum extent practicable, discharges to the MS4 from washing impervious surfaces in industrial/commercial areas which results in a discharge of untreated runoff to the MS4, unless specifically required by state law, or the City's Municipal code, or Los Angeles County's Health and Safety Codes, or permitted under a separate NPDES permit;
8. Discharges from the washing out of concrete trucks into the MS4;
9. Discharges to the MS4 of any pesticide, fungicide or herbicide, banned by the USEPA or the California Department of Pesticide Regulation; or
10. The disposal of hazardous wastes into trash containers used for municipal trash disposal where such disposal causes or threatens to cause a direct or indirect discharge to the MS4.

E. Car Washing. No motor vehicle, boat, trailer, or other type of mobile transportation may be washed, other than at a commercial carwash, unless such vehicle is being washed by:

1. A resident at their residence using a hand-held bucket or a water hose equipped with an automatic shutoff nozzle as long as water does not flow onto

streets; or

2. A business that has an approved car wash facility for its fleet vehicles, provided that water does not flow onto streets.

52.08 Exempted discharges, conditionally exempted discharges or designated discharges.

A. Discharges from those activities specifically identified in, or pursuant to, Part III.A.1-3 of the Municipal NPDES Permit as being exempted discharges, conditionally exempted discharges or designated discharges shall not be considered a violation of this chapter; provided that, consistent with Part III.A.1-3 of the Municipal NPDES Permit:

1. Any applicable BMPs developed pursuant to the Municipal NPDES Permit are implemented to minimize any adverse impacts from such identified sources;

2. The discharger meets all notification, reporting and recordkeeping requirements; and

3. The discharge has conducted all applicable monitoring requirements.

B. Discharges in Violation of the Municipal NPDES Permit. Any discharge that would result in or contribute to a violation of the Municipal NPDES Permit, either separately or in combination with other discharges, is prohibited. Liability for any such discharge shall be the responsibility of the person(s) causing or responsible for the discharge, and such person(s) shall defend, indemnify and hold harmless the City from all losses, liabilities, claims or causes of actions in any administrative or judicial action relating to such discharge.

52.09 Good housekeeping provisions.

Owners and occupants of property within the City shall comply with the following requirements:

A. Septic Waste. No person shall leave, deposit, discharge, dump, or otherwise expose any chemical or septic waste to precipitation in an area where a discharge to City streets or MS4 may or does occur.

B. Use of Water. Runoff of water used for irrigation purposes shall be minimized to the maximum extent practicable. Runoff of water from the permitted washing down of paved areas shall be minimized to the maximum extent practicable.

C. Storage of Materials, Machinery and Equipment. Machinery or equipment that is to be repaired or maintained in areas susceptible to or exposed to stormwater, shall be placed in a manner so that leaks, spills and other maintenance-related pollutants are not discharged to the MS4.

D. Removal and Disposal of Debris from Industrial/Commercial Motor Vehicle Parking Lots. Industrial/commercial motor vehicle parking lots with more than twenty-five (25) parking spaces that are located in areas potentially exposed to stormwater shall be swept regularly or other equally effective measures shall be utilized to remove debris from such parking lots.

E. Food Wastes. Food wastes generated by nonresidential food service and food distribution sources shall be properly disposed of and in a manner so such wastes are not discharged to the MS4.

F. Best Management Practices. Best management practices shall be used in areas exposed to stormwater for the removal and lawful disposal of all fuels, chemicals, fuel and chemical wastes, animal wastes, garbage, batteries, or other materials which have potential adverse impacts on water quality.

G. Maintenance of Structural BMPs. Structural BMPs shall be properly operated and maintained, consistent with the approved SUSMP. Records and documentation of such maintenance shall be provided to the Director upon request.

52.10 Requirements for industrial/commercial and construction activities.

A. Industrial/Commercial and Construction Related Dischargers Generally. Each discharger associated with industrial/commercial activity or construction activity, or other discharger described in any general NPDES permit addressing such discharges, as may be issued by the U.S. Environmental Protection Agency, the State Water Resources Control Board, or the Regional Board shall comply with all requirements of such NPDES permit and the City's development construction program. Each discharger identified in an individual NPDES permit shall comply with and undertake all activities required by such permit. Proof of compliance with any such NPDES permit and the City's development construction program may be required in a form acceptable to the Director prior to the issuance of any grading, building or occupancy permits, or any other type of permit or license issued by the City.

B. Source Control BMPs for Industrial/Commercial Facilities. Industrial/commercial facilities shall implement the effective source control BMPs listed in Table 10 of Part VI.D.6.f. of the Municipal NPDES Permit, unless a particular pollutant generating activity does not occur on a facility's site.

52.11 Standard urban stormwater mitigation plan (SUSMP) and low impact development (LID) requirements for new development and redevelopment projects.

a. Objective. Pursuant to Part VI.D.7.b of the Municipal NPDES Permit, the provisions of this section establish requirements for construction activities and facility operations of development and redevelopment projects to comply with the current Municipal NPDES Permit to lessen the water quality impacts of development by using smart growth practices and integrate LID practices and standards for stormwater pollution mitigation through means of infiltration, evapotranspiration, biofiltration, and rainfall harvest and use. Except as otherwise provided herein, the City shall administer, implement and enforce the provisions of this section.

b. Scope. This section contains requirements for stormwater pollution control measures in development and redevelopment projects and authorizes the City to further define and adopt stormwater pollution control measures, and to develop LID principles and requirements, including but not limited to the objectives and specifications for integration of LID strategies. As specified in this section, certain Planning Priority Projects shall meet the requirements of this section through the preparation and submittal of a standard urban stormwater mitigation plan (SUSMP), which shall include the applicable LID requirements set forth in this section as an element of the SUSMP.

c. Applicability – Planning Priority Projects. The following development and redevelopment projects shall be designated as Planning Priority Projects, which are subject to City conditioning and approval for the design and implementation of post- construction controls to mitigate storm water pollution prior to completion of the projects, and shall meet the requirements of this section:

(1) New Development Projects.

a. All development projects equal to one (1) acre or greater of disturbed area that adds more than 10,000 square feet of impervious surface area.

b. Industrial parks 10,000 square feet or more of surface area.

c. Commercial malls 10,000 square feet or more of surface area

d. Retail gasoline outlets with 5,000 square feet or more of surface area.

e. Restaurants (Standard Industrial Classification (SIC) of 5812) with 5,000 square feet or more of surface area.

f. Parking lots with 5,000 square feet or more of impervious surface area, or with 25 or more parking spaces.

g. Streets and roads construction of 10,000 square feet or more of impervious surface area. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects.

h. Automotive service facilities (Standard Industrial Classification (SIC) of 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) 5,000 square feet or more of surface area.

i. Projects located in or directly adjacent to, or discharging directly to an Environmentally Sensitive Area (ESA), where the development will:

1. Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and

2. Create 2,500 square feet or more of impervious surface area.

j. Single-family hillside homes.

(2) Redevelopment Projects

a. Land disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site on Planning Priority Project categories.

b. Where Redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, the entire project must be mitigated.

c. Where Redevelopment results in an alteration of less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, only the alteration must be mitigated, and not the entire development.

d. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.

e. Existing single-family dwelling and accessory structures are exempt from the Redevelopment requirements unless such projects create, add, or replace 10,000 square feet of impervious surface area.

f. Specific Requirements. The site for every Planning Priority Project shall be designed to control pollutants, pollutant loads, and runoff volume to the maximum extent feasible by minimizing impervious surface area and controlling runoff from impervious surfaces through infiltration, evapotranspiration, bioretention and/or rainfall harvest and use. In addition, the following specific requirements apply:

1. New Single-Family Hillside Homes. A new single-

family hillside home development project shall include mitigation measures to:

a. Conserve natural areas;

b. Protect slopes and channels;

c. Provide storm drain system stenciling and signage;

d. Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability; and

e. Direct surface flow to vegetated areas before discharge, unless the diversion would result in slope instability.

2. Street and Road Construction of 10,000 square feet or more. Street and road construction of 10,000 square feet or more of impervious surface shall follow the City's Green Streets Manual developed by the Director and approved by City Council resolution. The City's Green Street Manual shall be based on the USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets (December 2008 EPA-833-F-08-009).

3. Remainder of Planning Priority Projects Require a SUSMP. Except for the projects listed in paragraphs (1) and (2) of subsection D of this section, all other Planning Priority Projects shall prepare and submit to the Director for review and approval a SUSMP which shall also contain LID requirements consistent with Parts VI.D.7.c and VI.D.7.d(iii) of the Municipal NPDES Permit. In addition, Planning Priority Projects subject to this paragraph (3) shall do the following:

a. Incorporate the SUSMP into Project Plans. An applicant for a Planning Priority Project identified in paragraph (3) of subsection D of this section shall incorporate into the applicant's project plans a Storm Water Mitigation Plan (SWMP), which includes those BMPs necessary to control storm water pollution from construction activities and facility operations, as set forth in the SUSMP applicable to the applicant's project. Structural or Treatment Control BMPs (including, as applicable, post- construction treatment control BMPs) set forth in project plans shall meet the design standards set forth in the SUSMP and the current Municipal NPDES Permit.

b. Verify Maintenance of BMPs. If a project applicant has included or is required to include structural or treatment control BMPs in project plans, the applicant shall provide verification of maintenance provisions. The verification shall include the applicant's signed statement, as part of its project application, accepting responsibility for all structural and treatment control BMP maintenance until such time, if any, the property is transferred.

E. Issuance of Discretionary Permits. No discretionary permit may be issued for any Planning Priority Project identified in this section until the Director confirms the project plans comply with the applicable requirements of this section.

F. Issuance of Certificates of Occupancy. As a condition for issuing a certificate of occupancy for a Planning Priority Project identified in this section, the Director shall require facility operators and/or owners to build all the stormwater pollution control BMPs and structural or treatment control BMPs that are shown on the approved project plans and to submit a signed certification statement stating that the site and all structural or treatment control BMPs will be maintained in compliance with the SUSMP and other applicable regulatory requirements.

G. Transfer of Properties Subject to Requirement for Maintenance of Structural and Treatment Control BMPs.

1. The transfer or lease of a property subject to a requirement for maintenance of structural and treatment control BMPs shall include conditions requiring the transferee and its successors and assigns to either (a) assume responsibility for maintenance of any existing structural or treatment control BMP or (b) to replace an existing structural or treatment control BMP with new control measures or BMPs meeting the then current standards of the City and the SUSMP. Such requirement shall be included in any sale or lease agreement or deed for such property. The condition of transfer shall include a provision that the successor property owner or lessee conduct maintenance inspections of all structural or treatment control BMPs at least once a year and retain proof of inspection.

2. For residential properties where the structural or treatment control BMPs are located within a common area which will be maintained by a homeowners association, language regarding the responsibility for maintenance shall be included in the projects conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what stormwater management facilities are present, signs that maintenance is needed, and how the necessary maintenance can be performed. The transfer of this information shall also be required with any subsequent sale of the property.

3. If structural or treatment control BMPs are located within an area proposed for dedication to a public agency, said BMPs shall be the responsibility of the developer until the dedication is accepted by the public agency.

H. CEQA. Provisions of this section shall be complementary to, and shall not replace, any applicable requirements for stormwater mitigation required under the California Environmental Quality Act.

52.12 Enforcement.

A. Violations Deemed a Public Nuisance.

1. The following violations shall be deemed a public nuisance:

a. Any condition caused or permitted to exist in violation of any of the provisions of this chapter; or

b. Any failure to comply with any applicable requirement of either the SUSMP or an approved stormwater mitigation plan with respect to a property; or

c. Any false certification or verification, or any failure to comply with a certification or verification provided by a project applicant or the applicant's successor in interest; or

d. Any failure to properly operate and maintain any structural or treatment control BMP on a property in accordance with an approved stormwater mitigation plan or the SUSMP, is determined to be a threat to the public health, safety and welfare, is declared and deemed a public nuisance, and may be abated or restored by any Director, and a civil or criminal action to abate, enjoin or otherwise compel the cessation of such nuisance may be brought by the City Attorney.

2. The cost of such abatement and restoration shall be borne by the owner of the property and the cost shall be billed to the owner of the property, as provided by law or ordinance for the recovery of nuisance abatement costs,

3. If any violation of this chapter constitutes a seasonal and recurrent nuisance, the Director shall so declare. The failure of any person to take appropriate annual precautions to prevent stormwater pollution after written notice of a determination under this section shall constitute a public nuisance and a violation of this chapter.

B. Concealment. Causing, permitting, aiding, abetting or concealing a violation of any provision of this chapter shall constitute a violation of such provision.

C. Civil Actions. In addition to any other remedies provided in this chapter, any violation of this chapter may be enforced by civil action brought by the City. In any such action, the City may seek any or all of the following remedies:

1. A temporary and/or permanent injunction;
2. Assessment of the violator for the costs of any investigation, inspection or monitoring survey which led to the establishment of the violation, and for the reasonable costs of preparing and bringing legal action under this section;

4. Costs incurred in removing, correcting or terminating the adverse effects resulting from violation;

5. Compensatory damages for loss or destruction to water quality, wildlife,

fish and aquatic life.

D. Administrative Enforcement Powers. In addition to the other enforcement powers and remedies established by this chapter, the Director has the authority to utilize the following administrative remedies:

1. Cease and Desist Orders. When a discharge has taken place or is likely to take place in violation of this chapter, the Director may issue an order to cease and desist such discharge, or practice or operation likely to cause such discharge and direct that those persons not complying shall: (a) comply with the requirement; (b) comply with a time schedule for compliance; and (c) take appropriate remedial or preventive action to prevent the violation from recurring.

2. Notice to Clean. Whenever the Director finds any oil, earth, debris, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or any other material of any kind, in or upon the sidewalk abutting or adjoining any parcel of land, or upon any parcel of land or grounds, which may result in pollutants entering the MS4 or a non-stormwater discharge to the MS4, he or she may give notice to the owner or occupant of the adjacent property to remove such oil earth, debris, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or other material, in any manner that he or she may reasonably provide. The recipient of such notice shall undertake the activities as described in the notice.

E. Penalties. Violation of this chapter shall be punishable as provided in Chapter 1.16 of this code. Each day that a violation continues shall constitute a separate offense.

F. Permit Revocation. To the extent the City makes a provision of this chapter or any identified BMP a condition of approval to the issuance of a permit or license, any person in violation of such condition is subject to the permit revocation procedures set forth in this code.

G. Burden of Proof. In an enforcement action, the burden of proof shall be on the person who is the subject of such action to establish that the reduction or elimination of the discharge to the maximum extent practicable has been accomplished through compliance with the best management practices available, including applicable monitoring, notifications and reporting requirements.

H Remedies. Remedies under this chapter are in addition to and do not supersede or limit any and all other available remedies, civil or criminal. The remedies provided for in this chapter shall be cumulative and not exclusive.

52.13 Fees

A. Fees for Plan Reviews, Inspections, Violations Corrections and tasks associated with this Section shall be established by Resolution of the City Council.

SECTION 1 – INTRODUCTION

1.1 WHAT ARE GREEN STREETS?

City streets present many opportunities for green infrastructure application. One principle of green infrastructure involves reducing and treating stormwater close to its source. Urban transportation right-of-ways integrated with green techniques are often called "green streets." Green streets provide source controls for stormwater runoff and pollutant loads. In addition, green infrastructure approaches complement street facility upgrades, street aesthetic improvements, and urban tree canopy efforts that also make use of the right-of-way and allow it to achieve multiple goals and benefits. Using the right-of-way for treatment of stormwater runoff links green with grey infrastructure by making use of the engineered conveyance of roads and providing connections to conveyance systems when needed.

Green streets can incorporate a wide variety of design elements including street trees, permeable pavements, bioretention, and swales. Although the design and appearance of green streets will vary, the functional goals are the same; provide source control of stormwater, limit its transport and pollutant conveyance to the collection system, restore pre-development hydrology to the maximum extent practicable, and provide environmentally enhanced roads. Successful application of green techniques will encourage soil and vegetation contact and infiltration and retention of stormwater.

1.2 WHY ARE GREEN STREETS BEING REQUIRED?

It is the policy of the City of Whittier (City Council Resolution No. 8593) to comply with the requirements of the Municipal Separate Storm Sewer System (MS4) Permit (LARWQCB Order Number R4-2012-0175). This Green Streets Guidance Manual provides guidance to help achieve the goals of the MS4 Permit which requires that jurisdictions in Los Angeles County reduce contaminants in runoff to improve water quality in waterways. These requirements stem from the National Pollutant Discharge Elimination System (NPDES) requirements of the Clean Water Act (CWA). This Green Streets Guidance Manual shall be used as a guide in Green Street projects as required. Should a conflict arise between this manual and the requirements of the MS4 Permit and a grading permit, excavation permit, or building permit, those permits hold precedence over this manual.

The MS4 Permit requires Green Streets strategies to be implemented for transportation corridors. Transportation corridors represent a significant percentage of the impervious area within Los Angeles and therefore generate a substantial amount of runoff from storm events. The altered flow regime from traditional roadways, increased runoff volume, and high runoff peak flows, are damaging to the environment and a risk to property downstream.

Traditionally, street design has focused on removing water from the street as quickly as possible and transferring it to storm drains, channels, and water bodies. Stormwater runoff can contain bacteria and other pollutants, and is thereby regulated at the state and local level (refer to *Table 1* for a list of pollutants typical of city streets). Green Streets will help to transform the design of streets from the conventional method of moving water off-site as quickly as possible to a method of storing and treating water on-site for a cleaner discharge into the waters of the U.S.

Street and road construction applies to major arterials, state routes, highways, or rail lines used for the movement of people or goods by means of bus services, trucks, and vehicles, and transportation corridors within larger projects. Projects which are required under the MS4 permit (Order Number R4-2012-0175) to follow this Green Streets Guidance Manual include the following:

1. Public Street and road construction of 10,000 square feet or more of impervious surface area within a transportation corridor. (Private street and road construction activities are subject to separate development planning provisions of the MS4 permit).
2. Street and road redevelopment resulting in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.
3. For projects not listed above, as determined by the Director of Public Works.

Table 1: Examples of Stormwater Pollutants Typical of Roads (*Managing Wet Weather With Green Infrastructure Municipal Handbook: Green Streets, 2008*).

Pollutant	Source	Effects in Surface Water
Trash	Littering	Physical damage to aquatic animals and fish, release of poisonous substances
Sediment/solids	Construction, unpaved areas	Increased turbidity, increased transport of soil bound pollutants, negative effects on aquatic organisms reproduction and function
Metals (Copper, Zinc, Lead, Arsenic)	Vehicle brake pads, vehicle tires, motor oil, vehicle emissions and engines, vehicle emissions, brake linings, automotive fluids	Toxic to aquatic organisms and can accumulate in sediments and fish tissues
Organics associated with petroleum (e.g., PAHs)	Vehicle emissions, automotive fluids, gas stations	Toxic to aquatic organisms
Nutrients	Vehicle emissions, atmospheric deposition	Promotes eutrophication and depleted dissolved oxygen concentrations

1.3 PLANNING AND DEVELOPMENT

Ideally, a site would be designed to capture and use or infiltrate the entire runoff volume of a storm, however site and design constraints make it difficult to achieve that goal. This Green Streets Guidance Manual is designed to provide guidance with selection of Best Management Practices (BMP) based on site constraints typical to street design. Streetscape geometry, topography, climate, and other factors determine the types of controls that can be implemented. The initial step in selecting a stormwater tool is determining the available open space and constraints. Stormwater controls should be selected using the hierarchy represented in *Figure 1*, the site guidelines represented in *Table 2*, and the location opportunities listed in *Table 3*.

1.3.1 Site Considerations

Specific elements which should be given special consideration in the site assessment process for applicable Green Streets include:

- **Ownership of land adjacent to right of ways.** The opportunity to provide stormwater treatment may depend on the ownership of land adjacent to the right-of-way. Acquisition of additional right-of-way and/or access easements may be more feasible if land bordering the project is owned by relatively few land owners. If the adjacent land is not publicly owned, treatment implementation options may be significantly limited.

- **Location of existing utilities.** The location of existing storm drainage utilities can influence the opportunities for Green Streets infrastructure. For example, stormwater planters can be designed to overflow along the curb-line to an existing storm drain inlet, thereby avoiding the infrastructure costs associated with an additional inlet. The location of other utilities may limit the allowable placement of BMPs to only those areas where a clear pathway to the storm drain exists.
- **Grade differential between road surface and storm drain system.** Some BMPs require more head from inlet to outlet than others; therefore, allowable head drop may be an important consideration in BMP selection. Storm drain elevations may be constrained by a variety of factors in a roadway project (utility crossings, outfall elevations, etc.) that cannot be overcome and may override stormwater management considerations.
- **Longitudinal slope.** The suite of BMPs which may be installed on steeper road sections is more limited. Specifically, permeable pavement and swales are more suitable for gentle slopes. Other BMPs may be more readily terraced to be used on steeper slopes.
- **Soil suitability.** Infiltration BMPs require specific types of soil. The site assessment should determine the type of soils on the site and the infiltration rate (hydraulic conductivity) of the soils if infiltration BMPs are proposed.
- **Potential access opportunities.** A significant concern with installation of BMPs in major right of ways is the ability to safely access the BMPs for maintenance considering traffic hazards. Vehicle travel lanes and specific areas potentially hazardous for maintenance crews should be identified during the site assessment.

1.3.2 Design Considerations

The drainage patterns of the project should be developed so that drainage can be routed to areas with BMP opportunities before entering storm drains. For example, if a median strip or parkway is present, a reverse crown should be considered, where allowed, so that stormwater can drain to a median swale. Likewise, standard peak-flow curb inlets should be located downstream of areas with potential for stormwater planters so that water can first flow into the planter, and then overflow to the downstream inlet if capacity of the planter is exceeded. It is more difficult to apply green infrastructure after water has entered the storm drain.

Green Streets projects are not required to treat off-site runoff; however treatment of comingled off-site runoff may be used to off-set the inability to treat areas within the project for which significant constraints prevent the ability to provide treatment.

1.3.3 BMP Sizing for Applicable Green Streets Projects

An 85th percentile standard design storm should be used to determine the appropriate size, slope, and materials of each facility. After identifying the appropriate stormwater facilities for a site, an integrated approach using several BMPs is encouraged. To increase water quality and functional hydrologic benefits, several stormwater management BMPs can be used in succession. This is called a treatment train approach. The control measures should be designed using available topography to take advantage of gravity for conveyance to and through each facility. All Green Streets designs should be based on a published design standard.

The following steps should be used to size BMPs for applicable Green Streets projects:

1. Delineate drainage areas tributary to BMP locations and soil hydraulic conductivity.
2. Look up the recommended sizing method for the BMP selected in each drainage area and calculate target sizing criteria.
3. Design BMPs per a published design standard.
4. Attempt to provide the calculated sizing criteria for the selected BMPs.
5. If sizing criteria cannot be achieved, document the constraints that override the application of BMPs and provide the largest portion of the sizing criteria that can be reasonably provided given constraints. If BMPs cannot be sized to provide the calculated volume for the tributary area, it is still important to design the BMP inlet, energy dissipation, and overflow capacity for the full tributary area to ensure that flooding and scour is avoided. It is strongly recommended that BMPs which are designed to less than their target design volume be designed to bypass peak flows.

1.3.4 Alternative Compliance Options for Applicable Green Streets Projects

Alternative compliance programs may be considered for applicable Green Streets projects if on-site green infrastructure approaches cannot practicably treat the design volume with approval from the City Engineer. The primary alternative compliance option for applicable Green Streets projects is the completion of off-site mitigation projects. The proponent would implement a project to reduce stormwater pollution for other portions of roadway or similar land uses when being reconstructed to the project in the same hydrologic unit, ideally as close to the project as possible and discharging to the same outfall.

1.3.5 Infiltration Considerations

Appropriate soils, infiltration media, and infiltration rates should be used for infiltration BMPs. If infiltration is proposed, a complete geotechnical or soils report should be undertaken to determine infiltration rates, groundwater depth, soil toxicity and stability, and other factors that will affect the ability and the desirability of infiltration. At a minimum, the infiltration capacity of the underlying soils shall be deemed suitable for infiltration (0.3 inches per hour or greater), appropriate media should be used in the BMP itself, the groundwater should be at least ten feet below the ground surface.

Table 3: BMP Location Opportunity Summary.

BMP	Location Opportunity Summary
Bioretention	• Adjacent to traveled way and in frontage or furniture sidewalk zones • Can be located in curb extensions, medians, traffic circles, roundabouts, and any other landscaped area • Suitable for constrained locations
Infiltration Trench/Dry Well	• Can be located under sidewalks and in sidewalk planting strips, curb extensions, roundabouts, and medians
Rain Gardens	• Can be integrated medians, islands, circles, street ends, chicanes, and curb extensions • Can be located at the terminus of swales in the landscape
Permeable Pavement	• Suitable for parking or emergency access lanes • Can be located in furniture zones of sidewalks especially adjacent to tree wells • Cannot be placed in areas with large traffic volume or heavy load lanes • Avoid steep streets • Cannot be placed within 20 feet of sub-sidewalk basements • Cannot be within 50 feet of domestic water wells
Flow-Through Planters	• Above-grade planters should be structurally separate from adjacent sidewalks • At-grade planter systems can be installed adjacent to curbs within the frontage and/or furniture zones
Vegetated Swales	• Can be located adjacent to roadways, sidewalks, or parking areas • Can be integrated into traffic calming devices such as chicanes and curb extensions • Can be placed in medians where the street drains to the median • Can be placed alongside streets and pathways • Should be designed to work in conjunction with the street slope
Vegetated Buffer Strips	• Can be located in multi-way boulevards, park edge streets, or sidewalk furniture zones • Can serve as pre-treatment
Treatment BMPs	• Can be located in a catch basin, manhole, or vault • Can be installed on an existing outlet pipe or at the bottom of an existing catch basin with an overflow • Can be placed on existing curbside catch basins and flush grate openings • Can be installed on the existing wall of a catch basin and on the curb side wall of a catch basin • Minimum set-backs from foundations and slopes should be observed if the BMP is not lined
Street Trees	• Can be placed on sidewalks, in furniture zones, and on medians • Adequate spacing must be provided between trees and street lights, pedestrian lights, accessible parking spaces, bus shelters, awnings, canopies, balconies, and signs

SECTION 2 – INFILTRATION

Infiltration systems utilize rock, gravel, and other highly permeable materials for on-site infiltration. In these systems, stormwater runoff is directed to the system and allowed to infiltrate into the soils for on-site retention and groundwater recharge. During small storm events, infiltration systems can result in significant or even complete volume reduction of stormwater runoff.

Infiltration should be used to the maximum extent practicable. Biotreatment BMPs should be considered if infiltration is found to be infeasible due to low infiltration rates, soil instability, high groundwater, or soil contamination.

Infiltration BMPs may become damaged by stormwater carrying high levels of sediment, therefore pre-treatment features should be designed to treat street runoff prior to discharging to infiltration features. Media filters, filter inserts, vortex type units, bioretention devices, sumps, and sedimentation basins are several pre-treatment tools effective at removing sediment.

2.1 INFILTRATION TRENCHES AND DRY WELLS

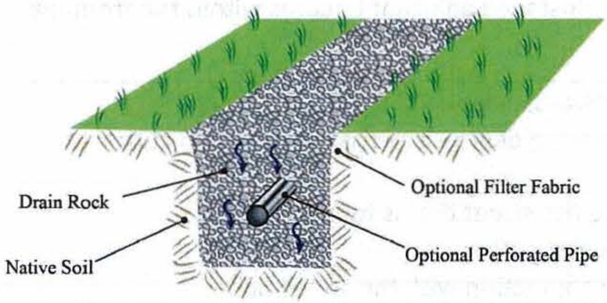

Figure 2: Infiltration Trench (*Model for Living Streets Design Manual, 2011*).

Description

Infiltration trenches are linear, rock-filled features that promote infiltration by providing a high ratio of sub-surface void space in permeable soils. They provide on-site stormwater retention and may contribute to groundwater recharge. Infiltration trenches may accept stormwater from sheet flow, concentrated flow from a swale or other surface feature, or piped flow from a catch basin. Because they are not flow-through BMPs, infiltration trenches do not have outlets but may have overflow outlets for large storm events.

Dry wells are typically distinguished from infiltration trenches by being deeper than they are wide. They are usually circular, resembling a well, and are backfilled with the same materials as infiltration trenches. Dry wells typically accept concentrated flow from surface features or from pipes and do not have outlets.

Infiltration trenches and dry wells are typically designed to infiltrate all flow they receive. In large storm events, partial infiltration of runoff can be achieved by providing an overflow outlet. In these systems, significant or even complete volume reduction is possible in smaller storm events. During large storm events, these systems may function as detention facilities and provide a limited amount of retention and infiltration.

Location and placement guidelines

Infiltration trenches and dry wells typically have small surface footprints so they are potentially some of the most flexible elements of landscape design. However, because they involve sub-surface excavation, these features may interfere with surrounding structures. Care needs to be taken to ensure that surrounding building foundations, pavement bases, and utilities are not damaged by infiltration features. Once structural soundness is ensured, infiltration features may be located under sidewalks and in sidewalk planting strips, curb extensions, roundabouts, and medians. When located in medians, they are most effective when the street is graded to drain to the median. Dry wells require less surface area than trenches and may be more feasible in densely developed areas.

Infiltration features should be sited on uncompacted soils with acceptable infiltration capacity. They are best used where soil and topography allow for moderate to good infiltration rates (0.3 inches per hour or better) and the depth to groundwater is at least 10 feet. Prior to design of any retention or infiltration system, proper soil investigation and percolation testing shall be conducted to determine appropriate infiltration design rates, depth to groundwater, and if soil will exhibit instability as a result of infiltration. Any site with potential for previous underground contamination shall be investigated. Infiltration trenches and dry wells can be designed as stand-alone systems when water quality is not a concern or may be combined in series with other stormwater tools.

Perforated pipes and piped inlets and outlets may be included in the design of infiltration trenches. Cleanouts should be installed at both ends of any piping and at regular intervals in long sections of piping, to allow access to the system. Access ports are recommended for both trenches and wells and can be combined with clean-outs. If included, the overflow inlet from the infiltration trench should be properly designed for anticipated flows.

2.2 RAIN GARDENS

Figure 3: Rain garden (*Model for Living Streets Design Manual, 2011*).

Description

Rain gardens are vegetated depressions in the landscape. They have flat bottoms and gently sloping sides. Rain gardens can be similar in appearance to swales, but their footprints may be any shape. Rain gardens hold water on the surface, like a pond, and have overflow outlets. The detained water is infiltrated through the topsoil and subsurface drain rock unless the volume of water is so large that some must overflow. Rain gardens can reduce or eliminate off-site stormwater discharge while increasing on-site recharge.

Location and Placement Guidelines

Rain gardens may be placed where there is sufficient area in the landscape and where soils are suitable for infiltration. Rain gardens can be integrated with traffic calming measures installed along streets, such as medians, islands, circles, street ends, chicanes, and curb extensions. Rain gardens are often used at the terminus of swales in the landscape.

2.3 PERMEABLE PAVEMENT

Figure 4: Permeable pavement during a storm event (*Model for Living Streets Design Manual, 2011*).

Description

Permeable pavement is a system with the primary purpose of slowing or eliminating direct runoff by absorbing rainfall and allowing it to infiltrate into the soil. Permeable pavement also filters and cleans pollutants such as petroleum deposits on streets, reduces water volumes for existing overtaxed pipe systems, and decreases the cost of offsite or onsite downstream infrastructure. This BMP is impaired by sediment-laden run-on which diminishes its porosity. Care should be taken to avoid flows from landscaped areas reaching permeable pavement. Permeable pavement is, in certain situations, an alternative to standard pavement. Conventional pavement is designed to move stormwater off-site quickly. Permeable pavement, alternatively, accepts the water where it falls, minimizing the need for management facilities downstream.

Location and Placement Guidelines

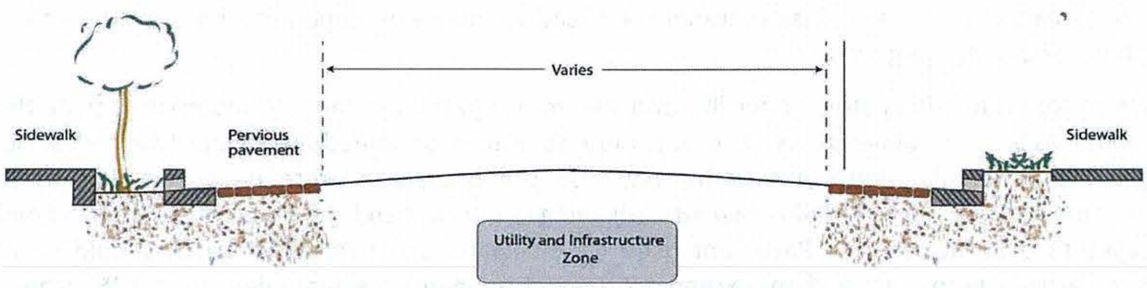

Figure 5: Possible pervious pavement design layout (*Model for Living Streets Design Manual, 2011*).

Conditions where permeable pavement should be encouraged include:

- Sites where there is limited space in the right-of-way for other BMPs;
- Parking or emergency access lanes; and
- Furniture zones of sidewalks especially adjacent to tree wells

Conditions where permeable pavement should be avoided include:

- Large traffic volume or heavy load lanes;
- Where runoff is already being harvested from an impervious surface for direct use, such as irrigation of bioretention landscape areas;
- Steep streets;
- Gas stations, car washes, auto repair, and other sites/sources of possible chemical contamination;
- Areas with shallow groundwater;
- Within 20 feet of sub-sidewalk basements; and
- Within 50 feet of domestic water wells.

Material and Design Guidelines

A soil or geotechnical report should be conducted to provide information about the permeability rate of the soil, load-bearing capacity of the soil, the depth to groundwater (10 feet or more required), and if soil will exhibit instability as a result of implementation. Infiltration rate and load capacity are key factors in the functionality of this BMP. Permeable pavement generally does not have the same load-bearing capacity as conventional pavement, so this BMP may have limited applications depending on the underlying soil strength and pavement use. Permeable pavement should not be used in general traffic lanes due to the possible variety of vehicles weights and heavy volumes of traffic.

When used as a road paving, permeable pavement that carries light traffic loads typically has a thick drain rock base material. Pavers should be concrete as opposed to brick or other light-duty materials. Other possible permeable paving materials include porous concrete and porous asphalt. These surfaces also have specific base materials that detain infiltrated water and provide structure for the road surface. Base material depths should be specified based on design load and the soils report.

Plazas, emergency roads, and other areas of limited vehicular access can also be paved with permeable pavement. Paving materials for these areas may include open cell paver blocks filled with stones or grass and plastic cell systems. Base material specifications may vary depending on the product used, design load, and underlying soils.

When used for pedestrian paths, sidewalks, and shared-use paths, appropriate materials include those listed above as well as rubber pavers and decomposed granite or something similar (washed or pore-clogging fine material). Pedestrian paths may also use broken concrete pavers as long as ADA requirements are met. Paths should drain into adjoining landscapes and should be higher than adjoining landscapes to prevent run-on. Pavement used for sidewalks and pedestrian paths should be ADA compliant, especially smooth, and not exceed a 2 percent slope or have gaps wider than 0.25 inches. In general, tripping hazards should be avoided.

Design considerations for permeable pavement include:

- The location, slope and load-bearing capacity of the street, and the infiltration rate of the soil;
- The amount of storage capacity of the base course;
- The traffic volume and load from heavy vehicles;
- The design storm volume calculations and the quality of water; and
- Drain rock, filter fabrics, and other subsurface materials.

Maintenance Guidelines

Maintenance of permeable pavement systems is essential to their continued functionality. Regular vacuuming and street sweeping should be performed to remove sediment from the pavement surface. The bedding and base material should be selected for long life and sufficient infiltration rates.

SECTION 3 – BIOTREATMENT

Biotreatment BMPs are landscaped, shallow depressions that capture and filter stormwater runoff. These types of BMPs are an increasingly common type of stormwater treatment device that are installed at curb level and filled with a bioretention type soil. They are designed as soil and plant-based filtration devices that remove pollutants through a variety of physical, biological, and chemical treatment processes. They typically consist of a ponding area, mulch layer, planting soils, and plants. Stormwater is directed to the system and pollutants are treated as the stormwater drains through the planting soil and either infiltrated or collected by an underdrain and directed to a collection system.

Biotreatment should only be used in cases where infiltration has been proven infeasible due to low infiltration rates, soil instability, high groundwater, or soil contamination.

3.1 BIORETENTION

Figure 6: Bioretention system (*Model for Living Streets Design Manual, 2011*).

Description

Bioretention is a stormwater management process that cleans stormwater by mimicking natural soil filtration processes as water flows through a bioretention BMP. It incorporates mulch, soil pores, microbes, and vegetation to reduce and remove sediment and pollutants from stormwater. Bioretention is designed to slow, spread, and, to some extent, infiltrate water. Each component of the bioretention BMP is designed to assist in retaining water, evapotranspiration, and adsorption of pollutants into the soil matrix. As runoff passes through the vegetation and soil, the combined effects of filtration, absorption, adsorption, and biological uptake of plants remove pollutants.

For areas with low permeability or other soil constraints, bioretention can be designed as a flow-through system with a barrier protecting stormwater from native soils. Bioretention areas can be designed with an underdrain system that directs the treated runoff to infiltration areas, cisterns, or the storm drain system, or may treat the water exclusively through surface flow. Examples of bioretention BMPs include swales, planters, and vegetated buffer strips.

Location and Placement Guidelines

Bioretention facilities can be included in the design of all street components; adjacent to the traveled way and in the frontage or furniture sidewalk zones. They can be designed into curb extensions, medians, traffic circles, roundabouts, and any other landscaped area. Depending on the feature, maintenance and access should always be considered in locating the device. Bioretention systems are also appropriate in constrained locations where other stormwater facilities requiring more extensive subsurface materials are not feasible.

If bioretention devices are designed to include infiltration, native soil should have a minimum permeability rate of 0.3 inches per hour and at least 10 feet to the groundwater table. Sites that have more than a 5 percent slope may require other stormwater management approaches or special engineering.

3.2 FLOW-THROUGH PLANTERS

Figure 7: Flow-through planter (*Model for Living Streets Design Manual, 2011*).

Description

Flow-through planters are typically above-grade or at-grade with solid walls and a flow-through bottom. They are contained within an impermeable liner and use an underdrain to direct treated runoff back to the collection system. Where space permits, buildings can direct roof drains first to building-adjacent planters. Both underdrains and surface overflow drains are typically installed with building-adjacent planters.

At-grade street-adjacent planter boxes are systems designed to take street runoff and/or sidewalk runoff and incorporate bioretention processes to treat stormwater. These systems may or may not include underdrains.

Location and Placement Guidelines

Above-grade planters should be structurally separate from adjacent sidewalks to allow for future maintenance and structural stability per local department of public works' standards. At-grade planter systems can be installed adjacent to curbs within the frontage and/or furniture zones.

All planters should be designed to pond water for less than 48 hours after each storm. Flow-through planters designed to detain roof runoff can be integrated into a building's foundation walls, and may be either raised or at grade.

For at-grade planters, small localized depressions may be included in the curb opening to encourage flow into the planter. Following the inlet, a sump (depression) to capture sediment and debris may be integrated into the design to reduce sediment loadings.

3.3 VEGETATED SWALES

Figure 8: Vegetated swale (*Signal hill, CA*).

Description

Swales are linear, vegetated depressions that capture rainfall and runoff from adjacent surfaces. The swale bottom should have a gradual slope to convey water along its length. Swales can reduce off-site stormwater discharge and remove pollutants along the way. In a swale, water is slowed by traveling through vegetation on a relatively flat grade. This gives particulates time to settle out of the water while contaminants are removed by the vegetation.

Location and Placement Guidelines

Swales can be located adjacent to roadways, sidewalks, or parking areas. Roadway runoff can be directed into swales via flush curbs or small evenly-spaced curb cuts into a raised curb. Swale systems can be integrated into traffic calming devices such as curb extensions.

Swales can be placed in medians where the street drains to the median. Placed alongside streets and pathways, vegetated swales can be landscaped with native plants which filter sediment and pollutants and provide habitat for wildlife. Swales should be designed to work in conjunction with the street slope to maximize filtration and slowing of stormwater.

Swales are designed to allow water to slowly flow through the system. Depending on the landscape and design storm, an overflow or bypass for larger storm events may be needed. Curb openings should be designed to direct flow into the swale. Following the inlet, a sump may be built to capture sediment and debris.

3.4 VEGETATED BUFFER STRIPS

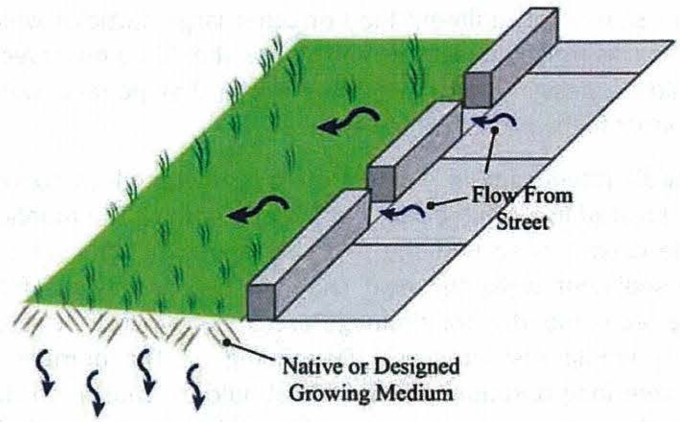

Figure 9: Vegetated buffer strip detail (*Model for Living Streets Design Manual, 2011*).

Description

Vegetated buffer strips are sloping planted areas designed to treat and absorb sheet flow from adjacent impervious surfaces. These strips are not intended to detain or retain water, only to treat it as a flow-through feature. They should not receive concentrated flow from swales or other surface features, or concentrated flow from pipes.

Location and Placement Guidelines

Vegetated buffer strips are well-suited to treating runoff from roads and highways, small parking lots, and pervious surfaces. They may be commonly used on multi-way boulevards, park edge streets, or sidewalk furniture zones with sufficient space. When selecting potential placement the need for supplemental irrigation should be considered. Vegetated buffers can also be situated so they serve as pre-treatment for another stormwater management feature, such as an infiltration BMP.

SECTION 4 – TREATMENT BMPS

4.1 SAND FILTERS & STORM DRAIN INLET PROTECTIONS

As described in Section 1 of this Green Streets Manual, it may be infeasible for specific projects to apply infiltration or biotreatment BMPs. In these cases, sand filters or filter inserts as treatment BMPs can be considered as an alternative. Sand filters and filter inserts can be designed to prevent particulates, debris, metals, and petroleum-based materials conveyed by stormwater from entering the storm drain system. All treatment BMP units should have an overflow system that allows the storm drain to remain functional if the filtration system becomes clogged during rainstorms. All storm drain inlet protections must be of a style and configuration approved by the agency with ownership of the inlet.

Typical maintenance of catch basins includes scheduled trash removal if a screen or other debris capturing device is used. Street sweeping should be performed by vacuum sweepers with occasional weed and large debris removal. Maintenance should include keeping a log of the amount of sediment collected and the data of removal.

The following are examples of possible treatment BMPs:

- **Sand Filters:** Sand filters are designed to filter stormwater through a constructed media bed and to an underdrain system. As stormwater flows through the media pollutants are filtered out of the water. The filtered water is conveyed through the underdrain to a collection system. Pretreatment is necessary to eliminate significant sediment load or other large particles which would clog the system. Minimum set-backs from foundations and slopes should be observed if the facility is not lined. Filters should be designed and maintained such that ponded water should not persist for longer than 48 hours following a storm event.
- **Cartridge Media Filters:** Cartridge media filters contain multiple modular filters which contain engineered media. The filters can be located in a catch basin, manhole, or vault. The manhole or vault may be divided into multiple chambers so that the first chamber may act as a pre-settling basin for removal of coarse sediment while the next chamber may act as the filter chamber. Cartridge media filters are recommended for drainage areas with limited available surface area or where surface BMPs would restrict uses. Depending on the number of cartridges, maintenance events can have long durations. Locations should be chosen so that maintenance events will not significantly disrupt businesses or traffic. Inlet inserts should be sized to capture all debris and should therefore be selected to match the specific size and shape of each catch basin and inlet. Filter media should be selected to target pollutants of concern. A combination of media may be used to remove a variety of pollutants. Systems with lower maintenance requirements are preferred.
- **Storm Drain Inlet Screens:** Inlet screens are designed to prevent large litter and trash from entering the storm drain system while allowing smaller particles to pass through. The screens function as the first preventive measure in removing pollutants from the storm water system. The city's street sweeping department should be consulted to ensure compliance with local specifications and to schedule regular maintenance. Annual inspection of the screen is recommended to ensure functionality. Note that most LA River drainage areas are already protected using connector pipe screens through collective systems.
- **Storm Drain Pipe Filter Insert:** The storm drain outlet pipe filter is designed to be installed on an existing outlet pipe or at the bottom of an existing catch basin with an overflow. This filter removes debris, particulates, and other pollutants from stormwater as it leaves the storm drain system. This BMP is less desirable than a protection system that prevents debris from entering the storm drain system because the system may become clogged with debris. Outlet pipe filters can be placed on existing curbside catch basins and flush grate openings. Regular maintenance is required and inspection should be performed rigorously. Because this filter is located at the

outlet of a storm drain system, clogging with debris is not as apparent as with filters at street level. This BMP may be used as a supplemental filter with an inlet screen or inlet insert unit.

SECTION 5 – STREET TREES

5.1 STREET TREES

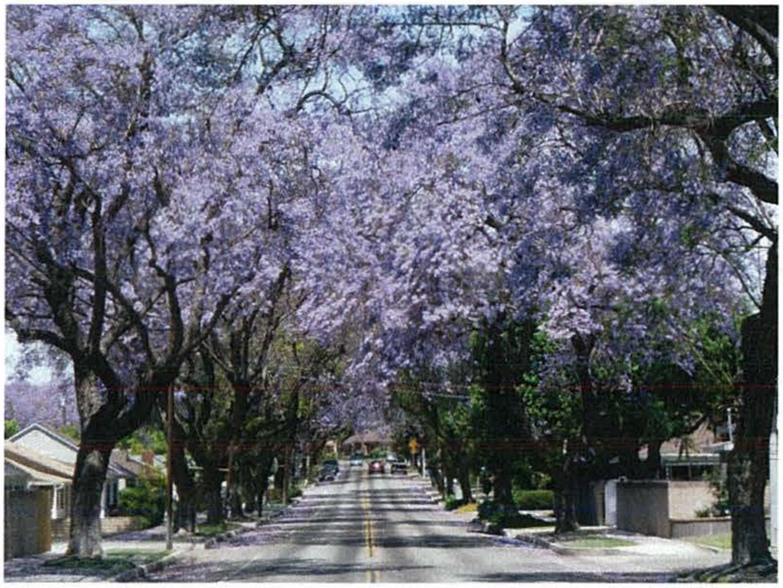

Figure 10: Street trees (*Whittier, CA*).

Description

Healthy urban trees are powerful stormwater management tools. Leaves and branches catch and slow rain as it falls, helping it to soak into the ground. The plants themselves take up and store large quantities of water that would otherwise contribute to surface runoff. Part of this moisture is then returned to the air through evaporation to further cool the city. As an important element along sidewalks, street trees must be provided with conditions that allow them to thrive, including adequate uncompacted soil, water, and air.

The goal of adding street trees is to increase the canopy cover of the street, the percentage of its surface either covered by or shaded by vegetation. The selection, placement, and management of all elements in the street should enhance the longevity of a city's street trees and healthy, mature plantings should be retained and protected whenever possible.

Benefits to adding street trees include:

- Creation of shade to lower temperatures in a city, reduces energy use, and makes the street a more pleasant place in which to walk and spend time
- Slowing and capture of rainwater, helping it soak into the ground to restore local hydrologic functions and aquifers
- Improving air quality by cooling air, producing oxygen, and absorbing and storing carbon in woody plant tissues

Guidelines

For guidelines on street tree design refer to the Whittier Parkway Tree Manual or contact the Whittier Department of Parks, Recreation, and Community Services.

SECTION 6 – DEFINITIONS

Best Management Practice (BMP)
Operating methods and/or structural devices used to reduce stormwater volume, peak flows, and/or pollutant concentrations of stormwater runoff through evapotranspiration, infiltration, detention, filtration, and/or biological and chemical treatment.

Bioretention
Soil and plant-based retention practice that captures and biologically degrades pollutants as water infiltrates through sub-surface layers containing microbes that treat pollutants. Treated runoff is then slowly infiltrated and recharges the groundwater.

Conveyance
The process of water moving from one place to another.

Design Storm
A storm whose magnitude, rate, and intensity do not exceed the design load for a storm drainage system or flood protection project.

Detention
Stormwater runoff that is collected at one rate and then released at a controlled rate. The volume difference is held in temporary storage.

Filtration
A treatment process that allows for removal of solid (particulate) matter from water by means of porous media such as sand, soil, vegetation, or a man-made filter. Filtration is used to remove contaminants.

Furniture Zone
The furniture zone is the area which lies between the curb and pedestrian zones and is intended to house utilities and pedestrian amenities.

Hardscape
Impermeable surfaces, such as concrete or stone, used in the landscape environment along sidewalks or in other areas used as public space.

Infiltration
The process by which water penetrates into soil from the ground surface.

Permeability/Impermeability
The relative quality of a soil or material that enables water to move through it, determining its suitability for infiltration. The quality is measured as the coefficient of hydraulic conductivity as determined by standard testing methods.

Retention
The reduction in total runoff that results when stormwater is diverted and allowed to infiltrate into the ground through existing or engineered soil systems.

Runoff
Water from rainfall that flows over the land surface that is not absorbed into the ground.

Sedimentation
The deposition and/or settling of particles suspended in water as a result of the slowing of the water.

Stormwater
Water runoff from rain or snow resulting from a storm.

Transportation Corridor
A major arterial, state route, highway, or rail line used for the movement of people or goods by means of bus services, trucks, and vehicles. City of Whittier streets qualifying as transportation corridors may include (but are not limited to):

- Whittier Boulevard
- Beverly Boulevard
- Colima Road
- Washington Boulevard
- Norwalk Boulevard

The City Engineer shall determine whether a city street or a bike way qualifies as a transportation corridor for the purposes of applying the provisions of this Green Streets Manual.

ORDINANCE NO. 3013

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF WHITTIER, CALIFORNIA, AMENDING THE WHITTIER MUNICIPAL CODE CHAPTER 8.36, "STORMWATER AND RUNOFF POLLUTION CONTROL"

WHEREAS, The Municipal Separate Storm Sewer System (MS4) Permit (LARWQCB Order No. R-2012-0175) was adopted by the Los Angeles Regional Water Quality Control Board (LARWQCB) on November 8, 2012;

WHEREAS, the MS4 Permit requires the adoption of a Green Streets Policy and a Low Impact Development ("LID") Ordinance;

WHEREAS, on June 11, 2013, the City Council approved a Draft Whittier Green Streets Policy Manual and approved a Draft LID Ordinance; and

WHEREAS, City staff, a technical consultant, and the City Attorney have reviewed the Draft LID Ordinance and then prepared the following recommended revisions to the Whittier Municipal Code to bring it into conformance with the MS4 Permit.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF WHITTIER, CALIFORNIA, DOES ORDAIN AS FOLLOWS:

SECTION 1. 8.36.010 - STORMWATER AND RUNOFF POLLUTION CONTROL, of Title 8 (Storm Water), of the Whittier Municipal Code is hereby repealed and replaced in its entirety with the following text:

8.36.010 Title.

The ordinance codified in this chapter shall be known as the "Stormwater and Runoff Pollution Control Ordinance of the City of Whittier" and may be referred to as such.

8.36.020 Statutory authority.

The provisions of this chapter are adopted pursuant to the Federal Water Pollution Control Act, also known as the Clean Water Act, as amended, 33 U.S.C. 1251 et seq.

8.36.030 Purpose and intent.

The purpose of this chapter is to protect and improve water quality of receiving waters by:

A. Reducing illicit discharges to the municipal stormwater system to the maximum extent practicable;
B. Eliminating illicit connections to the municipal stormwater system;
C. Eliminating spillage, dumping, and disposal of pollutant materials into the municipal stormwater system;
D. Reducing pollutant loads in stormwater and urban runoff, from land uses and activities identified in the municipal NPDES permit.
E. Reducing the contribution of pollutants from the MS4 through interagency coordination

The intent of this chapter is to enhance and protect the water quality of the receiving waters of the United States in a manner that is consistent with the Clean Water Act and acts amendatory thereof or supplementary thereto; applicable implementing regulations; the municipal NPDES permit and any amendment, revision or reissuance thereof.

8.36.040 Definitions.

For the purpose of the provisions of this chapter concerning water quality hereinafter set forth, the following words and phrases shall be construed to have the meanings set forth, unless it is apparent from the context that a different meaning is intended:

"Best management practices" or "BMPs" are practices or physical devices or systems designed to prevent or reduce pollutant loading from storm water or non-storm water discharges to receiving waters, or designed to reduce the volume of storm water or non-storm water discharged to the receiving water.

"Clean Water Act" means the Federal Water Pollution Control Act as amended, 33 U.S.C. 1251, et seq.

"Discharge" means any release, spill, leak, pumping, flow, escape, dumping, or disposal of any gas, liquid, semisolid or solid substance.

"Enforcing attorney" shall mean the city attorney or district attorney acting as counsel to the city and authorized to take enforcement action as described herein.

"Executive officer" means executive officer of the California Regional Water Quality Control Board, Los Angeles.

"Good housekeeping practice" means a best management practice related to the transfer, storage, use, or cleanup of materials performed in a regular manner that minimizes the discharge of pollutants to the storm drain system and/or receiving waters.

"Hearing officer" means the director of public works of the city of Whittier, who shall preside at the administrative hearings authorized by this chapter.

"Illicit connection" means any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections.

Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

"Illicit discharge" Any discharge into the MS4 or from the MS4 into a receiving water that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes any non-storm water discharge, except authorized non-storm water discharges; conditionally exempt non-storm water discharges; and non-storm water discharges resulting from natural flows specifically identified in Part III.A.1.d.

"Industrial activity" means any of the eleven classifications of industrial facilities specified in 40 Code of Federal Regulations Section 122.26(b)(14), defined by Standard Industrial Classification (SIC) and which is required to obtain a NPDES permit.

"Maximum extent practicable (MEP)"
In selecting BMPs which will achieve MEP, it is important to remember that municipalities will be responsible to reduce the discharge of pollutants in storm water to the maximum extent practicable. This means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive. The following factors may be useful to consider:

1. Effectiveness: Will the BMP address a pollutant of concern?
2. Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?
3. Public acceptance: Does the BMP have public support?
4. Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?
5. Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc.?

After selecting a menu of BMPs, it is of course the responsibility of the discharger to insure that all BMPs are implemented.

"Municipal NPDES permit" California Regional Water Quality Control Board, Los Angeles Region. Order No. R4-2012-0175, NPDES Permit No. CAS004001 Waste Discharge Requirements For Municipal Separate Storm Sewer System (MS4) Discharge Within the Coastal Watersheds of Los Angeles County, Except Those Discharges Originating From the City of Long Beach MS4, and any amendment thereto or re-issuance thereof.

"Municipal stormwater system" or "MS4" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains):

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or

other public body (created by or pursuant to State law) having jurisdiction over disposal of
sewage, industrial wastes, storm water, or other wastes, including special districts under State
law such as a sewer district, flood control district or drainage district, or similar entity, or an
Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United
States;

(ii) Designed or used for collecting or conveying storm water;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR §
122.2.

(40 CFR § 122.26(b)(8))

"Nonstormwater discharge" means any discharge to the storm drain system and/or receiving waters that is not composed entirely of stormwater.

"NPDES" or "National Pollutant Discharge Elimination System" means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA §307, 402, 318, and 405. The term includes an "approved program."

"Owner" as applied to a building or real property, means any part owner, joint owner, tenant in common, tenant in partnership, joint tenant or tenant by the entirety of the whole or of a part of such building or real property.

"Person" means, within the context of this chapter, any natural person, firm, association, organization, partnership, business trust, corporation or company.

"Pollutant" those "pollutants" defined in CWA §502(6) (33.U.S.C.§1362(6)), and incorporated by reference into California Water Code §13373, and may include but is not limited to garbage, debris, lawn clippings, leaves, fecal waste, biological waste, sediment, sludge, manure, fertilizers, pesticides, oil, grease, gasoline, paints, solvents, cleaners, and any fluid or solid containing toxic or nontoxic chemicals, metals, including batteries.

"Public works director" means the director of public works of the city of Whittier.

"Receiving waters" means rivers, lakes, oceans, or other bodies of water that receive runoff.

"Regional Board" means the appointed members of the California Regional Water Quality Control Board, Los Angeles Region.

"Runoff" means Any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

"State Board" means the State Water Resources Control Board of the California Environmental Protection Agency (hereinafter "SWRCB").

"Stormwater runoff" means any surface water flow produced by rain or snow melt.

"Urban runoff" means surface water flow produced by non-storm water resulting from residential, commercial and industrial activities.

8.36.050 Illicit discharges and nonstormwater discharges.

A. No person shall cause or allow an illicit discharge to enter the municipal stormwater system.

B. Any person causing an illicit discharge to the MS4 may be required by the public works director to pay for the cost of clean-up and remediation.

C. Any owner of any private property from which a nonstormwater discharge is observed may be required by the public works director to pay for the cost of collecting and analyzing the discharge to determine if it is an illicit discharge.

D. The following non-storm water discharges are considered exempt or conditionally exempt illicit discharges:

   1. Discharges identified in Part III.A of the 2012 NPDES MS4 permit.

8.36.060 Illegal disposal/dumping.

No person shall intentionally place, litter, accumulate, maintain, discharge, or cause to enter into the MS4 any pollutant or any foreign object such as batteries, tires, waste receptacles, yard debris, refuse, rubbish, food waste, chemicals, animal waste or oil cans.

8.36.070 Illicit connections.

A. No person shall maintain or intentionally use a connection that operates to convey an illicit discharge to the municipal stormwater system.

B. Upon discovery of an illicit connection, the person owning or operating such connection shall either remove it or render it incapable of conveying an illicit discharge.

C. If any person fails to eliminate an illicit connection after being called upon by the city to do so, the public works director shall take appropriate measures to remove or disable the illicit connection and may recover such costs from the owner of such illicit connection.

8.36.080 Reduction of pollutants in runoff.

A. No person shall cause or threaten to cause the discharge of pollutants to the MS4 by exposing such pollutants to storm water runoff.

B. The owner of parking lot surfaces, public or private, with a capacity of twenty-five spaces or more, shall cause the parking lot surface to be cleaned as often as necessary to remove refuse, residual oil, grease, or other pollutants that might otherwise be discharged to the MS4 by runoff.

8.36.090 Control of pollutants from commercial facilities.

Commercial facilities specified in the municipal NPDES permit shall implement BMPs prescribed by the regional board or its executive officer, through programs or actions made pursuant to the municipal NPDES permit, or by the city's director of public works, to minimize the discharge of pollutants to the MS4.

8.36.100 Control of pollutants from industrial activities.

A. It shall be a violation of this chapter for any industry in the city that is subject to waste discharge requirements specified in the SWRCB Water Quality Control Board's Industrial General Permit (IGP) , to operate without a NPDES general industrial activities stormwater permit.

B. Industries that require a NPDES IGP shall retain on-site the following documents which evidence compliance with permit requirements: (1) a copy of the notice of intent for general permit to discharge stormwater associated with industrial activity as submitted to the State Board or a copy of the report of waste discharge (ROWD) as submitted to the Regional Board; (2) a waste discharge identification number issued by the SWRCB; (3) a stormwater pollution prevention plan and monitoring program plan; (4) any storm water quality data; and (5) evidence of facility self-inspection.

C. Any industry in the city requiring a NPDES IGP shall, upon reasonable request from a duly authorized officer of the city, provide any of the documents described in subsection B of this section.

D. Industrial facilities not subject to the NPDES Industrial General permit that are subject to pollution control requirements under the municipal NPDES permit, shall implement BMPs prescribed by the Regional Board or its executive officer, through programs or actions made pursuant to the Municipal NPDES Permit.

8.36.110 Control of pollutants from construction activities requiring general construction activity stormwater permit.

A. No person shall commence or continue any construction activity in the city that causes the disturbance of one acre or more of soil by clearing, grading, and excavating without demonstrating to the city that such person has obtained a NPDES Construction General Permit from the SWRCB. The NPDES Construction General Permit does not apply to the following construction activity:

(1) Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility;
(2) Disturbances to land surfaces solely related to agricultural operations such as disking, harrowing, terracing and leveling, and soil preparation;
(3) Construction activity covered by an individual NPDES Permit for storm water discharges;
(4) Landfill construction activity that is subject to the Industrial General Permit; or
(5) Construction activity that discharges to Combined Sewer Systems.

In the case of a public emergency that requires immediate construction activities, a discharger shall submit a brief description of the emergency construction activity within five days of the onset of construction, and then shall submit all PRDs within thirty days.

B. Any person engaged in a construction activity in the city requiring a NPDES construction permit shall retain at the construction site the following documents: (1) a copy of the notice of intent to comply with terms of the general permit to discharge water associated with construction activity; (2) a waste discharge identification number issued by the SWRCB; (3) a stormwater pollution prevention plan and monitoring program plan for the construction activity requiring the construction permit; and (4) records of all inspections, compliance and noncompliance reports, evidence of self-inspection and good house keeping practices.

C. Any person engaged in a construction activity in the city requiring a general construction stormwater activity permit shall, upon reasonable request from a duly authorized officer of the city, provide any of the documents specified in subsection B of this section and shall retain said documents for at least three years after completion of construction.

D. Construction activity not subject to the NPDES Industrial General permit that are subject to pollution control requirements under the Municipal NPDES Permit, shall implement BMP's prescribed by the Regional Board or its executive officer, through programs or actions made pursuant to the Municipal NPDES Permit.

8.36.120 Control of pollutants from other construction activities.

Any person engaged in a construction activity subject to Municipal NPDES Permit, shall be required to implement BMPs specified by the Regional Board, its executive officer, or the city's public works director.

8.36.130 Control of pollutants from new developments.

A. Prior to the construction of a development or new development project, such project shall be evaluated by the city for its potential to discharge pollutants to the MS4 based on its intended land use. Such evaluation shall be conducted in accordance with development planning requirements established by the Regional Board or its executive officer, pursuant to the Municipal NPDES Permit.

B. Once a development or new development project has been evaluated for its potential to discharge pollutants to the MS4, the city shall require appropriate BMPs to be implemented during construction and following project completion in order to prevent or reduce the discharge of pollutants to achieve water quality standards/receiving water limitations. The prescription of BMPs shall be in keeping with requirements established by the regional board or its executive officer, pursuant to the Municipal NPDES Permit.

C. All structural BMPs are required to be properly operated and maintained according to product specifications and site characteristics to maintain effectiveness in reducing the discharge of pollutants. Documentation on operation and maintenance activities shall be retained onsite at all times, and made available upon request by an authorized enforcement officer.

8.36.140 Inspection.

A. Authority to Inspect. The director of public works and his designees (hereinafter "authorized officers") are authorized and directed to enforce all provisions of this chapter. Prior to commencing any inspection, the authorized enforcement officer shall obtain either the consent of the owner or occupant of the property or shall obtain an administrative inspection or criminal search warrant.

B. Authority to Conduct Sampling and Establish Sampling Devices. With the consent of the owner or occupant or pursuant to a search warrant, any authorized enforcement officer may establish on any property such devices as necessary to conduct sampling or monitoring activities necessary to determining the concentrations of pollutants in storm water and/or non-storm water runoff. During all inspections as provided herein, the authorized enforcement officer may take any samples deemed necessary to aid in the pursuit of the inquiry or in the recordation of the activities on-site.

C. Requirement to Sample or Monitor. Any authorized enforcement officer may request that any person engaged in any activity and/or owning or operating any facility which may cause or contribute to stormwater pollution or contamination, illicit discharges, and/or discharge of non-storm water to the stormwater system, undertake such monitoring activities and/or analyses and furnish such reports as the authorized enforcement officer may specify. The burden, including costs, of these activities, analyses and reports shall be paid by the owner of the property and bear a reasonable relationship to the need for the monitoring, analyses and reports and the benefits to be obtained.

8.36.150 Enforcement.

A. Criminal Sanctions.

1. Penalty for Violation. It is unlawful for any person to violate any provisions or fail to comply with any of the requirements of this chapter. Any violation of the provisions of this chapter shall be deemed an infraction, and may be punished as such, notwithstanding the fact that at the discretion of the enforcing attorney, the violation of any section of this chapter may be filed as a misdemeanor or an infraction. The complaint charging such violation shall specify whether the violation is a misdemeanor or an infraction.

2. Prosecutor. The enforcing attorney may act on the request of the city manager or his/her designee, to pursue enforcement actions in accordance with the provisions of this chapter.

B. Administrative Remedies. The authorized enforcement officer may, in his/her discretion, issue either a notice of noncompliance or a cease and desist order as hereinafter described. In determining which remedy option to pursue, the authorized enforcement officer may consider the severity of the discharge or violation, the potential for irreparable harm which may be caused by the discharge or violation, and/or whether the owner, occupant or responsible person is a repeat offender of the same or similar violation.

1. Notice of Noncompliance. The authorized enforcement officer may deliver to a permittee, the owner or occupant of any property, or to any person responsible for an illicit connection or prohibited discharge, or any other violation of this chapter, a notice of noncompliance. The notice of noncompliance shall be delivered in accordance with subsection (B)(4) of this section.

   a. The notice of noncompliance shall identify the provision(s) of this chapter and/or the applicable permit, which has been violated. The notice of noncompliance shall state that continued noncompliance may result in additional enforcement actions against the owner, occupant and/or person.

   b. The notice of noncompliance shall state a compliance date that must be met by the owner, occupant and/or person provided, however, that the compliance date may not exceed ninety days unless the authorized enforcement officer extends the compliance deadline up to an additional ninety days where good cause exists for an extension.

c. The notice of noncompliance may include the following terms and requirements:

   i. Specific steps and time schedules for compliance as reasonably necessary to eliminate an existing prohibited discharge and/or to prevent the imminent threat of a prohibited discharge including, but not limited to, a prohibited discharge from any pond, pit, well, surface impoundment, holding or storage area;

   ii. Specific steps and time schedules for compliance as reasonably necessary to discontinue any illicit connection;

   iii. Specific requirements for containment, cleanup, removal, storage, handling, use, proper disposal, and treatment of any pollutant having the potential to contact storm water or non-storm water runoff;

   iv. Any other terms or requirements reasonably calculated to prevent the imminent threat of or continuing violations of this chapter including, but not limited to, requirements for compliance with best management practices guidance documents promulgated by any federal, state of California or regional agency; and

   v. Any other terms or requirements reasonably calculated to achieve full compliance with the terms, conditions and requirements of any permit issued pursuant hereto.

2. Cease and Desist Orders. The authorized enforcement officer may issue a cease and desist order. A cease and desist order shall be delivered in accordance with subsection (B)(4) of this section. A cease and desist order may direct a permittee, the owner or occupant of any property and/or other person responsible for a violation of this chapter to:

   a. Immediately discontinue any illicit connection or prohibited discharge to the stormwater drainage system;

   b. Immediately contain or divert any flow of water off the property, where the flow is occurring in violation of any provision of this chapter;

   c. Immediately discontinue any other violation of this chapter;

   d. Clean up or remediate the area affected by the violation; or

   e. Immediately cease any activity not in compliance with the terms, conditions and requirements of the permit issued pursuant to this chapter.

3. Recovery of Costs. The authorized enforcement officer may deliver to the owner or occupant of any property, any permittee or any other person who has failed to comply with either a notice of noncompliance or a cease and desist order, an invoice for costs (invoice of cost) for reimbursement of the city's actual costs incurred in issuing and enforcement of any provision of this chapter.

Actual costs shall include, but are not limited to, the cost to the city for the reinspection of the property, preparation, issuance and enforcement of any subsequent notice or order. The invoice of cost shall not apply to the first reinspection after service of the notice or order if the owner or occupant of any property, the permittee or person has corrected all violations as set forth in the notice or order. The costs charged herein are intended to compensate for administration costs and not for enforcement of the law.

The invoice for costs shall be due and payable to the city within thirty days from the date of service. If any owner, occupant, permittee or person fails to pay the invoice for costs or file a timely appeal pursuant to subsections (B)(5) through (B)(9) of this section then the enforcing attorney may institute collection proceedings.

4. Delivery of Notice. Any notice of noncompliance, cease and desist order, notice of legal nonconforming connection or invoice of costs (hereinafter, collectively referred to as the "notice") shall be delivered pursuant to the following requirements:

   a. The notice shall state that the recipient has a right to appeal the matter as set forth in subsections (B)(5) through (B)(9) of this section;

   b. Delivery shall be deemed complete upon: (i) personal service to the recipient, (ii) deposit in the U.S. mail, postage pre-paid for first class delivery, or (iii) facsimile service with confirmation of receipt;

   c. Where the recipient of notice is the owner of the property, the address for notice shall be the address from the most recently issued equalized assessment roll for the property or as otherwise appears in the current records of the city;

   d. Where the recipient is a permittee, the address for notice shall be the address set forth on the application for a permit; and

   e. Where the owner or occupant of any property cannot be located after the reasonable efforts of the authorized enforcement officer, a notice shall be deemed delivered after posting said notice on the property for a period of ten business days.

5. Administrative Hearing. Except as set forth in subsection (B)(7) of this section any person receiving a notice, or any person who is subject to any adverse determination made pursuant to this chapter, may appeal the matter by requesting an administrative hearing as set forth below. Notwithstanding the foregoing, these administrative appeal procedures shall not apply to criminal proceedings initiated to enforce this chapter.

6. Request for Administrative Hearing. Any person appealing a notice or an adverse determination shall, within thirty days of receipt thereof, file a written request for an administrative hearing with the office of the city clerk, accompanied by an administrative hearing fee as established by separate resolution. A copy of the request for administrative hearing shall also be mailed

on the date of filing to the hearing officer. Thereafter, a hearing on the matter shall be held before the hearing officer within forty-five business days of the date of filing of the written request unless, in the reasonable discretion of the hearing officer and pursuant to a written request by the appealing party, a continuance of the hearing is granted.

7. Administrative Hearing for Cease and Desist Orders and Emergency Abatement Actions. An administrative hearing on the issuance of a cease and desist order or following an emergency abatement action shall be held within five business days following the issuance of the order or the action of abatement, unless the hearing (or the time requirement for the hearing) is waived in writing by the party subject to the cease and desist order or the emergency abatement. A request for an administrative hearing shall not be required from the person subject to the cease and desist order or the emergency abatement action.

8. Hearing Proceedings. The authorized enforcement officer shall appear in support of the notice, determination or emergency abatement action and the appealing party shall appear in opposition of the notice, determination or emergency abatement action. Each party shall have the right to present testimony and other documentary evidence as necessary for explanation of the case. The decision of the hearing officer shall be issued within ten business days of the conclusion of the hearing and shall be delivered by first-class mail, postage prepaid, to the appealing party.

Notwithstanding the above, the decision of the hearing officer in any preceding determining the validity of a cease and desist order or following an emergency abatement action shall be mailed within five business days following the conclusion of the hearing. However, all other provisions in this chapter regarding appeal procedures shall apply to cease and desist orders.

9. Final Decision and Appeal to the City Manager. A person may appeal the decision of the hearing officer by filing a written notice of appeal with the city manager's office within ten business days from the date of mailing of the hearing officer's decision. The appeal shall be scheduled for city manager or his/her designee action in accordance with customary filing deadlines for projects submitted to the city manager. The notice of appeal shall state in detail the factual basis for the appeal. The city manager shall consider the appeal not less than ten, nor more than forty-five days, following the filing of the appeal. The city manager may continue the hearing date where necessary. At the time and place set for such appeal hearing, the city manager shall hold a de novo hearing. If the city manager finds from the relevant evidence at the hearing that the action taken was in conformance with the provisions of this chapter, it shall require compliance with the hearing officer's decision. A copy of the city

manager's decision shall be mailed to the appellant within five working days after adoption thereof.

The decision of the city manager shall be final. The decision must include notice that any legal challenge to the final decision shall be made pursuant to the provisions of Code of Civil Procedure Section 1094.5 and Section 1094.6 and shall be commenced within ninety days following issuance of the final decision. The administrative hearing fee paid by a prevailing party in an appeal shall be refunded.

10. City Abatement. In the event the owner or occupant of property, the operator of a facility, a permittee or any other person fails to comply with any provision of a compliance schedule issued to such owner, occupant, operator, permittee or person pursuant to this chapter, the authorized enforcement officer may request the enforcing attorney to obtain an abatement warrant or other appropriate judicial authorization to enter the property, abate the condition and restore the property. Any costs incurred by the city in obtaining and carrying out an abatement warrant or other judicial authorization may be recovered pursuant to subsection (C)(4) of this section.

C. Nuisance. Any condition in violation of this chapter including, but not limited to, the maintenance or use of any illicit connection or the occurrence of any prohibited discharge, shall constitute a threat to the public health, safety and welfare, and is declared and deemed a nuisance pursuant to Government Code Section 38771. At the request of the city manager or his/her designee, the enforcing attorney may seek a court order to enjoin and/or abate the nuisance.

1. Court Order to Enjoin and/or Abate. At the request of the city manager or his/her designee, the enforcing attorney may seek a court order to enjoin and/or abate the nuisance.

2. Notice to Owner and Occupant. Prior to seeking any court order to enjoin or abate a nuisance or threatened nuisance, the authorized enforcement officer shall provide notice of the proposed injunction or abatement to the owner and occupant, if any, of the property where the nuisance or threatened nuisance is occurring.

3. Emergency Abatement. In the event the nuisance constitutes an imminent danger to public health and/or safety or the environment, the city manager or his/her designee may enter the property from which the nuisance emanates, abate the nuisance and restore any property affected by the nuisance. To the extent reasonably practicable, informal notice shall be provided to the owner or occupant prior to abatement. If necessary to protect the public health and/or safety or the environment, abatement may proceed without prior notice to or consent from the owner or occupant thereof and without judicial warrant.

An imminent danger shall include, but is not limited to, exigent circumstances created by the dispersal of pollutants, where the same presents a significant and immediate threat to the public health and/or safety of the environment. Notwithstanding the authority of the city to conduct an emergency abatement action, the administrative hearing and appeal procedures pursuant to subsections (B)(5) through (B)(9) of this section shall follow the abatement action.

4. Reimbursement of Costs. All costs incurred by the city in responding to any nuisance, all administrative expenses and all other expenses recoverable under state law shall be recoverable from the person(s) creating, causing, committing, permitting or maintaining the nuisance.

5. Nuisance Lien. All costs shall become a lien against the property from which the nuisance emanated and a personal obligation against the owner thereof in accordance with Government Code Section 38773.1 and Section 38773.5. The owner of record of the property subject to any lien shall be given notice of the lien prior to recording as required by Government Code Section 38773.1.

   At the direction of the city manager or his/her designee, the enforcing attorney may be authorized to collect nuisance abatement costs or enforce a nuisance lien in an action brought for a money judgement or by delivery to the county assessor of a special assessment against the property in accordance with the conditions and requirements of Government Code Section 38773.5.

D. Consecutive Violations. Each day in which a violation occurs and each separate failure to comply with either a separate provision of this chapter, a notice of noncompliance, a cease and desist order or a permit issued pursuant to this chapter shall constitute a separate violation of this chapter punishable by fines or sentences issued in accordance herewith.

E. Nonexclusive Remedies. Each and every remedy available for the enforcement of this chapter shall be nonexclusive and it is within the discretion of the authorized enforcement officer or enforcing attorney to seek cumulative remedies, except that multiple monetary fines or penalties shall not be available for any single violation of this chapter.

F. Violations of Other Laws. Any person acting in violation of this chapter also may be acting in violation of the Federal Clean Water Act or the State Porter-Cologne Act and other laws and also may be subject to sanctions including civil liability. Accordingly, the enforcing attorney is authorized to file a citizen suit, pursuant to Federal Clean Water Act Section 505(a), seeking penalties, damages, and orders compelling compliance, and other appropriate relief. The enforcing attorney may notify Regional Board or any other appropriate state or local agency, of any alleged violation of this chapter.

G. Injunctions. At the request of the city manager or his/her designee, the enforcing attorney may file in a court of competent jurisdiction a civil action seeking an injunction against any threatened or continuing noncompliance with the provisions of this chapter. Any temporary, preliminary or permanent injunction issued pursuant hereto may include an order for reimbursement to the city of all costs incurred in enforcing this chapter including costs of inspection, investigation and monitoring, the costs of abatement undertaken at the expense of the city, costs relating to restoration of the environment and all other expenses as authorized by law.

H. Other Civil Remedies.

1. The city manager or his/her designee may cause the enforcing attorney to file an action for civil damages in a court of competent jurisdiction seeking recovery of: (a) all costs incurred in enforcement of the chapter including, but not limited to, costs relating to investigation, sampling, monitoring, inspection, administrative expenses, all other expenses as authorized by law and consequential damages, (b) all costs incurred in mitigating harm to the environment or reducing the threat to human health, and (c) damages for irreparable harm to the environment.

2. The enforcing attorney is authorized to file actions for civil damages resulting from any trespass or nuisance occurring on public land or to the MS4 from any violation of this chapter where the same has caused damage, contamination or harm to the environment, public property or the MS4.

I. Whenever necessary, interagency coordination will be employed to enforce the provisions of this chapter.

SECTION 2. Any provision of the Whittier Municipal Code or appendices thereto inconsistent with the provisions of the Ordinance, to the extent of such inconsistencies and no further, are repealed or modified to that extent necessary to affect the provisions of this Ordinance.

SECTION 3. If any section, subsection, sentence, clause, phrase, or portion of this Ordinance is for any reason held to be invalid or unconstitutional by the decision of any court of competent jurisdiction, such decision shall not affect the validity of the remaining portions of this Ordinance. The City Council of the City of Whittier hereby declares that it would have adopted this Ordinance and each section, subsection, sentence, clause, phrase or portion thereof irrespective of the fact that any one or more sections, subsections, sentences, clauses, phrases, or portions be declared invalid or unconstitutional.

SECTION 4. The Mayor shall sign and the City Clerk shall attest to the passage of this Ordinance. The City Clerk shall cause the same to be published once in the official newspaper within 15 days after its adoption. This Ordinance shall become effective 30 days from its adoption.

APPROVED AND ADOPTED this 12th day of November 2013.

BOB HENDERSON, Mayor

ATTEST:

KATHRYN A. MARSHALL
City Clerk-Treasurer

CITY OF WHITTIER)

Lower San Gabriel River Watershed Management Group
(See Distribution List)

REVIEW OF THE LOWER SAN GABRIEL RIVER WATERSHED MANAGEMENT AREA DRAFT WATERSHED MANAGEMENT PROGRAM, PURSUANT TO PART VI.C OF THE LOS ANGELES COUNTY MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) PERMIT (NPDES PERMIT NO. CAS004001; ORDER NO. R4-2012-0175) AND PART VII.C OF THE LONG BEACH MS4 PERMIT (NPDES PERMIT NO. CAS004003; ORDER NO. R4-2014-0024)

Dear Lower San Gabriel River Watershed Management Group:

The Regional Water Board has reviewed the draft Watershed Management Program (WMP) submitted on June 30, 2014 by the Lower San Gabriel River Watershed Management Group. This program was submitted pursuant to the provisions of NPDES Permit No. CAS004001 (Order No. R4-2012-0175), which authorizes discharges from the municipal separate storm sewer system (MS4) operated by 86 municipal Permittees within Los Angeles County (hereafter, LA County MS4 Permit). The LA County MS4 Permit allows Permittees the option to develop either a Watershed Management Program (WMP) or Enhanced Watershed Management Program (EWMP) to implement permit requirements on a watershed scale through customized strategies, control measures, and best management practices (BMPs). Development of a WMP or EWMP is voluntary and may be developed individually or collaboratively.

NPDES Permit No. CAS004003 (Order No. R4-2014-0024) authorizes MS4 discharges from the City of Long Beach (hereafter, Long Beach MS4 Permit). The Long Beach MS4 Permit similarly allows for the City of Long Beach to develop either a WMP or EWMP to implement permit requirements, with the option of collaborating with LA County MS4 Permit Permittees. For simplicity, this letter and its enclosures cite provisions in the LA County MS4 Permit, though the City of Long Beach is a member of the Lower San Gabriel River Watershed Management Group and is permitted under its own individual permit.

The purpose of a WMP or EWMP is for a Permittee to develop and implement a comprehensive and customized program to control pollutants in MS4 discharges of stormwater and non-stormwater to address the highest water quality priorities. These include complying with the required water quality outcomes of Part V.A (Receiving Water Limitations) and Part VI.E and Attachments L through R (Total Maximum Daily Load (TMDL) Provisions) of the LA County MS4 Permit. If a Permittee opts to develop a WMP or EWMP, the WMP or EWMP must meet the requirements, including conducting a Reasonable Assurance Analysis (RAA), of Part VI.C (Watershed Management Programs) of the LA County MS4 Permit and must be approved by the Regional Water Board.

As stated above, on June 30, 2014, the Lower San Gabriel River Watershed Management Group submitted a draft WMP to the Regional Water Board pursuant to Part VI.C.4.c of the LA County MS4 Permit.

The Regional Water Board has reviewed the draft WMP and has determined that, for the most part, the draft WMP includes the elements and analysis required in Part VI.C of the LA County MS4 Permit. However, some revisions to the City's draft WMP are necessary. The Regional Water Board's comments on the draft WMP, including detailed information concerning necessary revisions to the draft WMP, are found in Enclosure 1 and Enclosure 2, respectively. The LA County MS4 Permit includes a process through which necessary revisions to the draft WMP can be made (Part VI.C.4 in the LA County MS4 Permit). The process requires that a final WMP, revised to address Regional Board comments identified in the enclosures, must be submitted to the Regional Water Board not later than three months after comments are received by the Permittees on the draft program. Please make the necessary revisions to the draft WMP as identified in the enclosures to this letter and submit the revised WMP as soon as possible and no later than **January 30, 2015.**

The revised WMP must be submitted to losangeles@waterboards.ca.gov with the subject line "LA County MS4 Permit – Revised Draft Lower San Gabriel River WMP" with a copy to Ivar.Ridgeway@waterboards.ca.gov and Chris.Lopez@waterboards.ca.gov.

If the necessary revisions are not made, the Lower San Gabriel River Cities will be subject to the baseline requirements in Part VI.D of the Order and shall demonstrate compliance with receiving water limitations pursuant to Part V.A and with applicable interim and final water quality-based effluent limitations (WQBELs) in Part VI.E and Attachment P pursuant to subparts VI.E.2.d.i.(1)-(3) and VI.E.2.e.i.(1)-(3), respectively.

Until the draft Lower San Gabriel River WMP is approved, the Cities are required to:

(a) Continue to implement all watershed control measures in its existing storm water management programs, including actions within each of the six categories of minimum control measures consistent with Title 40, Code of Federal Regulations, section 122.26(d)(2)(iv);
(b) Continue to implement watershed control measures to eliminate non-storm water discharges through the MS4 that are a source of pollutants to receiving waters consistent with Clean Water Act section 402(p)(3)(B)(ii); and
(c) Target implementation of watershed control measures in (a) and (b) above to address known contributions of pollutants from MS4 discharges to receiving waters.

In addition on June 30, 2014, the Lower San Gabriel River Watershed Management Group submitted a draft Coordinated Integrated Monitoring Program (CIMP) to the Regional Water Board pursuant to Part IV.C of Attachment E of the LA County MS4 Permit. The Regional Water Board review and comments on the draft CIMP will be provided under separate cover.

If you have any questions, please contact Mr. Chris Lopez of the Storm Water Permitting Unit by electronic mail at Chris.Lopez@waterboards.ca.gov or by phone at (213) 576-6674. Alternatively, you may also contact Mr. Ivar Ridgeway, Chief of the Storm Water Permitting Unit, by electronic mail at Ivar.Ridgeway@waterboards.ca.gov or by phone at (213) 620-2150.

Sincerely,

Samuel Unger

Samuel Unger, P.E.
Executive Officer

Enclosure 1 to October 30, 2014 Letter Regarding the Lower San Gabriel River Watershed Management Group's Draft Watershed Management Program

Summary of Comments and Necessary Revisions to Draft Watershed Management Program

LA County MS4 Permit Provision*	Regional Water Board Staff Comment and Necessary Revision
Part VI.C.1.d (Purpose of Watershed Management Program)	Section 1.1 of the draft WMP states, "the goal of these requirements is to reduce the discharge of pollutants from MS4s to the maximum extent practicable." The goal of the three permits and of a WMP is broader than presented (p. 1-1). Per Part VI.C.1.d of the LA County MS4 Permit, the goals of the Watershed Management Programs are to "... ensure that discharges from the Permittee's MS4: (i) achieve applicable water quality-based effluent limitations in Part VI.E and Attachments L through R pursuant to the corresponding compliance schedules, (ii) do not cause or contribute to exceedances of receiving water limitations in Parts V.A and VI.E and Attachments L through R, and (iii) do not include non-storm water discharges that are effectively prohibited pursuant to Part III.A. The programs shall also ensure that controls are implemented to reduce the discharge of pollutants to the maximum extent practicable (MEP) pursuant to Part IV.A.1." The revised WMP needs to acknowledge the broader goals set forth in the permit.
Part VI.C.5.a.ii.(1) (Category 1 Pollutants)	The MS4 permit requires WMPs to include the applicable numeric WQBELs for each approved TMDL within the WMA. These should be clearly listed within the WMP. They are currently identified in the RAA in Tables 5-4 and 5-5, but do not appear presented in the main document.
Part VI.C.5.a.ii.(2)-(3) (Categories 2 and 3 Pollutants)	The WMP needs to specify the applicable receiving water limitations for Category 2 water body pollutant combinations. These should be clearly listed within the WMP. It appears these are listed in Tables 2-3 to 2-11 in association with monitoring site specific summaries of exceedances of water quality objectives; however, it would provide greater clarity to also summarize them in a single table.

LA County MS4 Permit Provision*	Regional Water Board Staff Comment and Necessary Revision
Part VI.C.5.a.iii.(1)(a)(vii) (Source Assessment)	The MS4 Permit requires a map of the MS4 including major outfalls and major structural controls. Appendix H of the CIMP provides maps showing the major outfalls and Appendix D of the draft WMP provides a tabular list of existing and proposed BMPs. The revised WMP should include a map (or GIS project file) of these BMPs as well. Also, the outfall database should be submitted with the revised WMP. In addition, Section VII.A of Attachment E to the MS4 Permit requires maps of the drainage areas associated with the outfalls and these were not provided. Section 1.3.2 of the WMP does note that 107 catchments are located in the watershed, and maps showing these drainage areas should be provided. If these are not readily available, a process and timeline for developing this spatial information should be included in the revised WMP.
Part VI.C.5.a.iv (Watershed Control Measures)	Where data indicate impairment or exceedances of RWLs and the findings from the source assessment implicate discharges from the MS4, the Permit requires a strategy for controlling pollutants that is sufficient to achieve compliance as soon as possible. Although Section 3 includes a compliance strategy, the program needs to more clearly demonstrate that the compliance schedules (Section 5) ensure compliance is "as soon as possible." The WMP needs to provide a clear schedule that demonstrates implementation of the BMPs will achieve the required interim metal reductions by the compliance deadlines. The WMP schedule should at the least provide specificity on actions within the current and next permit terms. Also, given the Gateway Proposition 84 project has received funding as of May 2014, and sites have been identified for BMP installation, it would be reasonable to update the WMP to contain project milestones and implementation timeframes for projects that will be implemented under this grant.

LA County MS4 Permit Provision*	Regional Water Board Staff Comment and Necessary Revision
Part VI.C.5.b.iv.(5)(c) (Selection of Watershed Control Measures)	For waterbody-pollutant combinations not addressed by TMDLs, the MS4 Permit requires that the plan demonstrate using the reasonable assurance analysis (RAA) that the activities and control measures to be implemented will achieve applicable receiving water limitations as soon as possible. The RAA demonstrates the control measures would be adequate to comply with the limitations/deadlines for the "limiting pollutants" for TMDLs and concludes that this will ensure compliance for all other pollutants of concern. However, it does not address the question of whether compliance with limitations for pollutants not addressed by TMDLs could be achieved in a shorter time frame.
Part VI.C.5.b.iv.(1)(a)(ii) (Minimum Control Measures – Industrial/Commercial Facilities Program)	The Group proposes to alter the commercial and industrial facility inspection frequencies in Parts VI.D.6.d and VI.D.6.e of the LA County MS4 Permit. The proposed modification includes a prioritization process in which the member Cities rate applicable facilities as high, medium, or low priority. High priority facilities are inspected more frequently and low priority facilities are inspected less frequently. The prioritization scheme included in Figure ICF-2 prioritizes facilities by their potential water quality impact. However, the draft WMP also notes that Cities "may follow an alternative prioritization method provided it results in a similar three-tiered scheme." The revised WMP should ensure that any alternative prioritization method used by a City must also be based on water quality impact. No statement to this effect was included. Furthermore, the draft WMP also notes that Cities can prioritize and reprioritize facilities at any time based on their discretion. The Group should revise their draft WMP to clearly state when the initial prioritization of facilities will occur. Additionally, the Group should be explicitly clear that during any reprioritization, the ratio of low priority to high priority facilities must always remain at 3:1 or lower to maintain inspection frequencies identified in the draft WMP.
Part VI.C.5.b.iv.(4)(b)-(c) (Selection of Watershed Control Measures)	The RAA identifies potential areas for green street conversion and assumes a 30% conversion of the road length in the suitable areas; however, the specific locations and projects are not identified. Although it may not be possible to provide detailed information on specific projects at this time, the WMP should at least commit to the construction of the necessary number of projects to ensure compliance with permit requirements per applicable compliance schedules.

LA County MS4 Permit Provision*	Regional Water Board Staff Comment and Necessary Revision
Part VI.C.5.b.iv.(4)(d) (Watershed Control Measures – Milestones)	The MS4 Permit requires that the WMP provide specificity with regard to structural and non-structural BMPs, including the number, type, and location(s), etc. adequate to assess compliance. In a number of cases, additional specificity on the number, type and general location(s) of watershed control measures as well as the timing of implementation for each is needed. (Regional Water Board staff notes, for example, that many watershed control measures in the implementation schedule only reference the year (or years) that a measure or milestone will be implemented. This should be revised to include more specific and/or exact dates where appropriate.) Additionally, many watershed control measures in the implementation schedule are ongoing measures that are not new interim milestones (e.g. MCMs, implementation of SB 346, enhanced street sweeping, etc.). For transparency, Regional Water Board staff recommends that ongoing measures clearly be separated from interim milestones for structural controls and non-structural BMPs in the implementation schedule. Regional Water Board staff recognizes uncertainties may complicate establishment of specific implementation dates, however there should at least be more specificity on actions within the current and next permit terms to ensure that the following interim requirements are met: (1) a 10% reduction in metals loads during wet weather and a 30% reduction in dry weather by 2017 and (2) a 35% reduction in metals loads during wet weather and a 70% reduction during dry weather by 2020.
Part VI.C.5.b.iv.(4)(c) (Watershed Control Measures – SB 346 Copper Reductions)	The draft WMP appears to rely mostly on the phase-out of copper in automotive brake pads, via approved legislation SB 346, to achieve the necessary copper load reductions. Given the combination of other Cu sources identified in various LA TMDLs such as building materials, other vehicle wear, air deposition from fuel combustion and industrial facilities, and that SB 346 progressively phases out Cu content in brakes of new cars (5% by weight until 2021, 0.5% by weight until 2025), then other structural and non-structural BMPs may still be needed to reduce Cu loads sufficiently to achieve compliance deadlines for interim and/or final WQBELs.

LA County MS4 Permit Provision*	Regional Water Board Staff Comment and Necessary Revision
Part VI.C.5.b.iv.(5) (Reasonable Assurance Analysis – Limiting Pollutant)	The RAA identifies zinc as the limiting pollutant and notes that this pollutant will drive reductions of other pollutants. If the Group believes that that this approach demonstrates that activities and control measures will achieve applicable receiving water limitations, it should explicitly state and justify this for each category 1, 2, and 3 pollutant.
Part VI.C.5.b.iv.(5) (Reasonable Assurance Analysis – New Non-Structural Controls)	The draft assumes a 10% pollutant reduction from new non-structural controls. Although 10% is a modest fraction of the overall controls necessary, additional support for this assumption should be provided, particularly since the group appears to be relying almost entirely on these controls for near-term pollutant reductions to achieve early interim milestones/deadlines. Additionally, as part of the adaptive management process, the Permittees should commit to evaluate this assumption during program implementation and develop alternate controls if it becomes apparent that the assumption is not supported.
Part VI.C.5.b.iv.(5) (Reasonable Assurance Analysis – Irrigation Reductions)	For dry weather, the WMP assumes a 25% reduction in irrigation (RAA, section 7.1.2). Additional support should be provided for this assumption, particularly since the group appears to be relying almost entirely on this non-structural BMP for near-term pollutant reductions to meet early interim milestones/deadlines. Additionally, as part of the adaptive management process, the Permittees need to commit to evaluate this assumption during program implementation and develop alternate controls if it becomes apparent that the assumption is not supported.
Part VI.C.5.b.iv.(5) (Reasonable Assurance Analysis – Regional BMPs)	Section 1.4.2 of Attachment A to the RAA points out that additional potential regional BMPs were identified to provide the remaining BMP volume noted in Table 9-4. It indicates they can be found in Section 4 of the WMP (actually, they are found in Section 3). The RAA should clarify that sufficient sites were identified so that the remaining necessary BMP volume can be achieved by those sites that were not "excluded for privacy."

LA County MS4 Permit Provision*	Regional Water Board Staff Comment and Necessary Revision
Part VI.C.5.b.iv.(5) (Reasonable Assurance Analysis – Permitted Industrial Facilities)	The draft WMP, including the RAA, excludes stormwater runoff from non-MS4 facilities within the WMA from the stormwater treatment target. In particular, industrial facilities that are permitted by the Water Boards under the Industrial General Permit or an individual stormwater permit were identified and subtracted from the treatment target. Regional Water Board staff recognizes that this was done with the assumption that these industrial facilities will retain their runoff and/or eliminate their cause/contribution to receiving water exceedances, as required by their respective NPDES permit. However, it is important that the Group's actions under its Industrial/Commercial Facilities Program—including tracking critical industrial sources, educating industrial facilities regarding BMP requirements, and inspecting industrial facilities—ensure that all industrial facilities are implementing BMPs as required.

LA County MS4 Permit Provision*	Regional Water Board Staff Comment and Necessary Revision
Part VI.C.5.b.iv.(5) (Reasonable Assurance Analysis – Caltrans Facilities)	The draft WMP, including the RAA, takes a similar approach for areas under the jurisdiction of the California Department of Transportation (Caltrans). Caltrans facilities that are permitted under the Caltrans MS4 permit (Order No. 2012-0011-DWQ) were also identified and subtracted from the treatment target. It should be noted that the Amendment to the Caltrans Permit (Order WQ 2014-0077-DWQ) includes provisions to address TMDL requirements throughout the state. Revisions to Attachment IV of the Caltrans Permit require that Caltrans prioritize all TMDLs for implementation of source control measures and BMPs, with prioritization being "consistent with the final TMDL deadlines to the extent feasible." Additionally, the Caltrans Permit also includes provisions for collaborative implementation through Cooperative Implementation Agreements between Caltrans and other responsible entities to conduct work to comply with a TMDL. By contributing funds to Cooperative Implementation Agreements and/or the Cooperative Implementation Grant Program, Caltrans may receive credit for compliance units, which are needed for compliance under the Caltrans Permit. In a similar manner, the LA County MS4 Permit includes provisions for Permittees to control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements with other MS4 owners—such as Caltrans—to successfully implement the provisions of the Order (see Parts VI.A.2.a.viii and VI.A.4.a.iii). Therefore, the Group should ensure that it is closely coordinating with appropriate Caltrans District staff regarding the identification and implementation of watershed control measures to achieve water quality requirements (i.e. applicable Receiving Water Limitations and WQBELs). Regional Water Board staff recognizes that the Group has taken the initial steps for such collaboration since Caltrans participates in the Group.

LA County MS4 Permit Provision*	Regional Water Board Staff Comment and Necessary Revision
Part VI.C.5.b.iv.(4)(a) (Watershed Control Measures, page 63)	In Section 3.4.1.1, the draft WMP states, "[a]s recognized by the footnote in Attachment K-4 of the Permit, the Participating Agencies have entered into an Amended Consent Decree with the United States and the State of California, including the Regional Board, pursuant to which the Regional Board has released the Participating Agencies from responsibility for toxic pollutants in the Dominguez Channel and the Greater Los Angeles and Long Beach Harbors." This statement misinterprets the Regional Water Board's findings. Footnote 1 to Table K-4 of the LA County MS4 Permit states, "[t]he requirements of this Order to implement the obligations of this TMDL do not apply to a Permittee to the extent that it is determined that the Permittee has been released from that obligation pursuant to the Amended Consent Decree entered in United States v. Montrose Chemical Corp., Case No. 90-3122 AAH (JRx)." As stated in the responses to comments received on the Dominguez Channel and Greater Harbor Waters Toxic Pollutants TMDL, "...primarily one pollutant, DDT, is associated with the Superfund site and also addressed by the TMDL. The TMDL addresses numerous pollutants and utilizes a different process than Superfund. The other pollutants – heavy metals, PAHs, PCBs and other legacy pesticides are not within Superfund's focus at the Montrose OU2 Site..." Further, the WQBELs in Attachment P, Part E of the LA County MS4 Permit and Part VIII.P of the Long Beach MS4 Permit are for ongoing discharges from the MS4, not for the historic contamination of the bed sediments. Therefore, the statement in the draft WMP incorrectly concludes that the aforementioned Consent Decree releases MS4 Permittees from any obligation to implement the WQBELs in the MS4 permits.
Part VI.C.5.b.iv.(6) (Legal Authority)	Appendix 7 to the draft WMP includes a copy of legal certifications for all Group members except for Long Beach. The legal certification for Long Beach should be submitted in the revised WMP.

LA County MS4 Permit Provision*	Regional Water Board Staff Comment and Necessary Revision
Part VI.C.5.c (Compliance Schedules)	Page 6-1 notes that "[t]he final non-TMDL water quality standard compliance date is projected to be sometime in 2040." However, the pollutant reduction plan milestones in Section 5 only appear to go up to the year 2026. For watershed priorities related to addressing exceedances for receiving water limitations, the permit requires milestones based on measureable criteria or indicators, a schedule with dates for achieving the milestones, and a final date for achieving the receiving water limitations as soon as possible. These need to be included in the revised WMP.

* Equivalent provisions are also found in the Long Beach MS4 Permit

Los Angeles Regional Water Quality Control Board

FROM: C.P. Lai, Ph.D., P.E. and Thanhloan Nguyen
LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD

DATE: October 30, 2014

SUBJECT: COMMENTS ON REASONABLE ASSURANCE ANALYSIS FOR LOWER SAN GABRIEL RIVER WATERSHED MANAGEMENT AREA

This memorandum contains comments on the Reasonable Assurance Analysis (RAA), dated June 6, 2014, which was submitted by the Lower San Gabriel River Watershed Management Group.

A. General comments on the draft Reasonable Assurance Analysis section (Section 4 and Appendix A-4-1) of the Watershed Management Program.

1. The Lower San Gabriel River Watershed Management Area (LSGR WMA) is subject to interim and final water quality-based effluent limitations pursuant to Attachment P, Part A "San Gabriel River Metals and Impaired Tributaries Metals and Selenium TMDL" for both wet and dry weather conditions. The LSGR WMA is required to analyze a strategy to implement pollutant controls necessary to achieve applicable interim and final water quality-based effluent limitations for metals and selenium consistent with the interim and final implementation deadlines in the Basin Plan Amendment, Resolution No. R13-004 - Implementation Plan for the TMDLs for Metals and Selenium in the San Gabriel River and Impaired Tributaries. These include:

   - By September 30, 2017, for WQBELs applicable in wet weather a 10% reduction, and dry weather a 30% reduction in the difference between current pollutant loads and the WQBEL.
   - By September 30, 2020, for WQBELs applicable in wet weather a 35% reduction, and in dry weather a 70% reduction in the difference between current pollutant loads and the WQBEL.

   As proposed in the WMP, the 10% load reduction was assumed to result from the cumulative effect of nonstructural BMPs. There is uncertainty in the ability of these BMPs to meet the required reductions by September 2017. Additional support for the anticipated pollutant load reductions from these non-structural BMPs and source control measures over the next two to three years should be provided to increase the confidence that these measures can achieve the near-term interim WQBELs by September 2017.

2. Section 5 Compliance Schedule of the draft Watershed Management Plan only provided implementation schedule for non-structural targeted control measures up to 2017. The LSGR Watershed Management Group must provide measureable milestones for implementing each one of the proposed control measures that will allow an assessment of progress toward the interim and final WQBELs and receiving water limitations every two years.

3. LSGR WMA is also subject to Category 2 priority pollutants, including coliform bacteria. The LSGR WMP proposes to address bacteria with the same runoff reduction and stormwater capture measures proposed for Category 1 pollutants as well as ongoing implementation of minimum control measures. However, this might not be sufficient to reduce bacteria loading to the required levels. The LSGR WMP acknowledges that it will address bacteria more directly during the second and third adaptive management cycles. The LSGR WMP should include a more specific strategy to implement pollutant controls necessary to address this and other Category 2 pollutants prior to the second and third adaptive management cycles.

B. Modeling comments regarding analysis of copper, lead, zinc, DDT, PCB, PAH, and bacteria concentrations/loads:

1. The model predicted stormwater runoff volume is used as a surrogate for required pollutant load reductions for wet weather conditions. Thus, the predicted flow volume becomes a very important parameter for evaluating required volume reductions and BMP scenarios. Based on the results of the hydrology calibration shown in Table 4-3, the error difference between modeled flow volumes and observed data is 19% for the Lower San Gabriel River. The higher error percentage could be due to the exclusion of contributions of flow volume from upstream. For calibration purposes, upstream flow volume should be included to determine whether that improves the model performance to within the "Good" or "Very Good" range, per the RAA Guidelines. Once model calibration has been completed, the upstream flow volume can then be excluded when presenting the volume reduction targets in Tables 8-3 to 8-4.

2. While we understand that there is significant reliance on a volume-based approach, the predicted baseline concentrations and loads for all modeled pollutants of concern, including TSS, should be presented in summary tables for wet weather conditions. This model output should be available, since it is the basis for the percent reductions in pollutant load presented in Table 5-6. (See Table 5. Model Output for Both Process-based BMP Models and Empirically-based BMP Models, pages 20-21 of the RAA Guidelines).

3. Further, the differences between baseline concentrations/loads and allowable concentrations/loads should be presented in time series for each pollutant under long-term continuous simulation and as a summary of the differences between pollutant concentrations/loads and allowable concentrations/loads for the critical wet weather period. (See Table 5. Model Output for Both Process-based BMP Models and Empirically-based BMP Models, pages 20-21 of the RAA Guidelines).

4. We note that modeling was not conducted for organics (DDT, PCBs, and PAHs). It is not clear why these pollutants were not modeled or why previous modeling of these pollutants could not be used, such as that conducted during the development of the

Dominguez Channel and Greater LA and Long Beach Harbor Waters Toxic Pollutants TMDL. An explanation for the lack of modeling is needed.

5. The report presents the existing runoff volumes, required volume reductions and proposed volume reductions from BMP scenarios to achieve the 85th percentile, 24-hour volume retention standard for each major watershed area (e.g., LLAR, LCC and LSGR) and by jurisdiction. The same information on the runoff volume associated with the 85th percentile, 24-hour event and the proposed runoff volume reduction from each BMP scenario also needs to be presented for each modeled subbasin (e.g., a series of tables similar to 8-3 and 8-4 and 9-6 and 9-7). See Table 5 of the RAA Guidelines. Additionally, more explanation is needed as to what constitutes the "incremental" and "cumulative" critical year storm volumes in tables 9-6 and 9-7 and how these values were derived from previous tables.

6. The report needs to present the same information, if available, for non-stormwater runoff. Alternatively, the report should include a commitment to collect the necessary data in each watershed area, through the non-stormwater outfall screening and monitoring program, so that the model can be re-calibrated during the adaptive management process to better characterize non-stormwater flow volumes and to demonstrate that proposed volume retention BMPs will capture 100 percent of non-stormwater that would otherwise be discharged through the MS4 in each watershed area.

7. The ID number for each of the subwatersheds from the model input file should be provided and be shown in the simulation domain to present the geographic relationship of subwatersheds, within each watershed area, that are simulated in the LSPC model.

Los Angeles Regional Water Quality Control Board

November 21, 2014

Lower San Gabriel River Watershed Management Group
(See Distribution List)

REVIEW OF THE LOWER SAN GABRIEL RIVER WATERSHED MANAGEMENT GROUP'S DRAFT COORDINATED INTEGRATED MONITORING PROGRAM, PURSUANT TO PART VI.B AND ATTACHMENT E PART IV.B OF THE LOS ANGELES COUNTY MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) PERMIT (NPDES PERMIT NO. CAS004001; ORDER NO. R4-2012-0175) AND PART VII.B AND ATTACHMENT E, PART IV.B OF THE CITY OF LONG BEACH MS4 PERMIT (NPDES PERMIT NO. CAS004003; ORDER NO. R4-2014-0024)

Dear Lower San Gabriel River Watershed Management Group:

The Regional Water Board has reviewed the draft Coordinated Integrated Monitoring Program (CIMP) submitted on June 30, 2014 by the Lower San Gabriel River (LSGR) Watershed Management Group (WMG). This program was submitted pursuant to the provisions of NPDES Permit No. CAS004001 (Order No. R4-2012-0175), which authorizes discharges from the municipal separate storm sewer system (MS4) operated by 86 municipal Permittees within Los Angeles County (hereafter, LA County MS4 Permit).

The LA County MS4 Permit allows Permittees the option to develop and implement, in coordination with an approved Watershed Management Program per Part VI.C, a customized monitoring program that achieves the five Primary Objectives set forth in Part II.A of Attachment E and includes the elements set forth in Part II.E of Attachment E. Customized monitoring programs may be developed on an individual jurisdictional basis, referred to as an Integrated Monitoring Program (IMP), or a on watershed basis, referred to as a CIMP. These programs must be approved by the Executive Officer of the Regional Water Board.

NPDES Permit No. CAS004003 (Order No. R4-2014-0024) authorizes discharges from the MS4 operated by the City of Long Beach (hereafter, Long Beach MS4 Permit). The Long Beach MS4 Permit similarly allows the City of Long Beach to develop either an IMP or CIMP to implement Permit requirements, with the option of collaborating with LA County MS4 Permit Permittees. For simplicity, this letter and its enclosures cite provisions in the LA County MS4 Permit even though the City of Long Beach is a member of the LSGR WMG and is permitted under its own individual Permit.

The Regional Water Board has reviewed the draft CIMP and has determined that, for the most part, the CIMP includes the elements set forth in Part II.E and will achieve the Primary Objectives set forth in Part II.A of Attachment E of the LA County MS4 Permit. However, some additions and revisions to the CIMP are necessary. The Regional Water Board's comments on the CIMP, including detailed information concerning necessary additions and revisions to the CIMP, are found in Enclosure 1 and Enclosure 2.

Please make the necessary additions and revisions to the CIMP as identified in the enclosures to this letter and submit the revised CIMP as soon as possible and no later than **February 19, 2015.** The revised CIMP must be submitted to losangeles@waterboards.ca.gov with the subject line "LA County MS4 Permit – Revised LSGR CIMP" with a copy to Ivar.Ridgeway@waterboards.ca.gov and Chris.Lopez@waterboards.ca.gov.

Upon approval of the revised CIMP by the Executive Officer, the Permittees must prepare to commence their monitoring program within 90 days. If the necessary revisions are not made, the Permittees must comply with the Monitoring and Reporting Program (MRP) and future revisions thereto, in Attachment E of the LA County MS4 Permit and Attachment E of the Long Beach MS4 Permit.

Until the Permittees' CIMP is approved by the Executive Officer, the monitoring requirements pursuant to Order No. 01-182 and MRP CI 6948, Order No. 99-060 and MRP CI 8052 and pursuant to approved TMDL monitoring plans shall remain in effect for the Permittees.

If you have any questions, please contact Mr. Chris Lopez of the Storm Water Permitting Unit by electronic mail at Chris.Lopez@waterboards.ca.gov or by phone at (213) 576-6674. Alternatively, you may also contact Mr. Ivar Ridgeway, Chief of the Storm Water Permitting Unit, by electronic mail at Ivar.Ridgeway@waterboards.ca.gov or by phone at (213) 620-2150.

Sincerely,

Samuel Unger

Samuel Unger, P.E.
Executive Officer

Enclosure 1 – Summary of Comments and Necessary Revisions to Draft CIMP

Lower San Gabriel River Watershed Management Group

CIMP Reference	MRP Element/ Reference* (Attachment E)	Comment and Necessary Revision
Receiving Water Monitoring		
Section 5 (Metals TMDL Monitoring)	Part II.A.2	The draft CIMP indicates in Table 5-1 (page 21) that metals monitoring for the San Gabriel River Metals TMDL will include monitoring of three wet weather events per year instead of the minimum of four events recommended in the TMDL. The frequency of monitoring for metals should be increased to four wet weather events to be consistent with the recommendations listed in the TMDL. Wet-weather monitoring results from the first year may be evaluated to determine whether reducing the frequency to three wet-weather events per year would still provide sufficient data. The Lower San Gabriel River Watershed Management Group may request a reduction in frequency on the basis of this data evaluation. Furthermore, the USEPA TMDL recommends dry weather effectiveness monitoring at the San Gabriel River Estuary. However, the draft CIMP does not mention any Metals TMDL monitoring at the estuary in Table 3-1 (page 11).
Section 5.4 (PCBs)	Part XIV	For water samples taken under the water column monitoring requirement of the Harbor Toxics TMDL, it is unclear whether PCBs will be analyzed by EPA Method 1668C and reported as congeners as noted in Appendix F. Monitoring for PCBs in sediment or water should be reported as the summation of a minimum of 40 (and preferably at least 50) congeners. See Table C8 in the state's Surface Water Ambient Monitoring Program's Quality Assurance Program Plan (Page 72 of Appendix C), which can be downloaded at http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/qapp/qaprp082209.pdf for guidance. It is preferable samples be analyzed using EPA Methods 8270 or 1668C (as appropriate), and High Resolution Mass Spectrometry.
Section 5.5 (Mercury)	Part XIV	Table 5-7 (page 27) indicates that the EPA Method 245.1 will be used to analyze Mercury. This method is inadequately sensitive. The

CIMP Reference	MRP Element/ Reference* (Attachment E)	Comment and Necessary Revision
		draft CIMP should be revised to use either EPA Method 245.7 or 1631E to ensure sufficiently sensitive minimum levels that are comparable to the water quality criteria.
Section 5 (1st Year Screening)	Part VI.C.1.e and Part VI.D.1.d	Tables 5-1 and 5-2 (pages 21-22) indicate that Table E-2 parameters will be measured at all receiving water sites during the first year. However, the narrative on pages 17-19 only mention E-2 screening for monitoring sites S13 and GR1. The narrative should reflect that all Long-Term Assessment (LTA) receiving water monitoring sites will monitor Table E-2 parameters in their first year of monitoring. Additionally, Tables 5-1 and 5-2 should include and note the appropriate frequencies of analysis for Table E-2 constituents that are detected above the lowest applicable water quality objective during the 1st year of monitoring.
Section 6 (Adaptive Management)	Part VI.C.1 and Part VI.D.1	The draft CIMP notes on page 30 that category 2 water body-pollutant combinations "will be downgraded if data indicates that the pollutant meets delisting criteria." Furthermore, the draft CIMP notes on page 31 that category 3 water body-pollutant combinations "will be removed from the list of monitored constituents at the site if they are not detected at levels that exceed the minimum, appropriate water quality criteria for a period of two consecutive years." The CIMP needs to be revised to clarify that any such reduction in monitoring, including elimination of parameters from the monitoring program, would need to be proposed to the Regional Water Board and would be subject to Executive Officer approval.
Outfall Monitoring		
Section 3.2 (Outfall Monitoring Sites)	Part VIII.A.2.a	The MRP requires monitoring of "at least one major outfall per subwatershed (HUC 12) drainage area, within the Permittee's jurisdiction, or alternate approaches as approved in an IMP or CIMP." The draft CIMP identifies five HUC 12 drainage areas, but only establishes three outfall monitoring sites. Two sites are located in the "Coyote Creek – San Gabriel River" HUC 12 equivalent area and one site is located in the "Brea Creek – Coyote Creek" HUC 12 equivalent area. The draft CIMP notes on page 14 that "Brea Creek – Coyote Creek" is one of the two major HUC 12 equivalent units in the LSGR, however it should be noted that the majority of "Brea Creek – Coyote Creek" is in Orange County, and only portions of La Mirada

CIMP Reference	MRP Element/ Reference* (Attachment E)	Comment and Necessary Revision
		and Diamond Bar appear to be within the subwatershed. In contrast, the draft CIMP identifies the "La Mirada Creek" HUC 12 equivalent unit as "mid-size," although a larger area of the LSGR group lies within it as compared to the "Brea Creek-Coyote Creek" HUC 12 equivalent. Although the Group has established the NFC1 receiving water site within this area, an outfall monitoring location should also be established for this HUC 12 equivalent unit. The "Lower San Jose Creek" and "Upper San Jose Creek" HUC 12 equivalent units also do not have outfall monitoring sites. The Group has not provided thorough justification for not establishing monitoring stations for each of these areas, and should include outfall monitoring stations at these locations in its revised CIMP or provide further justification (that includes a description of land uses) that the one outfall monitoring site in the City of Diamond Bar is representative of the discharges from the "Lower San Jose Creek" and "Upper San Jose Creek" HUC 12 equivalent units.
Section 3.2 (SW Outfall Monitoring)	Part VIII.A.2.b	The draft CIMP states on page 14 that "[t]he drainage areas of the outfall monitoring sites are representative of a wide variety of land uses within the LLSG including residential, commercial and industrial." However, the draft CIMP does not provide a breakdown of land uses for each of these monitoring sites to support this statement. The Group should include a breakdown of land uses for each outfall monitoring site, a comparison of these land uses to the land uses in the entire watershed area, and an explanation of how these sites are representative.
Section 9 (SW Outfall Monitoring Constituents)	Part VIII.B.1.c.iii	Table 9-1 (page 61) does not include diazinon as a constituent to be monitored at stormwater outfall monitoring sites. However, diazinon is listed on the 303(d) list for Coyote Creek.
Section 10-3 (Maps and Databases)	Part VII.A	Table 10-3 (page 68) indicates the status of basic database and mapping information for the watershed. All of the completed mapping information as listed in Part VII.A of the MRP should be included and submitted in the revised CIMP.

*Equivalent provisions are also found in Attachment E of Long Beach MS4 Permit

ENCLOSURE 2
COMMENTS ON AQUATIC TOXICITY TESTING
LOWER SAN GABRIEL RIVER CIMP

Part XII.G.1. (Page E-30) and Part XII.G.2. (Page E-30) of the Monitoring and Reporting Program state that Permittees shall conduct aquatic toxicity monitoring utilizing the critical life stage chronic toxicity test methods listed. The draft CIMP does not propose use of critical life stage chronic toxicity test methods for assessment of toxicity in wet weather samples and instead proposes use of acute toxicity test methods. This is not acceptable; the appropriate chronic toxicity test method listed in the MRP must be used and both survival and sublethal endpoints must be reported. We suggest the group consult the State Water Resources Control Board 2011 publication, "Implementation Guidance: Toxicity Testing for Stormwater" to gain insight on how to run chronic toxicity tests on wet weather samples.

Part VIII.B.1.c.vi. (Page E-23) and Part VIII.G.1.d. (Page 27) of the Monitoring and Reporting Program state that where the TIE conducted at the downstream receiving water monitoring station was inconclusive then aquatic toxicity shall be monitored at the outfall. The draft CIMP does not propose conducting this required outfall toxicity monitoring.

While development of the proposed Discharge Assessment Plan (DAP) will be useful, it cannot take the place of the required outfall toxicity monitoring following an inconclusive TIE in the receiving water. And, while there may be situations where TIEs cannot be resolved due to non-persistent toxicity and no further action on that sample can be pursued, inconclusive TIEs often result from a lack of following well-defined procedures rather than non-persistent toxicity. As mentioned elsewhere in this comment letter, including pyrethroids in the TIE procedure will reduce the occurrence of inconclusive TIEs as will including chemical testing for fipronils and its degradates for comparison to U.S. EPA benchmarks.

Additionally, the toxicity flowcharts do not show the need to proceed to outfall toxicity testing should a TIE of a toxic receiving water sample be inconclusive and instead focus on the response to non-persistent toxicity. We strongly recommend a more cohesive approach whereby Permittees develop a Toxicity Assessment Plan analogous to the Discharge Assessment Plan currently proposed in the CIMP.

Part XII.I.1. (Page E-33) of the Monitoring and Reporting Program states that a toxicity test sample is immediately subject to TIE procedures if either survival or sublethal endpoints demonstrate a Percent Effect value equal to or greater than 50% at the Instream Waste Concentration, the draft CIMP does not propose to perform a TIE when at least a 50% sublethal effect is seen but instead proposes to first collect a confirmatory sample two weeks later.

This is not an acceptable approach. The CIMP seems to be implying that chronic toxicity has some inherent non-persistent quality to it that makes the results unreliable. It also implies that chronic toxicity is of lesser importance. Although it would be hard to generalize to all possible situations, the fact that a large number of invertebrates (or fish) living in a receiving water can survive an ambient pollutant concentration but are impacted in terms of growth or reproduction means that the population as a whole will be impacted, and could eventually collapse. Some species living in the receiving water have very short lifespans and during critical times of the year may be prey for other organisms that will in turn be impacted by their population decline.

Suggested Special Study: The 2013 study released by the California Stormwater Quality Association (CASQA) entitled "Review of Pyrethroid, Fipronil and Toxicity Monitoring Data from California Urban Watersheds" reviewed stormwater data from studies conducted during 2005 - 2012 and highlighted the toxicity impacts from use of pesticides not currently required to be monitored for by the MRP. We suggest the group begin monitoring for these chemicals in the receiving water and, in addition, assess toxicity using the 2002 acute toxicity testing protocol (EPA-821-R-02-012) with the amphipod *Hyalella azteca* as the test organism. *H. azteca* is known to be much more sensitive to pyrethroids than is *Ceriodaphnia dubia*, while the latter is useful for its sensitivity to OP pesticides. The two species together may also prove to be more useful in detecting toxicity from fipronil. And, should 50% or greater effect be detected in the toxicity test, we suggest a procedure to incorporate pyrethroids into the subsequent TIE be documented (three possible treatments have been identified by researchers, see http://www.pubfacts.com/detail/20018342/Focused-toxicity-identification-evaluations-to-rapidly-identify-the-cause-of-toxicity-in-environment). While fipronil does not have a TIE procedure identified currently, chemical testing for the parameter (and degradates) and comparison to U.S. EPA Office of Pesticide Program's aquatic life benchmarks at http://www.epa.gov/oppefed1/ecorisk_ders/aquatic_life_benchmark.htm will aid in determining the cause(s) of toxicity in order to follow up with outfall testing of the parameter(s) with the ultimate goal of removing the source. This approach will also help minimize inconclusive TIE results which would lead to required toxicity testing in a representative upstream outfall.

A-8-1 Coordinated Integrated Monitoring Program

EXECUTIVE SUMMARY

This Watershed Management Program (WMP) sets forth a path to achieve reductions in the pollutants in the waterbodies of the Lower San Gabriel River and its tributaries. The WMP includes: a discussion of existing and planned watershed control measures; a Reasonable Assurance Analysis (RAA) based upon the Watershed Management Modeling System previously developed by the Los Angeles County Flood Control District in collaboration with the USEPA; and a Coordinated Integrated Monitoring Program (CIMP) being implemented over a four year period which began in 2013 with the installation of an early action monitoring site.

The agencies of the Lower San Gabriel River (SGR) Watershed have been working cooperatively towards the goal of a cleaner watershed for several years. In 2011 the cities tributary to Coyote Creek (a major tributary of the San Gabriel River) formed a Technical Committee to address the USEPA's Metals TMDL. As the Regional Board neared completion of the current fourth term MS4 Permit, and as many of the Technical Committee agencies also had areas tributary to the San Gabriel River and in some cases San Jose Creek, the Technical Committee rapidly expanded to include these areas. Funding for the Technical Committee was originally approved by City Councils and agency governing boards through a Memorandum of Understanding (MOU) for the TMDL, which was quickly superseded by a second MOU with funding through December 31, 2022, for selected activities pertaining to the WMP and CIMP provisions of the fourth term MS4 permit. Through this cooperative effort, the Technical Committee requested and supported the Regional Board's effort to adopt a Basin Plan Amendment for a Metals TMDL implementation schedule which was accomplished in June of 2013. This cooperative effort continues and in 2014, the Watershed Group was notified of their successful multi-city grant application (as part of a larger Gateway effort) to install 17 LID BMPs along selected major thoroughfares.

Prior to 2012, MS4 permits required cities and agencies to implement a series of best management practices such as street sweeping and catch basin cleaning to demonstrate compliance. With the adoption of the fourth term MS4 permit by the Los Angeles Regional Water Quality Control Board on November 8, 2012, the emphasis shifted to a more watershed based effort that includes the goals of achieving specific pollutant targets as runoff leaves the storm drain system and enters the main river channels. This WMP and the accompanying RAA and CIMP constitute the first step in that watershed based effort.

The jurisdictional boundaries of the Lower San Gabriel River Watershed are complex. Coyote Creek has a larger drainage area in Orange County which is under a separate MS4 Permit issued by a different Regional Board. Efforts to coordinate activities between the areas of Orange and Los Angeles County are in their infancy and would benefit from a realignment of the two MS4 Permits. Many Cities have drainage areas in multiple watersheds. To facilitate the implementation of control measures and minimize the impact of multiple watershed implementation plans within a single city, the Cities have combined the efforts of the Lower Los Angeles River Watershed and the Los Cerritos Channel to create similar Watershed Management Programs. Two cities have areas that drain to San Jose Creek, also tributary to the San Gabriel River – these areas have been included in this WMP.

This WMP is a long-term planning document that takes a comprehensive look at the Lower SGR Watershed, including its land uses, MS4 system, existing and planned control measures (both structural and nonstructural), existing storm water treatment systems, historical monitoring data and the various segments of the San Gabriel River and its tributaries that have been identified as impaired by various pollutants. Using that data, the Watershed Management Modeling System, one of the three modeling system authorized by the MS4 Permit, is used to generate a Reasonable Assurance Analysis (RAA) which predicts an optimal combination of structural treatment systems and construction timelines to achieve the goals of the MS4 Permit. The RAA spreads responsibility for implementation of future treatment systems amongst all Participating Agencies.

The RAA identifies wet weather zinc as the primarily pollutant of concern[1]. This means that by designing treatment systems and other nonstructural controls measures for zinc, the targets for other pollutants of concern will also be met. The first target for zinc occurs in 2017, when 10 percent wet weather reduction of zinc must be demonstrated. The next targets specified in the MS4 Permit occur in 2020, 2023 and 2026 when 35, 65 and 100 percent respectively of the wet weather zinc reductions must be demonstrated. This WMP establishes milestones that are to be met through the implementation of enhanced nonstructural control measures (such as the City of Whittier's existing vacant parcel sediment ordinance that targets sediment reduction) and construction of structural treatment projects (such as the City of Downey's Discovery Park infiltration system and over 500 existing individual treatment systems).

The RAA provides a recommended volume of runoff on a city-by-city basis that must be treated in order to meet the milestones. In total, the RAA establishes a final (2026) goal of capturing and treating a cumulative 37 acre feet in the San Gabriel and 81.6 acre feet in the Coyote Creek portions of the Lower SGR Watershed. The ultimate cost will vary considerably depending on the availability and configuration of suitable treatment locations and effectiveness of nonstructural watershed control measures but is estimated to be cumulatively in the range of $33 to $65 million. The treatment volumes recommended by the RAA are estimates based on current land used data, historical monitoring and assumed treatment system efficiencies. The WMP also incorporates an adaptive management strategy to adjust and modify the various control measures as necessary.

A Coordinated Integrated Monitoring Program (CIMP) has been developed at a part of this WMP and greatly expands the monitoring of water quality in the Lower SGR Watershed. The CIMP goals are in part to measure the overall effectiveness of the control measures the Participating Agencies are implementing. Currently the Mass Emission Station operated by the Los Angeles County Flood Control District near the mouth of Coyote Creek is the only regularly monitored station in the watershed. A second Mass Emission Station located in the upstream section of the San Gabriel River near the Whittier Narrow Dam is conducting regular monitoring but due to its upstream location is only providing background and general health of the river monitoring information for the downstream portions of the San Gabriel River into which the Participating Agencies discharge.

[1] The discharge of copper is anticipated to be reduced as copper is removed from brake pads over the next decade.

The CIMP identifies five new monitor sites that will be phased in over a multi-year period and will include outfall and TMDL monitoring. The first of these sites has already been installed and is in operation at the base of the North Fork of Coyote Creek. Upon approval of the CIMP, a second station will be installed along the downstream portion of the San Gabriel River as it enters the estuary. Two stations will be added the following year and three potential sites have been identified for the year following that.

This WMP and its components, including Chapter 3 *Selection of Watershed Control Measures*, Chapter 4 *RAA* and Chapter 8 *CIMP* outline a path to achieve significantly improved water quality in the Lower SGR Watershed. The WMP outlines a path based on the optimal placement of treatment systems determined by the RAA, but this is not the only viable path. The agencies of the LSGR can follow the adaptive management strategy described in Chapter 9 to adjust the number, locations and sizes of future treatment systems as long as the timelines and goals of this WMP are followed. While this WMP has been developed to establish treatment and capture goals on an agency-by-agency basis, it does not preclude those agencies from collaborating (in actuality, collaboration is encouraged) on a regional and multi-agency basis.

As part of the overall collaborative and inclusive effort, this Draft Watershed Management Program was presented at a public stakeholder meeting at the Lakewood City Hall on April 30, 2014. The Watershed Control Measures, Reasonable Assurance Analysis and Coordinated Integrated Monitoring Programs were discussed and comments from interested members of the public were solicited.

1 INTRODUCTION AND BACKGROUND

1.1 INTRODUCTION

This Watershed Management Program (WMP) has been developed to implement the requirements of Los Angeles Regional Water Quality Control Board Order Nos. R4-2012-0175 and R4-2014-0024 (National Pollutant Discharge Elimination System (NPDES) Permit Nos. CA004001, CA004003 respectively) on a watershed scale. In addition, elements of this WMP relating to Total Maximum Daily Loads (TMDLs) address requirements of California State Water Resources Control Board Order No. 2012-0011-DWQ (the Caltrans Stormwater Permit) for those TMDLs within the watershed area as described in the Section 1.1.4. Combined, the Orders set forth waste discharge requirements for the Municipal Separate Storm Sewer (MS4) discharges by Caltrans, the Los Angeles County Flood Control District (LACFCD), the County of Los Angeles and 85 cities within the coastal watersheds of Los Angeles County (Permittees). These requirements include three fundamental elements: (i) effectively prohibit nonstormwater discharges through the MS4, (ii) implement controls to reduce the discharge of pollutants to the maximum extent practicable, and (iii) other provisions the Regional Water Board has determined appropriate for the control of such pollutants.[1] The ultimate goals of the WMP are listed in Section 1.2.3.

1.1.1 PARTICIPATING AGENCIES

This WMP is a collaborative effort of fourteen participating agencies with MS4 facilities within the subwatersheds[2] of Coyote Creek, Reaches 1, 2 and 3 of the San Gabriel River and San Jose Creek. For the purposes of this WMP, the area defined by the boundaries of the participating agencies with these subwatersheds is referred to as the Lower San Gabriel River Watershed (Lower SGR Watershed). The participating agencies and their respective MS4 stormwater Permits addressed by this WMP are listed in Table 1-1.

1.1.2 MS4 PERMITS ADDRESSED

As noted in Table 1-1, Caltrans and the City of Long Beach are regulated under their own MS4 Permits, separate from the Los Angeles MS4 Permit. The extent to which this impacts the contents of this WMP is explained in this section.

LONG BEACH AND LOS ANGELES MS4 PERMITS

The Long Beach and Los Angeles MS4 Permits, adopted by the Los Angeles Regional Water Quality Control Board (Regional Board) within 15 months of each other, contain similar language and requirements. Specifically, both Permits include an optional WMP approach to compliance. These similarities allow for the preparation of one WMP to address the requirements of both permits. Except

[1] LA County NPDES MS4 Permit Findings, page 20.

[2] Subwatersheds within this WMP are the “HUC-12 Equivalent” drainage areas as defined in 1.1.4.

where otherwise noted, the term *MS4 Permit* will refer exclusively to the Los Angeles and Long Beach MS4 Permits.

Table 1-1: Participating Agencies of the Lower SGR Watershed

Agency	Permit Order No.	Permit Name

Lakewood		
Norwalk		
Pico Rivera		
Santa Fe Springs		
Whittier		
Long Beach	R4-2014-0024	Long Beach NPDES MS4 Permit (LB MS4 Permit)
Caltrans[3]	2012-0011-DWQ	Caltrans Stormwater Permit (Caltrans MS4 Permit)

CALTRANS STORMWATER PERMIT

Discharges to Caltrans' MS4 are regulated through the Caltrans MS4 Permit. Although the Caltrans Permit does not include a WMP compliance approach like the Los Angeles and Long Beach MS4 Permits, its TMDL provisions do require cooperation with agencies subject to the same TMDLs. As such, Caltrans' participation is restricted to those sections of the WMP related to TMDL requirements. Caltrans has acknowledged their intent to participate.

1.1.3 NON-PARTICIPATING AGENCIES

All other NPDES MS4 permitted agencies within these subwatersheds that are not listed in Table 1-1 have developed either individual or collaborative draft WMPs or draft EWMPs separately and are not participating in this WMP. Non-participating agencies include the County of Los Angeles (unincorporated areas), the City of La Habra Heights, multiple cities within and upstream of Reach 3 of the San Gabriel River and San Jose Creek and the agencies draining to Coyote Creek located within Orange County. Figure 1-1 shows the participating agencies within the Lower SGR.

[3] LACFCD and Caltrans participation is restricted to their land and stormwater facilities within the Lower SGR Watershed.

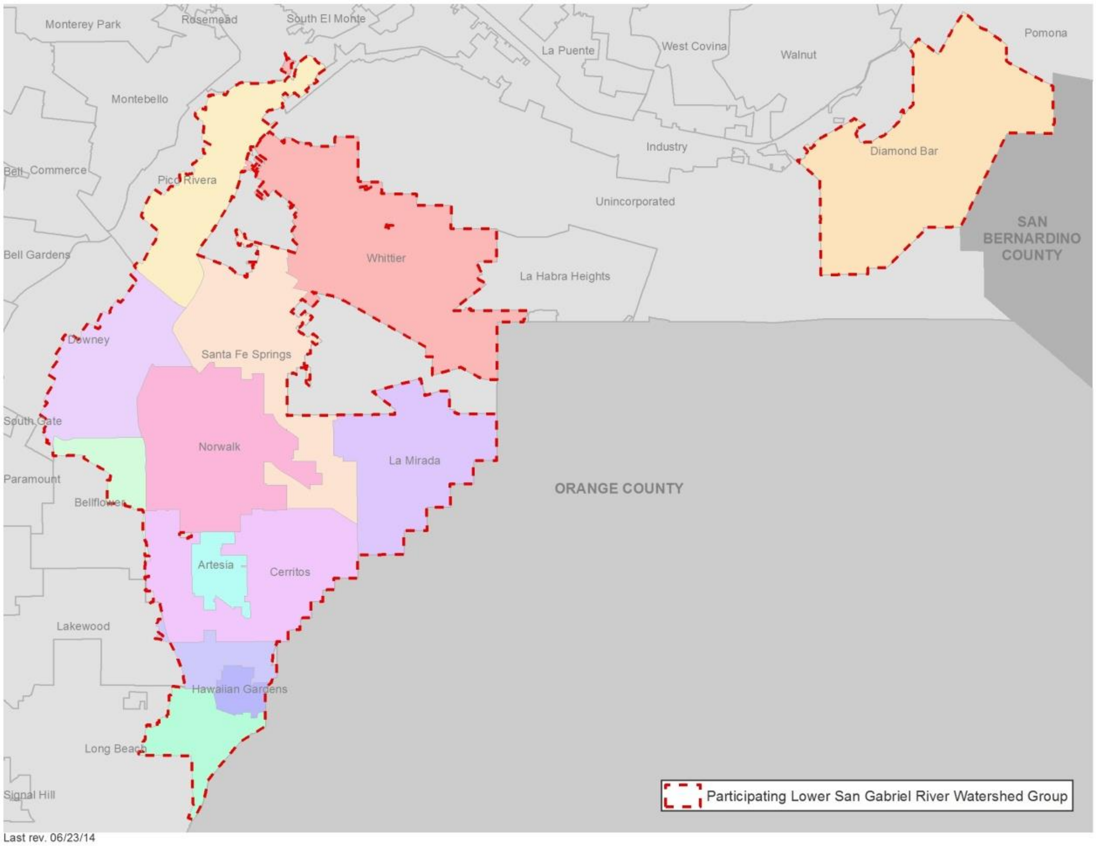

Figure 1-1: Participating Agencies map

1.1.4 THE LOWER SAN GABRIEL RIVER WATERSHED GROUP

DESIGNATION

Prior to the adoption of the MS4 permit, the participating agencies – with the exception of Caltrans, the LACFCD and the City of Pico Rivera – were under a Memorandum of Understanding to develop an Implementation Plan for the San Gabriel River Metals TMDL. After Permit adoption, this group decided to continue their collaborative efforts to develop a WMP. Caltrans, the LACFCD and the City of Pico Rivera decided to participate in this joint effort. The agencies' intent was to focus collective resources on water quality prioritization and implementation efforts to their shared receiving waters. The fourteen agencies submitted a Notice of Intent to develop a WMP to the Regional Board prior to the June 28, 2013[4], deadline and each signed a MOU to develop the WMP. Neighboring Los Angeles MS4 Permittees within the San Gabriel WMA chose to develop separate WMPs, either individually or collaboratively.

BOUNDARIES

The boundaries of the Lower SGR Watershed are both hydrological and jurisdictional. The jurisdictional boundaries, located in the east region, are primarily a consequence of the division of Coyote Creek

[4] The Notice of Intent was approved by the Regional Board on September 25, 2013

between the Counties of Los Angeles, Orange and San Bernardino. The Coyote Creek subwatershed is also split between Whittier and Diamond Bar, separated by the communities of La Habra Heights (incorporated) and Rowland Heights (unincorporated County), which are not participating in this WMP. In addition, the northeast boundary within the San Jose Creek subwatershed is defined by the jurisdictional boundaries of Diamond Bar. This WMP also applies to approximately 400 acres within Diamond Bar that does not have an MS4 draining to the San Gabriel River Watershed. The hydrological boundaries of Reach 1 and 2 of the San Gabriel River and Coyote Creek define the west region and most of the north region.

The Lower SGR Watershed is located within the San Gabriel River Watershed Management Area (WMA) as designated in the Los Angeles MS4 Permit (Figure B-5). The water bodies located within the Lower SGR Watershed - Coyote Creek, Reaches 1, 2 and 3 of the San Gabriel River and San Jose Creek - are defined by the Regional Board as inland Surface Waters of the State (A-9). As part of the main stem of the San Gabriel River, Reaches 1, 2 and 3 are considered Waters of the United States. By definition its tributaries are also Waters of the United States, which includes Coyote Creek and San Jose Creek (A-9). The drainage areas of these five water bodies in turn define five subwatersheds.

The main channels of the San Gabriel River, Coyote Creek and San Jose Creek and most of their tributaries are owned by the LACFCD, with the exception of a small area within the City of Pico Rivera owned by the Army Corps of Engineers. Figure 1-2 shows this area. Additionally, there are privately owned and maintained drains and open channels.

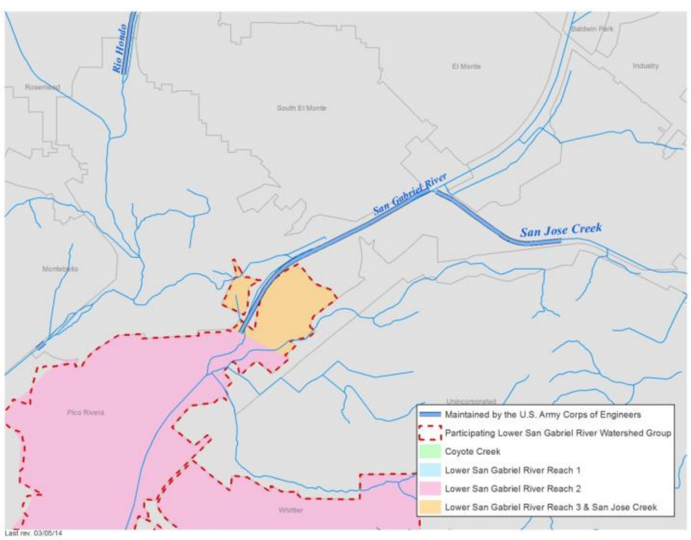

Figure 1-2: Extent of channel ownership by the Army Corps of Engineers

HYDROLOGIC UNIT CODES (HUC)

The United States Geological Survey's (USGS) Hydrologic Unit Codes (HUCs) are referenced in the MS4 Permits. The HUC system divides the United States into a hierarchical classification of defined, hydrologically-based watersheds. The LACFCD found that some of the HUC boundaries within the Los Angeles Basin were incorrect and have since developed more accurate "HUC equivalents". Following the

HUC Equivalent system, San Gabriel River Reach 1, 2 and 3 are within subwatershed 18070160606, Coyote Creek is within subwatersheds 180701060602, 180701060603 and 180701060606 and San Jose Creek is within subwatersheds 180701060501 and 180701060502. The subwatersheds of the Lower SGR Watershed are shown in Figure 1-3 and listed in Table 1-2.

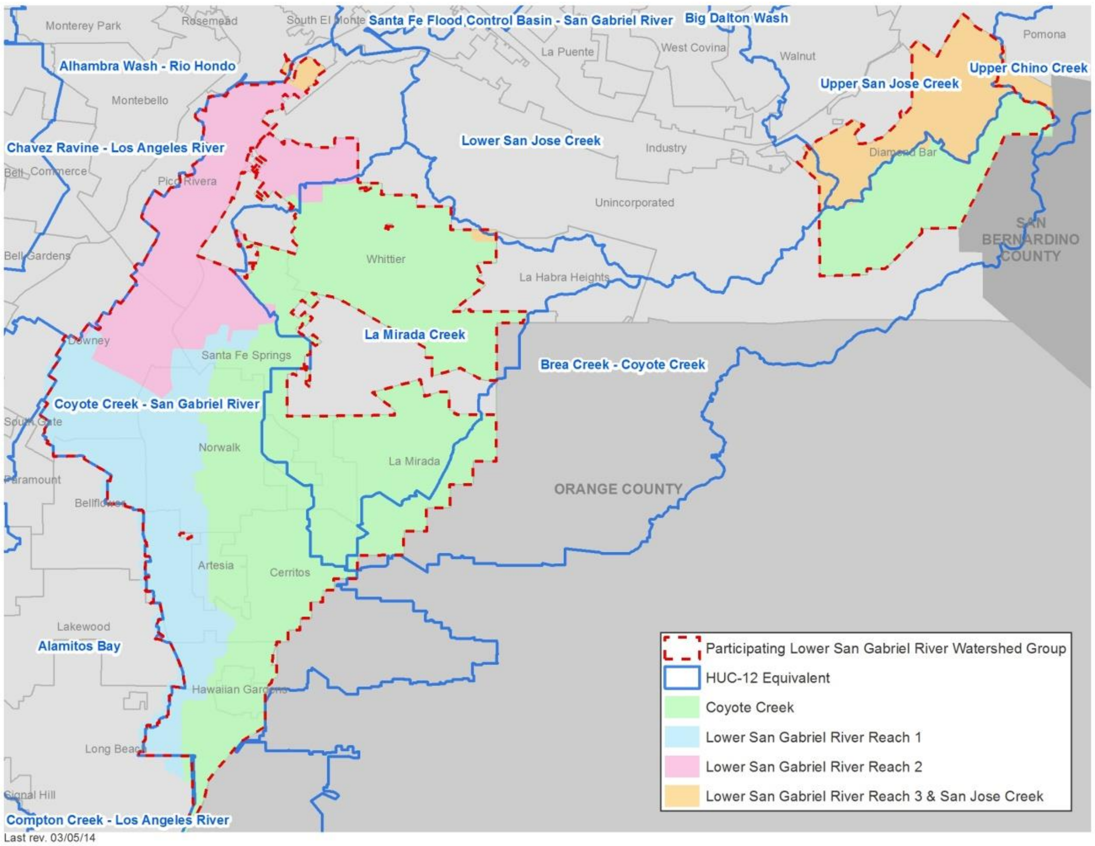

Figure 1-3: Watershed map with HUC-12 equivalent subwatershed

The subwatersheds defined by these 12 digit numbers are referred to as HUC-12. Groups of subwatersheds that share a common downstream waterbody form a watershed. A watershed is designated by the first 10 digits of a HUC-12 and as such is referred to as HUC-10. In the case of the Lower San Gabriel River Watershed, Coyote Creek and San Gabriel River Reach 1, 2 and 3 are within the Lower San Gabriel River HUC-10 watershed and San Jose Creek is itself a HUC-10 watershed. Both watersheds are within the San Gabriel HUC-08 subbasin, which shares most of its borders with the San Gabriel River WMA (Figure B-4).

WATERSHED AUTHORITY GROUP

Watershed Authority Groups (WAGs) as described in State Assembly Bill 2554, which in 2010 amended the Los Angeles County Flood Control District Act, are referenced in the MS4 Permits. The purpose of the WAGs is to implement collaborative water quality improvement projects and services, with the goal of improving water quality and reducing stormwater and urban runoff pollution. The creation and

funding of the WAGs has not yet occurred - it is dependent upon voter approval of the LACFCD's Water Quality Funding Initiative (a countywide parcel fee). AB 2554 divides the County into 9 WAGs - the LSGRW is located within the Lower San Gabriel River WAG, which shares borders with the Lower San Gabriel River HUC-10 watershed. Figure 1-4 is a complete map of the WAG groups.

Table 1-2: Subwatersheds/waterbodies within the Lower SGR Watershed

Subwatershed/ Waterbody	HUC 12 Equivalent	HUC Name	Area within Lower SGR Watershed (mi^2)
Coyote Creek	180701060602	La Mirada Creek	68.05
	180701060603	Brea Creek-Coyote Creek	
	180701060606	Coyote Creek-San Gabriel River	
San Gabriel Reach 1	180701060606	Coyote Creek-San Gabriel River	16.31
San Gabriel Reach 2	180701060606	Coyote Creek-San Gabriel River	15.45
San Gabriel Reach 3	180701060606	Coyote Creek-San Gabriel River	0.51
San Jose Creek	180701060501	Upper San Jose Creek*	7.7

* The USGS Hydrologic Unit Code Equivalent HUC boundaries created by LACFCD included the City of Diamond Bar in the Upper SJC HUC (180701060501); however, this designation does not coincide with the LA Basin Plan Reach designations that commence the Upper SJC (Reach 2) at Temple Avenue in Pomona. According to this designation, Diamond Bar drains solely to SJC Reach 1.

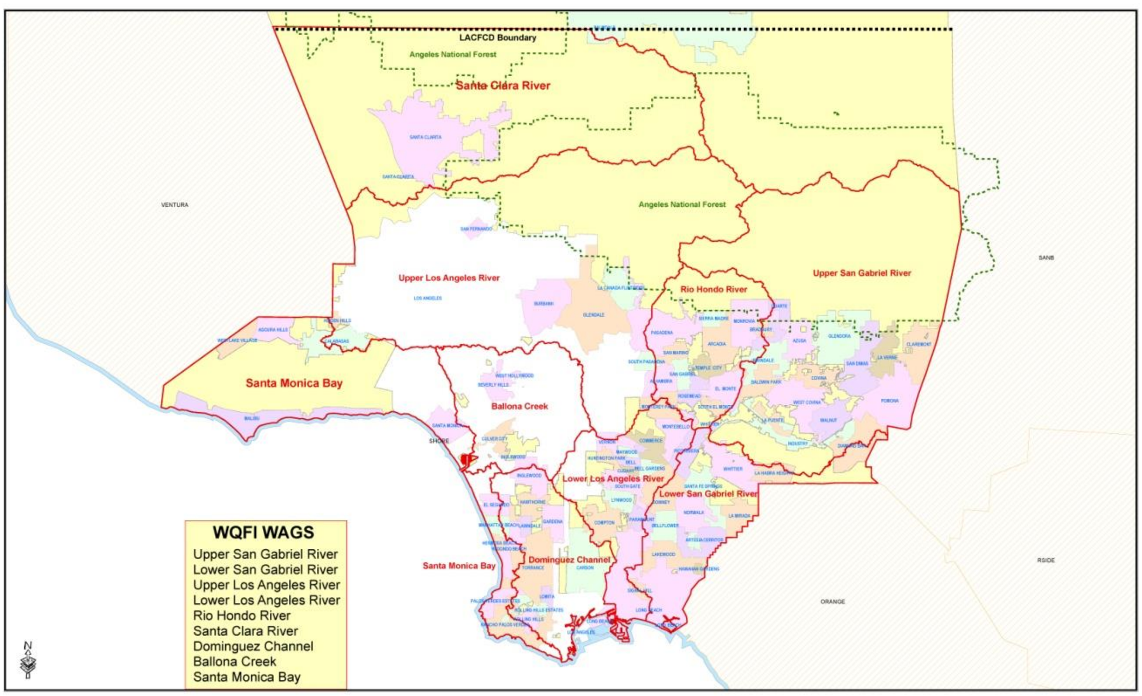

Figure 1-4: WAG map

1.2 The Watershed Management Program

1.2.1 Purpose of the MS4 Permit

MS4s receive stormwater and non-stormwater discharges from various sources, including municipal MS4s and other public agencies, discharges under NPDES permits or authorized by the USEPA[5], groundwater and natural flow. As the discharges flow over the urban landscape, they may pick up pollutants generated by urban activities, such as metals, bacteria, pesticides, fertilizers and trash. Polluted stormwater and non-stormwater discharges conveyed through the MS4 ultimately reach receiving waters, resulting in adverse water quality impacts.[6]

The goal of the MS4 Permit is to reduce the discharge of these pollutants from MS4s to the maximum extent practicable.

1.2.2 Watershed Management Emphasis

The watershed management approach to permit implementation - described in the current MS4 Permits as a voluntary approach to compliance - is a departure from previous permit structures. The previous MS4 Permits (Order Nos. 01-182 and 99-060) addressed implementation through jurisdictional Stormwater Quality Management Programs (SQMPs). The Los Angeles countywide SQMP, prepared jointly by the Permittees and approved by the Regional Board in 2001, described the controls to be implemented in order to comply with the special provisions (now referred to as the Minimum Control Measures, or MCMs) of the MS4 Permit. These controls were identical for each Permittee and did not: 1) differentiate between watersheds or agencies or 2) target or identify priority pollutants.

The emphasis of the prior SQMP approach was rote program development and implementation. In contrast, management actions under the WMP are driven by the water quality conditions of the receiving waters and outfalls within the watershed.

The Regional Board outlines several reasons for this shift in emphasis from the prior MS4 permit. A watershed based structure for permit implementation is consistent with TMDLs developed by the Los Angeles Water Board and USEPA, which are established at a watershed or subwatershed scale and are a prominent part of the MS4 Permit. Many of the Permittees have already begun collaborating on a watershed scale to develop monitoring and implementation plans required by TMDLs.

[5] Including discharges subject to a decision document approved pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)
[6] MS4 Permit Fact Sheet (pg. F7)

1.2.3 WATERSHED MANAGEMENT GOALS

Addressing MS4 discharges on a watershed scale focuses on water quality results by emphasizing the receiving waters and outfalls within the watershed[7]. The conditions of the receiving waters drive management actions, which in turn focus on the measures to address pollutant contributions from MS4 discharges.

The ultimate goals of the Watershed Management Programs is to ensure that discharges from the MS4:

1. Achieve applicable Water Quality Based Effluent Limitations (WQBELs) that implement TMDLs,
2. Do not cause or contribute to exceedances of receiving water limitations,
3. Non-stormwater discharges from the MS4 are not a source of pollutants to receiving waters.

1.2.4 WATERSHED MANAGEMENT APPROACH

In order to achieve the goals listed in the previous section, the approach of the WMP is to:

- Prioritize water quality issues resulting from stormwater and non-stormwater discharges from the MS4 to receiving waters,
- Identify and implement strategies, control measures, and BMPs that:
  - Achieve applicable water quality-based effluent limitations[8]
  - Do not cause or contribute to exceedances of receiving water limitations[9]
  - Do not include non-stormwater discharges that are effectively prohibited[10]
  - Ensure that controls are implemented to reduce the discharge of pollutants to the maximum extent practicable[11]
- Execute an integrated monitoring program and assessment program[12] to determine progress towards achieving applicable limitations and/or action levels
- Modify strategies, control measures, and BMPs as necessary based on analysis of monitoring data collected pursuant to the Monitoring and Reporting Program (MRP) to ensure that applicable water quality-based effluent limitations and receiving water limitations and other milestones set forth in the WMP are achieved in the targeted timeframes.
- Provide opportunity for meaningful stakeholder input. This includes participation in a permit-wide WMP technical advisory committee (TAC) that advises and participates in the development of the WMP from month six through the date of program approval.

[7] MS4 compliance is measured at 1) Receiving water monitoring, 2) Stormwater outfall based monitoring, 3) Non-storm water outfall based monitoring, and 4) New Development/Re-development effectiveness tracking

[8] Pursuant to Part VI.E and Attachments L through R pursuant to corresponding compliance schedules

[9] Pursuant to Parts V.A and VI.E and Attachments L through R of the Permit

[10] Pursuant to Part III.A of the Permit

[11] Pursuant to Part IV.A.1 of the Permit

[12] Pursuant to Attachment E – MRP, Part IV of the Permit

The overall approach is adaptive, whereby BMPs will be implemented, their effectiveness monitored and modifications to this WMP will be made as needed. These modifications will maintain consistency with the assumptions and requirements of applicable TMDL Waste Load Allocations.

1.2.5 CALIFORNIA ENVIRONMENTAL QUALITY ACT

The goals and objectives of the WMP may be achieved by development of stormwater structural controls that may require discretionary approval subject to review under the California Environmental Quality Act (CEQA). The participating agencies intend to comply with CEQA when implementing structural BMPs. Public agencies responsible for carrying out or approving stormwater structural controls are identified as the lead agency. The environmental review required imposes both procedural and substantive requirements. At a minimum, the lead agency must adhere to the consultation and public notice requirements set forth in the CEQA Guidelines, make determinations whether the proposed stormwater treatment control is a “project”, and if so, conduct an initial review of the project and its environmental effects. The lead agency must identify and document the potential environmental impacts of the proposed project in accordance with CEQA, (Public Resources Code Section 21000 et seq.), and the CEQA Guidelines (Title 14 of the California Code of Regulations, Section 15000, et seq.).

Certain classes of projects have been determined not to have significant effect on the environment and are exempt from the provisions of CEQA by statute or category. When a public agency decides that a project is exempt from CEQA, and the public agency approves or determines to carry out the project, the agency may file a Notice of Exemption. For projects deemed not exempt, the lead agency will prepare and Initial Study and decide whether a Negative Declaration will be required for the project, or depending on the potential effects, a further, and more substantial review may be conducted in the form of an Environmental Impact Report (EIR). A project may not be approved as submitted if feasible alternatives or Mitigation Measures are able to substantially lessen the significant environmental effects of the project. Moreover, environmental review must include provisions for wide public involvement, formal and informal, in order to receive and evaluate public reactions to environmental issues, and when deciding the matter, the lead agency must consider all comments it receives (Cal. Pub. Res. Code § 21091(d)(1); 14 CCR § 15074(b)). The lead agency will use the EIR in determining the environmental effects of the proposed storm water structural control project, and whether or not to approve the proposed project. If the proposed project is approved, all conditions and mitigations made in the adopted EIR will become part of any subsequent actions taken by the lead agency. The EIR will also be used by permitting agencies, funding agencies and the public to support proposed project decisions.

The National Environmental Quality Act (NEPA) comes into play less often than CEQA, but may be included for storm water treatment control projects involving federal funding. A joint NEPA and CEQA review process is encouraged to improve coordination and avoid redundancies. Like CEQA, NEPA process provides opportunities to address issues related to proposed projects early in the planning stages. NEPA was codified under Title 42 of the United States Code sections 4331 et seq. (42 U.S.C. 4331 et seq.).

1.3 LOWER SAN GABRIEL RIVER WATERSHED

1.3.1 OVERVIEW OF THE SAN GABRIEL RIVER WATERSHED

The San Gabriel River Watershed drains a watershed of 689 square miles. The main channel of the San Gabriel River is approximately 58 miles long. Its headwaters originate in the San Gabriel Mountains with the East, West, and North Forks. The river empties to the Pacific Ocean at the Los Angeles and Orange Counties boundary in Long Beach. The main tributaries of the river are Big and Little Dalton Wash, San Dimas Wash, Walnut Creek, San Jose Creek, Fullerton Creek, and Coyote Creek. Part of the Coyote Creek subwatershed is in Orange County and is under the authority of the Santa Ana Water Board. Land use in the watershed is diverse and ranges from predominantly open space in the upper watershed to urban land uses in the middle and lower parts of the watershed.

The remaining discussion on the watershed will solely refer to the specific characteristics of the Lower San Gabriel River Watershed.

1.3.2 LOWER SAN GABRIEL RIVER WATERSHED AREA

REGIONAL AND LOCAL SETTING

The Lower SGR Watershed encompasses an approximately 78.5 square miles (50,240 acres) within Los Angeles County and comprises 11.4% drainage area for the San Gabriel River Watershed. There are approximately 150 stream miles located in the watershed. The boundaries of the watershed are shown in Figure 1-1 and further explained in Section 1.1.

CLIMATE

Average annual precipitation for the watershed area is highly variable and terrain-dependent, averaging fifteen (15) inches annually and mainly occurring during the winter months (November through April). Due to the dominance of the stable marine layer, significant precipitation is rare between May and October.

During the winter months Pacific storms often push cold fronts across California from northwest to southeast. These storms and frontal systems account for the vast bulk of the area's annual rainfall. Such rainy season storms are migratory, with wet and dry periods alternating during the winter and early spring with irregularity in timing and duration. Rainfall patterns average 3.68 inches of rainfall in February to 0.01 inches of rainfall in July[13].

With the highly developed conditions within the watershed, most stormwater flows generated by the rainfall is routed to the ocean through the curb and gutters along the streets, catch basins and storm drains into the San Gabriel River. The velocity of the storm flows within this watershed ranges up to 20 feet per second within the waterways.

[13] National Climatic Data Center, http://lwf.ncdc.noaa.gov

RAINFALL AND FLOW CHARACTERISTICS

Historical rainfall records from 3 existing rain gauges located adjacent to the LSGR watershed were obtained and utilized in this analysis. These meteorological stations and resulting rain gauge data are maintained by National Climatic Data Center. The gauges were chosen due to their active status and the duration of available data. These locations are shown in Figure 1-5 with detailed location information provided in Table 1-3.

Table 1-3: Rainfall data summary

Station ID	Station	Period	Latitude	Longitude	Elevation (ft)	Mean Annual Precipitation (in)	85th Percentile Storm (in)
GHCND: USC00042494	Downey Fire Station	1949 - 2012	33.929	-118.145	110	12.32	0.22
GHCND: USW00023129	Long Beach Daugherty Field	1949 - 2014	33.811	-118.1463	30.84	11.20	0.18
GHCND: USC00049660	Whittier City Yard	1998 - 2014	33.9758	-118.0222	445.87	9.86	0.03

(1) National Climatic Data Center, http://lwf.ncdc.noaa.gov

Average monthly rainfall for the historical record has been calculated for each rain gauge and is provided in Table 1-3. The monthly values are similar among the two rain gauges.

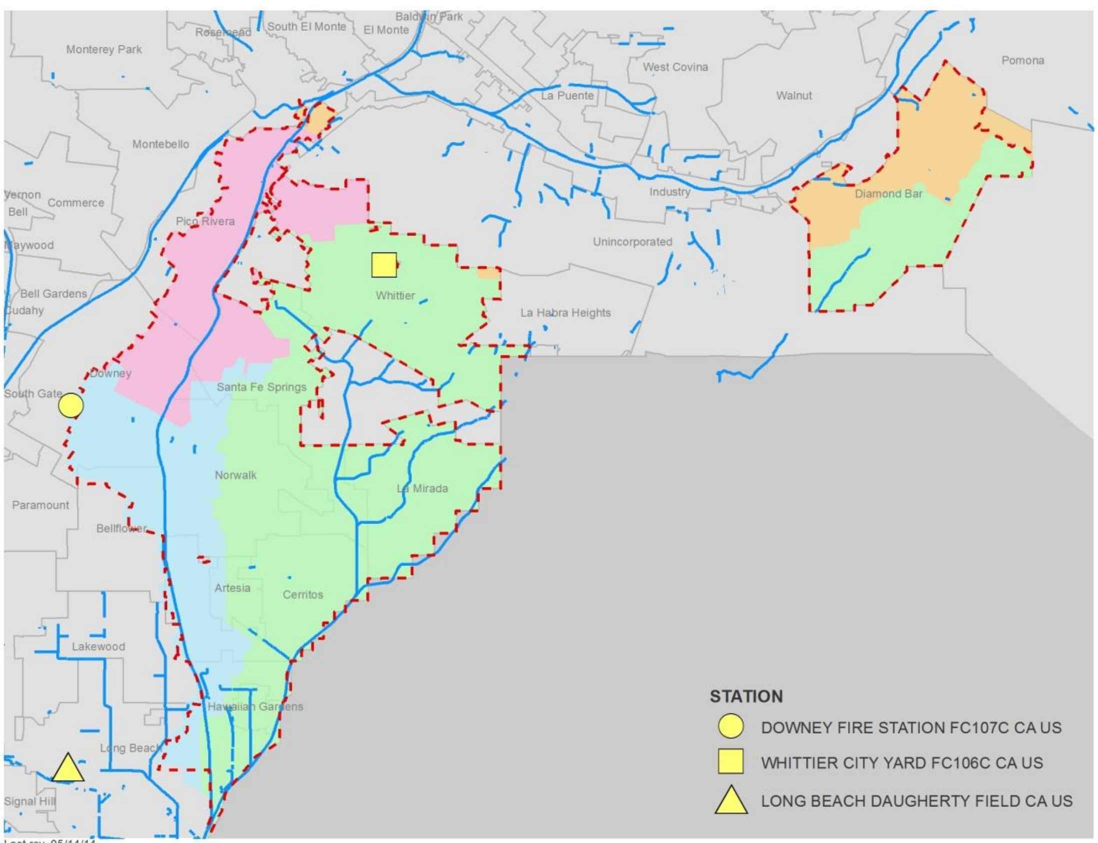

Figure 1-5: Rainfall gauge stations in Downey and Long Beach (yellow squares)

Table 1-4: Summary of average monthly rainfall (in)

Month	Downey Fire Station	Long Beach Daugherty Field	Whittier City Yard
January	3.3	2.8	2.8
February	3.3	3.6	3.7
March	2.4	2.2	2.2
April	1.0	0.6	0.7
May	0.3	0.3	0.3

July	0.0	0.0	0.0
August	0.1	0.1	0.1
September	0.3	0.3	0.3
October	0.4	0.4	0.4
November	1.5	1.0	0.9
December	2.0	2.0	2.0
Total Average Monthly Rainfall	1.2	1.1	1.1

(1) National Climatic Data Center, http://lwf.ncdc.noaa.govhttp://lwf.ncdc.noaa.gov/

DRY WEATHER FLOWS TO THE LOWER SAN GABRIEL RIVER

Dry weather flow in the San Gabriel River comes predominantly from effluent discharges and groundwater inflow. Sources of effluent discharges in the Lower San Gabriel River watershed include the Sanitation Districts of Los Angeles County, urban runoff such as irrigation overflows and car wash water, and various industrial discharges.

The Sanitation Districts of Los Angeles County maintain a regional, interconnected sewerage system called the Joint Outfall System. The Joint Outfall System includes five satellite water reclamation plants (WRPs) that discharge effluent into the San Gabriel River during dry weather:

THE LONG BEACH WRP is located at 7400 E. Willow Street in the City of Long Beach. The plant occupies 17 acres west of the San Gabriel River (605) Freeway and began operation in 1973. The Long Beach WRP provides primary, secondary and tertiary treatment for 25 million gallons of wastewater per day, and serves a population of approximately 250,000 people. Almost 6 million gallons per day of the reclaimed water is reused at over 60 reuse sites, including landscape irrigation of schools, golf courses, parks, and greenbelts by the City of Long Beach. The remaining water is discharged directly to Coyote Creek at one effluent discharge point directly above the confluence with the San Gabriel River. The average monthly effluent discharge from the Long Beach WRP was 11.97 MGD in 2012, with the average monthly max being 17.50 MGD and the average monthly minimum flows measured at 7.84 MGD.

THE LOS COYOTES WRP is located at 16515 Piuma Avenue in the city of Cerritos and occupies 34 acres at the northwest junction of the San Gabriel River (605) and the Artesia (91) Freeways. The Los Coyotes WRP provides primary, secondary and tertiary treatment for 37.5 million gallons of wastewater per day, and serves a population of approximately 370,000 people. Over 5 million gallons per day of the reclaimed water is reused at over 270 reuse sites, including landscape irrigation of schools, golf courses, parks, nurseries, and greenbelts. The remaining water is discharged directly to the San Gabriel River at one effluent discharge point above the confluence

with Coyote Creek. The average monthly effluent discharge from the Los Coyotes WRP was 18.85 MGD in 2012, with the average monthly max being 22.62 MGD and the average monthly minimum flows measured at 15.58 MGD.

The Pomona WRP is located at 295 Humane Way in the City of Pomona. The plant occupies 14 acres northeast of the intersection of the Pomona (60) and Orange (57) Freeways. The Pomona WRP provides primary, secondary and tertiary treatment for 15 million gallons of wastewater per day, and serves a population of approximately 130,000 people. Approximately 8 million gallons per day of the reclaimed water is reused at over 190 different reuse sites, including landscape irrigation of parks, schools, golf courses, greenbelts. The remaining water is discharged to the San Jose Creek channel at 1 effluent discharge point, where it is allowed to percolate into the groundwater in the unlined portions of the San Gabriel River before flowing into the ocean. The average monthly effluent discharge from the Pomona WRP was 4.22 MGD in 2012, with the average monthly max being 7.42 MGD and the average monthly minimum flows measured at 2.09 MGD.

The San Jose Creek WRP is located at 1965 Workman Mill Road, in unincorporated Los Angeles County, next to the City of Whittier. The plant occupies 39 acres north of the Pomona (60) Freeway on both sides of the San Gabriel (605) Freeway and consists of an East WRP and a West WRP. The San Jose Creek WRP provides primary, secondary and tertiary treatment for 100 million gallons of wastewater per day, and serves a large residential population of approximately one million people. Approximately 42 million gallons per day of the reclaimed water is reused at over 130 different reuse sites, including groundwater recharge and irrigation of parks, schools, and greenbelts. The remainder is discharged to the San Gabriel River at 5 discharge points. The average monthly effluent discharge from the East San Jose Creek WRP was 31.64 MGD in 2012, with the average monthly max being 44.34 MGD and the average monthly minimum flows measured at 9.03 MGD. The average monthly effluent discharge from the West San Jose Creek WRP was 9.65 MGD in 2012, with the average monthly max being 18.00 MGD and the average monthly minimum flows measured at 1.28 MGD.

The Whittier Narrows WRP is located at 301 N. Rosemead Boulevard in the City of El Monte. The plant occupies 27 acres south of the Pomona (60) Freeway, and provides primary, secondary and tertiary treatment for 15 million gallons of wastewater per day. Most of the reclaimed water is reused as groundwater recharge into the Rio Hondo and San Gabriel Coastal Spreading Grounds, or for irrigation at an adjacent nursery. Remaining effluent is discharged directly into the San Gabriel River at 1 effluent discharge point above Whittier Narrows Dam. The average monthly effluent discharge from the Whittier Narrows WRP was 6.44MGD in 2012, with the average monthly max being 8.05MGD and the average monthly minimum flows measured at 4.97MGD.

Wet Weather Flows to the Lower San Gabriel River

In addition to stormwater flows within the Los Angeles Basin, wet weather flows from the San Gabriel River Mountains also contribute to flows in the San Gabriel River.

WATERSHED CATCHMENT HYDROLOGIC CONNECTIVITY

The main reach through the watershed is the San Gabriel River, with Coyote Creek and San Jose Creek as major tributaries. The stretch of the San Gabriel River within the watershed consists of a concrete lined channel spanning 140 to 200 feet in width. Coyote Creek and San Jose Creek also have concrete channels at their confluence with the San Gabriel River. Figure 1-6 shows the LACFCD storm drain system within the LSGRW as well as its main channels and tributaries.

The Coyote Creek subwatershed drains approximately 185 square miles to its confluence with the San Gabriel River. The subwatershed is almost entirely developed.

The San Jose Creek subwatershed drains approximately 7.29 square miles to its confluence with the San Gabriel River.

The Lower SGR Watershed drains runoff directly from urbanized area totaling approximately 78.5 square miles. From its upstream beginning in Whittier (in Reach 3 of the San Gabriel River) to its downstream confluence with the San Gabriel River Estuary, the Lower SGR stretches approximately 17.1 miles. The Los Angeles County Department of Public Works provided the delineation of the catchments within each subwatershed. Approximately 107 catchments are located within this watershed[14]. These delineations are based on a combination of contour information and existing underground storm sewer systems.

Drainage areas for individual outfalls are not readily available at this time. Defining these areas would require significant resources. The Group proposes to provide drainages areas for major outfalls with significant discharges and outfalls to be monitored as part of the CIMP. To complete this task, existing drainage maps from the LACFD and/or cities will be obtained and converted to GIS project files. This task will be completed within one year of WMP approval.

The watershed is predominately served by storm drain systems, extending across 15 agency jurisdictions, connecting drainage in urbanized areas with the main tributaries. Although most agencies are not directly adjacent to the LSGR, their runoff ultimately reaches the SGR through its tributaries and connected storm sewer systems.

GEOPHYSICAL SETTING

TOPOGRAPHY

Natural topography is comprised of the existing soils, ground elevation/slope, vegetation, stream network, and groundwater. These features impact each other in both the natural and built environments, and therefore should not be analyzed independently when evaluating BMP location options.

SOILS

The Lower SGR Watershed can be characterized as having seven soil types. Figure 1-7 shows the various soil types underlying the watershed. Soils range from sandy loam to clay loam, having a varying range of saturated hydraulic conductivity.

GROUNDWATER

Groundwater flow in the Lower SGR Watershed generally mimics surface topography. Depth to the groundwater varies from 11 feet to greater than 40 feet. Figure 1-8 shows the groundwater basin for the Lower SGR Watershed.

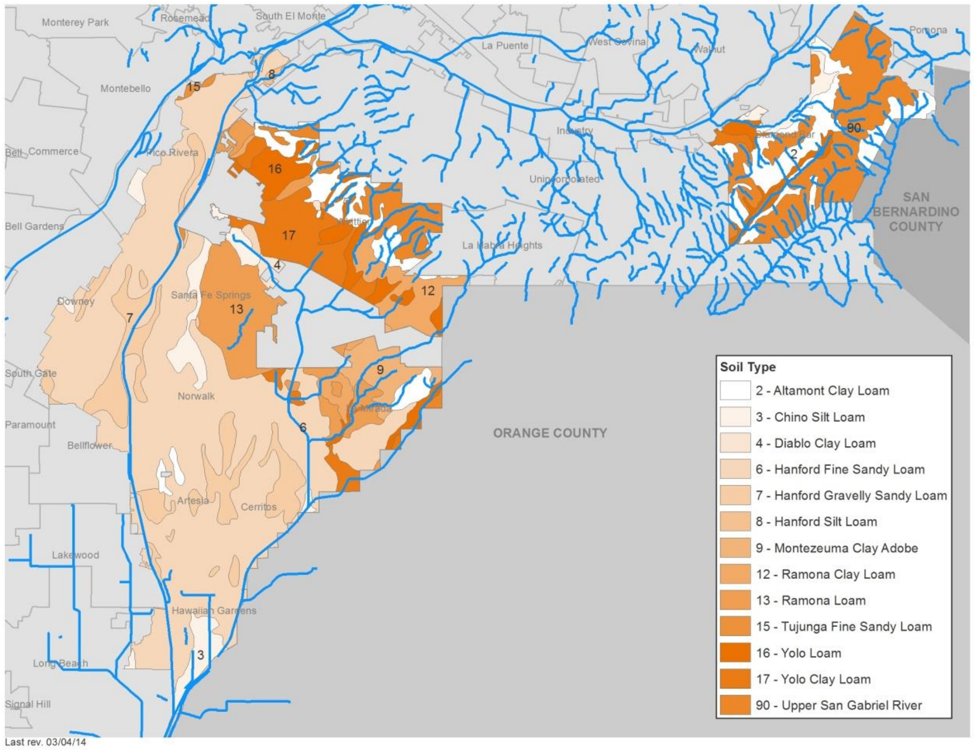

Figure 1-7: Soil types

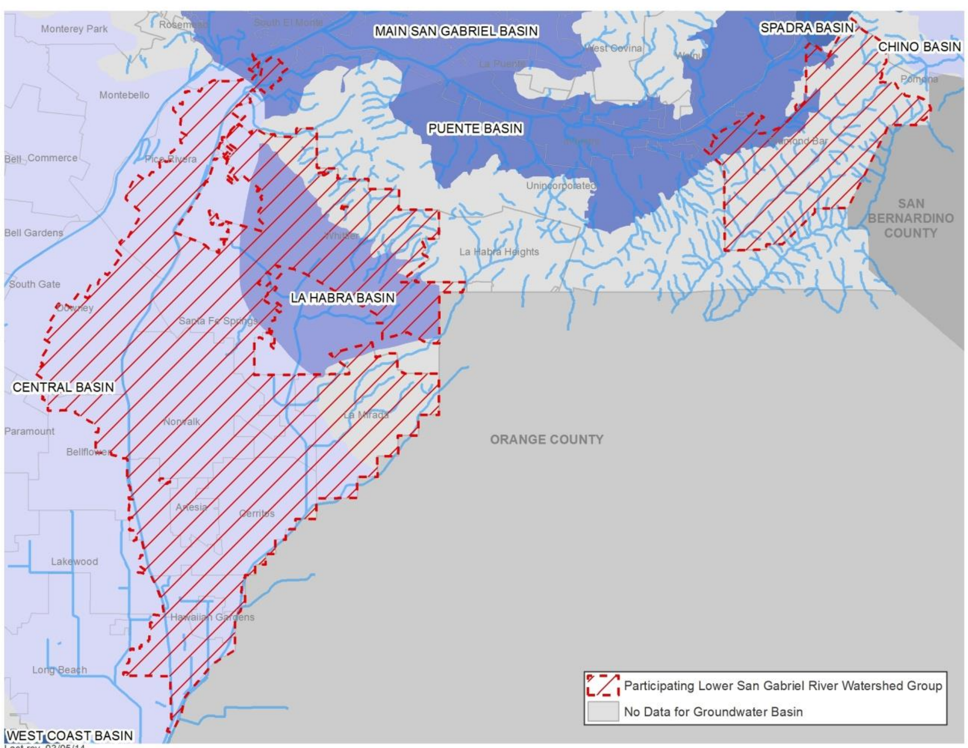

Figure 1-8: Groundwater basins

WATERSHED LAND AREA

Table 1-5 lists the percent land area within the Lower SGR for each participant. In addition to the areas listed in Table 1-5, the WMP will also cover the portions of the cities of Diamond Bar and Whittier do not drain to San Gabriel River Reach 1 and Reach 2 or Coyote Creek.

Table 1-5: Watershed land area

Permittee	Land Area (Acres)	Percent of Total Area
Artesia	1,037	2%
Bellflower	1,216	2%

DISADVANTAGED COMMUNITY

The Lower SGR Watershed is in a geographic area encompassing all or part of thirteen cities. This area is a high-minority and economically disadvantaged region. Of the thirteen cities participating in this WMP, twelve are categorized as disadvantaged communities in part (see Table 1-7)[15], meaning that the median income levels in the city as a whole are less than 80% of the state's median household income ($48,706).

[15] United States Census Bureau, as accessed at *http://www.census.gov/*. February 2014.

1.4 Water Quality Impairments

1.4.1 History of Impairments in the Lower SGR Watershed

Various reaches of the Lower SGR Watershed are on the 2010 CWA Section 303(d) List of impaired water bodies due to metals (copper, lead, selenium, and zinc). Segments of the San Gabriel River and its tributaries are listed as exceeding water quality objectives for copper, lead, selenium, and zinc. Metals loadings to San Gabriel River have the potential to cause impairments of the WILD, WARM, COLD, RARE, EST, MAR, MIGR, SPWN, WET, MUN, IND, AGR, GWR, and PROC beneficial uses. The San Gabriel River metals and selenium TMDL found that the MS4 contributes a large percentage of the metals loadings during dry weather because although their flows are typically low, concentrations of metals in urban runoff may be quite high. During wet weather, most of the metals loadings are in the particulate form and are associated with wet-weather stormwater flow.

1.4.2 Organizing to address TMDLs

TMDLs represent large-scale efforts crossing jurisdictional boundaries and often encompassing the entire drainage of a major regional waterbody (e.g., San Gabriel River). These TMDLs involve coordinated participation from multiple agencies to address the impairments. Several agencies participating in the development of this WMP have already worked in a coordinated effort to address water quality issues throughout the San Gabriel River. This includes the Coyote Creek/San Gabriel River Metals TMDL Committee, which organized several cities under a Memorandum of Agreement in 2012 to develop an Implementation Plan for that TMDL. This effort has now been incorporated into this WMP approach in 2013 and development and adoption of a Basin Plan Amendment by the Regional Board in June 2013. Additional efforts included the cities of Downey, Norwalk, Pico Rivera, Santa Fe Springs and Whittier jointly applied for a Proposition 84 grant to install Low Impact Development (LID) BMPs along high traffic transportation corridors.

1.5 Water Quality Issues and the History of Water Quality Regulations

1.5.1 Federal and State Law

The Clean Water Act (CWA) establishes the basic structure for regulating discharges of pollutants into the waters of the United States and regulating quality standards for all inland surface waters, estuaries, and coastal waters. The federal Environmental Protection Agency (EPA) is ultimately responsible for implementation of the CWA and its associated regulations. However, the CWA allowed EPA to authorize the NPDES Permit Program to state governments, enabling states to perform many of the permitting, administrative, and enforcement aspects of the NPDES Program. California, like other states, implements the CWA by promulgating its own water quality protection laws and regulations. As long as this authority provides equivalent protections as the federal CWA, EPA can delegate CWA

responsibilities to the state while retaining oversight responsibilities. In some cases, California has established requirements that are more stringent than federal requirements.

The 1970 Porter-Cologne Water Quality Control Act granted the California State Water Resources Control Board (SWRCB) and nine California Regional Water Quality Control Boards (Regional Boards) broad powers to protect water quality. This Act and its governing regulations provide the basis for California's implementation of CWA responsibilities. The Los Angeles Regional Water Quality Control Board (Regional Board) is the governing regulatory agency for the Lower SGR Watershed.

Section 303(d) of the CWA requires waterbodies not meeting water quality objectives even after all required effluent limitations have been implemented (e.g. through wastewater or stormwater discharge permits) to be regularly identified. These waters are often referred to as "303(d) listed" or "impaired" waters. Waterbodies that are listed on the 303(d) list typically require development of a Total Maximum Daily Load (TMDL) for the pollutant(s) impairing the use of the water. Development and approval of the 303(d) list is a lengthy state and federal process. A list is not effective until the EPA approves the list. The current EPA-approved 303(d) list for California is the 2010 list; this list can be found in APPENDIX X.

A TMDL establishes the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards. Depending on the nature of the pollutant, TMDL implementation requires limits on the contributions of pollutants from point sources (waste load allocation), nonpoint sources (load allocation), or both. The Regional Board is responsible for TMDL development in the LSGRW.

Adoption of a TMDL requires an amendment to the Water Quality Control Plan (known as the Basin Plan) for the Los Angeles Region. The Regional Board's Basin Plan is designed to preserve and enhance water quality and protect the beneficial uses of regional waters. Specifically, the Basin Plan (i) designates beneficial uses for surface and ground waters, (ii) sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the state's antidegradation policy, and (iii) describes implementation programs to protect all waters in the Region. The Basin Plan is reviewed and updated as necessary (Regional Board 1994, as amended). Following adoption by the Regional Board, the Basin Plan and subsequent amendments are subject to approval by the State Board, the State Office of Administrative Law (OAL), and the Environmental Protection Agency (EPA).

1.5.2 WATER QUALITY REQUIREMENTS

The Regional Board designates "beneficial uses" for waterbodies in the watersheds that it governs and adopts water quality objectives to protect these uses[16]. In some cases, EPA may also promulgate objectives where it makes a finding that the state's objectives are not protective enough to protect the beneficial use. The nature of the objectives is directly related to the type of beneficial use. For example, the freshwater warm habitat beneficial use protects aquatic organisms resident in warm-water streams. The associated water quality objectives are for those constituents known to affect both the growth and reproduction of aquatic life. These objectives range from physical characteristics such as temperature,

[16] See Regional Board's 1994 Los Angeles Region Basin Plan, as amended.

dissolved oxygen, and pH to potential toxic constituents including metals and organics. In California, the objectives for metals and a number of organic compounds have been established by the federal EPA rather than the state (California Toxics Rule, 2000). The EPA promulgated numeric water quality criteria for priority toxic pollutants and other water quality standards provisions based on the determination that the numeric criteria were necessary (since the state had been without numeric water quality criteria for many priority toxic pollutants as required by the CWA) to protect human health and the environment. These Federal criteria are legally applicable in the state for inland surface waters, enclosed bays and estuaries for all purposes and programs under the CWA.

1.6 MS4 PERMIT REQUIREMENTS

The development of this WMP is a compliance option of the MS4 Permit held by the Permittees[17]. The WMP includes an evaluation of existing water quality conditions, including characterization of stormwater and non-stormwater discharges from the MS4 and receiving water quality to support identification and prioritization/sequencing of management actions. At a minimum, water quality priorities within each Watershed Management Area must include achieving applicable water quality based effluent limitations and/or receiving water limitations established.

The MS4 permit requires that this WMP identify strategies, control measures, and BMPs to implement through the stormwater management programs on a watershed scale, with the goal of creating an efficient program to focus collective resources on watershed priorities and effectively eliminate the source of pollutants. This WMP has identified strategies, control measures, and BMPs to be implemented on a watershed scale. Customization of the BMPs to be implemented, or required to be implemented, has been done with the goal of creating an efficient program to focus individual and collective resources on watershed priorities.

On the basis of the evaluation of existing water quality conditions, water body-pollutant combinations were classified into one of the following three categories:

- CATEGORY 1 (HIGHEST PRIORITY): Waterbody-pollutant combinations for which water quality based effluent limitations and/or receiving water limitations are included in the MS4 permit to implement TMDLs.

[17] The Cities of Pico Rivera, Downey, Norwalk, La Mirada and Artesia (hereinafter "the Cities") submitted Administrative Petitions (Petitions) to the California State Water Resources Control Board (SWRCB) pursuant to section 13320(a) of the California Water Code requesting that the SWRCB review various terms and requirements set forth in the 2012 MS4 Permit, Order No. R4-2012-0175 (2012 Permit) adopted by the California Regional Water Quality Control Board, Los Angeles Region (Regional Board)." These Cities have participated in good faith in the development of this Lower San Gabriel River Watershed Management Program (WMP). Nothing in this WMP shall affect those cities' administrative petitions, nor shall anything in this WMP constitute a waiver of any positions or rights therein.

- CATEGORY 2 (HIGH PRIORITY): Pollutants for which data indicate water quality impairment in the receiving water according to the State's Listing Policy and for which MS4 discharges may be causing or contributing to the impairment.
- CATEGORY 3 (MEDIUM PRIORITY): Pollutants for which there are insufficient data to indicate water quality impairment in the receiving water according to the State's Listing Policy, but which exceed applicable receiving water limitations contained in the MS4 permit and for which MS4 discharges may be causing or contributing to the exceedance.

Sources for the waterbody-pollutant combinations are identified by considering the following:

- Review of available data, including historical findings from the participating agencies' Minimum Control Measure and TMDL programs, watershed model results and other pertinent information, data or studies.
- Locations of major MS4 outfalls and major structural controls for stormwater and nonstormwater that discharge to receiving waters.
- Other known and suspected sources of pollutants from the MS4 to receiving waters.

Based on the findings of the source assessment, the issues within the watershed are prioritized and sequenced. Factors considered in establishing watershed priorities include:

1. Pollutants for which there are water quality based effluent limitations and/or receiving water limitations with interim or final compliance deadlines within the permit term.
2. Pollutants for which there are water quality based effluent limitations and/or receiving water limitations with interim or final compliance deadlines between October 26, 2012 and October 25, 2017.
3. Pollutants for which data indicate impairment in the receiving water and the findings from the source assessment implicates discharges from the MS4, but no TMDL has been developed.

1.6.1 REASONABLE ASSURANCE ANALYSIS AND WATERSHED CONTROL MEASURES

As part of the WMP plan, a Reasonable Assurance Analysis (RAA) is conducted for each waterbody-pollutant combination. The RAA consists of an assessment, through quantitative analysis or modeling, to demonstrate that the activities and control measures (i.e. BMPs) identified in the Watershed Control Measures section of the WMP are performed to demonstrate that applicable water quality based effluent limitations and/or receiving water limitations with compliance deadlines during the permit term will be achieved. Watershed Control Measures are subdivided into 1) Minimum Control Measures, 2) Non-Stormwater Discharge Measures 3) TMDL Control Measures and 4) other control measures for water-body pollutant Categories 1, 2 and 3.

Schedules are developed for strategies, control measures and BMPs to be implemented by each individual Permittee within its jurisdiction and for those that will be implemented by multiple

Permittees on a watershed scale. The schedule will measure progress and incorporate 1) Compliance deadlines occurring within the permit term for all applicable interim and/or final water quality based effluent limitations and/or receiving water limitations to implement TMDLs, 2) Interim deadlines and numeric milestones within the permit term for any applicable final water quality based effluent limitation and/or receiving water limitation to implement TMDLs, where deadlines within the permit term were not otherwise specified, and 3) For watershed priorities related to addressing exceedances of receiving water limitations.

1.6.2 ADAPTIVE MANAGEMENT

An adaptive management process will be implemented every two years from the date of program approval, adapting the WMP to become more effective, based on, but not limited to the following:

1. Progress toward achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the watershed control measures,
2. Progress toward achieving interim and/or final water quality based effluent limitations and/or receiving water limitations, or other numeric milestones where specified, according to established compliance schedules,
3. Re-evaluation of the highest water quality priorities identified for the Watershed Management Area based on more recent water quality data for discharges from the MS4 and the receiving water(s) and a reassessment of sources of pollutants in MS4 discharges,
4. Availability of new information and data from sources other than the Permittees' monitoring program(s) within the Watershed Management Area that informs the effectiveness of the actions implemented by the Permittees,
5. Regional Water Board recommendations; and
6. Recommendations for modifications to the WMP solicited through a public participation process

Based on the results of the iterative process, modifications necessary to improve the effectiveness of the WMP will be reported in the Annual Report, and as part of the Report of Waste Discharge (ROWD). Any necessary modifications to the WMP will be implemented upon acceptance by the Regional Water Board Executive Officer or within 60 days of submittal if the Regional Water Board Executive Officer expresses no objections.

2 IDENTIFICATION OF WATER QUALITY PRIORITIES

2.1 WATERBODY POLLUTANT CLASSIFICATION

One of the goals of this Watershed Management Program (WMP) is to identify and address water quality priorities within the Lower San Gabriel River Watershed (Lower SGR Watershed). In order to begin prioritizing water quality issues within the Lower SGR Watershed, an evaluation of existing water quality conditions, including characterization of stormwater and nonstormwater discharges from the Municipal Separate Storm Sewer System (MS4) and receiving waters has been completed per section VI.C.5.a of the MS4 Permit.

The existing water quality conditions of the Lower SGR Watershed were used to classify pollutants into three categories each with specific subcategories. These categories outline watershed priorities, which include, at a minimum, achieving applicable water quality-based effluent limitations and/or receiving water limitations established pursuant to TMDLs. The categories and subcategories are described below:

- Category 1: Waterbody-pollutant combinations for which water quality-based effluent limitations and/or receiving water limitations are established in Part VI.E TMDL Provisions and Attachments L through R of the MS4 Permit.
    - Category 1A: **Final** deadlines within permit term (after approval of WMP[1] & prior to December 28, 2017)
    - Category 1B: **Interim** deadlines within permit term (after approval of WMP[2] & prior to December 28, 2017)
    - Category 1C: **Final** deadlines between December 29, 2017 - December 28, 2022
    - Category 1D: **Interim** deadlines between December 29, 2017 - December 28, 2022
    - Category 1E: **Interim & final** deadlines after December 28, 2022
    - Category 1F: **Past final** deadlines (final deadlines due prior to approval of WMP)
- Category 2: Pollutants for which data indicate water quality impairment in the receiving water according to the State Board's Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List (State Listing Policy) and for which MS4 discharges may be causing or contributing to the impairment.
    - Category 2A: Non-legacy pollutants
    - Category 2B: Bacterial indicators
    - Category 2C: Legacy pollutants
    - Category 2D: Water quality indicators
- Category 3: Pollutants for which there are insufficient data to indicate water quality impairment in the receiving water according to the State's Listing Policy, but which exceed applicable receiving water limitations contained in this Order and for which MS4 discharges may be causing or contributing to the exceedance.

[1] Upon approval and no later than April 28, 2015.

[2] *Ibid.*

- Category 3A: Non-legacy pollutants
- Category 3B: Bacterial indicators
- Category 3C: Legacy pollutants
- Category 3D: Water quality indicators

The Lower SGR Watershed encompasses Reaches 1, 2, and 3 of the San Gabriel River, Coyote Creek, and the lower portions of the San Jose Creek (SJC Reach 1)[3]. A small portion of the watershed in the Diamond Bar area drains primarily through natural drainage to Chino Creek and the jurisdiction of the Santa Ana Region (Region 8). This area will be addressed through watershed control measures discussed in later chapters of this WMP. The pollutants for which the Lower SGR Watershed is listed as impaired for are shown on Figure 1-1.

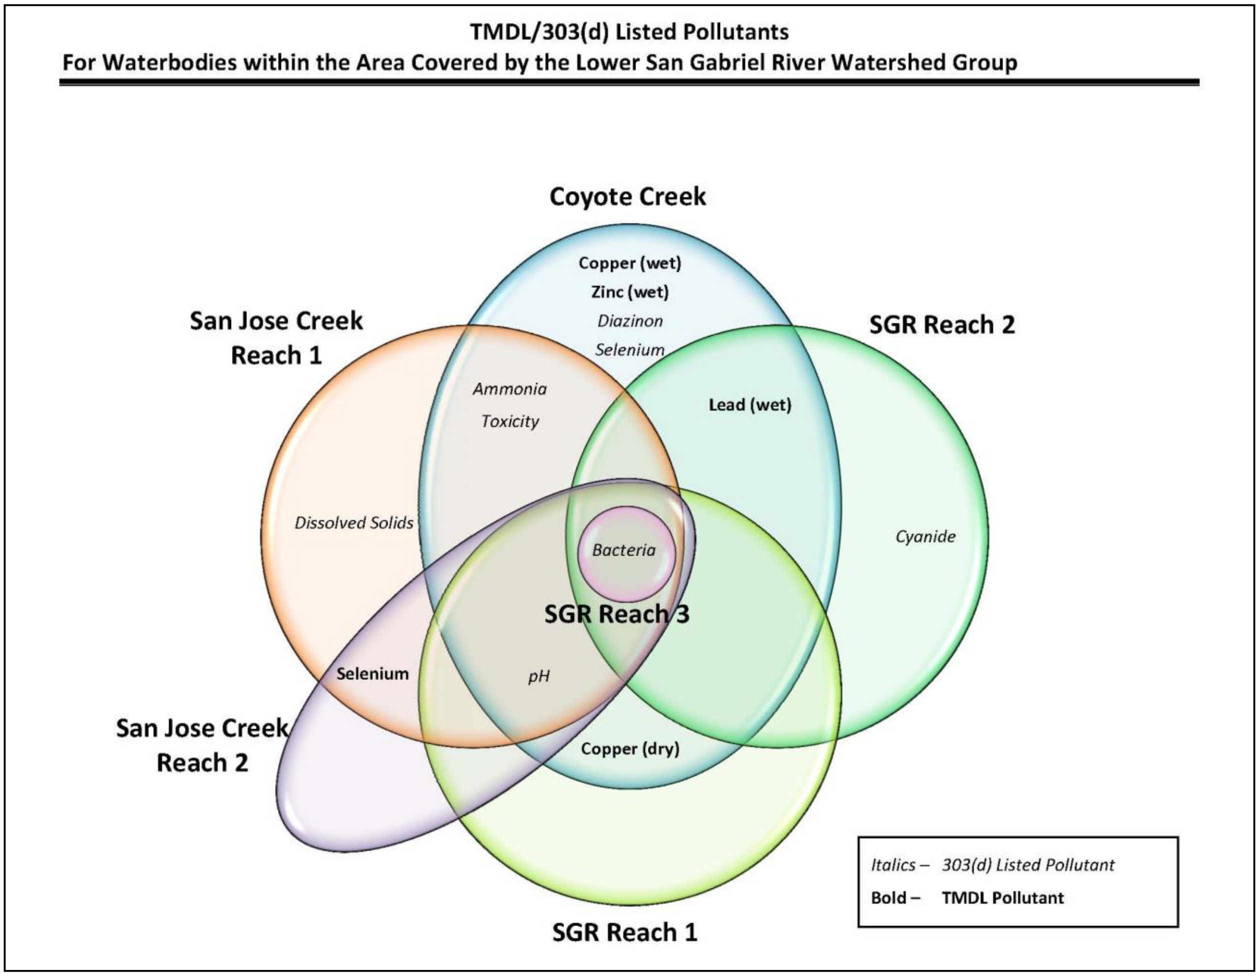

Figure 2-1: Lower San Gabriel River Watershed pollutant Venn diagram

[3] The USGS Hydrologic Unit Code Equivalent HUC boundaries created by LACFCD included the City of Diamond Bar in the Upper SJC HUC (180701060501); however, this designation does not coincide with the LA Basin Plan Reach designations that commence the Upper SJC (Reach 2) at Temple Avenue in Pomona. According to this designation, Diamond Bar drains solely to SJC Reach 1.

The pollutant categories are summarized below including the weather condition for which impairment was determined:

Category 1 B

- ***Copper*** *– San Gabriel River Reach 1 (Dry), Coyote Creek (Wet & Dry), North Fork Coyote Creek (Wet)*
- ***Lead*** *– San Gabriel River Reach 2 (Wet), Coyote Creek (Wet), San Jose Creek Reach 1 (Wet), North Fork Coyote Creek (Wet)*
- ***Zinc*** *– Coyote Creek (Wet), North Fork Coyote Creek (Wet)*
- ***Selenium*** *– San Jose Creek Reach 1 (Dry)*

Category 2A

- ***Ammonia*** *– Coyote Creek (Wet & Dry), San Jose Creek Reach 1 (Wet & Dry)*
- ***Cyanide*** *– Coyote Creek (Wet & Dry), San Gabriel River Reach 2 (Wet & Dry)*
- ***Diazinon*** *– Coyote Creek (Wet & Dry)*
- ***PAHs*** *– San Gabriel River Reach 2 (Wet & Dry), San Jose Creek Reach 1 (Wet and Dry)*Category 2B
- ***Bacteria*** *– San Gabriel River Reach 1 (Wet & Dry), San Gabriel River Reach 2 (Wet & Dry), Coyote Creek (Wet & Dry), San Jose Creek Reach 1 (Wet & Dry), North Fork Coyote Creek (Wet & Dry)*

Category 2C

- ***Copper*** *– San Gabriel River Reach 2 (Wet & Dry), San Jose Creek Reach 1 (Wet & Dry)*
- ***Lead*** *– Coyote Creek (Dry)*
- ***Mercury*** *– North Fork Coyote Creek (Wet & Dry)*
- ***Nickel*** *– Coyote Creek (Dry)*
- ***Selenium*** *– North Fork Coyote Creek (Wet & Dry)*
- ***Zinc*** *–San Gabriel River Reach 2 (Wet & Dry), San Jose Creek Reach 1 (Wet & Dry), Coyote Creek (Dry)*

Category 2D

- ***Chloride*** *– San Jose Creek Reach 1 (Dry)*
- ***pH*** *– San Gabriel River Reach 1 (Wet & Dry), Coyote Creek (Wet & Dry), San Jose Creek Reach 1 (Wet & Dry)*
- ***Total Dissolved Solids*** *– San Jose Creek Reach 1 (Dry)*
- ***Toxicity*** *– Coyote Creek (Wet & Dry), San Jose Creek Reach 1 (Wet & Dry)*

Category 3A

- ***Cyanide*** *– North Fork Coyote Creek (Wet and Dry), San Jose Creek Reach 1 (Wet and Dry)*
- ***Chloride*** *– San Gabriel River Reach 2 (Dry), Coyote Creek (Dry), San Jose Creek Reach 1 (Dry)*
- ***Lindane*** *– San Gabriel River Reach 2 (Wet and Dry)*

- ***Sulfate*** *– San Gabriel River Reach 2 (Dry)*[4]*, San Jose Creek Reach 1(Dry)*

CATEGORY 3C

- ***Alpha-Endosulfan*** *– Coyote Creek (Dry)*[5]
- ***Copper*** *– North Fork Coyote Creek (Dry)*
- ***Selenium*** *– San Gabriel River Reach 1 (Dry)*

CATEGORY 3D

- ***Dissolved Oxygen*** *– San Gabriel River Reach 1 (Dry),San Gabriel River Reach 2 (Wet and Dry), Coyote Creek (Wet)*[6]*, San Jose Creek Reach 1 (Wet & Dry)*
- ***MBAS*** *– Coyote Creek (Wet), San Gabriel River Reach 2 (Wet)*
- ***pH*** *–North Fork Coyote Creek (Dry)*
- ***Total Dissolved Solids*** *– San Gabriel River Reach 2 (Dry)*

Tables 2-1 and 2-2 summarize the waterbody pollutant combinations for the Lower SGR Watershed.

Table 2-1: Wet weather waterbody/pollutant categories

[a]San Gabriel River Reach 1, [b]San Gabriel River Reach 2, [c]San Jose Creek Reach 1
[d]Coyote Creek, [e]North Fork Coyote Creek

2.1.1 CATEGORY 1 POLLUTANTS

METALS (COPPER, LEAD, & ZINC) AND SELENIUM

Copper (for San Gabriel River Reach 1 and Coyote Creek), lead (for San Gabriel River Reach 2, Coyote Creek, and San Jose Creek Reach 1), zinc (for Coyote Creek), and selenium (for San Jose Creek Reach 1) are classified as a Category 1B pollutants. These waterbody-pollutant combinations are addressed in the USEPA established San Gabriel River and Impaired Tributaries Metals and Selenium TMDL. Implementation of this TMDL to achieve applicable receiving water limitations for these pollutants is discussed in later chapters of this WMP. Table 2-3 lists the TMDL targets.

Table 2-3: TMDL Targets for Category 1 Pollutants

Weather	Waterbody	Pollutant	Target	Source
Wet	San Gabriel River Reach 2	Pb	81.34 ug/L	WQBEL
	Coyote Creek	Cu	24.71 ug/L	WQBEL
	Coyote Creek	Pb	96.99 ug/L	WQBEL
	Coyote Creek	Zn	144.57 ug/L	WQBEL
Dry	San Gabriel River Reach 1	Cu	18 ug/L	WQBEL
	San Gabriel River Reach 1	*E-coli*	126 MPN/100 mL	WQBEL
	San Jose Creek Reach 1, 2	Se	5 ug/L	WQBEL
	San Jose Creek Reach 1, 2	*E-coli*	126 MPN/100mL	WQBEL
	Coyote Creek	Cu	0.941 kg/d	WQBEL
	Coyote Creek	*E-coli*	126 MPN/100mL	WQBEL

2.1.2 CATEGORY 2 POLLUTANTS

The following pollutants have been categorized as Category 2 because data indicate water quality impairment due to these constituents according to the State's Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List (State Listing Policy)[7]. This section concludes with Table 2-4, a summary of the applicable Water Quality Objectives (WQOs) for these pollutants.

AMMONIA[8]

Ammonia is a nutrient which is harmful in high levels. The 303(d) List has indicated that the San Jose Creek Reach 1 and Coyote Creek are impaired by ammonia; therefore, ammonia is classified as a Category 2A pollutant for San Jose Creek Reach 1 and Coyote Creek.

According to the California 2010 Integrated Report, ammonia was considered for removal from the 303(d) list for Coyote Creek and San Gabriel River Reach 1; however, it was concluded that the pollutant should not be removed from the 303(d) list because applicable water quality standards for the pollutant are being exceeded.

BACTERIA

The 303(d) List has indicated that the San Gabriel River (Reaches 1 & 2), San Jose Creek (Reach 1), North Fork Coyote Creek, and Coyote Creek are impaired by bacteria[9]. In addition, Los Angeles County Flood Control District (LACFCD) Tributary Station TS(17) North Fork Coyote Creek detected 8 out of 8 wet weather exceedances of LA Basin Plan bacterial WQOs for total coliform, fecal coliform, and fecal

[7] An excerpt of the 2010 California 303(d) List of Water Quality Limited Segments for Region 4 is included in Appendix 2-1

[8] According to the Council for Watershed Health's State of the San Gabriel River watershed, over the last 10 years, upgrades to water reclamation plant (WRP) technologies has resulted in significant decreases in nitrogen compounds (such as ammonia) in receiving waters.

[9] According to the California 2010 Integrated Report, bacteria was considered for removal from the 303(d) list for Coyote Creek and San Gabriel River Reaches 1 and 2; however, it was concluded that the pollutant should not be removed from the 303(d) list because applicable water quality standards for the pollutant are being exceeded.

enterococcus. Therefore, bacteria is classified as a Category 2B pollutant for Reaches 1, 2, and 3 of the San Gabriel River, Reach 1 of the San Jose Creek, and Coyote Creek.

CHLORIDE

LACSD data detected 26 out of 108 dry weather exceedances at C1, 22 out of 108 dry weather exceedances at C2, and 21 out of 102 dry weather exceedances at RD in of the LA Basin Plan WQO for chloride between 2004 and 2012. These stations all correspond to Coyote Creek. Since the number of exceedances meets the State Listing Criteria for 303(d) listing[10] chloride is classified as a Category 2D pollutant in Coyote Creek.

COPPER

LACFCD mass emission station S(14) San Gabriel River detected 23 out of 38 wet weather exceedances and 14 out of 21 dry weather exceedances, and LACFCD Tributary Station TS(17) North Fork Coyote Creek detected 9 out of 10 wet weather exceedances and TS(15) Upper San Jose Creek detected 9 out of 10 wet weather and 4 out of 4 dry weather exceedances of the CTR WQO for copper between 2002 and 2012. Since this meets the State Listing Criteria for 303(d) listing[11] Copper is classified as a Category 2C pollutant in San Gabriel River Reach 2, North Fork Coyote Creek and San Jose Creek Reach 1.

CYANIDE

Cyanide is an inorganic chemical compound. The 303(d) List has indicated that San Gabriel River Reach 2 is impaired by cyanide. In addition, there were 4 out of 40 wet weather and 22 out of 23 dry weather exceedances of the CTR water quality objective for cyanide at Coyote Creek between 2002 and 2012[12]. Since this meets the State Listing Criteria for 303(d) listing[13], cyanide is classified as a Category 2A pollutant for the Reach 2 of the San Gabriel River and Coyote Creek.

DIAZINON

Diazinon is an organophosphate insecticide. The 303(d) List has indicated that Coyote Creek is impaired by diazinon; therefore, diazinon is classified as a Category 2A pollutant for the Reach 1 of Coyote Creek.

According to the California 2010 Integrated Report, diazinon was considered for removal from the 303(d) list for Coyote Creek; however, it was concluded that the pollutant should not be removed from the 303(d) list because applicable water quality standards are exceeded and diazinon contributes to or causes the problem.

[10] According to the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List Minimum Number of Measured Exceedances Needed to Place a Water Segment on the Section 303(d) List for Conventionals – Table 3.2.

[11] According to the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List Minimum Number of Measured Exceedances Needed to Place a Water Segment on the Section 303(d) List for Toxicants – Table 3.1.

[12] According to the California 2010 Integrated Report, cyanide was considered for placement onto 303(d) list for Coyote Creek; however, it was concluded that the pollutant should not be placed on the 303(d) list for Coyote Creek because applicable water quality standards for the pollutant are not being exceeded.

[13] According to the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List Minimum Number of Measured Exceedances Needed to Place a Water Segment on the Section 303(d) List for Toxicants – Table 3.1.

LEAD

Lead is classified as a Category 1B pollutant for San Gabriel River Reach 2, Coyote Creek, and San Jose Creek Reach 1 during wet weather as it is to be addressed by the USEPA established San Gabriel River Metals and Impaired Tributaries Metals and Selenium TMDL; however, waste load allocations (WLAs) are not provided during dry weather.

Although Coyote Creek does not have an established dry weather WLA within the San Gabriel River Metals and Impaired Tributaries Metals and Selenium TMDL, data indicates that Coyote Creek is impaired by lead in dry weather. LACFCD Mass Emission Station S(13) detected 9 out of 23 dry weather exceedances of the CTR water quality objective for lead between 2002 and 2012. Therefore, lead is classified as a Category 2C pollutant for Coyote Creek.

MERCURY

Although the waterbodies within the Lower SGR Watershed are not listed as impaired by mercury, the LACFCD Tributary station TS(17) North Fork Coyote Creek collected 1 out of 4 wet weather samples and 2 out of 10 dry weather samples exceeding the California Toxics Rule WQO for this pollutant between 2002 and 2012. Since this meets the State Listing Criteria for 303(d) listing[14], mercury is classified a category 2C pollutant within this WMP. It is anticipated that the control measures used to address the pollutants within San Gabriel River Metals and Impaired Tributaries Metals and Selenium TMDL will subsequently address mercury; however, if exceedances occur and the implemented or proposed control measures do not address mercury, the Lower SGR WMP will be revised to include control measures to address the pollutant directly.

NICKEL

LACSD data detected 58 out of 85 dry weather exceedances of the CTR WQO for nickel in the Coyote Creek between 2004 and 2012. Since this meets the State Listing Criteria for 303(d) listing[15] nickel is classified as a Category 2C pollutant in Coyote Creek.

PAHS

Although the San Gabriel River and San Jose Creek are not listed as impaired on the 303(d) List for PAHs, monitoring data from the LA County Sanitation Districts (LACSD) indicate numerous exceedances of PAH compounds in the San Gabriel River and San Jose Creek from 2004-2012. Therefore, PAHs are classified as a Category 2A pollutant for San Gabriel River Reach 2 and San Jose Creek Reach 1.

PH

pH is a measure of the acidity or basicity of an aqueous solution. The 303(d) List has indicated that San Gabriel River Reach 1, Coyote Creek, and San Jose Creek Reach 1 are impaired by pH; therefore, pH is

[14] According to the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List Minimum Number of Measured Exceedances Needed to Place a Water Segment on the Section 303(d) List for Toxicants – Table 3.1.

[15] According to the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List Minimum Number of Measured Exceedances Needed to Place a Water Segment on the Section 303(d) List for Toxicants – Table 3.1.

classified as a Category 2D for Reach 1 of the San Gabriel River, Coyote Creek, and Reach 1 of the San Jose Creek.

According to the California 2010 Integrated Report, pH was considered for removal from the 303(d) list for Coyote Creek and San Gabriel River Reach 1; however, it was concluded that the pollutant should not be removed from the 303(d) list because applicable water quality standards for the pollutant are being exceeded.

SELENIUM

Selenium is classified as a Category 1C pollutant for San Jose Creek Reaches 1 and 2 as it is to be addressed by the USEPA established San Gabriel River Metals and Impaired Tributaries Metals and Selenium TMDL; however, waste load allocations (WLAs) are not provided for Reaches 1, 2, or 3 of the San Gabriel River or for Coyote Creek.

Although Coyote Creek does not have an established WLA within the San Gabriel River Metals and Impaired Tributaries Metals and Selenium TMDL, the 303(d) List has indicated that North Fork Coyote Creek is impaired by selenium[16]. Therefore, selenium is classified as a Category 2C pollutant for Coyote Creek.

TOTAL DISSOLVED SOLIDS

Total Dissolved Solids (TDS) is a measure of the combined content of all inorganic and organic substances contained in a liquid. The 303(d) List has indicated that the San Jose Creek Reach 1 is impaired by TDS; therefore, TDS is classified as a Category 2D for San Jose Creek Reach 1.

TOXICITY

The 303(d) List has indicated that Coyote Creek and San Jose Creek Reach 1 are impaired by toxicity; therefore, toxicity is classified as a Category 2D for Coyote Creek and Reach 1 of the San Jose Creek.

According to the California 2010 Integrated Report, San Gabriel River Reaches 1 and 3 were originally listed on the 303(d) list for toxicity and were removed based on the conclusion that applicable water quality standards are not being exceeded.

ZINC

LACFCD mass emission station S(13) Coyote Creek detected 5 out of 23 dry weather exceedances, LACFCD mass emission station S(14) San Gabriel River detected 27 out of 38 wet weather exceedances and 8 out of 21 dry weather exceedances, and LACFCD Tributary Station TS(15) Upper San Jose Creek detected 9 out of 10 wet weather exceedances and 3 out of 4 dry weather exceedances of the CTR WQO

[16] Based on data from the State Listing Policy lines of evidence ID #2425, #2426, #25164, and #25162 collected by the County of Los Angeles Department of Public Works, and the Los Angeles County Sanitation Districts, selenium is being considered for removal from the 303(d) list for Coyote Creek. The Regional Board concluded that the pollutant should not be on the 303(d) list because applicable water quality standards are not being exceeded. It has been recommended that the decision be approved by the State Board and selenium has not yet been removed from the 303(d) list for Coyote Creek

for zinc between 2002 and 2012. Since this meets the State Listing Criteria for 303(d) listing[17] zinc is classified as a Category 2C pollutant in San Gabriel River Reach 2 and San Jose Creek Reach 1.

Table 2-4: Water Quality Objectives for Category 2 Pollutants

Pollutant	Weather	Lowest Applicable WQO	Source
Ammonia	Wet	Varies based on pH and temperature for Cold waters and Warm Waters (Table 3-1 to 3-4 of Basin Plan)	Basin Plan—Total Ammonia-Nitrogen (NH3-N)
	Dry		
Copper	Wet	5.7 ug/L[(a)]	CTR Freshwater (1 hr avg.) dissolved
	Dry	4.1 ug/L[(a)]	CTR Freshwater (4 day avg.) dissolved
Cyanide	Wet	22 ug/L	CTR Freshwater (1 hr avg.)
	Dry	5.2 ug/L	CTR Freshwater (4 day avg.)
Diazinon	Wet	0.16 ug/L[(b)]	CA Dept. of Fish and Game Freshwater (1-hour avg)
	Dry	0.1 ug/L[(b)]	CA Dept. of Fish and Game Freshwater (4-day avg)
PAHs	Wet	See footnote (c)	CTR Human Health other than drinking water
	Dry	See footnote (c)	CTR Human Health other than drinking water
E. coli	Wet	235/100 ml	LA Basin Plan
	Dry	235/100 ml	LA Basin Plan
Mercury	Wet/Dry	0.051 ug/L	CTR Human Health (30-d avg; fish consumption only)
pH	Wet/Dry	6.5-8.5	LA Basin Plan
Selenium	Wet	20 ug/L	NTR Freshwater (1 hr avg.) total recoverable
	Dry	5 ug/L	NTR Freshwater (4 day avg.) total recoverable
Toxicity	Wet/Dry	See footnote (d)	Basin Plan
Zinc	Wet	54 ug/L[(a)]	CTR Freshwater (1 hr avg.) dissolved
	Dry	54 ug/L[(a)]	CTR Freshwater (4 day avg.) dissolved
Chloride	Dry	150 mg/L	Basin Plan: applies to specific portions of watershed
Lead	Dry	0.92 ug/L[(a)]	CTR Freshwater (4 day avg.) dissolved
Nickel	Dry	20 ug/L[(a)]	CTR Freshwater (4 day avg.) dissolved

a) Objectives for these constituents are hardness dependent. Values listed are based upon a total hardness of 40 mg/L.

b) Value adjusted by removing *Gammarus fasciatus* study results per recommendation of Finlayson, California Dept. of Fish and Game.

c) CTR does not contain criteria for total PAHs. Each available human health CTR Water Quality Objectives for other than drinking water will be applied.

d) There shall be no acute toxicity in ambient waters, including mixing zones. The acute toxicity objective for discharges dictates that the average survival in undiluted effluent for any three consecutive 96-hour static continuous flow bioassay tests shall be at least 90%, with no single test having less than 70% survival when using an established USEPA, State Board, or other protocol authorized by the Regional Board. There shall be no chronic toxicity in ambient in ambient waters outside mixing zones. To determine compliance with this objective, critical life stage tests for at least three species with approved testing protocols shall be used to screen for the most sensitive species. The test species used for screening shall include a vertebrate, an invertebrate, and an aquatic plant. The most sensitive species shall then be used for routine monitoring. Typical endpoints for chronic toxicity tests include hatchability, gross morphological abnormalities, survival, growth, and reproduction.

[17] According to the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List Minimum Number of Measured Exceedances Needed to Place a Water Segment on the Section 303(d) List for Toxicants – Table 3.1.

2.1.3 CATEGORY 3 POLLUTANTS

The waterbody-pollutant combinations described below have been identified as exceeding water quality objectives (WQOs) in the Lower SGR Watershed. Through the adaptive management process, water quality priorities identified in this WMP will be re-evaluated every two years, and if exceedances of Category 3 WQOs are identified through monitoring, then the WMP will be adapted to become more effective in addressing these constituents, per Section VI.C.8.a.ii of the MS4 Permit. Note that station S(14) is of limited value to the Lower SGR Watershed as the watershed's drainage comprises approximately 2% of the drainage captured by this station. Therefore its precision in measuring MS4 contributions from the watershed is uncertain.

ALPHA-ENDOSULFAN

Although the waterbodies within the Lower SGR Watershed are not listed as impaired by Endulsulfan sulfates, the LACFCD Mass Emissions station S(13) in the Coyote Creek collected 1 out of 22 dry weather samples exceeding the California Toxics Rule WQO for this pollutant between 2002 and 2012. This exceedance occurred during the 2009-10 storm year, and there have been no further exceedances detected since this time. Alpha-Endosulfan is classified a category 3C. If exceedances are found to occur and the implemented or proposed control measures do not address Alpha-Endosulfan, the WMP will be revised to include control measures to address the pollutant directly.

CHLORIDE

According to the California 2010 Integrated Report, Coyote Creek was originally listed on the 303(d) list for chloride and was removed based on the conclusion that applicable water quality standards are not being exceeded. However, there were 4 out of 22 dry weather exceedances of the LA Basin Plan WQO for chloride at the LACFCD Mass Emissions station S(14) in San Gabriel River between 2002 and 2012 and 3 out of 23 wet weather exceedances of the USEPA National Recommended WQO for chloride at S(13) between 2002 and 2012; therefore, Chloride is classified a category 3A pollutant within this WMP. If exceedances are found to occur and the implemented or proposed control measures are not expected to address chloride, the Lower SGR WMP will be revised to include control measures to address the pollutant directly.

COPPER

LACFCD Tributary Station TS(17) North Fork Coyote Creek detected 4 out of 4 dry weather exceedances of the CTR WQO for copper between 2002 and 2012. Copper is classified as a Category 3C pollutant within this WMP. If exceedances are found to occur and the implemented or proposed control measures are not expected to address Copper, the Lower SGR WMP will be revised to include control measures to address the pollutant directly.

CYANIDE

LACFCD Tributary Station TS(17) North Fork Coyote Creek detected 1 out 8 wet weather and 1 out of 4 dry weather exceedances and Station TS(15) Upper San Jose Creek detected 1 out of 9 wet weather exceedances of the CTR WQO for cyanide between 2002 and 2012. Therefore Cyanide is classified as a

Category 3C pollutant for North Fork Coyote Creek and San Jose Creek Reach 1. If exceedances are found to occur and the implemented or proposed control measures are not expected to address cyanide, the Lower SGR WMP will be revised to include control measures to address the pollutant directly.

Dissolved Oxygen

According to the California 2010 Integrated Report, dissolved oxygen (more correctly a lack of dissolved oxygen) was considered for placement onto 303(d) list for Coyote Creek; however, it was concluded that the dissolved oxygen should not be placed on the 303(d) list for Coyote Creek because applicable water quality standards are not being exceeded.

Although the waterbodies within the Lower SGR Watershed are not listed as impaired by low dissolved oxygen, the LACFCD Mass Emissions station S(13) in Coyote Creek collected 1 out of 39 wet weather samples below the dissolved oxygen water quality criteria between 2002 and 2012. This exceedance occurred during the 2003-04 storm year, and there have been no exceedances detected since that time. In addition, LACSD detected 10 out of 501 samples during dry weather in San Jose Creek and 11 out of 550 samples in San Gabriel River that were below the WQO for dissolved oxygen between 2004 and 2012. Therefore, dissolved oxygen is classified as a Category 3D pollutant within this WMP. If exceedances are found to occur through monitoring and the implemented or proposed control measures are not expected to address the dissolved oxygen impairment, the WMP will be revised to include control measures to address it directly.

Lindane

Lindane is a persistent organic pollutant and is relatively long-lived in the environment.

Although the waterbodies within the Lower SGR Watershed are not listed as impaired by lindane, historical data detected exceedances of lindane in San Gabriel River Reach 2. Therefore, lindane is classified as Category 3A within this WMP. If exceedances are found to occur and the implemented or proposed control measures are not expected to address the pollutant, the WMP will be revised to include control measures to address it directly.

Methylene Blue Active Substances (MBAS)

An MBAS assay is used to detect the presence of detergents or foaming agents in water samples.

Although the waterbodies within the Lower SGR Watershed are not listed as impaired by MBAS, the LACFCD Mass Emissions station S(13) in Coyote Creek collected 5 out of 42 wet weather samples, the LACFCD Mass Emissions station S(14) in Upper San Gabriel River collected 1 out of 37 wet weather samples that exceeded the Basin Plan WQO for MBAS between 2002 and 2012. Therefore, MBAS is classified as Category 3D within this WMP. If exceedances are found to occur and the implemented or proposed control measures are not expected to address the pollutant, the WMP will be revised to include control measures to address it directly.

pH

LACFCD Tributary Station TS(17) North Fork Coyote Creek detected 3 out of 4 dry weather exceedances of the LA Basin Plan WQO for pH between 2002 and 2012. Therefore pH is classified as a Category 3D pollutant within this WMP. If exceedances are found to occur through monitoring and the implemented or proposed control measures are not expected to address the impairment, the WMP will be revised to include control measures to address pH directly.

Selenium

Selenium is classified as a Category 1B pollutant for San Jose Creek Reach 1 during dry weather as it is to be addressed by the USEPA established San Gabriel River Metals and Impaired Tributaries Metals and Selenium TMDL; however, waste load allocations (WLAs) are not provided for the San Gabriel River or Coyote Creek.

Although the San Gabriel River Reach 1 is not listed as impaired by selenium, the Council for Watershed Health monitoring site SGLT5617 in the San Gabriel River detected 1 exceedance of the National Toxics Rule WQO for selenium between 2005 and 2009. Therefore, selenium is classified as a Category 3C pollutant within this WMP for the San Gabriel River Reach 1. It is anticipated that the control measures used to address the pollutants within the San Gabriel River and Impaired Tributaries Metals and Selenium TMDL will subsequently address selenium; however, if exceedances are found to occur and the implemented or proposed control measures do not address sulfates, the WMP will be revised.

Sulfates

Although the waterbodies within the Lower SGR Watershed are not listed as impaired by sulfates, the LACFCD Mass Emissions station S(14) in the Upper San Gabriel River collected 1 out of 22 dry weather samples exceeding the Basin Plan WQO for sulfates between 2002 and 2012. This exceedance occurred during the 2009-10 storm year, and there have been no exceedances detected since that time. In addition, the LACSD detected 1 out of 503 dry weather samples exceeding the California Secondary MCL for sulfates between 2004 and 2012 in the San Jose Creek. Therefore, Sulfates are classified as a Category 3A within this WMP for the San Gabriel River Reach 1 and the San Jose Creek; however, these waterbody/pollutant combinations will not be directly addressed through the WMP. It is anticipated that the control measures used to address the pollutants within San Gabriel River Metals and Impaired Tributaries Metals and Selenium TMDL will subsequently address sulfates; however, if exceedances are found to occur and the implemented or proposed control measures do not address sulfates, the WMP will be revised to include control measures to address the pollutant directly.

Total Dissolved Solids

Total Dissolved Solids (TDS) is a measure of the combined content of all inorganic and organic substances contained in a liquid. The LACFCD Mass Emission station S(14) collected 2 out of 22 dry weather samples exceeding the LA Basin Plan WQO for Total Dissolved Solids between 2002 and 2012.

Therefore TDS is classified as a Category 3D within this WMP. If exceedances are found to occur and the implemented or proposed control measures are not expected to address the condition, the WMP will be revised to include control measures to address it directly.

2.1.4 POLLUTANT CLASSIFICATION

In order to determine the sequence of addressing pollutants of concern, the pollutants have been placed into classification groups. Pollutants have been identified to be in the same "class" if they have a similar fate and transport, can be addressed via the same types of control measures, and can be addressed within the same timeline. The six following classes have been identified:

- Metals
- Nutrients
- Bacteria
- Pesticides
- Semivolatile Organic Compounds (SVOC)
- Water Quality Indicators/General

The specific classes and pollutants associated can be found below. Since similar control measures and timelines are to be implemented for pollutants within the same class, each class will be treated with the highest priority of any one pollutant within that class. Watershed Control Measures and Compliance Schedules are discussed in Sections 3 and 5, respectively.

2.2 WATER QUALITY CHARACTERIZATION

In order to characterize existing water quality conditions in the Lower SGR Watershed, and to identify pollutants of concern for prioritization per section VI.C.5.a.ii of the MS4 Permit, available monitoring data collected during the previous ten years were analyzed. The following sources were utilized during the water quality characterization:

- LACFCD Mass Emission and Tributary Monitoring Programs
- Los Angeles County Sanitation Districts (LACSD)
- San Gabriel River Regional Watershed Monitoring Program (SGRRMP)
- County of Orange Coyote Creek Monitoring Program

A summary of each of these monitoring efforts and relevant findings is presented below. In addition to providing a characterization of the current conditions within the watershed, this information will be used to target watershed management efforts in the Lower SGR Watershed.

2.2.1 MASS EMISSIONS HISTORICAL DATA ANALYSIS

Since 1994, the LACFCD has conducted stormwater monitoring in Los Angeles County. The LACFCD operates seven mass emission monitoring stations, which collect runoff from the major watersheds in the county with the goal of estimating the mass emissions from the MS4, assessing mass emissions trends, and determining whether the MS4 is contributing to exceedances of water quality standards by comparing results to applicable objectives in the Water Quality Control Plan for the Los Angeles Region (Basin Plan), and the California Toxics Rule (CTR).

The mass emissions monitoring dataset is the most comprehensive information to date regarding the condition of water quality in the San Gabriel River and its tributaries. Two LACFCD Monitoring Stations, S(13) and S(14), collect samples that are applicable to the Lower SGR Watershed.

COYOTE CREEK MONITORING STATION S(13)

The Coyote Creek Monitoring station, S(13), is located at the existing Army Corps of Engineers stream gauge station (i.e. Stream Gauge F354-R) below Spring Street in the Lower SGR Watershed. The upstream tributary area is 150 square miles and extends into Orange County. The sampling station was chosen to avoid backwater effects from the San Gabriel River to ensure that all water being sampled is from Coyote Creek only. Coyote Creek is a concrete-lined trapezoidal channel at this location. Figure 2-2 shows the location and sub-drainage area of this station.

SAN GABRIEL MONITORING STATION S(14)

The San Gabriel River Monitoring Station, S(14), is located at an historic stream gauge station (Stream Gauge F263C-R), below San Gabriel River Parkway in Pico Rivera. Approximately 10% of the Lower SGR Watershed area drains to the San Jose Creek which discharges to the San Gabriel River Reach 2 upstream of the S(14) monitoring station. Lower SGR Watershed drainage comprises approximately 2% of the drainage captured by this station. While the Watershed Group is aware of this monitoring

location and analyzed 10 years of data to determine WQPs, it may not be wholly representative of MS4 contributions from the Lower SGR Watershed since the station captures runoff from a large area outside of the Lower SGR Watershed. The Lower SGR Watershed Group will continue to monitor this station through the Lower SGR CIMP.

The upstream tributary area for station S(14) is 450 square miles (most of this area falls outside of the Lower SGR Watershed). The San Gabriel River is a grouted rock-concrete stabilizer along the western levee and a natural section on the eastern side. Flow measurement and water sampling are conducted in the grouted rock area along the western levee of the river. The length of the concrete stabilizer is nearly 70 feet. The San Gabriel River sampling location has been an active stream gauging station since 1968. Figure 2-3 shows the location and sub-drainage area of this station.

Both stations, S(13) and S(14), are equipped with automated samplers with integral flow meters, and collect flow composite samples from a minimum of three storm events, including the first storm, and two dry weather events in accordance with the 1996 MS4 Permit.

Monitoring data from stormwater collected at stations S(13) and S(14) were compared to the most stringent applicable WQOs to determine exceedances of receiving water limitations. WQOs were determined pursuant to TMDLs, the Basin Plan and the California Toxics Rule, 40 CFR Part 131.38 (CTR). Water quality objectives for chlorpyrifos and diazinon were determined using the freshwater final acute criteria set by the California Department of Fish and Game. Many of the WQOs were used as benchmarks for determining Water Quality Priorities, and should not be used for compliance purposes. Please refer to the Lower SGR Watershed Coordinated Integrated Monitoring Plan (CIMP) for a table of monitored constituents along with their most up-to-date WQOs.

A summary of the constituents not attaining WQOs at stations S(13) and S(14) during the monitoring years 2002-2012 is presented in Tables 2-5 to 2-8 below. Complete tables of monitoring results can be found in Appendix 2-2. Constituents were compared against the most appropriate WQO to date. Refer to CIMP Appendices for a table of monitored constituents along with applicable WQOs.

2.2.2 LACFCD TRIBUTARY MONITORING

In addition to the Mass Emission Station monitoring, LACFCD conducted tributary monitoring during the 2006-07 and 2007-08 storm years. This monitoring occurred at 4 tributary stations that fall within the Lower SGR Watershed: TS15: Upper San Jose Creek, TS16: Maplewood Channel, TS17: North Fork Coyote Creek, and TS18: SD 21 (Artesia Norwalk Drain). Two of these sites are located in the storm drain system (TS15 and TS18), while TS15 and TS17 are in 303(d) listed receiving waterbodies. Note: only the data from TS15 and TS17 was used to characterize receiving water and identify WQPs in the Lower SGR watershed. Data analyzed from the TS16 and TS18 will be considered in pollutant source identification during WMP implementation.

TS15: UPPER SAN JOSE CREEK

The Upper San Jose Creek tributary monitoring site is located on Upper San Jose Creek in the City of Industry, upstream of the confluence with Puente Creek. The site is approximately 500 feet south of where Don Julian Road crosses Puente Creek. The upstream tributary watershed area of Upper San Jose Creek is approximately 72.60 square miles.

TS16: MAPLEWOOD CHANNEL

The Maplewood Channel tributary monitoring site is located on Maplewood Channel in Bellflower City, where Trabuco Street ends and crosses Maplewood Channel. The upstream tributary watershed area of Maplewood Channel is approximately 4.90 square miles.

TS17: NORTH FORK COYOTE CREEK

The North Fork Coyote Creek tributary monitoring site is located on North Fork Coyote Creek in the City of Cerritos, where Artesia Boulevard crosses North Fork Coyote Creek. The upstream tributary watershed area of North Fork Coyote Creek is approximately 34.89 square miles.

TS 18: SD 21 (ARTESIA-NORWALK DRAIN)

The SD 21 (Artesia-Norwalk Drain) monitoring site is located on SD 21 (Artesia–Norwalk Drain) in the City of Long Beach, where Wardlow Road crosses the SD 21 (Artesia-Norwalk Drain). The upstream tributary watershed area of this site is approximately 4.14 square miles.

Monitoring data from stormwater collected at stations TS15 and TS17 were compared to the most stringent applicable WQOs to determine exceedances of receiving water limitations. WQOs were determined pursuant to TMDLs, the Basin Plan and the California Toxics Rule, 40 CFR Part 131.38 (CTR). WQOs for chlorpyrifos and diazinon were determined using the freshwater final acute criteria set by the California Department of Fish and Game. Many of the WQOs were used as benchmarks for determining Water Quality Priorities, and should not be used for compliance purposes. Please refer to the CIMP for a table of monitored constituents along with their most up-to-date WQOs.

A summary of the constituents not attaining WQOs at stations TS(15) and TS(17) during the monitoring years 2002-2012 is presented in Tables 2-9 to 2-12 below. Complete tables of monitoring results can be found in Appendix 2-2.

2.2.3 LA County Sanitation District Monitoring

The County Sanitation Districts of Los Angeles County (LACSD) are a confederation of 23 independent special districts serving the water pollution control management needs of about 5.7 million people in Los Angeles County. The Sanitation Districts' service area covers approximately 820 square miles and encompasses 78 cities and unincorporated territory within the County. With regard to wastewater treatment, the Sanitation Districts construct, operate and maintain facilities to collect, treat and dispose of wastewater and industrial wastes.

Seventeen of the 23 districts are signatory to an agreement which provides for sewerage service to the majority of residential, commercial and industrial users (IUs) within the County, but mostly located outside of the City of Los Angeles service area. This treatment system, known as the Joint Outfall System (JOS), currently consists of the Joint Water Pollution Control Plant (JWPCP) located in the City of Carson and six upstream water reclamation plants (WRPs); the Whittier Narrows WRP near the City of South El Monte, the Los Coyotes WRP in the City of Cerritos, the San Jose Creek WRP adjacent to the City of Industry, the Long Beach WRP in the City of Long Beach, the Pomona WRP in the City of Pomona and the La Cañada WRP in La Cañada Flintridge. All JOS facilities except the La Cañada WRP are regulated under the NPDES program; all six WRPs are subject to California Waste Discharge or Water Reclamation Requirements. See Chapter 1 Introduction for more detail on the WRP discharges within the Lower SGR Watershed.

The LACSD monitors its effluent at multiple locations within the Lower SGR Watershed. Data from 2004 to 2012 was analyzed and exceedances of the following constituents were found: PAHs in San Gabriel River Reach 2 and San Jose Creek Reach 1, Nickel in Coyote Creek, Chloride in San Jose Creek Reach 1, Sullfates in San Jose Creek Reach 1, and Dissolved Oxygen in San Gabriel River Reach 1 and San Jose Creek Reach 1.

2.2.4 Council for Watershed Health San Gabriel River Regional Monitoring Program

Since 2005, the San Gabriel River Regional Monitoring Program (SGRRMP), a group of local, state, and federal stakeholders led by the Council for Watershed Health, has conducted watershed scale dry weather (May through July) monitoring at targeted and random sites throughout the San Gabriel River watershed. From 2005-2009, the SGRRMP collected and analyzed aquatic chemistry, toxicity bioassessment, and physical habitat data from 69 randomly selected sites within the San Gabriel River watershed representing the upper river watershed, the lower river watershed, and mainstream channel below Whittier Narrows. The SGRRMP also relied on LACFCD tributary monitoring in the San Gabriel River and Coyote Creek watersheds for assessing water quality conditions. A map of randomly selected sites used for biological assessment, along with their biological condition scores is shown in Figure 2-29.

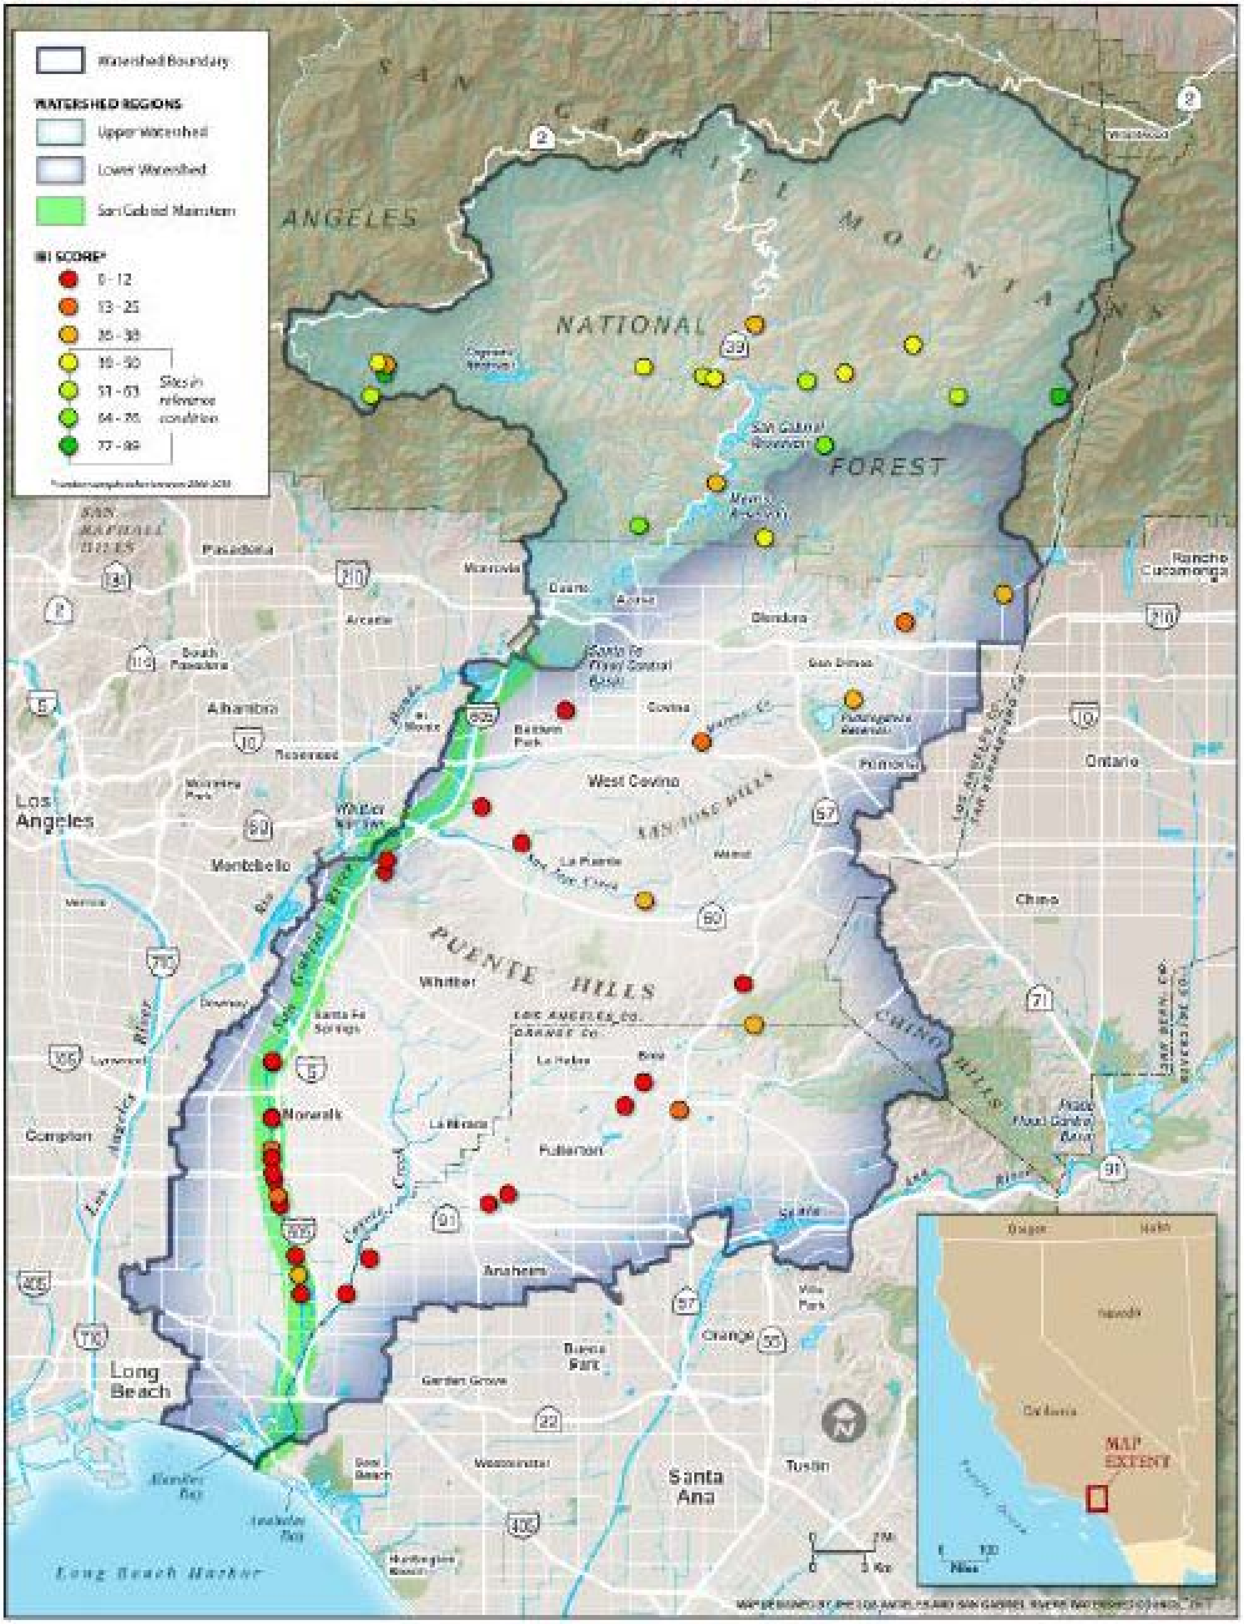

Figure 2-8: SGRRWMP stream monitoring locations used for water quality and biological conditions assessment

The following is a summary of significant observations found after the first five years of monitoring under this program[18]:

- "There were few exceedances of dry weather Basin Plan standards for any water quality parameters measured during the 5-year period."
- "Nutrients were greatest on the mainstem, while most metals were greatest in lower tributaries. An exception to this was dissolved zinc, which was much greater on the mainstem compared to other sub-regions."
- "While nutrients and metals were elevated in the lower tributaries and mainstem, they rarely exceeded water quality objectives and did not strongly correlate with the biotic condition."
- "Nitrate and ammonia were well below toxicity thresholds/standard and there were no exceedances of the hardness-adjusted California toxics rule for any dissolved metal."
- "Organophosphorous and pyrethroid pesticides were nearly always below method detection limits (i.e. Non-detect)."
- "A total of 61 water samples tested for acute and chronic toxicity using water fleas"…"All of the toxic endpoints measured during the five years were in the lower or upper watershed, with no toxicity measured on the San Gabriel River mainstem."
- 317 water samples collected at the confluence of 5 major tributaries with the San Gabriel River during the summers of 2007, 2008, and 2009 were analyzed for E. coli. "47% of these samples exceeded standards with the greatest rate of exceedances occurring at San Jose Creek (range 89 to 100%) and the fewest at Coyote Creek (10 to 29%)."[19]
- "San Jose Creek conveys the largest [relative] loads of most constituents during wet weather, particularly total suspended solids (TSS)."[29]

The Lower SGR Watershed will use these results, and continue to track future SGRRMP results to help target watershed control measures identified in the WMP.

2.2.5 ORANGE COUNTY COYOTE CREEK SOURCE CONTROL PLAN

The Orange County NPDES Municipal Stormwater Permit (Order No. R8-2009-0030) requires Permittees with discharges tributary to Coyote Creek to develop and implement a constituent-specific source control plan to include a monitoring program to control the discharge of copper, lead and zinc into Coyote Creek and other tributaries in Orange County that discharge into the San Gabriel River.

The Coyote Creek Source Control Plan outlines the monitoring and source control strategy for jurisdictions within Orange County draining to Coyote Creek. This Plan identifies monitoring locations to be used in determining source control strategies and compliance with TMDL targets for Coyote Creek within the Orange County jurisdiction. According to this plan, stormwater discharges from Los Angeles County are contributed through North Fork Coyote Creek, and at the confluence with the San Gabriel River. All monitoring locations identified in this plan that are downstream of North Fork Coyote Creek

[18] Morris, K. et al.

[19] Only approximately 10% of the Lower SGR Watershed contributes discharge to San Jose Creek

are located on the Orange County side of the confluence with the Creek, and are meant to be representative of Orange County drainage. Therefore, data collected from these locations cannot be used to characterize Los Angeles County MS4 discharges at this time. The Watershed Group will continue to remain apprised of monitoring results collected through the Orange County Source Control effort, and revise this WMP should data suggest that the Los Angeles County MS4 may be contributing to exceedances of water quality objectives.

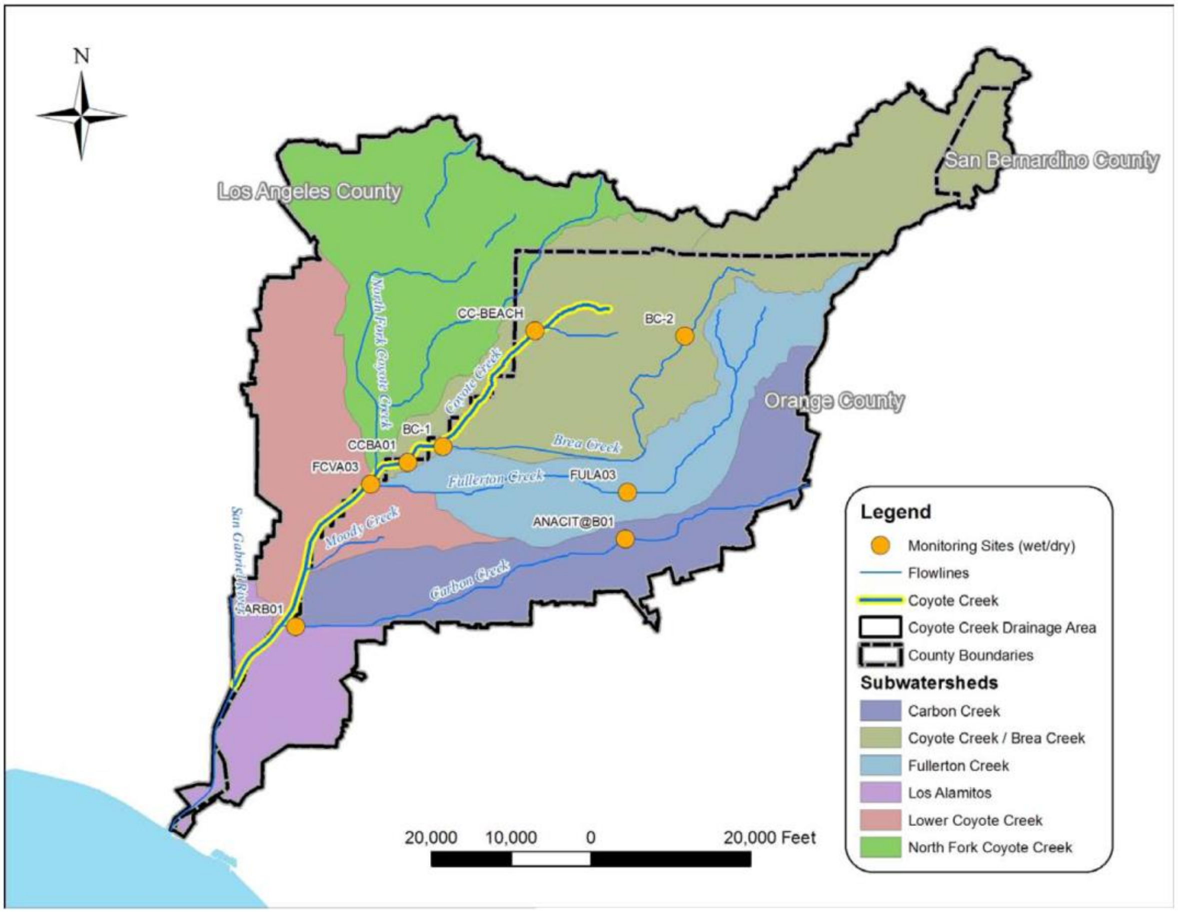

Figure 2-9: County of Orange, OC Watersheds Program Source Control Plan Monitoring Locations along Coyote Creek (*Coyote Creek Watershed Water Quality Monitoring Plan, Figure 2-1*)

2.3 Source Assessment

This section identifies the potential sources of pollutants within the Lower LSGR Watershed for the waterbody-pollutants classified in section 2.2. Information was gathered from several water quality monitoring programs and special studies related to pollutant sources and conditions that contribute to the highest water quality priorities to identify known and suspected stormwater and non-stormwater pollutant sources to and from the MS4.

The pollutants addressed in this section are bacteria, nutrients, metals and sediment. In order to generally describe the potential sources in the Lower LSGR Watershed for these pollutants, pollutant sources have been divided into the following categories: NPDES discharges, road infrastructure, atmospheric deposition, and wastewater from sanitary sewer and SSOs.

2.3.1 NPDES Sources

Pollutant sources may be categorized as either point sources or non-point sources. Point source discharges are regulated through National Pollutant Discharge Elimination System (NPDES) permits. Point sources include those associated with the MS4 (stormwater and urban runoff) and other NPDES discharges. Stormwater runoff in the watershed is regulated through four types of permits including MS4 permits, a statewide stormwater permit for Caltrans; a statewide Construction General Permit (CGP); and a statewide Industrial General Permit (IGP). The NPDES IGP regulates stormwater discharges and authorized non-stormwater discharges from ten specific categories of industrial facilities, including manufacturing facilities, oil and gas mining facilities, landfills, and transportation facilities. The NPDES CGP regulates stormwater discharges from construction sites that result in land disturbances equal to or greater than one acre. Point source discharges from IGP, CGP, residential, commercial and transportation activities can be a significant source of pollutant loads.

Non-point sources by definition include pollutants that reach waters from a number of land uses and are not regulated through NPDES permits. Non-point sources include existing contaminated sediments within the watershed and direct air deposition to the waterbody surface.

The following provides additional discussion regarding the presence of pollutants in stormwater runoff within the watershed.

Bacteria

Specific sources of bacteria are associated with categories such as, anthropogenic, non-anthropogenic, and environmental sources, which may include:

- Sanitary sewer overflows (SSOs), leaks and spills; illicit connections of sanitary lines to the storm drain system.
- Animal wastes – the bacteria indicators used to assess water quality are not specific to human sewage; therefore, natural influences of fecal matter from animals and birds can also be a source of elevated levels of bacteria.

- Organic debris from gardens, landscaping, parks, food waste and illegal dumping from recreational vehicle holding tanks among others, can be a source of elevated levels of total coliform bacteria[1].
- Environmental – soils, decaying vegetation
- Illegal connections and illicit discharges (IC/IDs) to the MS4 are also very likely sources of bacteria in stormwater discharges. The following table includes data based on annual reports submitted to the LA County DPW (previous principal permittee), for illicit connections and illicit discharges. Current data on the constituents for the IC/IDs recorded during this period is not available.

Table 2-13 Illicit Connections/Illicit Discharges 2001-2012

Agency	Illicit Discharges	Illicit Connections
Artesia	21	0
Bellflower	135	0
Cerritos	100	0

Lakewood	162	0
Long Beach	-	-
Norwalk	219	1
Pico Rivera	-	-
Santa Fe Springs	82	2
Whittier	7	1
Total	1,504	11

NUTRIENTS

Possible sources of nutrients include runoff from residential and commercial areas due to landscaping activities and use of fertilizer for lawns and gardens, this includes organic debris. Activities such as washing cars, parking lots and driveways can contribute to nutrients pollutants in the MS4 since most of the detergents used contain phosphorus. Other sources of nutrients include food wastes, domestic animal waste; and human waste from areas inhabited by the homeless. These pollutants build up and are then washed into the waterways through the storm drain system when it rains. These kinds of loads are typically highest during the first major storm flush and even after extended periods of dry weather when pollutants have accumulated. Other major categories of nutrients sources include:

Golf courses are a major source of nutrients since fertilization activities and watering rates are generally much greater than the residential and commercial areas. The excess nutrients accumulated in the soils can be transported to waterways through excess irrigation or stormwater runoff. There are approximately 23 golf courses within the watershed area.

METALS

Heavy metals including copper, lead, and zinc are Category 1 pollutants in the Lower SGR Watershed. Although naturally occurring, concentrations of these metals are a concern in many watersheds because of potential industrial and urban discharges. These types of sources include Industrial General

Permit (IGP) covered facilities, Construction General Permit (CGP) covered facilities, and other types of urban activities.

Industrial General Permit Activities

The types of facilities covered under the IGP have the potential for metal loads, in particular metal plating, transportation, scrap yards and recycling and manufacturing facilities.

According to the Storm Water Multiple Application and Report Tracking System (SMARTS) database, there are approximately 360 current active industrial permits within the watershed; and from 2002-2012 there have been approximately 471 combined, active/terminated, industrial permits. Approximately 204 violations were recorded on the SMARTS database for inspections conducted from 2002-2012. No further data is available to determine the kind of violations or the kind of pollutants these facilities contributed to.

Table 2-14 Active IGP Facilities as of May 1, 2014

Agency	Total
Artesia	3
Bellflower	1
Cerritos	8
Diamond Bar	0
Downey	22
Hawaiian Gardens	0
La Mirada	22
Lakewood	1
Long Beach	78
Norwalk	15
Pico Rivera	12
Santa Fe Springs	176
Whittier	22
Total	360

Construction General Permit Activities

Discharges covered under the CGP also have the potential to contribute metals loading from construction sites. Sediment delivered from construction sites can contain metals from construction materials and heavy equipment. Additionally, metals can leach out of building materials and construction waste exposed to stormwater[20].

Pollutants sources from construction activities are not considered a major concern since the watershed is mainly built-out. However, according to the SMARTS database, there are approximately 127 current active constructions permits within the watershed; and from 2002-2012 there have been approximately 470 combined, active/inactive, construction permits. Approximately 36 violations were recorded on the SMARTS database for inspections conducted from 2002-2012. No further data is available to determine the kind of violations or the kind of pollutants these facilities contributed to.

LAND USE ACTIVITIES

These include general wear and tear of automotive parts which can be a significant source of metals. For example, brake wear can release copper, lead, and zinc into the environment and this contributes to concentrations of metals in urban runoff. Motor oil and automotive coolants spills are another potential land use source of metals. Pesticides, algaecides, wood preservatives, galvanized metals, and paints used across the watershed can also contain these metals. In the watershed, sources for these heavy metals have been identified as automotive repair, maintenance, fueling, cleaning and painting locations, metal fabrication facilities, and transportation activities and facilities.

The fertilizers used for lawn and landscape maintenance are also a source of metals and organic chemicals. Fertilizers, herbicides, and pesticides contain metals such as cadmium, copper, mercury, zinc, lead, iron, and manganese, which are also distributed when applying fertilizers and pesticides.

2.3.2 ROAD INFRASTRUCTURE SOURCES

Runoff from highways and roads carries a significant load of pollutants. Pollutants originate from cars, roadway degradation, and surrounding landscape. Typical contaminants associated with these include sediment, heavy metals, oils and grease, debris, fertilizers, and pesticides, among others[21]. The use and wear of cars is one of the most prevalent sources of roadway pollutants. A study found that cars are the leading source of metal loads in stormwater, producing over 50 percent of copper, cadmium, and zinc loads[22]. Vehicle brake pads constitute the single largest source of copper[23]. Simultaneously, tires, and engine parts are also a significant source of metals pollutants; almost 50 percent of tire wear accounts

for over 50 percent of the total cadmium and zinc loads[24]. Roadways can also be a source of nutrients because nutrients are found in fertilizers that are commonly applied.

2.3.3 ATMOSPHERIC DEPOSITION

Atmospheric deposition is the direct and indirect transfer of pollutants from the air to surface waters. Pollutants in the atmosphere deposit onto solid surfaces and can then be washed off by rain, becoming part of the stormwater runoff that reaches the MS4. Atmospheric deposition of pollutants can be a large source of contamination to surface waters. Typical pollutants associated with atmospheric deposition are metals, PAHs, PCBs, and, to a lesser extent, nutrients. These pollutants enter the atmosphere from point sources (i.e., industrial facility emitting metals into the air). A comparison of trace metals contributions from aerial deposition, sewage treatment plans, industrial activities, and power plants is shown in Table 2-17.

Table 2-17 Comparison of source annual loadings to Santa Monica Bay (metric tons/year)

		Non-Aerial Sources		
Metal	Aerial Deposition	Sewage Treatment Plants	Industrial	Power Plants
Chromium	0.5	0.6	0.02	0.14
Copper	2.8	16	0.03	0.01
Lead	2.3	<0.01	0.02	<0.01
Nickel	0.45	5.1	0.13	0.01
Zinc	12.1	21	0.16	2.4

[24] Davis A.P., M. Shokouhian, and S. Ni. 2001. Loading estimates of lead, copper, cadmium, and zinc in urban runoff from specific sources. *Chemosphere.*

In addition to the pollutants listed above, nutrients are also atmospherically deposited. The annual loading of nitrogen through atmospheric deposition in the neighboring Los Angeles River watershed is 5,559 tons per year, with 845 tons per year in the neighboring Ballona Creek watershed.[25]

2.3.4 SANITARY SEWERS AND SEPTIC SYSTEMS

Sanitary sewer systems and septic systems are potential sources of contaminants. Aging systems in need of repair or replacement, severe weather, improper system operation and maintenance (O&M), clogs, and root growth can contribute to sanitary sewer leaks and overflows. When sanitary sewers overflow or leak, they can release raw sewage into the environment, which can contain pollutants such as suspended solids, pathogenic organisms, toxic pollutants, oil and grease but in particular, high concentrations of bacteria and nutrients.[19]

According to the SSO database in the California Integrated Water Quality System (CIWQS) a total of 198 SSOs have been recorded within the watershed since 2006. Table 2-18 includes information on the total reported SSO discharges.

Table 2-18 SSO Total and Volume

2.4 PRIORITIZATION

Section VI.C.5.a.iv of the MS4 Permit outlines factors that should be considered when developing the sequence of addressing pollutants of concern within the Lower SGR Watershed. Based on the source assessment analysis, Water Quality Priorities (WQPs) within the watershed have been determined based on the following:

- Highest WQPs: TMDLs
    - TMDL pollutants with past due interim or final limits
    - TMDL pollutants with interim and final limits that fall within the MS4 Permit term, or the time period: September 6, 2012 – October 25, 2017
    - Pollutants that are in the same class as a TMDL pollutant
- High WQPs: other receiving water considerations
    - Pollutants on the 303(d) List for which MS4 discharges are a suspected source based on findings from the source assessment
    - Pollutants that exceed receiving water limitations and the findings from the source assessment indicate the MS4 as a source (these pollutants will be evaluated based on monitoring data collected as part of the CIMP).
- All Category 1 pollutants with TMDL compliance deadlines that are past due, or that fall within the MS4 Permit term are prioritized as a Highest WQP. In addition, pollutants that fall within the same class (as defined in Section 2.1) as a TMDL pollutant with a compliance deadline that is past due or falls within the MS4 Permit term are prioritized as a Highest WQP. All other pollutants that are associated with the MS4 (based on the Source Assessment in Section 2.3) are prioritized as a High WQP. Table 2-20 summarizes the WQPs for the watershed based on the criteria described above.

Table 2-20: Priority Pollutants

Category	Class	Pollutant	Waterbody	Associated with MS4	Priority
1	Metals	Copper	San Gabriel Reach 1, Coyote Creek	Yes	Highest
		Lead	San Gabriel River Reach 2, Coyote Creek, and San Jose Creek Reach 1	Yes	Highest
		Zinc	Coyote Creek	Yes	Highest
		Selenium	San Jose Creek Reach 1	UTD[a]	Highest
2	Nutrients	Ammonia	San Jose Creek Reach 1 and Coyote Creek	Yes	High
	Metals	Copper	San Gabriel River Reach 2, North Fork Coyote Creek, San Jose Creek Reach 1	Yes	Highest
		Lead	Coyote Creek	Yes	Highest
		Mercury	North Fork Coyote Creek	UTD	Highest
		Nickel	Coyote Creek	UTD	Highest
		Selenium	North Fork Coyote Creek	UTD	Highest
		Zinc	San Gabriel River Reach 2, San Jose Creek Reach 1, Coyote Creek	Yes	Highest
	Bacteria	Coliform & Enterococcus	San Gabriel River Reach 1, San Gabriel River Reach 2, San Jose Creek Reach 1, North Fork Coyote Creek and Coyote Creek	Yes	High
	Pesticides	Diazinon	Coyote Creek	Yes	High
	SVOC	PAHs	San Gabriel River Reach 2, San Jose Creek Reach1	Yes	High
	Water Quality Indicators / General	Chloride	San Jose Creek Reach 1	UTD	High
		Cyanide	Coyote Creek, San Gabriel Reach 2	UTD	High
		pH	San Gabriel Reach 1, Coyote Creek, and San Jose Reach 1	UTD	High
		Total Dissolved Solids	San Jose Creek Reach 1	Yes	High
		Toxicity	Coyote Creek, San Jose Creek Reach 1	Yes	High
3	Metals	Copper	North Fork Coyote Creek	Yes	Highest
		Selenium	San Gabriel River Reach 1	UTD	Highest
	Water Quality Indicators / General	Chloride	San Gabriel River Reach 2, San Jose Creek Reach 1, Coyote Creek	UTD	High
		Cyanide	North Fork Coyote Creek, San Jose Creek Reach 1	UTD	High
		Dissolved Oxygen	San Gabriel River Reach 1 & 2, Coyote Creek, San Jose Creek Reach 1	UTD	High
		MBAS	Coyote Creek, San Gabriel River Reach 2	UTD	High
		Sulfates	San Gabriel River Reach 2, San Jose Creek Reach 1	UTD	High
		Total Dissolved Solids	San Gabriel River Reach 2	Yes	High
		pH	North Fork Coyote Creek	UTD	High
		Alpha-Endusulfan	Coyote Creek	UTD	High
	Pesticides	Lindane	San Gabriel River Reach 2	UTD	High

3 SELECTION OF WATERSHED CONTROL MEASURES

This chapter identifies Watershed Control Measures (WCMs) to implement through the Participating Agencies' jurisdictional stormwater management programs, and collectively on a watershed scale. The WCMs are structural and/or nonstructural controls designed with the following objectives:

- Prevent or eliminate nonstormwater discharges to the MS4 that are a source of pollutants from the MS4 to receiving waters.
- Implement pollutant controls necessary to achieve all applicable interim and final water quality-based effluent limitations and/or receiving water limitations pursuant to corresponding compliance schedules.
- Ensure that discharges from the MS4 do not cause or contribute to exceedances of receiving water limitations.

The goal is to create an efficient program that focuses individual and collective resources on water quality priorities (WQPs). The WCMs are categorized as

- Minimum Control Measures (MCMs),
- Nonstormwater Discharge (NSWD) Measures and
- Targeted Control Measures (TCMs), which are designed to achieve applicable water quality-based effluent limitations and receiving water limitations.

Each WCM category may be further categorized as either structural or nonstructural (nonstructural includes operation and maintenance procedures and pollution prevention measures) as well as either existing or proposed. Combined with Chapter 4 (RAA) and Chapter 5 (Compliance Schedules), the WMP includes the nature, scope and timing of implementation for each WCM and provides interim milestones for the WCMs to achieve TMDL compliance. Also included are the responsibilities of each Permittee.

3.1 STRATEGY FOR SELECTION AND IMPLEMENTATION OF WATERSHED CONTROL MEASURES

Pursuant to Part VI.C.1.a of the MS4 Permit (Part VII.C.1.a - LB Permit), the Watershed Group has developed customized strategies, control measures and BMPs to implement the requirements of the MS4 Permit. Addressing WQPs will be based on a multi-faceted strategy initially focused on source control, including total suspend solids (TSS) reduction and runoff reduction. If pollutants are not generated or released, they will not be available for transport to the receiving waters. In addition, if soils can be stabilized, sediment controlled, and dry-weather runoff and initial flushes of stormwater runoff eliminated or greatly reduced, the major transportation mechanisms will be eliminated or greatly reduced, and fewer pollutants will reach the receiving waters.

The Watershed Group is particularly focused on source control because major sources of many of the highest WQPs, such as copper, lead and zinc, are released into the atmosphere, resulting in widespread

aerial deposition onto impervious surfaces in the Watershed. In addition, these pollutants are discharged directly onto streets, highways, parking lots, and driveways from motor vehicle components such as brakes, wheel weights, and tires. The Participating Agencies have concluded that the most cost-effective and long-lasting way to address WQPs is to develop and support state-wide or regional measures that will encourage or require, if necessary, product or material substitution at the manufacturing stage. This can be a complex and time-consuming process, but the payoff in water quality improvement can be tremendous.

For example, the recent efforts of the California Stormwater Quality Association (CASQA) and Sustainable Conservation that led to the passage of the SB 346 legislation is a milestone that will significantly reduce the level of copper in metropolitan area waters throughout the state. SB 346 requires incremental reduction in the amount of copper in vehicle brake pads, which constitute the single largest source of copper in metropolitan environments. Based on available information, which was largely developed through a lengthy collaboration among brake pad manufacturers, government agencies, and environmental groups in the Brake Pad Partnership, a preliminary estimate of copper runoff reduction due to this piece of legislation was developed[1]. The estimate examined three scenarios and determined a 45- 60% reduction in copper in runoff could be attributed to reduction of its use in brake pads. Already in effect, new edge codes required on brake pads sold in California will provide information on copper content and a notice that on and after January 1, 2014 any motor vehicle brake friction materials sold in California must contain no more than 0.1 percent by weight of the following materials: cadmium and its compounds, chromium (VI) salts, lead and its compounds, mercury and its compounds, and asbestiform fibers.

In addition, the Department of Toxic Substances Control (DTSC) adopted new Safer Consumer Product Regulations that became effective October 1, 2013. These regulations contain a process for identifying and prioritizing Chemicals of Concern in Priority Products containing these constituents, as well as a process for eliminating or reducing the adverse impacts of Chemicals of Concern in Priority Products. It will apply to most consumer products placed into the stream of commerce in California. It specifically applies to adverse environmental impacts, including adverse water quality impacts, and it contains a petition process for identification and prioritization of chemicals and projects. CASQA, supported by Watershed Group, has started the process of conducting research and building a file of critical information to support the designation of zinc in tires as a future priority product/constituent combination.

As explained later in this chapter, many of the new requirements of the MS4 Permit also involve enhanced source control measures that will be implemented such as enhanced inspections programs and outfall screening measures. The *Targeted Control Measures* section of this chapter supplements these efforts with targeted source control measures such as incentives for irrigation control and upgraded street sweeping equipment, designed with the objective of achieving interim and final water quality-based effluent limitations and/or receiving water limitations.

[1] Based on the Los Cerritos Channel Watershed Group commissioned study, "Estimate of Urban Runoff Copper Reduction in Los Angeles County from the Brake Pad Copper Reductions Mandated by SB 346."

In concert with these initial source control efforts, which constitute 10% of the load reduction in the RAA (higher reductions may be realized), structural controls will also be implemented. The MS4 Permit mandates implementation of structural LID BMPs for certain classes of new developments and roadway projects. In addition, the *Targeted Control Measures* section of this chapter describes supplemental targeted structural BMPs. These structural controls are used to meet the load reduction requirements and structural BMP capacities for each participating agency as noted in Chapter 4 (the RAA) following the schedules provided for each agency in Chapter 5 (Compliance Schedules).

3.2 Minimum Control Measures

The Minimum Control Measures (MCMs) are baseline WCMs required for all Permittees. The MCMs are defined in the MS4 Permit (excluding modifications set forth in an approved WMP) and are generally implemented individually by each Permittee. The objectives of the MCMs are to 1) result in a significant reduction in pollutants discharged into receiving waters and 2) satisfy the requirements of 40 CFR §122.26(d)(2)(iv). The MCMs are separate from Targeted Control Measures, which are developed by the Watershed Group and included in the WMP to specifically address WQPs.

The MS4 Permit allows the modification of several MCMs programs, so long as the modified actions are set forth in the approved WMP and are consistent with 40 CFR §122.26(d)(2)(iv). The modifications are based on an assessment to identify opportunities for focusing resources on WQPs. The term "modifications" refers only to instances where language from the MS4 Permit MCM provisions is removed and/or replaced. Any control measures that are strictly enhancements of the existing programs (i.e. do not conflict with the MS4 Permit MCM provisions) are included in the separate category of Targeted WCMs.

The following sections include a summary of the assessment of each MCM program as well as a determination as to whether each Participating Agency will implement the MCM provisions 1) as explicitly stated in the corresponding section of the MS4 Permit or 2) with modifications to focus resources on WQPs. Independent of the determinations made, the Agencies may consider additional MCM modifications through the Adaptive Management Process. Implementation of the MCMs will follow the approval of this WMP by the Regional Board Executive Officer following MS4 Permit §VI.D.1.b (LB Permit - §VII.D.1.ii).

3.2.1 Los Angeles County Flood Control District Minimum Control Measures

The LACFCD will implement the MCMs as defined from §VI.D.1 to §VI.D.4 of the MS4 Permit.

3.2.2 Assessment of Minimum Control Measures (Cities Only)

Pursuant to MS4 Permit §VI.C.5.b.iv.(1).(a) (LB Permit - §VII.C.5.h.i), the following section is an assessment of the MS4 Permit MCMs, intended to identify opportunities for focusing resources on WQPs.

3.2.2.1 Development Construction Program

Assessment

Although controlling sediment is not a WQP, the reduction of sediment through an effective Development Construction Program will address WQPs. This is because sediment mobilizes other pollutants, including many of the WQP pollutants. As such the Development Construction Program is an integral component of each City's jurisdictional stormwater management program.

Compared to the prior MS4 Permit, the current Permit expands the provisions for the Development Construction Program. This expansion includes additional or enhanced requirements for plan review, site tracking, inspection frequencies, inspection standards, BMP implementation and employee training. If implemented effectively, these enhancements will aid in the control of sediment within the Watershed, and consequently, will address WQPs. As such, no modifications to the provisions of the Development Construction Program have been identified.

Determination

The Cities will implement the MCMs as defined in §VI.D.8 of the MS4 Permit (§VII.D.K of the LB Permit). To assist the Cities in the development and implementation of a jurisdictional program, a guidance document is included in Appendix A-3-1.

3.2.2.2 Industrial/Commercial Facilities Program

Assessment

The MS4 Permit provisions for the Industrial/Commercial Facilities Program provide opportunities for customization to address WQPs. Specifically, §VI.D.6.e.i.4 (§VII.D.G.5.i.4 - LB Permit) states that industrial inspection frequencies may be modified through the WMP development process. The Cities propose modifying the inspection frequencies of both industrial and commercial facilities based on a facility prioritization scheme that considers WQPs. For example, facilities that are deemed to have a high potential to discharge metals (a WQP pollutant) may be prioritized as "High" and inspected more frequently while facilities that have a small likelihood to adversely impact WQPs may be prioritized as "Low" and inspected less frequently.

Determination

Sections VI.D.6.d and VI.D.6.e of the MS4 Permit (Sections VII.D.G.4 and VII.D.G.5 of the LB Permit) will be replaced with the language in Table 3-3, which is located in the following *New Fourth Term Permit MCMs* section of this chapter and is identified as MCM-ICF-3.

In order to provide clarity to the Cities, one combined guidance document has been prepared for the Program, with the prioritization and revised inspection frequencies included – see Appendix A-3-1. The document is also intended to assist the Cities in the development and implementation of a jurisdictional program.

3.2.2.3 Illicit Connection and Illicit Discharges Elimination Program

Assessment

The purpose of the Illicit Connection and Illicit Discharges Elimination (ICID) Program is to detect, investigate and eliminate IC/IDs to the MS4. In order to address WQPs, a potential modification to MS4 Permit provisions would be the inclusion of a proactive approach for the detection of illicit discharges. However such an approach will be addressed through nonstormwater outfall based screening monitoring as outlined in the MRP. Also, such activities do not conflict with the MS4 Permit provisions for an IC/ID Program, and as such would be classified as a Targeted Control Measure. As such there is no need to modify the base provisions of the program.

Determination

The Cities will implement the MCMs as defined in §VI.D.10 of the MS4 Permit (§VII.D.M of the LB Permit). To assist the Cities in the development and implementation of a jurisdictional program, a guidance document is included in Appendix A-3-1.

3.2.2.4 Planning and Land Development Program

Assessment

Following MS4 Permit §VI.C.5.b.iv.1.a (LB Permit - §VII.C.5.h.i.), the Planning and Land Development Program was not assessed for potential modifications.

Determination

The Cities will implement the MCMs as defined in §VI.D.7 of the MS4 Permit (§VII.D.J of the LB Permit). To assist the Cities in the development and implementation of a jurisdictional program, a guidance document is included in Appendix A-3-1.

3.2.2.5 Public Agency Activities Program

Assessment

The Public Agency Activities Program is divided into several sub-programs. Many of the MS4 Permit provisions within the sub-programs consist of baseline BMPs that do not suggest modification. The sub-programs that do suggest a prioritized approach – such as street sweeping and catch basin cleaning frequencies – already provide this opportunity (frequencies are based on a City's assessment of trash and debris generation). The Public Facility Inventory sub-program also provides a prioritization opportunity, based on the tracking data obtained for each facility. However, since these facilities are not subject to regular "public agency" inspections as in the Industrial/Commercial Facilities Program, there is little utility in incorporating such a prioritization. The provisions of the public construction activities sub-program are considered an integral component of the jurisdictional stormwater program, for the reasons explained in the assessment of the Development Construction Program provisions. In summary there is no need to modify the MS4 Permit provisions of the program.

DETERMINATION

The Cities will implement the MCMs as defined in §VI.D.9 of the MS4 Permit (§VII.D.L of the LB Permit). To assist the Cities in the development and implementation of a jurisdictional program, a guidance document is included in Appendix A-3-1.

3.2.2.6 PUBLIC INFORMATION AND PARTICIPATION PROGRAM

ASSESSMENT

The MS4 Permit allows a City to implement the requirements of the Public Information and Participation Program (PIPP) 1) by participating in a County-wide effort, 2) by participating in a Watershed Group effort, 3) individually within its jurisdiction or 4) through a combination of these approaches. The Cities will implement the PIPP following a combination of approaches. Consequently some clarifications of the MS4 Permit provisions are necessary.

In terms of modifications to address WQPs, the MS4 Permit provisions for the PIPP are not particularly prescriptive, thus allowing the Cities the flexibility to focus efforts on WQPs through the development of the program. As such, there is no need to modify the MS4 permit provisions of the program.

DETERMINATION

The table below provides clarification on elements of the MS4 Permit provisions for the PIPP:

Permit section	Clarification
§VI.D.5.c.(i) - MS4 Permit §VII.D.F.3.i - LB Permit Public Participation	Each City will participate in a County-wide sponsored PIPP to provide a means for public reporting of clogged catch basin inlets and illicit discharges/dumping, faded or missing catch basin labels, and general stormwater and nonstormwater pollution prevention information.
§VI.D.5.d - MS4 Permit §VII.D.F.4- LB Permit Residential Outreach Program	Each City will work in conjunction with a County-wide sponsored PIPP to implement the Residential Outreach Program. Elements of the program that will not be administered or implemented as a county-wide effort (currently the provision to provide educational materials to K-12 school children) will be addressed individually by each City or jointly on a watershed level. Through the adaptive management process, PIPP participation may develop into a watershed group or individual effort, or some combination of these approaches.

In order to provide clarity to the Cities, one combined guidance document has been prepared for the Program, with the approach for each provision (i.e. joint or individual effort) included – see Appendix A-3-1. The document is also intended to assist the Cities in the development and implementation of a jurisdictional program.

3.2.2.7 PROGRESSIVE ENFORCEMENT AND INTERAGENCY COORDINATION

ASSESSMENT

Following MS4 Permit §VI.C.5.b.iv.1.a (LB Permit - §VII.C.5.h.i), the Progressive Enforcement and Interagency Coordination Program was not assessed for potential modifications.

DETERMINATION

The Cities will implement the MCMs as defined in §VI.D.2 of the MS4 Permit (§VII.D.2 of the LB Permit). To assist the Cities in the development and implementation of a jurisdictional program, a guidance document is included in Appendix A-3-1.

3.2.3 THIRD TERM PERMIT MCMS

Until the WMP is approved by the Executive Officer of the Regional Board, the MCM provisions of the prior third term MS4 permit continue to be implemented by the participating agencies. Some of the MCMs of the current MS4 Permit are relatively unchanged carry-overs from the prior third term permit. The remaining MCMs are either enhancements of the third term MCMs or entirely new provisions. These new and enhanced fourth term MCMs are described in the following section.

3.2.4 NEW FOURTH TERM PERMIT MCMS (CITIES ONLY)

Part VI.D of the MS4 Permit and Part VII.D of the LB Permit (the MCM provisions) introduces many new provisions and program elements to be developed and incorporated within each participating agency's jurisdictional stormwater program. This section briefly describes the new and enhanced MCMs required for the Cities (City MCMs), excluding those required for the LACFCD in §VI.D.4. An MCM is considered new if it was not required by the prior MS4 Permit and is considered enhanced if it is an enhancement of a related provision of the prior MS4 Permit.

The details of each provision may be found in the relevant sections of the MS4 Permit, which are included. Unless an alternate date is provided in the MS4 Permit or in this section, the adoption date for the City MCMs coincides with the approval of the WMP by the Regional Board's Executive Officer.

3.2.4.1 STRUCTURAL CONTROLS

The new and enhanced MCMs consist primarily of nonstructural control measures, with the marked exception of the Planning and Land Development provisions, described as follows.

LID and Hydromodification

MS4 Permit §VI.D.7 (LB Permit §VII.D.J)

The LID and hydromodification provisions of the Planning and Land Development program are a significant enhancement from the prior MS4 Permit. The implementation of structural LID BMPs at new developments throughout the watershed will appreciably decrease the effective impervious area, reducing flow and, consequently, pollutant loads. The program is unique in that it will increase in effectiveness over time as more and more existing developments are redeveloped and bound to the LID/hydromodification requirements.

Trash Excluder Installation

MS4 Permit §VI.D.9.h.vii.(1) (LB Permit §VII.D.L.8. vii.(1))

In areas that are not subject to a trash TMDL, the Public Agency Activities Program includes a requirement to install excluders (or equivalent devices) on or in Priority A (MS4 Permit §VI.D.9.h.iii.(1)), LB Permit §VII.D.L.8. iii.(1)) area catch basins or outfalls to prevent the discharge of trash to the MS4. For LA MS4 Permittees, the deadline is no later than four years after the effective date of the Permit. This provision may be supplanted by the statewide trash amendments, which in their current draft iteration include the installation of full-capture devices in the priority land use areas of high density residential, industrial, commercial, mixed urban and public transportation stations as a compliance route.

3.2.4.2 Nonstructural Controls

Table 3-2 lists the new and enhanced nonstructural City MCMs as well as the new and enhanced NSWD measures. The BMP effectiveness from Table 3-2 is based on similar BMPs listed in Tetra Tech's Comprehensive Load Reduction Plan (CLRP) for Chollas Creek Watershed in San Diego County, 2012. The correlation of BMP effectiveness with WQPs is based on Table 3-1. The pages following Table 3-2 describe each of the listed controls.

Table 3-1 Pollutant Category versus Water Quality Classification

Waterbody-pollutant classification	Type of pollutant								
	Bacteria	Metals	Organics	Sediment	Pesticides	Nutrients	Oil and grease	Dissolved minerals	Trash
Category 1		✗						✗	
Category 2	✗	✗	✗	✗	✗	✗		✗

ENHANCED STAFF/CONTRACTOR TRAINING PROGRAMS — MCM-TRA-1

MS4 Permit §VI.D.7.d.iv.(b), §VI.D.8.l, §VI.D.9.k, §VI.D.10.f (LB Permit §VII.D.J.5.iv.(b), §VII.D.K.xiv, §VII.D.L.11, §VII.D.M.6)

Measures introduced:

- Prescriptive staff training requirements to the Development Construction, Illicit Connections and Illicit Discharges Elimination and Public Agency Activities Programs. For example, relevant staff involved with the Construction Program must be knowledgeable in procedures consistent with the State Water Board sponsored Qualified SWPPP Practitioner/Developer (QSP/QSD) program.
- Inspections of structural BMPs under the Planning and Land Development Program must be conducted by trained personnel.
- Outside contractors are bound to the same training standards as in-house staff

These new and enhanced provisions will increase the overall effectiveness of the JSWMPs.

AMEND DEVELOPMENT REGULATIONS TO FACILITATE LID IMPLEMENTATION — MCM-PLD-1

MS4 Permit §VI.C.4.c.i, §VI.D.7.d.i (LB Permit §VII.C.4.c.i, §VII.D.J.5.i)

The participating agencies have developed and adopted LID ordinances and Green Street Policies. These measures will facilitate LID implementation.

POST-CONSTRUCTION BMP TRACKING, INSPECTIONS AND ENFORCEMENT — MCM-PLD-2

MS4 Permit: §VI.D.7.d.iv (LB Permit §VII.D.J.5.iv)

The Cities must track post-construction BMPs, conduct BMP verification and maintenance inspections and follow the Progressive Enforcement Policy in cases of non-compliance. This will improve the effectiveness of the Planning and Land Development program.

INCREASE IN FACILITY TYPES INSPECTED AND NUMBER OF INSPECTIONS CONDUCTED — MCM-IFC-1

MS4 Permit: §VI.D.6.d, §VI.D.6.e (LB Permit §VII.D.G.4, §VII.D.G.5), also affected by NPDES No. CAS000001, the State Water Resources Control Board's (SWRCB) Industrial General Permit (IGP)

Measures introduced:

- Inspect nurseries and nursery centers
- Perform follow-up *No Exposure Verification* inspections for at least 25% of industries that have filed a *No Exposure Certification (NEC)*
- Inspect light industrial facilities. Under the SWRCB's IGP adopted in April 1, 2014, light industries previously excluded from coverage under the IGP must now obtain coverage. Light industry is defined as SICs 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39 and 4221-4225. This includes facilities ubiquitous

in industrial zones such as warehouses and machine shops. Although many of these facilities will likely qualify for the NEC, the type and number of facilities requiring inspection under the MS4 Permit will still increase.

These new and enhanced measures will increase the effectiveness of the Industrial/Commercial Facilities Program.

BUSINESS ASSISTANCE PROGRAM AND BMP NOTIFICATION

MCM-IFC-2

MS4 Permit: §VI.D.6.c (LB Permit §VII.D.G.3)

Measures introduced:

- Notify industrial/commercial owner/operators of applicable BMP requirements.
- Implement a Business Assistance Program to provide technical information to businesses to facilitate their efforts to reduce the discharge of pollutants in stormwater. The business assistance program described in the prior LA MS4 Permit was an optional provision.

These new and enhanced measures will increase the effectiveness of the Industrial/Commercial Facilities Program.

PRIORITIZE FACILITIES/INSPECTIONS BASED ON WATER QUALITY PRIORITIES

MCM-IFC-3 (TCM-ICF-1)

MS4 Permit: Modified MCM (replaces §VI.D.6.d, §VI.D.6.e), LB Permit: (replaces §VII.D.G.4, §VII.D.G.5)

A program has been developed to prioritize industrial/commercial facilities based on their potential to adversely impact WQPs. The resulting prioritization scheme determines the inspection frequency, replacing the uniform inspection frequency provided in the MS4 Permit. This allows Cities to concentrate efforts on WQPs. Sections VI.D.6.d and VI.D.6.e of the MS4 Permit (Sections VII.D.G.4 and VII.D.G.5 of the LB Permit) will be replaced with the language presented in Table 3-3.

TABLE 3-3

REPLACES §VI.D.6.D AND §VI.D.6.E OF THE MS4 PERMIT
REPLACES §VII.D.G.4 AND §VII.D.G.5 OF THE LB PERMIT

MS4 PERMIT VI.D.6.d (LB Permit VII.D.G.4) Prioritize Critical Industrial/Commercial Sources

MS4 Permit VI.D.6.d.i (LB Permit VII.D.G.4.i) Prioritization Method

Prioritizing facilities by potential water quality impact provides an opportunity to optimize the effectiveness of the Industrial/Commercial Facilities Program and to focus efforts on water quality priorities. The inventory fields in Part VI.D.6.b.ii (VII.D.G.2.i) provide information that allows for such a facility prioritization. Based on these fields, Figure ICF-1 establishes a method for each City to prioritize all industrial/commercial facilities into three tiers – High, Medium and Low. A City may follow an alternative prioritization method provided it is based on water quality impact and results in a similar three-tiered scheme.

Prioritization factors

Factor	Description
A	Status of exposure of materials and industrial/commercial activities to stormwater
B	Identification of whether the facility is tributary to a waterbody segment with impairments[2] for pollutants that are also generated by the facility
C	Other factors determined by the City, such as size of facility, presence of exposed soil or history of stormwater violations

Utilizing these factors, follow steps 1, 2 and 3 below:

1. Collect necessary information to evaluate factors

Factor	Initial method	Subsequent method
A	Satellite imagery	Results of stormwater inspection
B	Cross reference Table 4 or Table 5* with tributary TMDL/ 303(d) pollutants	Cross reference inspection results with tributary TMDL/ 303(d) pollutants
C	Varies	

* See pages 9 and 10 of Appendix A-3-1 ICF (guidance for the Industrial/Commercial Facilities Program)

2. Evaluate factors

Factor	Result	Score
A	Low or no exposure	0
	Moderate exposure	½
	Significant exposure	1
B	No*	0
	Yes**	1
C	Low	0
	Medium	½
	High	1

** No pollutant generation/impairment matches
*** ≥ 1 pollutant generation/impairment matches

3. Prioritize facilities

		C Score		
		0	**½**	**1**
A×B Score	**0**	Low	Medium	High
	½	Medium	High	High
	1	High	High	High

This method serves only as a guide to prioritization. The City may also prioritize facilities based on a qualitative assessment of factors A, B and C.

Figure ICF-1: Industrial/Commercial Facility Prioritization Scheme

Step 3 in Figure ICF-1 may also be expressed by the relationships $A \cdot B + C \geq 1 \rightarrow$ High, $1 > A \cdot B + C > 0 \rightarrow$ Medium and $A \cdot B + C = 0 \rightarrow$ Low. The purpose of multiplying A and B is to scale the impact of the presence of the

[2] CWA §303(d) listed or subject to a TMDL

TABLE 3-3

REPLACES §VI.D.6.D AND §VI.D.6.E OF THE MS4 PERMIT
REPLACES §VII.D.G.4 AND §VII.D.G.5 OF THE LB PERMIT

pollutants at a facility (B) by the likelihood that they will be discharged to the MS4 (A). Factor C quantifies water quality concerns that are independent of A or B and as such is incorporated through addition. The purpose of this numerical approach is to provide consistency to the prioritization process. It is intended solely as a guide. The City may also prioritize facilities based on a qualitative assessment of factors A, B and C as listed in Figure ICF-1.

MS4 Permit VI.D.6.d.i.(1), (LB Permit VII.D.G.4.(1)), Prioritization Condition
The following condition will be met during the prioritization process: ***The total number of low priority facilities is less than or equal to 3 times the number of high priority facilities***. This condition is applied to maintain a minimum inspection frequency as explained in Section VI.D.6.e.i.

MS4 Permit VI.D.6.d.i.(2), (LB Permit VII.D.G.4.(2)), Prioritization Frequency
The default priority for a facility is Medium. Facilities will be reprioritized as necessary following the results of routine inspections. The City may also use any readily available information that clarifies potential water quality impacts (e.g., satellite imagery) in order to prioritize a facility before the initial inspection. Reprioritization may also be conducted at any time as new water quality based information on a facility becomes available. During reprioritization, the ratio of low priority to high priority facilities will remain at 3:1 or lower. Figure ICF-2 is a flowchart of the prioritization process.

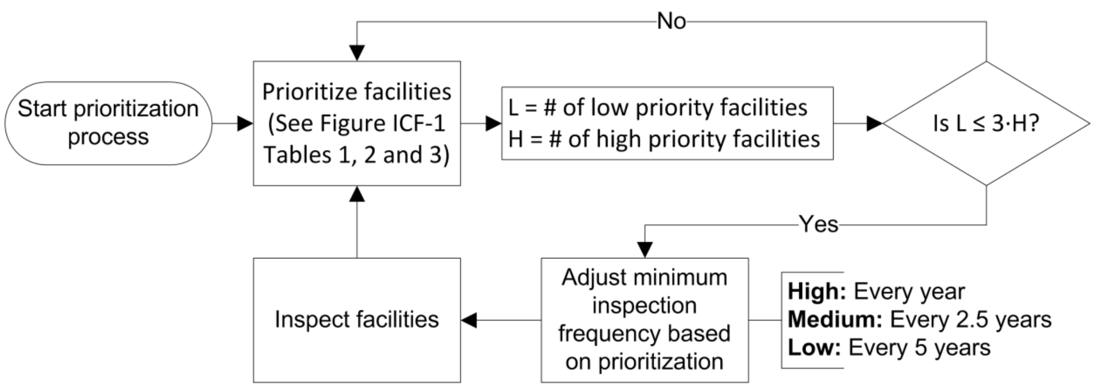

Figure ICF-2

MS4 Permit VI.D.6.e (LB Permit VII.D.G.5) Inspect Critical Industrial/Commercial Sources

MS4 Permit VI.D.6.e.i (LB Permit VII.D.G.5.i) Frequency of Industrial/Commercial Inspections
Following the facility prioritization method in Part VI.D.6.d.i, each City will inspect high priority facilities annually, medium priority facilities semi-quinquennially (once every 2.5 years) and low priority facilities quinquennially (once every five years). The frequencies may be altered by the exclusions defined in Part VI.D.6.e.i.(1). The condition in Part VI.D.6.d.i.(1) ensures at least the same average number of inspections conducted per year as the semi-quinquennial frequency defined in the MS4 Permit.

Each City will conduct the first compliance inspection for all industrial/commercial facilities within one year of the approval of their Watershed Management Program by the Executive Officer. A minimum interval of six months between the first and the second mandatory compliance inspection is required.

MS4 Permit VI.D.6.e.i.(1) (LB Permit VII.D.G.5.i(1)) Exclusions to the Frequency of Industrial Inspections

TABLE 3-3

REPLACES §VI.D.6.D AND §VI.D.6.E OF THE MS4 PERMIT *REPLACES §VII.D.G.4 AND §VII.D.G.5 OF THE LB PERMIT*
MS4 Permit VI.D.6.e.i.(1).(a) (LB Permit VII.D.G.5.i(1).(a)) Exclusion of Facilities Previously Inspected by the Regional Water Board Each City will review the State Water Board's Stormwater Multiple Application and Report Tracking System (SMARTS) database at defined intervals to determine if an industrial facility has recently been inspected by the Regional Water Board. The first interval will occur approximately 2 years after the effective date of the Order. The City does not need to inspect the facility if it is determined that the Regional Water Board conducted an inspection of the facility within the prior 24 month period. The second interval will occur approximately 4 years after the effective date of the Order. Likewise, the City does not need to inspect the facility if it is determined that the Regional Water Board conducted an inspection of the facility within the prior 24 month period. **MS4 Permit VI.D.6.e.i.(1).(b) (LB Permit VII.D.G.5.i(1).(b)) No Exposure Verification** As a component of the first mandatory inspection, each City will identify those facilities that have filed a No Exposure Certification with the State Water Board. Approximately 3 to 4 years after the effective date of the Order, each City will evaluate its inventory of industrial facilities and perform a second mandatory compliance inspection at a minimum of 25% of the facilities identified to have filed a No Exposure Certification. The purpose of this inspection is to verify the continuity of the no exposure status. **MS4 Permit VI.D.6.e.ii (LB Permit VII.D.G.5.ii) Scope of Industrial/Commercial Inspections** **MS4 Permit VI.D.6.e.ii.(1) (LB Permit VII.D.G.5.ii.(1) Scope of Commercial Inspections** Each City will inspect all commercial facilities to confirm that stormwater and nonstormwater BMPs are being effectively implemented in compliance with municipal ordinances. At each facility, inspectors will verify that the operator is implementing effective source control BMPs for each corresponding activity. Each City will require implementation of additional BMPs where stormwater from the MS4 discharges to a significant ecological area (SEA), a water body subject to TMDL provisions in Part VI.E, or a CWA §303(d) listed impaired water body. Likewise, for those BMPs that are not adequately protective of water quality standards, a City may require additional site-specific controls. **MS4 Permit VI.D.6.e.ii.(2) (LB Permit VII.D.G.5.ii.(2) Scope of Industrial Inspections** Each City will confirm that each industrial facility: a) Has a current Waste Discharge Identification (WDID) number for coverage under the Industrial General Permit, and that a Stormwater Pollution Prevention Plan (SWPPP) is available on-site; or b) Has applied for, and has received a current No Exposure Certification for facilities subject to this requirement; c) Is effectively implementing BMPs in compliance with municipal ordinances. Facilities must implement the source control BMPs identified in Table 10, unless the pollutant generating activity does not occur. The Cities will require implementation of additional BMPs where stormwater from the MS4 discharges to a water body subject to TMDL Provisions in Part VI.E, or a CWA §303(d) listed impaired water body. Likewise, if the specified BMPs are not adequately protective of water quality standards, a City may require additional site-specific controls. For critical sources that discharge to MS4s that discharge to SEAs, each City will require operators to implement additional pollutant-specific controls to reduce pollutants in stormwater runoff that are causing or contributing to exceedances of water quality standards. d) Applicable industrial facilities identified as not having either a current WDID or No Exposure Certification will be notified that they must obtain coverage under the Industrial General Permit and will be referred to the Regional Water Board per the Progressive Enforcement Policy procedures identified in Part VI.D.2 of the MS4 Permit (Part VII.D.2 of the LB Permit).

Enhanced plan review program

MCM-DC-1

MS4 Permit: §VI.D.8.h, §VI.D.8.i (LB Permit: §VII.D.K.x, §VII.D.K.xi)

In general the MS4 Permit introduces provisions that conform to the SWRCB's Construction General Permit. For construction sites one acre or greater, measures include the following:

- Construction activity operators must submit Erosion and Sediment Control Plans (ESCPs) prior to grading permit issuance, developed and certified by a QSD to SWPPP standards.
- Operators must propose minimum BMPs that meet technical standards. The cities must provide these standards.
- Develop procedures and checklists to review and approve relevant construction plans.

These new and enhanced measures will increase the effectiveness of the Development Construction Program, which in turn is expected to reduce TSS loading into the MS4. TSS reduction is an integral component in addressing WQPs.

Enhanced inspection standards/BMP requirements at construction sites

MCM-DC-2

MS4 Permit: §VI.D.8.d, §VI.D.8.i, §VI.D.8.j (LB Permit: §VII.D.K.vi, §VII.D.K.xi, §VII.D.K.xii)

Measures introduced:

- Ensure BMPs from the ESCPs are properly installed and maintained.
- Ensure the minimum BMPs for sites less than one acre are installed and maintained.
- Develop and implement standard operating procedures for City stormwater inspections of construction sites.
- Require activity-specific BMPs for paving projects.

These new and enhanced measures will increase the effectiveness of the Development Construction Program, which in turn is expected to reduce TSS loading into the MS4. TSS reduction is an integral component in addressing WQPs.

Increased inspection frequencies

MCM-DC-3

MS4 Permit: §VI.D.8.j (LB Permit: §VII.D.K.xii)

The inspection frequency for construction sites one acre or more has significantly increased. The prior LA MS4 Permit required a minimum of one inspection during the rainy season. The current MS4 Permit requires monthly inspections year-round, as well as mandatory inspections based on the phase of construction. This enhanced measure will increase the effectiveness of the Development Construction Program, which in turn is expected to reduce TSS loading into the MS4. TSS reduction is an integral component in addressing WQPs.

Enhanced IC/ID enforcement and written program procedures

MCM-ICID-1

MS4 Permit: §VI.D.2, §VI.D.10; LB Permit: §VII.D.2 , §VII.D.M

Measures introduced:

- Develop and implement a Progressive Enforcement Policy that applies to the IC/ID Elimination, Development Construction, Planning and Land Development and Industrial/Commercial Facilities Programs. The Progressive Enforcement Policy is an augmentation of the policy listed in the prior LA MS4 Permit, which was restricted to the Industrial/Commercial Facilities Program.
- Maintain written procedures for receiving complaints, conducting investigations and responding to spills.

These new and enhanced measures will increase the effectiveness of the IC/ID Elimination program, as well as the related enforcement components of the Development Construction, Planning and Land Development and Industrial/Commercial Facilities Programs.

STORMWATER RESOURCES ON CITY WEBSITE — *MCM-PIP-1*

MS4 Permit: §VI.D.5.d.i.(4) (LB Permit: §VII.D.F.4.i.(4))

Measures introduced:

- The MS4 Permit introduces a requirement to maintain a stormwater webpage or provide links to stormwater websites via the City's website. The website (in-house or linked) will include:
    - Educational material and
    - Opportunities for the public to participate in stormwater pollution prevention and clean-up activities.

ENHANCED BMP REQUIREMENTS FOR FIXED FACILITY/FIELD ACTIVITIES — *MCM-PAA-1*

MS4 Permit: §VI.D.9.e (LB Permit: §VII.D.L.5)

Measures introduced:

- Implement effective source control BMPs for 65 specific pollutant-generating activities such as mudjacking, shoulder grading and spall repair.
- Contractually require hired contractors to implement and maintain the activity specific BMPs. Conduct oversight of contractor activities to ensure the BMPs are implemented and maintained.

These new and enhanced measures will increase the effectiveness of the Public Agency Activities program.

REPRIORITIZATION OF CATCH BASINS AND CLEAN-OUT FREQUENCIES — *MCM-PAA-2*

MS4 Permit: §VI.D.9.h.iii (LB Permit: §VII.D.L.8.iii)

In areas not subject to a trash TMDL, measures introduced include the following:

- Determine priority areas and update the map of catch basins with GPS coordinates and priority.

- Include the rationale or data to support the priority designations.

These new and enhanced measures will increase the effectiveness of the Public Agency Activities program.

INTEGRATED PEST MANAGEMENT PROGRAM — *MCM-PAA-3*

MS4 Permit: §VI.D.9.g (LB Permit: §VII.D.L.7)

The MS4 Permit introduces entirely new, prescriptive requirements to implement an Integrated Pest Management (IPM) Program for public agency activities and at public facilities. These requirements include adopting and verifiably implementing policies, procedures and/or ordinances that support the IPM program. Intertwined with the IPM provisions are additional requirements to control and minimize the use of fertilizers. These new and expansive measures will increase the effectiveness of the Public Agency Activities program and address WQPs.

ENHANCED MEASURES TO CONTROL INFILTRATION FROM SANITARY SEWERS — *MCM-PAA-4*

MS4 Permit: §VI.D.9.ix (LB Permit: §VII.D.L.ix)

The MS4 Permit introduces specific requirements to control infiltration from the sanitary sewer into the MS4. The measures include adequate plan checking, preventative maintenance, spill response, enforcement, interagency coordination and staff/contractor education. The requirements may be fulfilled through implementation of a Sewer System Management Plan in accordance with the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems.

INSPECTION AND MAINTENANCE OF PERMITTEE OWNED TREATMENT CONTROLS — *MCM-PAA-5*

MS4 Permit: §VI.D.9.x (LB Permit: §VII.D.L.x)

The MS4 Permit introduces requirements to implement an inspection and maintenance program for all Permittee owned treatment control BMPs, including post-construction treatment control BMPs. This measure will increase the effectiveness of the Public Agency Activities program.

3.3 NONSTORMWATER DISCHARGE MEASURES

The Participating Agencies will require dischargers that drain to their respective MS4s to implement the Nonstormwater Discharge (NSWD) Measures as defined in §III.A of the MS4 Permit (§IV.B of the LB Permit). If the Participating Agencies identify nonstormwater discharges from the MS4 as a source of pollutants that cause or contribute to exceedances of receiving water limitations, the WCMs will be modified and implemented – subject to the adaptive management process – to effectively eliminate the source of pollutants consistent with MS4 Permit §III.A and §VI.D.10 (LB Permit §IV.B and §VII.D.M). In these instances, potential WCMs may include prohibiting the nonstormwater discharge to the MS4, requiring the responsible party to 1) incorporate additional BMPs to reduce pollutants in the nonstormwater discharge or conveyed by the nonstormwater discharge or 2) divert to a sanitary sewer for treatment, or strategies to require the nonstormwater discharge to be separately regulated under a general NPDES permit.

It is important to note that the nonstormwater Outfall Based Screening and Monitoring Program (MRP §IX) introduces additional NSWD measures through the intensive procedures required for the identification of NSWDs from MS4 outfalls.

3.3.1 NEW FOURTH TERM PERMIT NONSTORMWATER DISCHARGE MEASURES

Parts III.A and VI.B (MRP IX) of the MS4 Permit (Parts IV.B and VII.B (MRP IX) of the Long Beach Permit introduce new provisions and program elements that address NSWDs. This section briefly describes these new and enhanced NSWD measures. A NSWD measure is considered new if it was not required by the prior MS4 Permit and is considered enhanced if it is an enhancement of a related provision of the prior MS4 Permit.

Table 3-2 from the previous section lists the new and enhanced nonstructural NSWD measures as well as the City MCMs. The BMP effectiveness from Table 3-2 is based on similar BMPs listed in Tetra Tech's CLRP for Chollas Creek Watershed in San Diego County, 2012. The correlation of BMP effectiveness with WQPs is based on Table 3-1. The following pages describe each of the listed controls. The details of each provision may be found in the relevant sections of the MS4 Permit, which are included. Unless an alternate date is provided in the MS4 Permit or in this section, the adoption date for the NSWD measures coincides with the approval of the WMP by the Regional Board's Executive Officer.

NSWD-1 OUTFALL SCREENING AND SOURCE INVESTIGATIONS

NSWD-1

MS4 Permit: §VI.B (MRP §IX) (LB Permit: MRP §IX)

The outfall screening and source investigation provisions of the MS4 Permit constitute an entirely new, expansive addition to each City's JSWMP. Implementing these new provisions will significantly support the control of unauthorized nonstormwater discharges.

ENHANCED CONDITIONS FOR EXEMPT NONSTORMWATER DISCHARGES

NSWD-2

MS4 Permit: §III.A (LB Permit: §IV.B)

The NSWD prohibitions of the MS4 Permit, which include specific measures to reduce irrigation runoff, are a significant enhancement from the prior LA MS4 Permit. Measures introduced include the following:

- Require the implementation of BMPs following established BMP manuals for discharges from non-emergency fire fighting activities and drinking water supplier distribution systems. Require specific BMPs for lake dewatering, landscape irrigation, pool and fountain discharges and non-commercial car washing.
- Require notification, monitoring (i.e. sampling) and reporting for drinking water supplier discharges and lake dewatering greater than 100,000 gallons.
- Require advance notification for any discharge of 100,000 gallons or more into the MS4.
- Minimize discharge of landscape irrigation through implementation of an ordinance specifying water efficient landscaping standards.
- Promote water conservation programs to minimize the discharge of landscape irrigation water into the MS4. This includes the following, where applicable:
    - Coordinate with local water purveyor(s) to promote:
        - Landscape water efficiency requirements for existing landscaping,
        - Drought tolerant, native vegetation, and
        - Less toxic options for pest control and landscape management.
    - Develop and implement a coordinated outreach and education program to minimize the discharge of irrigation water and pollutants associated with irrigation water.
- If monitoring results indicate that a conditionally exempt NSWD is a source of pollutants that causes or contributes to exceedances of applicable receiving water limitations and/or water quality-based effluent limitations, the Permittee must either:
    - Effectively prohibit the nonstormwater discharge to the MS4, or
    - Impose additional conditions, subject to approval by the Regional Water Board Executive Officer, or
    - Require diversion of the NSWD to the sanitary sewer, or
    - Require treatment of the NSWD prior to discharge to the receiving water.

Implementing these enhanced provisions will significantly support the control of unauthorized nonstormwater discharges.

3.4 TARGETED CONTROL MEASURES

Targeted Control Measures (TCMs) are additional control measures beyond the baseline MCMs and NSWD measures of the MS4 Permit that are intended to target the Watershed Group's WQPs. TCMs may be divided into two categories: nonstructural and structural. The selection of structural and nonstructural control measures to address WQPs within the Watershed Group is a vital component of the WMP planning process.

The Participating Agencies have already proposed and implemented a number of structural and nonstructural control measures in the watershed that collectively may contribute to considerable pollutant load reductions. These existing and planned BMPs provide a head start in the planning process to address WQPs within the Watershed Group. There are many different types of structural and nonstructural control measures that provide varying benefits from their implementation. The following sections describe Planned TCMs to be implemented, Potential TCMs that may be implemented (implementation is conditional upon factors such as site constraints, governing body approval, etc.) as well types of structural BMPs available to the Watershed Group.

3.4.1 NONSTRUCTURAL TARGETED CONTROL MEASURES

3.4.1.1 CONTROL MEASURES IDENTIFIED IN TMDLS/IMPLEMENTATION PLANS

There are no control measures identified in the San Gabriel River Metals TMDL. Planned and potential control measures to address the Metals TMDL are incorporated within the WCMs identified in this Chapter.

As recognized by the footnote in Attachment K of the Permit, the Participating Agencies have entered into an Amended Consent Decree with the United States and the State of California, including the Regional Board. The footnote specifically states: "The requirements of this Order to implement the obligations of [the Dominguez Channel and Greater Los Angeles and Long Beach Harbor Waters Toxic Pollutants TMDL] do not apply to a Permittee to the extent that it is determined that the Permittee has been released from that obligation pursuant to the Amended Consent Decree entered in *United States v. Montrose Chemical Corp.*, Case No. 90-3122 AAH (JRx)." The submission of this WMP and its associated CIMP and any action or implementation taken pursuant to it shall not constitute a waiver of any such release of obligations established by that Amended Consent Decree.

3.4.1.2 TOTAL SUSPENDED SOLIDS REDUCTION

As explained in the introduction to this chapter, emphasis is placed on source control as a cost-effective measure to reduce pollutant loads. In this WMP, the chief approach is controlling Total Suspended Solids (TSS) at the source, as explained in the following section. Combining this approach with true source control, low impact development, green streets, and the MCMs constitutes a strong and effective initial implementation of the WMP, providing time for funding measures to be put in place to pay for the design, construction, and operation of stormwater capture and low flow diversion facilities and to develop working relationships with water and wastewater agencies.

BACKGROUND

TSS is the governing pollutant for metals. This is consistent with that found within the USEPA approved San Gabriel River Metals TMDL which represents metals (copper, lead, and zinc) through their associations with sediment. Reducing TSS in the receiving waters is anticipated to result in a significant reduction of metals in the receiving waters since both pollutant groups adhere to sediment; therefore initial implementation will focus on TSS reduction. Initial emphasis on TSS reduction should reduce the volume of water that ultimately needs to be captured and infiltrated or used to achieve standards for the Category 1 pollutants being addressed by the WMP – namely metals. This would make implementation of the WMP more cost-efficient.

Documentation is not available for the LSGR watershed; however it is available for the adjacent Los Cerritos Channel (LCC) Watershed, of which many LSGR cities drain to in part. For that watershed, Table 3-4 below provides a summary of TSS concentrations at the Stearns Street monitoring site over a 13-year period based on 74 wet-weather observations and 25 dry-weather observations.

Table 3-4: TSS statistics measured at LCC TMDL Monitoring Site

Statistic	Wet Weather (mg/L)	Dry Weather (mg/L)
No. of observations	74	25
Minimum	17	2
Maximum	1700	128
1st Quartile	96	7.5
Median	155	13
3rd Quartile	260	41
Mean	227	27
Standard deviation (n-1)	256	30

Although the RAA is only assuming a 5% pollutant load reduction through implementation of the TSS Reduction Strategy, the Watershed Group is targeting greater reductions. In an analysis performed by the Los Cerritos Channel WMP Group, it was determined that the expected reduction in the mean concentration of TSS at Stearns Street from 227 mg/l to 150 mg/l, which would be a 34% reduction in the mean concentration of TSS. The reduced value is consistent with those found in other watersheds with similar land uses. A quantification of the program's potential effectiveness is included in Section 4.3.1.

TSS REDUCTION STRATEGY

The core of the TSS Reduction Strategy is the Group's soil stabilization/sediment control. Two key components of this strategy are implementation of enhanced erosion and sediment control at construction sites, in accordance with each city's Development Construction Program, and stabilization of exposed soil not associated with construction sites. Initial assessments conducted by the LCC Watershed Group have indicated that vacant lots, Caltrans rights-of-way and transmission line rights-of-way are the primary areas of exposed soil not associated with construction sites. Specific control measures for these areas are explained in the following section.

3.4.1.3 List of Nonstructural TCMs

Table 3-5 lists planned and potential nonstructural TCMs for each participating agency. The BMP effectiveness from Table 3-2 is based on similar BMPs listed in Tetra Tech's CLRP for Chollas Creek Watershed in San Diego County, 2012. The correlation of BMP effectiveness with WQPs is based on Table 3-1. The pages following Table 3-5 describe each of the listed controls.

The responses for each agency under Table 3-5 are defined as follows:

✗ *Planned TCM*. Under the presumption that 1) the TCM will likely not require approval of the governing body and 2) the governing body approves adequate staff/budget (if necessary), the TCM will be implemented.

P *Potential TCM*. The TCM is under consideration by the agency, however implementation is contingent upon yet to be determined factors. These factors include approval by the governing body, additional time needed to inform the governing body and/or relevant staff and approval of service contracts. As such implementation cannot be assured at this time. If the Potential TCM is not adopted by the agency within the first two years of the implementation of the WMP, it will be reconsidered through the adaptive management process.

C *Completed TCM*. The TCM is preexisting (has been in effect for several years or more).

It is important to note that Caltrans and the LACFCD are operating regional stormwater programs and consequently incorporating localized institutional TCMs may not be feasible. As such their exclusion from such TCMs is justified.

The schedule of implementation for the TCMs is provided in Chapter 5.

ENHANCED TRACKING THROUGH USE OF ONLINE GIS MS4 PERMIT DATABASE

TCM-MRP-1

Measures:

- Enter the enhanced tracking requirements of the fourth term MS4 Permit on an online GIS database management system dedicated to Phase I MS4 Permit compliance. Program elements addressed include all the MCMs (Development Construction, Planning and Land Development, Industrial/Commercial Facilities, Public Agency Activities, Public Information and Participation and Illicit Connection/Discharge Elimination) and the Monitoring and Reporting Program.
- Use the consolidated tracking data to:
    - Improve the effectiveness of the JSWMP (e.g. examine geospatial trends in IC/IDs, which could be used to strategically distribute public education materials) and WMP.
    - Assess the JSWMP and improve the annual reporting process.
    - Guide the adaptive management process through this assessment.

Many of the cities are implementing the measures through the use of *MS4Front*, a propriety online GIS MS4 Permit database management system.

TRAIN STAFF TO FACILITATE LID AND GREEN STREETS IMPLEMENTATION

TCM-PLD-1

Measures:

- Conduct training for relevant staff in LID and Green Streets implementation prior to the onset of the programs. The elements of the training follow the provisions listed in MS4 Permit §VI.D.7.
- Educate governing bodies in LID and Green Streets implementation (optional).

Several cities have already accomplished these measures, which facilitate LID implementation and address WQPs.

ORDINANCE REQUIRES LID BMPS FOR PROJECTS BELOW MS4 PERMIT THRESHOLDS

TCM-PLD-2

Measures:

- Adopt an ordinance requiring LID BMPs for smaller development projects that are below the thresholds for inclusion under the Planning and Land Development MCM Program.

Downey, South Gate and Signal Hill have already accomplished this measure, which facilitates LID and addresses WQPs.

PRIORITIZE FACILITIES/INSPECTIONS BASED ON WATER QUALITY PRIORITIES

TCM-ICF-1 (MCM-ICF-3)

MS4 Permit: Modified MCM (replaces §VI.D.6.d, §VI.D.6.e)

A program has been developed to prioritize industrial/commercial facilities based on their potential to adversely impact WQPs. The resulting prioritization scheme determines the inspection frequency,

replacing the uniform inspection frequency provided in the MS4 Permit. This allows Cities to concentrate efforts on WQPs.

The complete program is detailed in the Minimum Control Measures section of this chapter – see MCM-ICF-3.

EXPOSED SOIL ORDINANCE

TCM-TSS-1

This TCM is an element of the TSS Reduction Strategy.

- Adopt ordinances that require landscaping, erosion control, and sediment control on vacant lots and other significant sources of exposed dirt.
- These efforts are distinct from construction activity control measures, which are addressed under the Development Construction MCM program.

The City of Whittier has successfully adopted and implemented such an ordinance. The ordinance also requires drought tolerant landscaping/xeriscaping. The ordinance language may be used as a template to develop similar ordinances for the other participating agencies, and as such is included in Appendix A-3-3.

EROSION REPAIR AND SLOPE STABILIZATION ON PRIVATE PROPERTY

TCM-TSS-2

This TCM is an element of the TSS Reduction Strategy. Measures include:

- If adopted, enforce the ordinances from TCM-TSS-1.
- Proactively enforce the existing stormwater ordinance regarding TSS-laden stormwater discharges (or potential discharges) from significant sources of exposed dirt and follow the Progressive Enforcement Policy. This may include observing site conditions prior to rain events and visual monitoring of stormwater discharges.

The City of Whittier has successfully implemented an ordinance in conformance with TCM-TSS-1. Pictures of some of the landscaped lots are included.

Wardman St and Philadelphia St, NW corner (1)

Wardman St and Philadelphia St, NW corner (2)

Greenleaf Ave and Philadelphia St, east side

Bailey St and Comstock Ave, NW corner

PRIVATE PARKING LOT SWEEPING ORDINANCE

TCM-TSS-3

This TCM is an element of the TSS Reduction Strategy.

- Adopt an ordinance that requires sweeping of private parking lots. An example ordinance from the City of Signal Hill is included in Appendix A-3-3.

SWEEPING OF PRIVATE ROADS AND PARKING LOTS

TCM-TSS-4

This TCM is an element of the TSS Reduction Strategy.

- If adopted, enforce the ordinance from TCM-TSS-3.
- Proactively enforce the existing stormwater ordinance regarding TSS-laden stormwater discharges (or potential discharges) for private roads and parking lots and follow the Progressive Enforcement Policy. This may include observing site conditions prior to rain events and visual monitoring of stormwater discharges.

NEGOTIATIONS WITH REGULATED UTILITIES FOR EROSION CONTROL WITHIN R.O.W.

TCM-TSS-5

This TCM is an element of the TSS Reduction Strategy.

- As a Watershed Group, pursue agreements between cities and utilities regarding erosion and sediment control in rights-of-way.

Since Caltrans is a participant in the Watershed Group, the cities will work with Caltrans to ensure that its rights-of-way are stabilized in a timely manner. However, since the public and private utilities whose rights-of-way must be stabilized are not members of the Watershed Group, negotiations with the utilities on how best to keep sediment from their rights-of-way out of the storm drain system will be necessary.

EROSION REPAIR AND SLOPE STABILIZATION ON PUBLIC PROPERTY

TCM-TSS-6

This TCM is an element of the TSS Reduction Strategy.

- Implement landscaping, erosion control, and sediment control on significant sources of exposed dirt on public property.

Encourage retrofitting of downspouts (downspout disconnect) — *TCM-RET-1*

Measures:

- Encourage owners/operators of existing developments to disconnect existing downspouts from the MS4.

Incentives for irrigation reduction practices — *TCM-NSWD-1*

Measures:

- Provide incentives such as rebates for irrigation reduction (i.e. runoff reduction) practices such as xeriscaping and turf conversion.

All cities are currently involved in this effort through the Metropolitan Water District's water conservation rebate program.

Refocused outreach to target audiences and water quality priorities — *TCM-PIP-1*

Measures:

- Within the Public Information and Education Program, elements such as material use/development and advertisements will address WQPs. The development of this effort will be ongoing throughout the MS4 Permit term, and may be regarded as a Watershed Group effort.

Upgraded sweeping equipment (e.g. regenerative) — *TCM-PAA-1*

Measures:

- Upgrade street sweeping equipment to regenerative or other high-efficiency new technology.

Most of the Cities contract street sweeping to private companies. These companies have already phased in regenerative sweepers. The City of Whittier has been phasing in regenerative sweepers and expects to be 100% regenerative by the end of the MS4 Permit term. The City of Long Beach operates vacuum sweepers over regenerative due to maintenance concerns. However the City is considering contracting this service in the near future. If this occurs, the vacuum sweepers will likely be replaced with regenerative sweepers provided by the contractor.

ADOPT SEWER SYSTEM MANAGEMENT PLAN MEASURES: *TCM-PAA-2*

All agencies are enrolled in the statewide Waste Discharge Requirements for Sanitary Sewer Systems, which required the development and implementation of a Sewer System Management Plan (SSMP in mid 2009. The goal of the SSMP is to reduce and prevent sanitary sewer overflows (SSOs), as well as mitigate any SSOs that do occur. This goal also addresses WQPs. Elements of the SSMP include:

- Sanitary sewer system operation and maintenance program
- Design and performance provisions
- Overflow emergency response plan
- FOG Control Program
- System Evaluation and Capacity Assurance Plan

Following these SSMP elements will address WQPs.

ADOPT (NONSTRUCTURAL) STATEWIDE TRASH AMENDMENTS *TCM-PAA-3*

Measures:

- Any mandatory nonstructural control measures required by the statewide Trash Amendments (currently in draft form) will result in trash load reductions. Since pollutants such as organics can adhere to plastic trash, secondary reductions for non-trash pollutants may be expected.

INCREASED STREET SWEEPING FREQUENCY OR ROUTES *TCM-PAA-4*

Measures:

- Increase the street sweeping frequency, jurisdiction-wide or in high trash-generating areas and/or include additional routes (e.g. center medians and intersections).

PREPARE GUIDANCE DOCUMENTS TO AID IMPLEMENTATION OF MS4 PERMIT MCMS *TCM-SWM-1*

This WMP includes in Appendix A-3-1 guidance documents and template forms to aid the Agencies in implementation of the MS4 Permit MCMs. These documents were developed to address two issues: 1) the MS4 Permit introduces many new and enhanced MCM provisions that do not have preexisting guidance documentation and 2) the model Stormwater Quality Management Program (SQMP) – which was required in the prior LA MS4 Permit and served as a guide to permit implementation – is now obsolete. Unlike the SQMP, the Agencies are not bound to the guidance and forms provided. They are provided as a resource to improve the effectiveness of the JSWMPs.

COPPER REDUCTION THROUGH IMPLEMENTATION OF SB 346 *TCM-INI-1*

This initiative TCM has been completed recently. The impact of the TCM over time has been incorporated into the RAA.

LEAD REDUCTION THROUGH IMPLEMENTATION OF SB 757 **TCM-INI-2**

This initiative TCM has been completed recently.

SUPPORT ZINC REDUCTION IN TIRES THROUGH SAFER CONSUMER PRODUCT REGULATIONS **TCM-INI-3**

Measures:

- As a Watershed Group, plan to work with others to use the Department of Toxic Substances Control's Safer Consumer Product Regulations to reduce the zinc in tires, which one of the greatest sources of zinc in urban areas.

APPLY FOR GRANT FUNDING FOR STORMWATER CAPTURE PROJECTS **TCM-INI-4**

Measures:

- Initiate Individual or multi-jurisdictional efforts to apply for grant funding for stormwater quality/capture projects.

In April 2014, The Gateway Water Management Authority received grant funding of $1.3 million for LID projects in the Cities of Downey, Norwalk, Pico Rivera, Santa Fe Springs and Whittier (as well as Lynwood, Paramount, Signal Hill and South Gate).

3.4.2 STRUCTURAL TARGETED CONTROL MEASURES

Structural TCMs are Structural BMPs, in addition to MCMs, designed with the objective to achieve interim and final water quality-based effluent limitations and/or receiving water limitations. Structural TCMs are an important component of the Watershed Group's load reduction strategy. These BMPs are constructed to capture runoff and filter, infiltrate, or treat it. If properly maintained, these BMPs can have high pollutant removal efficiencies (see the *Performance Evaluation of Structural BMPs* element of this section); however, they tend to be more expensive than nonstructural BMPs. The two prevailing approaches for implementing Structural BMPs are regional and distributed approaches. Both serve important purposes and should be considered in combination to determine the best possible implementation strategy to meet the Watershed Group's water quality goals.

DISTRIBUTED BMPS

Distributed Structural BMPs are generally built at the site-scale. They are intended to treat stormwater runoff at the source and usually capture runoff from a single parcel or site.

Figure 3-1: Distributed BMP Schematic

REGIONAL BMPS

Regional BMPs refer to large structural BMPs that receive flows from neighborhoods or large areas and may serve dual purposes for flood control or groundwater recharge[3].

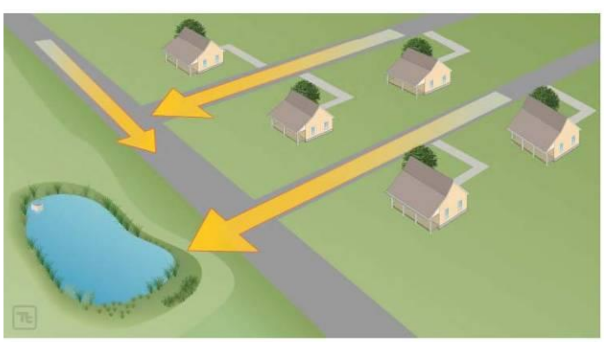

Figure 3-2: Regional BMP Schematic

[3] San Diego River Watershed Comprehensive Load Reduction Plan (2012)

3.4.2.1 STRUCTURAL BMP SUBCATEGORIES

Structural BMPs fall under a variety of subcategories that correspond to their function and water quality benefit. Some of the most common of these subcategories are described below. These subcategories will be used throughout the WMP to describe existing, planned, and potential regional and distributed BMPs.

INFILTRATION BMPS

Infiltration BMPs allow for stormwater to percolate through the native soils and recharge the underlying groundwater table, subsequently decreasing the volume of water discharged to the downstream waterbodies. These BMPs must be constructed in areas where the native soils have percolation rates and groundwater levels sufficient for infiltration.

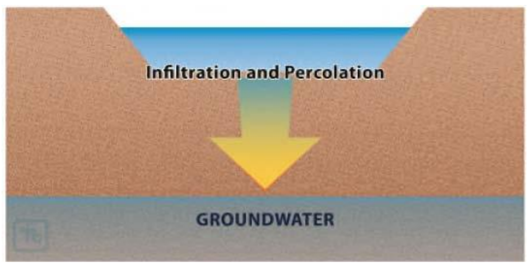

Figure 3-3: Infiltration BMP Schematic

INFILTRATION BASIN

An infiltration basin consists of an earthen basin with a flat bottom. An infiltration basin retains stormwater runoff in the basin and allows the retained runoff to percolate into the underlying soils. The bottom of an infiltration basin is typically vegetated with dryland grasses or irrigated turf grass.

INFILTRATION TRENCH

An infiltration trench is a long, narrow, rock-filled trench with no outlet other than for overflow. Runoff is stored in the void space between stones and infiltrates through the bottom and sides of the trench. Infiltration trenches provide the majority of their pollutant removal benefits through volume reduction. Pretreatment is important for limiting amounts of coarse sediment entering the trench which can clog and render the trench ineffective.

BIORETENTION WITH NO UNDERDRAIN

Bioretention facilities with no underdrain are landscaped shallow depressions that capture and infiltrate stormwater runoff. These facilities function as a soil and plant-based filtration device that removes pollutants through a variety of physical, biological, and chemical treatment processes. The facilities normally consist of a ponding area, mulch layer, engineered media, and vegetation. As stormwater passes down through the media, pollutants are filtered, adsorbed, and biodegraded by the soil and vegetation.

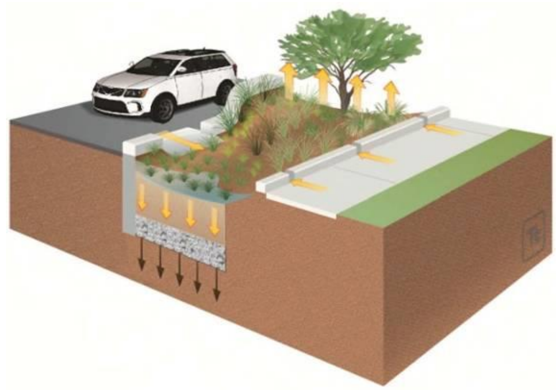

Figure 3-4: Bioretention without underdrain schematic

Drywell

Drywells are similar to infiltration trenches in their design and function; however, drywells generally have a greater depth to footprint area ratio and can be installed at relatively deep depths. A drywell is a subsurface storage facility designed to temporarily store and infiltrate runoff. A drywell may be either a small excavated pit filled with aggregate or a prefabricated storage chamber or pipe segment.

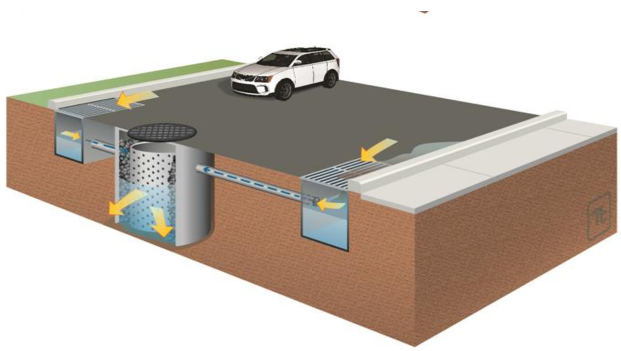

Figure 3-5: Drywell schematic

Porous pavement

Porous pavement (concrete, asphalt, and pavers) contain small voids that allow water to pass through to a gravel base. They come in a variety of forms; they may be a modular paving system (concrete pavers, grass-pave, or gravel-pave) or poured in place pavement (porous concrete, permeable asphalt). Porous pavements treat stormwater and remove sediments and metals within the pavement pore space and gravel base. While conventional pavement results in increased rates and volumes of surface runoff, properly constructed and maintained porous pavements allow stormwater to percolate through the pavement and enter the soil below. This facilitates groundwater recharge while providing the structural and functional features needed for the roadway, parking lot, or sidewalk. The paving surface, subgrade, and installation requirements of porous pavements are more complex than those for conventional asphalt or concrete surfaces.

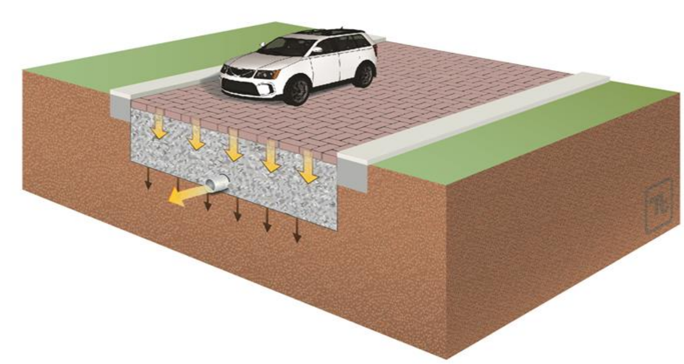

Figure 3-6: Porous pavement schematic

Biotreatment BMPs

Biotreatment BMPs treat stormwater through a variety of physical, chemical, and biological processes prior to being discharged to the MS4 system. These BMPs should be considered where Infiltration BMPs are infeasible.

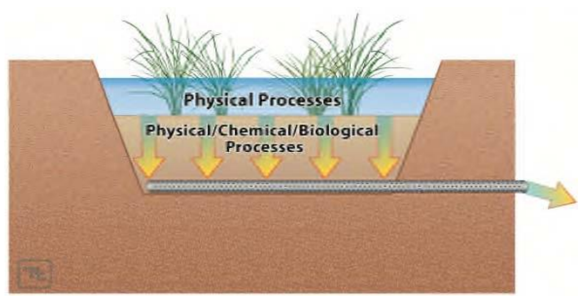

Figure 3-7: Biotreatment BMP schematic

Bioretention with Underdrains

Bioretention stormwater treatment facilities are landscaped shallow depressions that capture and filter stormwater runoff. These facilities function as a soil and plant-based filtration device that removes pollutants through a variety of physical, biological, and chemical treatment processes. The facilities normally consist of a ponding area, mulch layer, engineered media, and vegetation. As stormwater passes down through the media, pollutants are filtered, adsorbed, biodegraded, and sequestered by the soil and vegetation. Bioretention with underdrain systems are utilized for areas containing native soils with low permeability or steep slopes, where the underdrain system routes the treated runoff to the storm drain system.

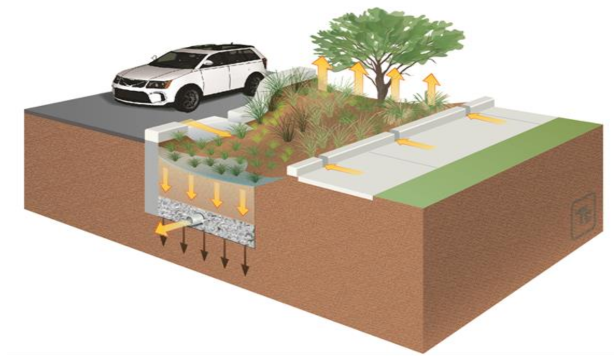

Figure 3-8: Bioretention with Underdrains schematic

Vegetated Swales

Vegetated swales are open, shallow channels with low-lying vegetation covering the side slopes and bottom that collect and slowly convey runoff flow to downstream discharge points. Vegetated swales provide pollutant removal through settling and filtration in the vegetation (usually grasses) lining the channels. In addition, although it is not their primary purpose, vegetated swales also provide the opportunity for volume reduction through subsequent infiltration and evapotranspiration and reduce the flow velocity. Where soil conditions allow, volume reduction in vegetated swales can be enhanced by adding a gravel drainage layer underneath the swale allowing additional flows to be retained and infiltrated. Where slopes are shallow and soil conditions limit or prohibit infiltration, an underdrain system or low flow channel for dry weather flows may be required to minimize ponding and convey treated and/or dry weather flows to an acceptable discharge point. An effective vegetated swale achieves uniform sheet flow through a densely vegetated area for a period of several minutes (depending on design standard used).

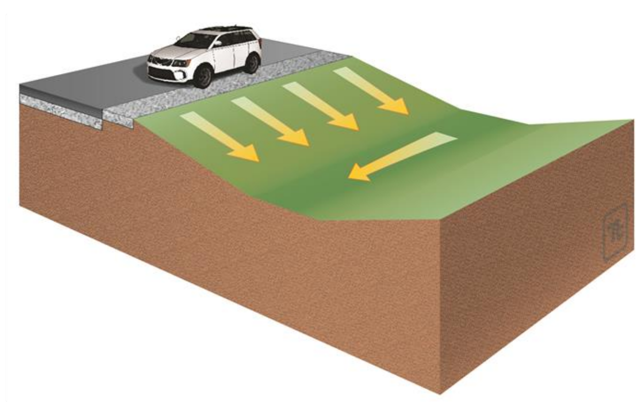

Figure 3-9: Vegetated swale schematic

Wet Detention Basin

Wet detention basins are constructed, naturalistic ponds with a permanent or seasonal pool of water (also called a “wet pool” or “dead storage”). Aquascape facilities, such as artificial lakes, are a special

form of wet pool facility that can incorporate innovative design elements to allow them to function as a stormwater treatment facility in addition to an aesthetic water feature. Wet ponds require base flows to exceed or match losses through evaporation and/or infiltration, and they must be designed with the outlet positioned and/or operated in such a way as to maintain a permanent pool. Wet ponds can be designed to provide extended detention of incoming flows using the volume above the permanent pool surface.

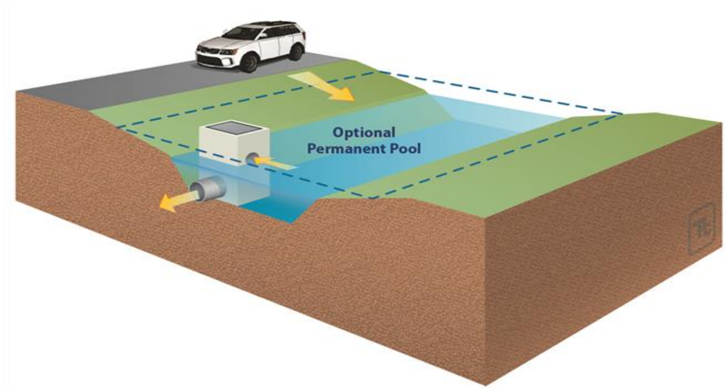

Figure 3-10: Wet detention basin schematic

DRY EXTENDED DETENTION BASIN

Dry extended detention basins are basins whose outlets have been designed to detain the stormwater runoff to allow particulates and associated pollutants to settle out. Dry extended detention basins do not have a permanent pool; they are designed to drain completely between storm events. They can also be used to provide hydromodification and/or flood control by modifying the outlet control structure and providing additional detention storage. The slopes, bottom, and forebay of Dry extended detention basins are typically vegetated.

Figure 3-11: Dry extended detention basin schematic

Pre Treatment BMPs

Pre-treatment BMPs are typically not used as primary treatment; however, they are highly recommended for preliminary treatment in order to prolong the life and prevent clogging of the downstream system in a treatment train.

Media Filters

Media filters are usually designed as multi-chambered stormwater practices; the first is a settling chamber, and the second is a filter bed filled with sand or another filtering media. As stormwater flows into the first chamber, large particles settle out, and then finer particles and other pollutants are removed as stormwater flows through the filtering medium. They can also be used as pre-treatment, with their location prior to any infiltration or biotreatment BMP.

Catch Basin Inserts

Catch basins inserts typically include a grate or curb inlet and a sump to capture sediment, debris, and pollutants. Filter fabric can also be included to provide additional filtering of particles. The effectiveness of catch basins, their ability to remove sediments and other pollutants, depends on its design and maintenance. Some inserts are designed to drop directly into existing catch basins, while others may require retrofit construction. Similar to media filters, catch basin filters can also be used as a pre-treatment BMP for infiltration and biotreatment BMPs.

Figure 3-12: Pre-treatment BMP schematic

Rainfall Harvest

Rainfall Harvest BMPs capture rainwater to be reused in lieu of discharging directly to the MS4.

Above Ground Cisterns

Cisterns are large above ground tanks that store stormwater collected from impervious surfaces for domestic consumption. Above ground cisterns are used to capture runoff. Mesh screens are typically used to filter large debris before the stormwater enters the cistern. The collected stormwater could potentially be used for landscape irrigation and some interior uses, such as toilets and washing machines. The collection and consumption of the stormwater results in pollution control, volume reduction, and peak flow reduction from the site.

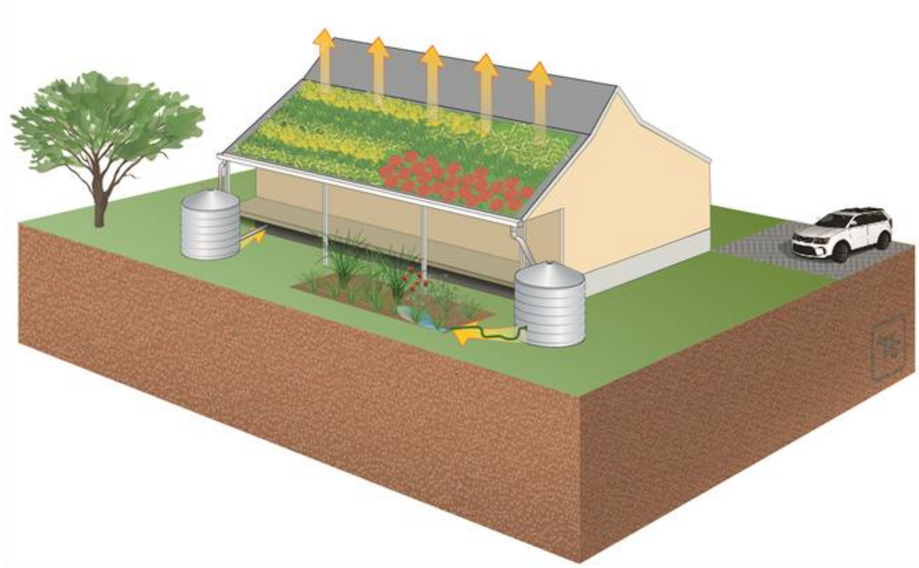

Figure 3-13: Above ground cisterns schematic

UNDERGROUND DETENTION

Underground detention systems function similarly to above ground cisterns in that they collect and use stormwater from impervious surfaces. These systems are concealed underground and can allow for larger stormwater storage and capture additional impervious surfaces not easily captured in an above ground system (e.g. parking lots and sidewalks).

Figure 3-14: Underground detention schematic

Diversion Systems

Low Flow Diversion

Flow diversion systems collect and divert runoff. Flow diversion structures can primarily be used in two ways. First, flow diversion structures may be used to direct dry weather flows to a treatment facility, preventing the runoff from reaching a receiving water body. This is typically done with low flow runoff, which occurs during periods of dry weather. Second, flow diversion structures can also be modified by incorporating them into other BMPs. For example, diverted flow can be fed into a regional BMP. Properly designed stormwater diversion systems are very effective for preventing stormwater from being contaminated and for routing contaminated flows to a proper treatment facility.

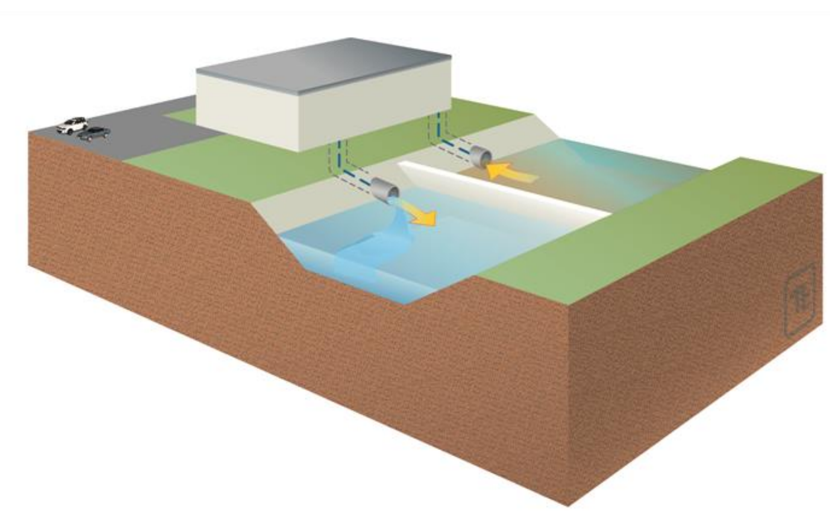

Figure 3-15: Low flow diversion schematic

3.4.2.2 PERFORMANCE EVALUATION OF STRUCTURAL BMPS

It is important to take the performance of stormwater BMPs into consideration during the planning and implementation process. This section provides an analysis of specific BMPs to determine the pollutant removal effectiveness of those BMPs. The International Stormwater BMP Database[4] (BMP Database) project website was used to analyze different BMP types for their effectiveness in removing specific pollutants. The website features a database of over 530 BMP studies, performance analysis results, BMP performance tools, monitoring guidance and other study-related publications. Performance studies relevant to BMPs matching the criteria for an effective regional or distributed application were analyzed to include the following:

- Bioretention
- Bioswale
- Detention Basin
- Grass Strip
- Porous Pavement
- Retention Pond
- Wetland Basin
- Wetland Channel

The average influent and effluent concentrations for the 95th percentile confidence interval were analyzed for pollutants of concern for the Lower Los Angeles River (LSGR) watershed available through the BMP Database. The following pollutants were analyzed:

- Arsenic (Dissolved)
- Arsenic (Total)
- Cadmium (Dissolved)
- Cadmium (Total)
- Chromium (Dissolved)
- Chromium (Total)
- Copper (Dissolved)
- Copper (Total)
- E. coli
- Enterococcus
- Fecal Coliform
- Lead (Dissolved)
- Lead (Total)
- Nickel (Dissolved)
- Nickel (Total)
- TSS
- Zinc (Dissolved)

[4] Geosyntec Consultants, Wright Water Engineers. International Stormwater Best Management Practices (BMP) Database Pollutant Category Summary Statistical Addendum: TSS, Bacteria, Nutrients, and Metals. July 2012.

- Zinc (Total)

The majority of the BMPs analyzed by the BMP Database project are located in major transportation corridors. Land use categories such as residential, commercial, and industrial are not heavily represented in the analysis. The BMP effectiveness may also vary with regional conditions. Many BMPs were monitored in areas where a higher intensity and volume of rainfall than LA County is observed. Additionally, some of the BMPs monitored were designed in the 1990s, 1980s, or earlier. These are expected to have been designed with less stringent guidelines resulting in a more conservative analysis. Although the conditions noted above may result in a slight variance in BMP effectiveness, the pollutant removal efficiencies are considered to be applicable.

It is important to note that the majority of pollutant load reduction is achieved using infiltration BMPs which result in an overall volume reduction. The analysis emphasizes reduction in concentrations of constituents, rather than volume or load reduction. Flow reduction analyses were not performed due to the dependence on rainfall intensity, soil types, and other site-specific conditions. The RAA has determined the volume reduction needed to meet compliance goals.

RESULTS

The analysis can be used to evaluate BMPs and support assumptions made in the RAA regarding effluent concentrations from specific BMPs. The required pollutant reductions determined through the RAA will be used to prioritize the BMPs to maximize effectiveness. The results of the BMP Database analysis are presented in a comparison format to easily visualize the pollutant removal efficiencies of each BMP type.

Each pollutant analyzed is a pollutant of concern for the LSGR WMP watersheds, with the exception of Total Suspended Solids (TSS). The reason for its inclusion is that studies have shown that there is a direct correlation between sediment concentration and various pollutants for which the watersheds are impaired. The data compiled from the BMP Database was used to determine the percent removal of each BMP for each pollutant. Each BMP was ranked in terms of pollutant removal efficiency for each pollutant type (see the *BMP Pollutant Removal Effectiveness Comparison Charts* Below). Data for specific pollutants was not available for each BMP; therefore, only available data is presented.

The next analysis included taking the data and grouping the removal efficiencies under each BMP type. The pollutants were then ranked in terms of pollutant removal efficiency for each BMP type (see the *BMP Type Comparison Charts for Pollutant Removal* below). Data for specific pollutants was not available for each BMP; therefore, only available data is presented.

Results Analysis Summary

The statistical analysis presented has many applications, including supporting BMP prioritization and the RAA analysis. As future applications are undertaken, the results can be analyzed in more detail. For this analysis, the following observations were discovered:

- Overall, the retention pond returned the best results in terms of pollutant removal efficiency for several pollutants, with more than 60% removal for E. coli, TSS, Enterococcus, total lead, fecal coliform, and total zinc.
- Among the constituents analyzed, the percent removals were often the highest for metals, lead and zinc in particular.
- The poorest performance was often observed for nutrients and bacteria, with concentrations increasing for some BMP types. Leaching of nutrients from soils/planting media and resuspension of captured pollutants may be a cause of the increases observed in these BMPs[5].

It is important to note that the majority of pollutant removal associated with stormwater BMPs will be due to infiltration and overall volume reduction. Although this is the case, a small component may be associated with inflow to outflow pollution concentration reduction and the analysis focuses on this percent reduction. Percent reduction is easily understandable and convenient for reporting; therefore, the method seems to be appropriate for this analysis. Refer to the article "Voodoo Hydrology" in the July 2006 article of Stormwater Magazine[6] for further information on caveats to this method. Although the analysis does not cover volume reduction, the RAA analysis has estimated the pollutant reduction necessary to meet compliance.

3.4.2.3 Existing Targeted Structural BMPs

The existing structural BMPs in place within the Watershed Group area have been included in the RAA model. Figure 3-16 indicates the locations of these existing BMPs. Refer to Chapter 4 for more details.

3.4.2.4 Control Measures identified in TMDLs, Implementation Plans and State Amendments

There are no control measures identified in the San Gabriel River Metals TMDL. Planned and potential control measures to address the Metals TMDL are incorporated within the WCMs identified in this Chapter.

The State Water Resources Control Board is expected to adopt the statewide trash amendments in late 2014. The current draft amendments include as a compliance route the installation of full-capture devices in the priority land use areas of high density residential, industrial, commercial, mixed urban and public transportation stations. These structural control measures are expected to result in significant reductions in trash loading. Also, since pollutants such as organics can adhere to plastic trash, secondary reductions for non-trash pollutants may be expected.

3.4.2.5 PLANNED TARGETED CONTROL MEASURES

The projects listed below have been planned to some extent by the Participating Agencies. A literature review was conducted of existing TMDL Implementation Plans, the existing IRWMP, and other planning documents to collect data. The extent of planning of these projects ranges from a roundtable discussion to being in preliminary phases of design.

GATEWAY MULTI-AGENCY, MULTI-WATERSHED PROJECT TO INCORPORATE LOW IMPACT DEVELOPMENT (LID) BMPS INTO MAJOR TRANSPORTATION CORRIDORS IN THE GATEWAY REGION OF LOS ANGELES (GATEWAY PROP 84 PROJECT - **GRANT APPLICATION APPROVED**)

This project is a planned regional project within multiple cities to include the cities of Downey, Norwalk, Santa Fe Springs, and Whittier. The Gateway Water Management Authority (GWMA) applied for funds through the Prop 84 Grant Round 2 program to put towards this project, which was approved in May 2014. The project is in the preliminary design phase and the information provided is subject to change.

The project seeks to prevent stormwater contamination of surface waters in three watersheds, to include the San Gabriel River. This will be accomplished by installing LID BMPs to treat stormwater runoff, and its associated pollutants. Table 3-6 lists the BMPs to be implemented within the Cities and Figures 3-18 to 3-22 show the project locations within each city.

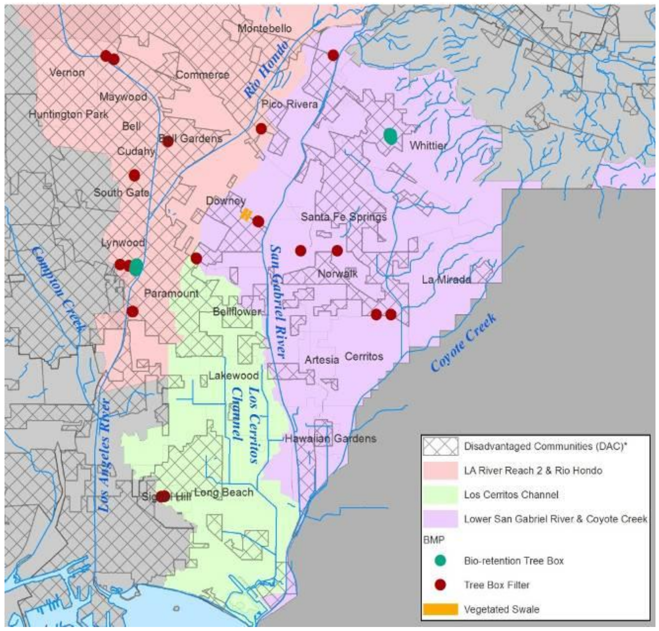

Figure 3-17: BMP Locations within the Gateway Prop 84 Project

Table 3-6: Proposed BMPs within the Gateway Prop 84 Project

City	LID BMPs	Location	Anticipated treatment[7]
Downey	(2) Tree box filters	(1) NEC Pangborn Ave & Firestone Blvd, (1) NWC Pangborn Ave & Firestone Blvd	29,032 cf
	(1) Bioswale	(1) Firestone Blvd. at Stonewood Mall	11,741 cf
Norwalk	(2) Tree box filters	(1) Imperial Highway & Volunteer Ave, (1) Firestone Blvd & Imperial Highway	14,516 cf
Pico Rivera	(1) Tree box filter	(1) Beverly Boulevard and Tobias Avenue	7, 258 cf
Santa Fe Springs	(2) Tree box filters	(1) Alondra Blvd and Shoemaker Ave, (1) Alondra Blvd and Marquardt Ave	14,516 cf
Whittier	(10) Bioretention Tree Wells	Locations to be determined	5,870 cf

[7] Treatment volume calculations based on a 24-hour, 0.75 in storm, 6x6 tree box filter units and a 1200 LF swale.

IRWMP Projects

The following project descriptions are from the Gateway Integrated Regional Watershed Management Plan (IRWMP). These projects have been discussed in detail with the Gateway Water Management Authority (GWMA) and are likely to be implemented once the required funding is acquired. Further details about each project can be found in the Gateway IRWMP documents.

Bellflower NPDES Permit and TMDL Compliance Stormwater Improvements

This project will consist of installing catch basin automatic retractable screens (ARS), vegetated swales, bioretention systems, infiltration basins, porous pavement, and covered trash receptacles at various locations within the city of Bellflower.

The specific locations have not yet been identified; therefore, as this project progresses the RAA results will be taken into consideration in order to place the BMPs in locations with the highest potential for pollutant loading reduction.

Construct Bioswales/Landscaping in various locations in Long Beach

This project will be located in the city of Long Beach and is planned to construct and/or reconstruct new and existing medians to capture and treat stormwater runoff.

The specific locations have not yet been identified; therefore, as this project progresses the RAA results will be taken into consideration in order to place the BMPs in locations with the highest potential for pollutant loading reduction.

The Los Cerritos, San Gabriel River and Alamitos Bay Low Flow Diversion System

This project will serve the cities of Long Beach, Bellflower, Norwalk, and Cerritos. The project plans to investigate sites along three waterbodies, to include the Lower San Gabriel River, to determine the feasibility of constructing Low Flow Diversion (LFD) Devices in locations that have high levels of metals and bacteria. This work will include the design and construction of four (4) LFDs that will be identified in the feasibility report.

The specific locations have not yet been identified; therefore, as this project progresses the RAA results will be taken into consideration in order to place the BMPs in locations with the highest potential for pollutant loading reduction.

Pump Station Vortex Separation System (VSS) Devices

This project will serve the cities of Long Beach, Bellflower, Norwalk, Cerritos and proposes to investigate sites upstream of the storm drain pump station along the Lower San Gabriel River to determine the feasibility of constructing Pre Filter Vortex Separation System Structural BMPs to capture trash, metals, and sediment possibly containing bacteria in five (5) locations. This project would provide a large amount of treatment in the San Gabriel River.

The specific locations have not yet been identified; therefore, as this project progresses the RAA results will be taken into consideration in order to place the BMPs in locations with the highest potential for pollutant loading reduction.

3.4.2.6 Potential Sites for Future Targeted Control Measures

A preliminary assessment has been performed for the Lower San Gabriel River Watershed to determine potential areas to locate regional BMPs. This was done with a preliminary GIS approach by screening areas within 660 feet (1/8 mile) of a waterbody and currently designated as open space as well as other potentially useful zoning designations. The overall size of each site was used to calculate the maximum amount of volume which could be stored at the site and the maximum amount of area that could be diverted to the site assuming the entire site were redeveloped to incorporate infiltration.

The equations used were derived from the Orange County Technical Guidance Document (OC TGD)[8] and can be found below:

$$\mathbf{DCV = CdA_{TRIBUTARY} \times \left(\frac{43560}{12}\right)}$$

Driving Equation No. 1

$$D_{MAX} = K_{DESIGN}T \times \left(\frac{1}{12}\right)$$

Assume K_{DESIGN} = 0.3 in/hr

0.3 in/hr is the lowest infiltration rate where infiltration is deemed feasible per the MS4 Permit.

$$D_{MAX} = 0.3 \times 48 \times \frac{1}{12} = 1.2 \text{ feet}$$

$$A_{BMP} = \frac{DCV}{D_{MAX}}$$

$$\mathbf{A_{TRIBUTARY} = \frac{A_{BMP} \times 1.2}{Cd \times \left(\frac{43560}{12}\right)}}$$

Driving Equation No. 2

$$C = (0.75 \times IMP) + 0.15 = 0.9$$

Assume 100% imperviousness

Assume d=1.1

1.1 inches is the highest depth on the LA County 85th Percentile Isohyetal Map for the LSGR watershed.

$$\mathbf{A_{TRIBUTARY} = \frac{A_{BMP} \times 1.2}{0.9 \times 1.1 \times \left(\frac{43560}{12}\right)}}$$

Final Equation No. 1

$$\mathbf{DCV = A_{BMP} \times 1.2}$$

Final Equation No. 2

A_{BMP} has been assumed to be the total site area to determine the maximum tributary area that can be diverted to the site and the maximum volume the site can treat.

Where:

DCV:	Design Capture Volume	$A_{TRIBUTARY}$:	Area Tributary to BMP	T:	Drawdown Time
C:	Runoff Coefficient	D_{MAX}:	Maximum Effective Depth	A_{BMP}:	Footprint Area of BMP
d:	Rainfall Depth	K_{DESIGN}:	Design Infiltration Rate	IMP:	Percent Impervious

[8] Orange County. *Technical Guidance Document for the Preparation of Conceptual/Preliminary and/or Project Water Quality Management Plans (WQMPs).* May 19, 2011.

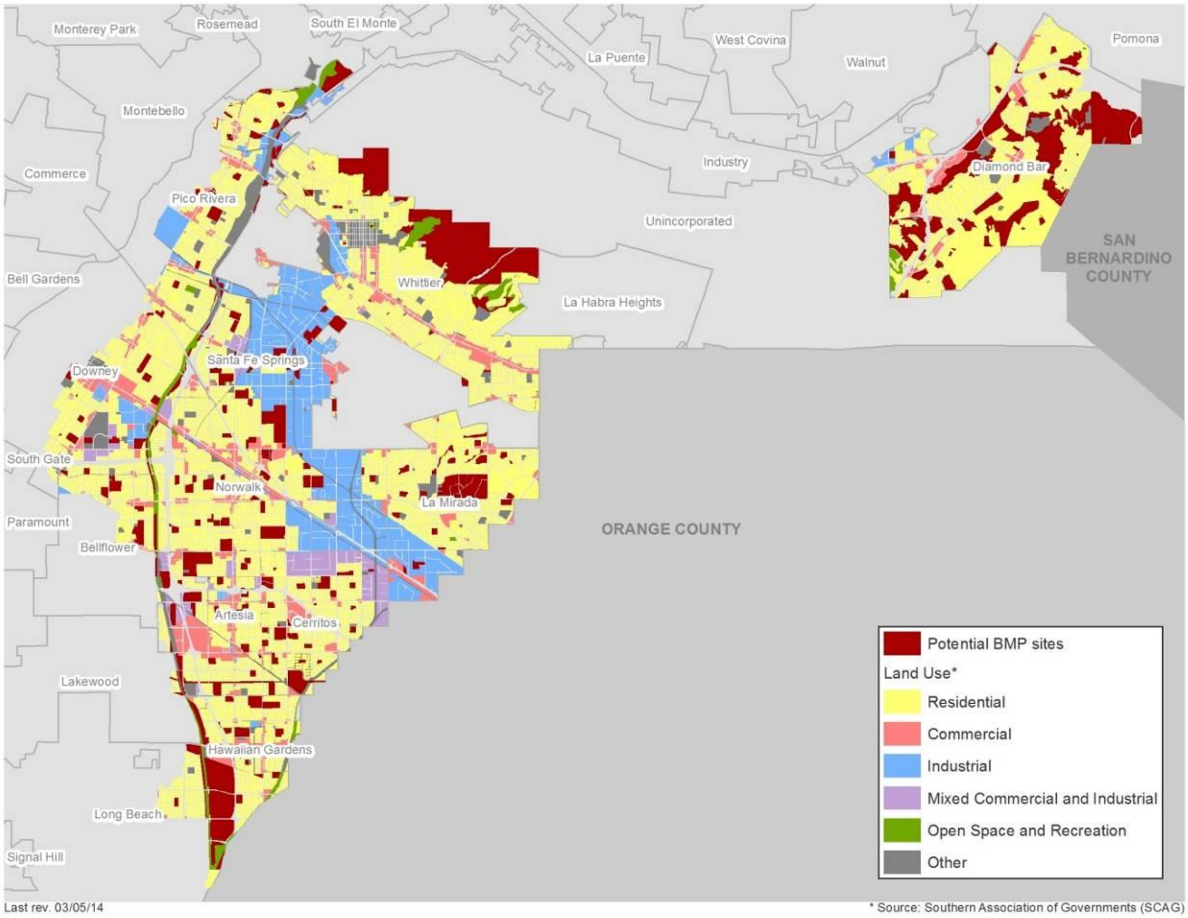

Figure 3-23: Potential Sites for Future Structural BMPs

Figure 3-23 indicates the locations of sites potentially available for future regional BMPs. Additionally, Table 3-7 and Table 3-8 indicate the locations of sites potentially available for future regional BMPs within the Coyote Creek Watershed and the San Gabriel River Watershed, respectively. These locations can serve as a starting point during the implementation phase of the WMP. They have been grouped by jurisdiction and listed in order by land use. The land use with the highest accessibility is listed first. Within each land use designation, the sites have been listed from largest to smallest. Note that with regional BMPs there are opportunities for multiple agencies to benefit from the same site. The land uses are ranked as follows:

Open Space and Recreation: Sites designated for open space, parks, and recreational activities were ranked with the highest potential for future regional BMPs. The reasoning being that these types of areas have the highest likeliness to be publically owned and not require land acquisition, generally have a high percentage of landscaped area available, and have a high opportunity for multiple benefits.

Educational Use: Sites designated for educational use were ranked with the second highest potential for future regional BMPs. The reasoning being that these types of areas although not city-

owned could have an easier land acquisition process than privately owned land, generally have a high percentage of landscaped area available, and have a high opportunity for multiple benefits.

Government Institution: Sites designated for educational use were ranked with the third highest potential for future regional BMPs. This is due to the institution being government owned presenting a higher chance of collaboration than a privately owned facility. Although this may be the case, many government institutions may not be willing to take on maintenance responsibilities which would result in the necessity of land acquisition or maintenance agreements.

Golf Courses/ Country Clubs: Sites designated for golf courses or country clubs were ranked with the fourth highest potential for future regional BMPs. The reasoning being that these types of areas generally have a high percentage of landscaped area available and have a high opportunity for multiple benefits. Although this may be the case, land acquisition for these sites is expected to be a difficult accomplishment.

Commercial Use: Sites designated for commercial areas were ranked with the fifth highest potential for future regional BMPs. The reasoning being that these types of areas generally have a high percentage of parking area available which could potentially be retrofitted for infiltration opportunities. Although this may be the case, land acquisition for these sites is expected to be a difficult accomplishment.

The available sites will be further assessed to determine the best location for a regional BMP. Note that the sites presented do not represent the only sites available for the Watershed Group. The ultimate site selection process should take into account the following characteristics:

Location in relation to RAA results: The RAA provides an estimation of runoff reduction to be provided in each area in order to meet the water quality objectives. The sites should be selected taking this into consideration.

GIS Data: GIS data should be further analyzed to screen projects based on criteria such as land use, topography, hydrologic features, streets and roads, existing storm drain infrastructure, and storm drain invert depth.

Project benefits: It is preferred that a project contains multiple benefits in order to increase the overall benefit and support for the project. Benefits to take into consideration include, but are not limited to, the following:

- Water quality benefits
- Water supply benefits
- Recreational use
- Multi-agency benefits
- Publically owned
- Storage availability
- Funding available

- Project readiness
- Flood control benefits
- Proximity to pollutant sources or impaired waters
- Adjacent to existing storm drain

PROJECT CONSTRAINTS: Not every project will be feasible; therefore, it is important to take into consideration any constraints that may result in project infeasibility. These constraints include, but are not limited to, the following:

- High groundwater
- Low infiltration rates
- Existing soil contamination/proximity to existing soil contamination
- Brownfields[9]
- Existing groundwater contamination/proximity to existing groundwater contamination
- Potential for soil instability (liquefaction zones, hillside areas)
- Existing private ownership (requires land acquisition)
- Cost Effectiveness
- Historical landmarks

[9] With certain legal exclusions and additions, the term "brownfield site" means real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant (*Environmental Protection Agency*).

3.4.3 RIGHT-OF-WAY BMPS

Right-of-way BMPs are systems of multiple distributed BMPs placed within a street right-of-way. These BMPs are designed to reduce the volume of stormwater discharge into the MS4 and treat stormwater runoff from adjacent streets and developments. Common right-of-way BMPs include bioretention, biofiltration, and permeable pavement. See the previous section for BMP descriptions. These BMPs can be implemented alone or in conjunction with one another.

A preliminary assessment has been performed to assess areas potentially available for right-of-way BMPs. This was done with a preliminary GIS approach by screening highways, arterial roads, and secondary (collector) roads located in non-residential areas within 200 feet of a catch basin location. The potential locations are indicated with grey circles on **Figure 3-24** below.

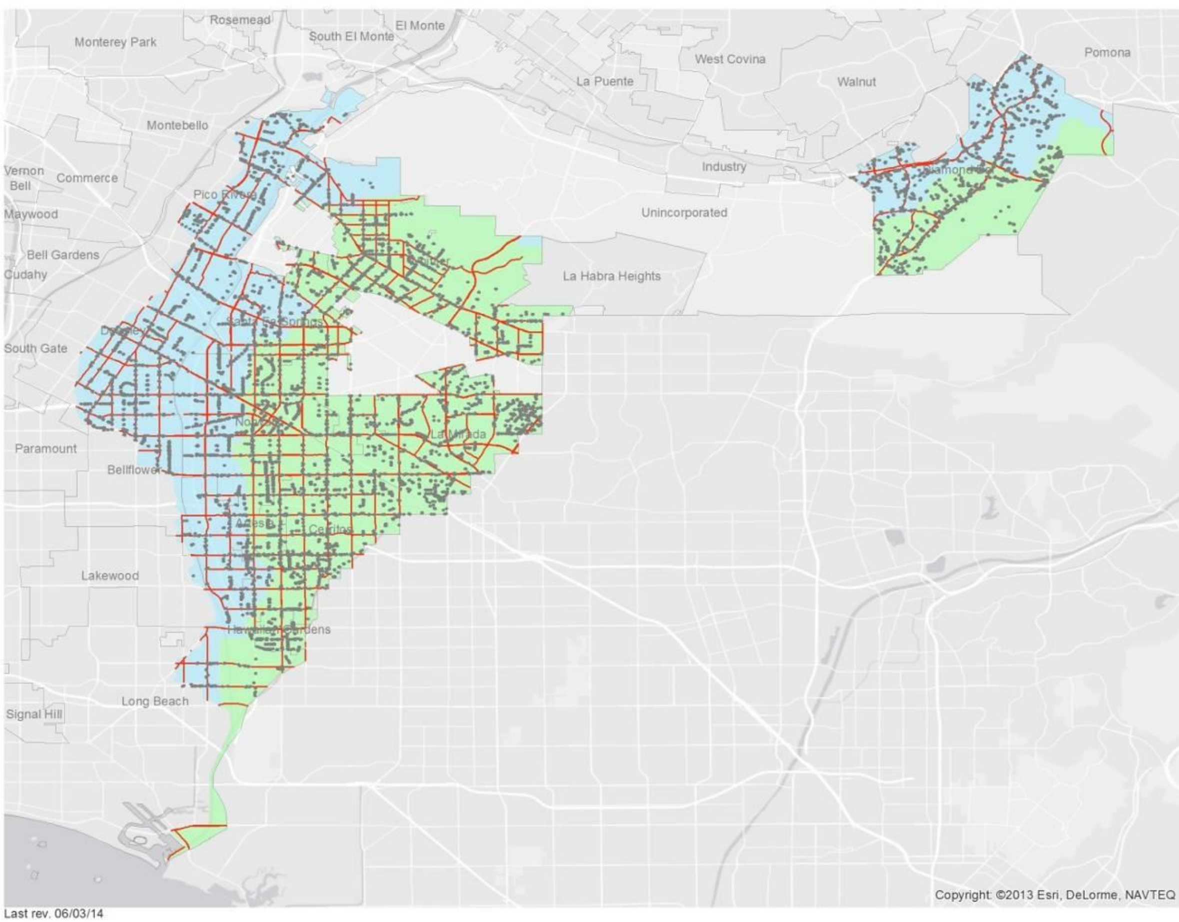

Figure 3-24: Areas potentially available for right-of-way BMPs

4 Reasonable Assurance Analysis

4.1 Executive Summary

A required element the WMP is the Reasonable Assurance Analysis (RAA). The MS4 Permit specifies the RAA use a watershed based computer modeling system to demonstrate:

“that the activities and control measures…will achieve applicable WQBELs and/or RWLs with compliance deadlines during the Permit term”.

There are three computer modeling systems approved by the MS4 Permit and the Watershed Management Modeling System (WMMS) was selected to develop this RAA. The Los Angeles County Flood Control District (LACFCD), through a joint effort with U.S. Environmental Protection Agency (USEPA), developed WMMS specifically to support informed decisions associated with managing stormwater.

While the Permits prescribes the RAA as a quantitative demonstration that control measures will be effective, the RAA also promotes a modeling process to identify and prioritize potential control measures to be implemented by the WMP. In other words, the RAA not only demonstrates the cumulative effectiveness of BMPs to be implemented, it also supports their selection. Furthermore, the RAA incorporates the applicable compliance dates and milestones for attainment of the WQBELs and RWLs, and therefore supports BMP scheduling. The ultimate goal of WMMS is to identify cost-effective water quality improvement projects through an integrated, watershed-based approach.

On March 25, 2014, the Los Angeles Regional Water Quality Control Board (Regional Board) issued “RAA Guidelines” (LARWQCB 2014) to provide information and guidance to assist permittees in development of the RAA. Appendix 4-1 provides appropriate documentation on the modeling assumptions that meet the RAA Guidelines.

The RAA describes the process for identifying milestones the current and next Permit periods, as well as final milestones to meet applicable TMDLs. Modeling was performed to quantify necessary load reductions to achieve the milestones. Based on these load reduction targets, a pollutant reduction plan was established that outlines the types and sequencing of BMPs for each jurisdiction to achieve milestones throughout the schedule. The RAA provides a detailed list of the capacities needed for BMPs over time, incorporating the existing BMPs and control measures identified in the WMP. These recommendations serve as goals for each jurisdiction to seek opportunities for implementation over time, but strategies may change as opportunities for more cost-effective BMPs are identified throughout the schedule.

The RAA has determined that the metal zinc will be the primary or “limiting” pollutant and that by implementing the structural and non-structural measures in Chapter 3 to reduce zinc, the remaining pollutant goals will be achieved for the Water Quality Priorities defined in Chapter 2. The rationale for this modeling approach is included Section 5.3.1 of the RAA (Appendix 4-1).

Over the entire Lower San Gabriel River Watershed, the RAA projects a need for structural controls be sized to capture and or treat 118.6 acre -feet.

4.2 REASONABLE ASSURANCE ANALYSIS

The Reasonable Assurance Analysis for the Lower San Gabriel River Watershed is included in Appendix 4-1. As data is collected through the monitoring program the model will be re-calibrated during the adaptive management process, which allow for improved simulation of physical processes such as flow volumes and volume retention BMPs.

4.2.1 IRRIGATION REDUCTION

There is sufficient information available to justify a 25% reduction in irrigation through specific controls.

- **"Landscape Water Conservation Programs: Evaluation of Water Budget Based Rate Structures" (1997).**[1] This study was prepared for The Metropolitan Water District of Southern California to evaluate the effects of customer outreach programs and adjustment of water-budget based rate structures on landscape water use. Communities that installed these water conservation programs saw landscape irrigation water use reduced 20-37%.
- **"The Residential Runoff Reduction Study" (2004).**[2] This study was produced for the Municipal Water District of Orange County to determine the effects of certain interventions on water savings. This study used a control or baseline site, an educational only site, and a retrofit site that installed weather-based controller technology and public education. The observed reduction at the retrofit site was 50% from pre- to post-intervention, and a reduction of 71% when comparing to the control group (which had no intervention). The education site also saw a reduction of 21% when compared to the control group.
- **"20x2020 Water Conservation Plan" (2010).**[3] This water conservation plan was prepared by a host of California agencies in response to the Californian Governor's Delta plan initiative that mandates California to have to achieve a 20 percent reduction per capita water use statewide by 2020. This study demonstrated that, for the South Coast specifically (which includes Greater Los Angeles, Long Beach and Orange County), potential conservation savings from current actions—basic measures, such as regulatory activities and reinforcing codes related to plumbing and appliance efficiency—are 3% per capita, or 6 gallons per capita per day (GPCD). Potential conservation savings for "cost effective measures" (such as BMPs and new technologies) are 7% per capita at 80% compliance (13 GPCD at 80% compliance and 17 GPCD at 100% compliance). Total "basic measure" savings are 24 GPCD. Baseline water use level for the South Coast region is 180 GPCD, which means with basic measures in place there is

(2010). 20x2020 Water Conservation Plan.

potential for 13.3% conservation savings. The study further demonstrates that with additional measures (such as residential weather-based irrigation controllers, landscape practices, recycled water, etc.) potential conservation savings are 29 GPCD, or 16% for the South Coast Region. While this study evaluates the effects of interventions on a *per capita* basis, the results of this study have implications on water reductions and water savings for watersheds as a whole.

- **"Landscape Management for Water Savings" (1998).[4]** This study resulted in a "43% increase in landscape water efficiency (water savings) from 1990-1997" after instituting conservation pricing, financial incentives, and education programs for customers and landscape professionals. The author makes a strong conclusion that most irrigation systems need to be recalibrated to only provide the amount of water necessary for the plants within the landscape to grow. Furthermore, the author provides several specific cases that demonstrate that when water resources are mismanaged by outdated irrigation systems or uninformed landscape professionals, this wastes precious water resources and costs the landscape owners excess money.

In addition, on July 28, 2014, an emergency regulatory action went into effect in response to the ongoing drought conditions within California[5]. This emergency regulatory action prohibits: 1) The application of water to outdoor landscapes in a manner that causes runoff such that water flows onto adjacent property, non-irrigated areas, private and public walkways, roadways, parking lots or structures; 2) The use of a hose to wash a motor vehicle, except where the hose is fitted with a shut-off nozzle or similar; and 3) The application of water to driveways and sidewalks. These mandatory regulations are expected to reduce landscape and water runoff.

The study results show a strong nexus between public education (leading to an increased awareness of water conservation and usage) and a reduction in irrigation use. The Participating Agencies will develop an outreach and education program focusing on water conservation and landscape water use efficiency.

Based on study results and the initiation of regulations aimed to reduce irrigation water use, a 25% reduction of irrigation water utilized in the RAA is considered reasonable and conservative.

As part of the adaptive management process the Participating Agencies will evaluate these assumptions during Program implementation and develop alternate controls if it becomes apparent that the assumption is not supported.

4.3 NON-MODELED CONTROLS

Currently there is insufficient information to accurately model the implementation of the controls listed in Section 3.2.3 through 3.4.1. These non-modeled controls were instead assigned a modest fraction of 10% for their cumulative load reduction. As part of the adaptive management process the Participating

[4] Ash, T. (1998). How to Profit from a Water Efficient Future. In *Landscape Management for Water Savings*. Tustin, CA: Municipal Water District of Orange County. P 8.

[5] Title 23, California Code of Regulations. Government Code Sections 11346.1 and 11349.6. OAL File No. 2014-0718-01 E.

Agencies will evaluate this assumption during Program implementation and develop alternate controls if it becomes apparent that the assumption is not supported. However, despite the uncertainty surrounding the specific load reductions for these controls, there is support to suggest that the assumption is in fact a modest one.

Chapter 3 provides qualitative assessments of potential pollutant reductions for new non-modeled, nonstructural and structural controls required by the 2012 MS4 Permit (Sections 3.2.4 and 3.3.1) as well as new non-modeled controls developed as part of this WMP (i.e., the "targeted" control measures of Section 3.4.1). As explained in detail in Sections 3.2.4 and 3.3.1, the number and scope of the new and modified (i.e. enhanced) minimum provisions under the Permit is substantial. Of particular note are the Low Impact Development (LID) provisions—which replace prior SUSMP provisions—for new developments. Potential load reductions from future LID projects were not incorporated into the RAA and as such contribute to the 10% non-modeled assumption. Also, pollutant reductions may be expected from continued, preexisting minimum controls with an educational component, such as public education, inspections of industrial/commercial and construction sites, and illicit discharge detection and elimination. Such programs can benefit from a continued increase in behavior change over time. Finally, the TSS Reduction Program—one of the non-modeled targeted control—does allow for a rough estimate of potential load reductions, as outlined in the following subsection.

4.3.1 TSS Reduction Program Quantification

Although expected pollutant reductions resulting from the TSS Reduction Strategy are not modeled empirically within WMMS, a simplified quantification of the program's potential effectiveness may be calculated through the application of the Revised Universal Soil Loss Equation (RUSLE). The RUSLE is defined as

$$A = RKLS$$

where

$A =$ Spatially and temporally averaged soil loss per unit area per unit time. The result is expressed in the units elected for K and R.
$R =$ Rainfall-runoff erosivity factor (per unit time, generally one year),
$K =$ Soil erodibility factor (mass per unit area – an area density – generally tons per acre),
$L =$ Slope length factor and
$S =$ Slope steepness factor.

Using local values of R, K and LS obtained through maps available on the State Water Resources Control Board's website for the Construction General Permit[6],

$R \approx 40\ year^{-1}$
$K \approx 0.32\ \frac{tons}{acre}$ and

[6] http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

$LS \approx 0.45$

giving

$$A = (40\ year^{-1})\left(0.32\ \frac{tons}{acre}\right)0.45$$
$$A = 5.76\ \frac{tons}{acre\ year}.$$

Following the CGP Risk assessment procedures, 5.76 tons per acre year is within the "low sediment risk" designation.

During the preparation of this WMP, several participating agencies provided estimates of exposed soil within their jurisdiction that were not related to construction activities. The City of Bellflower field-verified these estimates, which totaled approximately 18 acres or about 0.5% of the City. Following the calculated value for A, this equates to approximately 100 tons of soil loss per year within the City.

Extrapolating this tonnage to the Lower SGR Watershed,

$$M_{TSS} = fWA = 0.005(50{,}240\ acres)\left(5.76\ \frac{tons}{acre\ year}\right)$$
$$M_{TSS} = 251\ acres\left(5.76\ \frac{tons}{acre\ year}\right)$$
$$M_{TSS} \approx 1{,}500\ \frac{tons}{year}$$

where

$M_{TSS} =$ Estimated annual soil loss within the LSGR watershed in tons,
$f =$ Estimated fraction of exposed soil (non-construction) within a given urbanized area and
$W =$ Watershed area.

Historical monitoring results from the adjacent Los Cerritos Watershed suggest that approximately 1.8 grams of zinc adheres to every kilogram of TSS, so that the zinc discharge M_{Zn} associated with M_{TSS} is

$$M_{Zn} \approx \left(\frac{1.8}{1000}\right)M_{TSS}$$
$$M_{Zn} \approx \left(\frac{1.8}{1000}\right)\left(1{,}500\ \frac{tons}{year}\right)\left(\frac{2000\ lbs}{1\ ton}\right)$$
$$M_{Zn} \approx 5{,}400\ \frac{lbs}{year}\ or\ 2{,}400\ \frac{kg}{year}.$$

The RAA predicts an annual zinc loading of 7,962 kg within the Lower SGR Watershed for the average storm year. Assuming that within the term of the MS4 Permits the TSS Reduction Strategy approaches an effectiveness goal of 10% (240 kg/year), this would equate to a load reduction of **3.0%**. Reductions of this magnitude provide support for the 10% load reduction assumed for non-modeled controls. Further development of the TSS Reduction program is anticipated to meaningfully aid in the achievement of targeted load reductions.

4.4 Synchrony of Non-modeled and Modeled Controls

Although the Compliance Schedule Chapter indicates that a 10% reduction is sufficient for near-term pollutant reductions to achieve early interim milestones, it should be noted that the Group expects some targeted structural BMPs to be in place prior to these milestones. For example, implementation of the Prop 84 Grant is scheduled for completion in 2017. As such, the Group need not rely solely on the veracity of the 10% assumption to meet the interim milestones.

5 COMPLIANCE SCHEDULE

This Chapter provides the compliance schedule for each Participating Agency. The compliance schedule will be used to measure progress toward addressing the highest WQPs and achieving interim and final WQBELs and RWLs. Where deadlines are not specified within the MS4 Permit term, interim milestones are provided. The schedule is expressed as the needed structural BMP capacities over space and time. The Reasonable Assurance Analysis (RAA, Chapter 4) refines the capacity over space to the subwatershed level. The BMP capacities assume a 10% reduction over the MS4 Permit term through implementation of the nonstructural BMPs described in Chapter 3. The following section of this chapter includes the nonstructural BMP schedule.

Meeting the load reductions determined by the RAA results in an aggressive compliance schedule in terms of the technological, operational, and economic factors that affect the design, development, and implementation of the necessary control measures. Notably, as described in Chapter 6, there is currently no funding source to pay for these controls. Assuming finances are available, conversion of available land into a regional BMP is a protracted process that can take several years (not accounting acquisition, when required). As such the Group considers the compliance schedule to be as short as possible.

This is true for all WQPs—by the nature of the limiting pollutant approach, it is expected that each of the remaining WQPs will be controlled at a faster rate than zinc. So the aggressive schedule in place to target zinc provides an equally aggressive schedule to target the remaining WQPs, and as such it is considered to be as short as possible for all WQPs.

5.1 NONSTRUCTURAL BEST MANAGEMENT PRACTICES SCHEDULE

A 10% load reduction is assumed to result from the cumulative effect of nonstructural BMPs. These nonstructural BMPs consist of Minimum Control Measures, Nonstormwater Discharge Measures and Targeted Control Measures (MCMs, NSWD measures and TCMs) as described in Chapter 3.

5.1.1 NONSTRUCTURAL MINIMUM CONTROL MEASURES SCHEDULE

The MCMs will be implemented by the Participating Agencies upon approval of the WMP by the Regional Board Executive Officer or by the implementation dates provided in the MS4 Permit, where applicable. The scope of the MCM programs has expanded significantly from the prior third term MS4 Permit. This change is not entirely unexpected as a period of over ten years separates the adoption of the third and fourth term permits. Consequently significant pollutant reductions are anticipated through effective implementation of the new nonstructural MCMs. In particular, effective implementation of the Development Construction program will compliment the nonstructural TSS Reduction Strategy.

MCM provisions new to the Cities are described in WMP Section 3.2. Guidance documents have been prepared as an optional aid to Cities in MCM development/implementation – see Attachment 3.1.

5.1.2 Nonstructural Non Stormwater Discharge Measures Schedule

The NSWD measures will be implemented by the Participating Agencies upon approval of the WMP by the Regional Board Executive Officer or by the implementation dates provided in the MS4 Permit, where applicable. The scope of the NSWD measures has expanded from the prior third term MS4 Permit. In particular, NSWD source investigations are now tied into a robust outfall screening program required by the MS4 Permit Monitoring and Reporting Program and additional conditions have been placed on common exempt NSWDs, such as potable water discharges and irrigation runoff. Consequently significant pollutant reductions are anticipated through the resulting reductions in NSWD flows.

NSWD measures new to the Participating Agencies are described in WMP Section 3.3.

5.1.3 Nonstructural Targeted Control Measures Schedule

The specific Participating Agencies implementing each TCM is included in Table 3-5 in Chapter 3. The table also lists whether the TCM is a *planned* or a *potential* control measure. Potential control measures are contingent upon unknown factors such as governing body approval and as such implementation within the MS4 Permit term cannot be guaranteed. Descriptions of each nonstructural TCM are included in WMP Section 3.4.

Uncertainties associated with the targeted nonstructural controls complicate establishment of specific implementation dates. Despite this uncertainty, the Group has made a diligent effort to provide a clear schedule of specific actions within the current and next permit terms in order to achieve target load reductions. In addition, the status of these controls will be included in the annual watershed reports as well as through the adaptive management process in order to assess their progress in attaining targeted load reductions. Table 5-1 lists the nonstructural TCM compliance schedule.

TSS Reduction Strategy

The expanded start-date ranges for the TSS Reduction Strategy (TCM-TSS-1 to 6) are set to accommodate the time needed to develop, adopt and implement model ordinances. A successfully implemented ordinance from the City of Whittier is included in this WMP as Appendix A-3-2. The remaining Cities will consider this ordinance as a template for their own TSS Reduction Strategy.

Complete implementation of this Program throughout the watershed is not expected by the end of the MS4 Permit term. However, as discussed in WMP Section 3.4, appreciable pollutant reductions may be realized with only partial implementation.

Table 5-1: Nonstructural TCM Compliance Schedule

Nonstructural TCM	Chapter 3 ID	Effort	Start date	Milestones
Prioritize facility inspections based on WQPs	TCM-ICF-1	J*	7/1/2015	Reprioritize facilities as new water quality data is collected.
Enhance tracking through use of online GIS MS4 Permit database	TCM-MRP-1	J	7/1/2015	Modify database to reflect MS4 Permit provisions by 7/1/2016.
Statewide Trash Amendments (nonstructural measures)**	TCM-PAA-3	J	(Estimate) 7/1/2015	Schedule is listed in draft amendments, est. 10-15 year schedule.
Increased street sweeping frequency or routes	TCM-PAA-4	J	7/1/2015	Report on status with annual report submittal.
Apply for grant funding for stormwater quality projects	TCM-INI-4	W/J	7/1/2014	Suitable grants are pursued when practicable.
Refocused outreach to target audiences and WQPs	TCM-PIP-1	W/J	7/1/2015	Report on status with annual report submittal.
Train staff to facilitate LID and Green Streets implementation	TCM-PLD-1	J	7/1/2014	Complete first round by 7/1/2016. Continue periodic staff training.
LID ordinance for projects below MS4 Permit thresholds	TCM-PLD-2	J	7/1/2014	When practicable, adopt ordinance by end of permit term.
Encourage retrofitting of downspouts	TCM-RET-1	J	7/1/2015	Report on status with annual report submittal.
Prepare guidance documents to aid implementation of MCMs	TCM-SWM-1	W/J	7/1/2014	Develop documents by 7/1/2015. Revise documents as needed.
Exposed soil ordinance	TCM-TSS-1	J	7/1/2015	Develop by 12/28/2015. If practicable adopt by 12/28/2016.
Erosion repair and slope stabilization on private property	TCM-TSS-2	J	7/1/2015	Report on status with annual report submittal.
Private parking lot sweeping ordinance	TCM-TSS-3	J	7/1/2015	When practicable, adopt ordinance by 12/28/2016.
Sweeping of private roads and parking lots	TCM-TSS-4	J	7/1/2015	Enforce TCM-TSS-3 once adopted.
Erosion repair and slope stabilization on public property	TCM-TSS-6	J	7/1/2015	Report on status with annual report submittal.
Copper reduction through implementation of SB 346	TCM-INI-1	W*	Ongoing	Milestones are independent of participating agency actions.
Lead reduction through implementation of SB 757	TCM-INI-2	W	Ongoing	Milestones are independent of participating agency actions.
Support safer consumer product regs for zinc reduction in tires	TCM-INI-3	W	Ongoing	Report on status with annual report submittal.
Incentives for irrigation reduction practices	TCM-NSW-1	J	Ongoing	Ongoing; no interim or final milestones.
Upgraded sweeping equipment	TCM-PAA-1	J	Ongoing	Report on status with annual report submittal.
(Sanitary) Sewer System Management Plan	TCM-PAA-2	J	Ongoing	Ongoing; no interim or final milestones.
Negotiate with utilities for erosion control within ROW	TCM-TSS-5	W	Ongoing	Report on status with annual report submittal.

*W – Watershed Group effort, J – Jurisdictional effort

** Contingent upon State Water Board's adoption of Trash Amendments

5.2 PLANNED PROJECT - PROPOSITION 84 GRANT AWARD

The cities of Downey, Norwalk, Santa Fe Springs, and Whittier are participating in a regional multi-watershed project through the Gateway Water Management Authority (GWMA). This project applied for and was awarded funding though the Proposition 84 Grant. Initiation of this project will begin as soon as the grant contracts and funding are finalized which is expected to be in the fall of 2014. The BMPs include: one (1) vegetated bioswale, six (6) tree box filters, and ten (10) bioretention tree wells. The project will install LID BMPs along transportation corridors to treat stormwater runoff and its associated pollutants.

With the installation of these LID BMPs, this project is expected to reduce pollutant loads throughout the watershed. The full benefits of this project as it ties into interim and final compliance milestones will be determined during the adaptive management process. The project is currently in the design phase. Project milestones and implementation timeframes are as follows:

Design, Environmental Documentation and Design and Bid Solicitation Process

The Project went through review to determine compliance with the environmental requirements such as those outlined in the California Environmental Quality Act (CEQA) in December 2014.

The Project will begin the process of obtaining necessary permits such as local construction permits and Los Angeles County permits in May 2015. This task is expected to be finalized in July 2015, prior to commencement of construction. All proposed BMPs will be located on public property in the public right of way and therefore, issues obtaining site access are not expected as well as obtaining access agreements and easement deeds will not be required.

During the Project design and bid process, a preliminary engineering analysis will be performed for proposed designs and locations, preparation and review of design drawings and technical specifications. The Participating Agencies will collaborate in reviewing the submitted proposals and construction documents. Once the review process is complete a construction contract will be awarded and finalized by the end of July 2015.

Construction and Implementation

The Project construction and implementation process is expected to begin in August 2015. Construction is anticipated to last for approximately twelve months and completion is expected in August 2016. Associated activities for construction will include mobilization and site preparation, excavation, installation of BMPs and proper coordination with contractors.

5.3 STRUCTURAL BEST MANAGEMENT PRACTICE SCHEDULE

Uncertainties associated with the structural controls complicate establishment of specific implementation dates. Despite this uncertainty the Group has made a diligent effort to provide a clear schedule of specific actions within the current and next permit terms in order to achieve target load reductions.

5.3.1 STRUCTURAL MINIMUM CONTROL MEASURES SCHEDULE

Significant pollutant reductions are anticipated through each City's effective implementation of the new structural LID BMP requirements of the Planning and Land Development Program. These new MCM provisions are described in WMP Section 3.2. Guidance documents have been prepared as an optional aid to Cities in MCM development/implementation – see Attachment 3.1. The Planning and Land Development Program will be implemented no later than June 28, 2014.

5.3.2 STRUCTURAL TARGETED CONTROL MEASURES SCHEDULE

The RAA (see Chapter 4) demonstrates the cumulative effectiveness of BMPs to be implemented, supports BMP selection, and provides volume reduction goals optimized across the entire watershed. The results are summarized for volume reduction (represented in acre-feet) for interim and final compliance milestones.

The plan depicted in the RAA is considered a potential initial scenario. Through the adaptive management process, the participating agencies may select different types of BMPs (e.g. increase implementation of green streets and reduce implementation of regional BMPs) or substitute alternative BMPs altogether (e.g., implement dry wells instead of green streets).

The wet weather volume reductions necessary for each milestone (10%, 35% and Final) for each City show the combined total estimated BMP volume (acre-feet) for right-of-way (ROW) BMPs and regional Low Impact Development (LID) BMPs on public or private parcels. Specific green streets projects were not investigated during this initial analysis for potential BMPs, therefore, the City-specific summary lists potential regional LID BMPs that *could* be used to achieve the required interim milestones and targets. Since this WMP is a planning-level document, over time the Watershed Group will report and demonstrate that the summative effect of projects implemented add up to the required reductions for interim milestones and final targets.

Dry weather reductions are attained through a combination of non-structural practices and structural BMPs as they are implemented as part of the wet weather attainment of limits. As wet-weather BMPs are implemented, they serve to remove the dry-weather flows thus meeting the compliance set forth to achieve dry-weather reductions.

APPROACH TO IMPLEMENTING STRUCTURAL CONTROLS

As expressed in the tables of Section 5.4, the Participating Agencies can meet the September 30, 2017, 10% milestone without structural controls. Despite this, the Group understands that targeting subsequent load reductions demands that the process of implementing structural controls begin as soon as possible. The initial phase of this process is as follows:

Right-of-Way BMPs (green street principles) - As the Participating Agencies prepare new capital improvement projects throughout their jurisdiction, a review to incorporate green street principles into the project will be done. Additionally, the Strategic Transportation Plan (STP), currently a draft document), prepared by the Gateway Water Management Authority, identifies major transportation corridors slated for significant redevelopment. The STP will require that structural stormwater BMPs be considered and incorporated into these projects where feasible. Implementation of the STP is expected to contribute to the achievement of the required metal reductions by the compliance deadlines.

Schedule: Every two years the adaptive management process will include an assessment of the effectiveness of both 1) right-of-way BMPs incorporated into CIP projects and 2) the STP in contributing toward targeted load reductions.

Regional BMPs - In each jurisdiction, potential Regional BMP locations have been identified and ranked. To maximize efficiency and resources, a feasibility study will be developed to aid in selection of the most effective BMPs. The study will provide criteria for selecting locations for regional BMPs, the process of ground-truthing to concretely determine feasibility, and a schedule that demonstrates implementation of regional BMPs. In conjunction with development of the feasibility study, each Participating Agency will conduct a preliminary site assessment at the highest ranked potential BMP. The preliminary site assessment will include reviewing available plans, and identifying nearby stormdrain systems and drainage areas. Should information acquired during the preliminary assessment suggest the selected potential BMP to be infeasible, additional high ranked potential BMPs in that jurisdiction will be explored. By December 2016, each Participating Agency would have conducted sufficient preliminary site determinations to select a location sufficient for further exploration. Selected sites will be chosen for additional exploration to include field analysis.

Schedule: The preliminary site assessments and feasibility study will be completed by March 2016. Field analysis at selected sites will begin in December 2016.

Even though not all projects can be specified and scheduled at this time, the Participating Agencies are committed to constructing the necessary regional and right-of-way BMPs to meet the determined load reductions per applicable compliance schedules. Through implementation of the WMP and adaptive management there is the potential for the final compliance milestones to change.

Furthermore, the LACFCD will work with the Watershed group in their efforts to address source controls; assess, develop, and pursue funding for structural BMPs, and promote the use of water reuse and infiltration. As regional project scopes are further refined, the LACFCD will contribute to the WMP projects on a case-by-case basis, agreed upon with the Watershed Group.

5.4 POLLUTANT REDUCTION PLAN TO ATTAIN INTERIM & FINAL LIMITS

The following pages describe the pollutant reduction plans for each City for drainage areas within both the San Gabriel River and Coyote Creek. Figure 5-1 is an illustration of the total structural BMP capacity needed to comply with final WQBELs/RWLs within the Lower SGR Watershed.

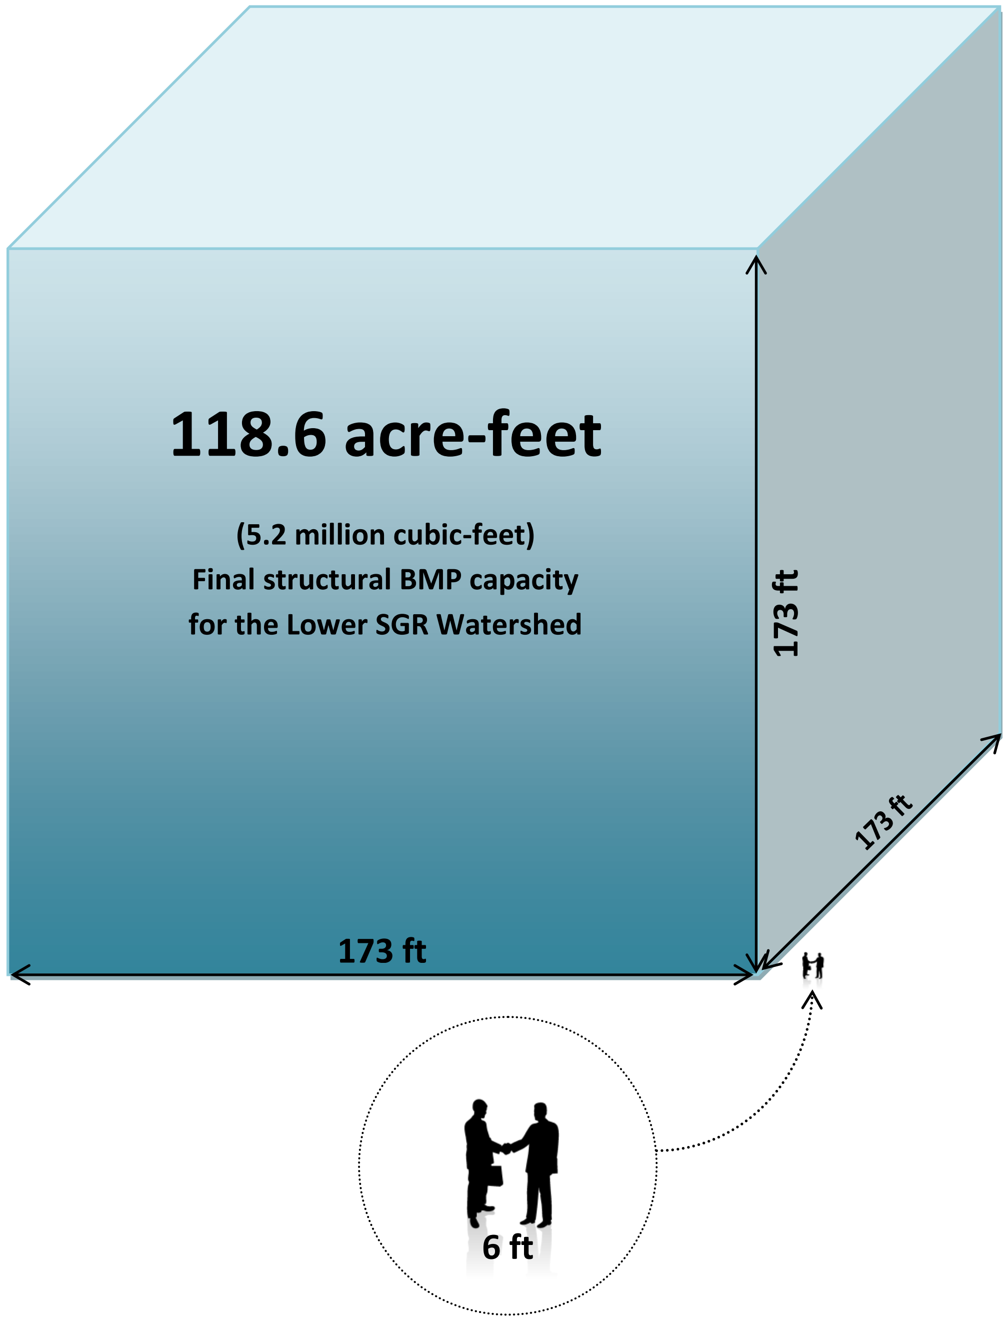

Figure 5-1: The Compliance Cube (total required BMP capacity for the Lower SGR Watershed)

5.4.1 City of Artesia

San Gabriel River

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN Total Estimated BMP Volume (acre-ft) Incremental	Cumulative
Artesia	10%	NS*	NS*
	35%	0.1	0.1
	Final	---	0.1

* Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Artesia within the San Gabriel River Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% interim milestone; however, the city will need to capture 0.1 acre-feet by September 30, 2020 to meet the 35% interim milestone, which is equivalent to the final compliance milestone by September 30, 2026.

Since many of the open space areas identified as potential locations for regional BMPs would provide a treatment volume much larger than the compliance volume, the remaining 0.1 acre-feet could be addressed using Right-of-Way BMPs to meet the 35% interim milestone and final compliance milestone.

Coyote Creek

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN Total Estimated BMP Volume (acre-ft) Incremental	Cumulative
Artesia	10%	NS*	NS*
	35%	1.1	1.1
	Final	0.0	1.1

* Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Artesia within the Coyote Creek Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% interim milestone; however, the city will need to capture 1.1 acre-feet by September 30, 2020 to meet the 35% interim milestone, which is equivalent to the final compliance milestone.

If Padelford Park was transformed into an infiltration BMP, the potential capture volume would be 1.6 acre-feet, which would be sufficient to meet the 35% interim compliance and the final compliance. Additionally, the 1.1 acre-feet needed to meet the 35% interim milestone and final compliance milestone could be addressed using Right-of-Way BMPs.

5.4.2 CITY OF BELLFLOWER

SAN GABRIEL RIVER

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN* Total Estimated BMP Volume (acre-ft)	
		Incremental	Cumulative
Bellflower	10%	NS**	NS**
	35%	0.2	0.2
	Final	5.2	5.5

* Values taken directly from RAA. Differences between the sum of the incremental reduction volumes and the cumulative reduction volumes are attributed to rounding errors of the second decimal place.

** Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Bellflower within the San Gabriel River Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% interim milestone; however, the city will need to capture 0.2 acre-feet by September 30, 2020 to meet the 35% interim milestone, and total of 5.5 acre-feet by September 30, 2026 for the final compliance milestone.

Since many of the open space areas identified as potential locations for regional BMPs would provide a treatment volume much larger than the compliance volume, the 0.2 acre-feet needed to meet the 35% interim milestone could be addressed using Right-of-Way BMPs. Potential regional BMPs for the final compliance milestone will be explored as described in Section 3. This includes potential projects such as Cerritos Regional Park and Caruthers Park.

5.4.3 City of Cerritos

San Gabriel River

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN	
		Total Estimated BMP Volume (acre-ft)	
		Incremental	Cumulative
Cerritos	10%	NS*	NS*
	35%	0.0	0.0
	Final	0.6	0.6

* Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Cerritos within the San Gabriel River Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% or September 30, 2020 35% interim milestone; however, the city will need to capture 0.6 acre-feet by September 30, 2026 to meet the final compliance milestone. Potential regional BMPs for the final compliance milestone will be explored as described in Section 3. Additionally, Right-of-Way BMPs to meet the final compliance milestone will be explored.

Coyote Creek

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN*	
		Total Estimated BMP Volume (acre-ft)	
		Incremental	Cumulative
Cerritos	10%	NS**	NS**
	35%	0.0	0.0
	Final	6.4	6.5

* Values taken directly from RAA. Differences between the sum of the incremental reduction volumes and the cumulative reduction volumes are attributed to rounding errors of the second decimal place.

** Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Cerritos within the Coyote Creek Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% or September 30, 2020 35% interim milestone; however, the city will need to capture 6.5 acre-feet by September 30, 2026 to meet the final compliance milestone. Potential regional BMPs for the final compliance milestone will be explored as described in Section 3. This includes potential projects such as Cerritos Regional Park and Caruthers Park.

5.4.4 City of Diamond Bar

San Gabriel River

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN	
		Total Estimated BMP Volume (acre-ft)	
		Incremental	Cumulative
Diamond Bar	10%	NS*	NS*
	35%	0.0	0.0
	Final	0.2	0.2

* Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Diamond Bar within the San Gabriel River Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% or September 30, 2020 35% interim milestone; however, the city will need to capture 0.2 acre-feet by September 30, 2026 to meet the final compliance milestone. Potential regional BMPs for the final compliance milestone will be explored as described in Section 3. Additionally, Right-of-Way BMPs to meet the final compliance milestone will be explored.

Coyote Creek

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN*	
		Total Estimated BMP Volume (acre-ft)	
		Incremental	Cumulative
Diamond Bar	10%	NS**	NS**
	35%	0.3	0.3
	Final	8.7	8.9

* Values taken directly from RAA. Differences between the sum of the incremental reduction volumes and the cumulative reduction volumes are attributed to rounding errors of the second decimal place.

** Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Diamond within the Coyote Creek Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% interim milestone; however, the city will need to capture 0.3 acre-feet by September 30, 2020 to meet the 35% interim milestone, and total of 8.9 acre-feet by September 30, 2026 for the final compliance milestone.

Since many of the open space areas identified as potential locations for regional BMPs would provide a treatment volume much larger than the compliance volume, the 0.3 acre-feet needed to meet the 35% interim milestone could be addressed using Right-of-Way BMPs. Potential regional BMPs for the final compliance milestone will be explored as described in Section 3. This includes potential projects such as Cerritos Regional Park and Caruthers Park.

5.4.5 CITY OF DOWNEY

SAN GABRIEL RIVER

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN Total Estimated BMP Volume (acre-ft) Incremental	 Cumulative
Downey	10%	NS*	NS*
	35%	0.0	0.0
	Final	10.4**	10.4**

* Nonstructural practices achieve 10% milestone
**Value attained after the city's existing distributed BMP volumes totaling 7.1 acre-ft were incorporated

According to the RAA results, the areas of the city of Downey within the San Gabriel River Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% or September 30, 2020 35% interim milestone; however, the city will need to capture 10.4 acre-feet by September 30, 2026 to meet the final compliance milestone. Potential regional BMPs for the final compliance milestone will be explored as described in Section 3. This includes potential projects such as Cerritos Regional Park and Caruthers Park.

5.4.6 CITY OF HAWAIIAN GARDENS

COYOTE CREEK

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN* Total Estimated BMP Volume (acre-ft)	
		Incremental	Cumulative
Hawaiian Gardens	10%	NS**	NS**
	35%	1.8	1.8
	Final	0.3	2.2

* Values taken directly from RAA. Differences between the sum of the incremental reduction volumes and the cumulative reduction volumes are attributed to rounding errors of the second decimal place.

** Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Hawaiian Gardens within the Coyote Creek Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% interim milestone; however, the city will need to capture 1.8 acre-feet by September 30, 2020 to meet the 35% interim milestone, and total of 2.2 acre-feet by September 30, 2026 for the final compliance milestone.

Since the available area in Hawaiian Gardens consists mostly of educational use, the 1.8 acre-feet needed to meet the 35% interim milestone and 0.3 acre-feet needed to meet the final compliance milestone could be addressed using Right-of-Way BMPs.

5.4.7 CITY OF LA MIRADA

COYOTE CREEK

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN Total Estimated BMP Volume (acre-ft) Incremental	 Cumulative
La Mirada	10%	NS*	NS*
	35%	0.0	0.0
	Final	15.2	15.2

* Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of La Mirada within the Coyote Creek Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% or September 30, 2020 35% interim milestone; however, the city will need to capture 15.2 acre-feet by September 30, 2026 to meet the final compliance milestone. Potential regional BMPs for the final compliance milestone will be explored as described in Section 3. This includes potential projects such as Cerritos Regional Park and Caruthers Park.

5.4.8 CITY OF LAKEWOOD

SAN GABRIEL RIVER

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN	
		Total Estimated BMP Volume (acre-ft)	
		Incremental	Cumulative
Lakewood	10%	NS*	NS*
	35%	0.0	0.0
	Final	0.3	0.3

* Non-structural practices achieve 10% milestone

According to the RAA results, the areas of the city of Lakewood within the San Gabriel River Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% or September 30, 2020 35% interim milestone; however, the city will need to capture 0.3 acre-feet by September 30, 2026 to meet the final compliance milestone. Potential regional BMPs for the final compliance milestone will be explored as described in Section 3. Additionally, Right-of-Way BMPs to meet the final compliance milestone will be explored.

COYOTE CREEK

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN*	
		Total Estimated BMP Volume (acre-ft)	
		Incremental	Cumulative
Lakewood	10%	NS**	NS**
	35%	1.6	1.6
	Final	0.3	1.8

* Values taken directly from RAA. Differences between the sum of the incremental reduction volumes and the cumulative reduction volumes are attributed to rounding errors of the second decimal place.
** Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Lakewood within the Coyote Creek Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% interim milestone; however, the city will need to capture 1.6 acre-feet by September 30, 2020 to meet the 35% interim milestone, and total of 1.8 acre-feet by September 30, 2026 for the final compliance milestone.

Since many of the open space areas identified as potential locations for regional BMPs would provide a treatment volume much larger than the compliance volume, the 1.6 acre-feet needed to meet the 35% interim milestone and 0.3 acre-feet needed to meet the final compliance milestone could be addressed using Right-of-Way BMPs.

5.4.9 City of Long Beach

San Gabriel River

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN Total Estimated BMP Volume (acre-ft) Incremental	 Cumulative
Long Beach	10%	NS*	NS*
	35%	2.4	2.4
	Final	0.3	2.7

* Non-structural practices achieve 10% milestone

According to the RAA results, the areas of the city of Long Beach within the San Gabriel River Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% interim milestone; however, the city will need to capture 2.4 acre-feet by September 30, 2020 to meet the 35% interim milestone, and total of 2.7 acre-feet by September 30, 2026 for the final compliance milestone.

Since many of the open space areas identified as potential locations for regional BMPs would provide a treatment volume much larger than the compliance volume, the 2.4 acre-feet needed to meet the 35% interim milestone could be addressed using Right-of-Way BMPs.

Coyote Creek

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN Total Estimated BMP Volume (acre-ft) Incremental	 Cumulative
Long Beach	10%	NS*	NS*
	35%	0.0	0.0
	Final	0.0	0.0

* Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Long Beach within the Coyote Creek Watershed will not need to capture to capture and/or treat stormwater in order to meet the compliance milestones. The suggested approach for these areas is to implement the targeted nonstructural source control BMPs along with all required MCMs until further information is gathered from the adaptive management process.

5.4.10 CITY OF NORWALK

SAN GABRIEL RIVER

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN* Total Estimated BMP Volume (acre-ft)	
		Incremental	Cumulative
Norwalk	10%	NS**	NS**
	35%	0.1	0.1
	Final	0.3	0.3

* Values taken directly from RAA. Differences between the sum of the incremental reduction volumes and the cumulative reduction volumes are attributed to rounding errors of the second decimal place.
** Non-structural practices achieve 10% milestone

According to the RAA results, the areas of the city of Norwalk within the San Gabriel River Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% interim milestone; however, the city will need to capture 0.1 acre-feet by September 30, 2020 to meet the 35% interim milestone, and total of 0.3 acre-feet by September 30, 2026 for the final compliance milestone.

Since many of the open space areas identified as potential locations for regional BMPs would provide a treatment volume much larger than the compliance volume, the 0.1 acre-feet needed to meet the 35% interim milestone and 0.3 acre-feet needed to meet the final compliance milestone could be addressed using Right-of-Way BMPs.

COYOTE CREEK

Jurisdiction	Milestone	POLLUTANT REDUCTION PLAN Total Estimated BMP Volume (acre-ft)	
		Incremental	Cumulative
Norwalk	10%	NS*	NS*
	35%	0.2	0.2
	Final	4.6	4.8

* Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Norwalk within the Coyote Creek Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% interim milestone; however, the city will need to capture 0.2 acre-feet by September 30, 2020 to meet the 35% interim milestone, and total of 4.8 acre-feet by September 30, 2026 for the final compliance milestone.

Since many of the open space areas identified as potential locations for regional BMPs would provide a treatment volume much larger than the compliance volume, the 0.2 acre-feet needed to meet the 35% interim milestone could be addressed using Right-of-Way BMPs. Potential regional BMPs for the final compliance milestone will be explored as described in Section 3. This includes potential projects such as Cerritos Regional Park and Caruthers Park.

5.4.11 City of Pico Rivera

San Gabriel River

Whittier	10%	NS*	NS*
	35%	0.0	0.0
	Final	39	39

* Nonstructural practices achieve 10% milestone

According to the RAA results, the areas of the city of Whittier within the Coyote Creek Watershed will not need to capture and/or treat stormwater in order to meet the September 30, 2017 10% or September 30, 2020 35% interim milestone; however, the city will need to capture 39 acre-feet by September 30, 2026 to meet the final compliance milestone. Potential regional BMPs for the final compliance milestone will be explored as described in Section 3. This includes potential projects such as Cerritos Regional Park and Caruthers Park.

5.4.14 THE STATE OF BACTERIA

A bacteria TMDL has not been adopted for the Lower SGR Watershed. The RAA Guidelines state that in such an instance targets and critical conditions from other TMDLs in the region should be utilized. For bacteria, the existing Los Angeles River Bacteria TMDL is applicable. This results in a final wet and dry weather deadline of 2040, which extends beyond the 2026 deadline for the limiting pollutant zinc. If it is determined through the adaptive management process (e.g., due to future model simulations) that required bacteria load reductions may not be met by controlling for zinc, then the WMP will be modified to incorporate bacteria milestones with measureable criteria or indicators with a final deadline of 2040.

5.5 ESTIMATED COSTS OF STRUCTURAL BMPS

Future costs associated with regional and Right-of-Way BMPs were estimated by using costs associated with an existing regional project (Discovery Park) and estimated costs for potential regional projects. Potential regional project costs were obtained from Los Angeles County.[1] Table 5-2 includes the estimated total costs and cost per acre-foot for regional and Right-of-Way BMPs.

The cost estimates only represent permitting, material, construction, and operation and maintenance (O&M) cost - with the exception of Discovery Park which does not take into account O&M costs. The cost of land acquisition, which is estimated to be over $5,000,000 per acre, was not included since initial regional and Right-of-Way BMP projects are planned for public lands. Because of the preliminary nature of the projects, the estimates developed for the proposed BMPs on public property lie between the preliminary/order of magnitude and budget level estimates, with an expected accuracy of about minus 25 percent to plus 40 percent.[2]

Table 5-2: Existing or potential estimated structural BMP cost

Project Name	Total Estimated Cost	BMP Capacity (acre-feet)	Cost Per Acre Foot
Bethune Park	$570,000	0.9	$1,000,000
Enterprise Park	$1,240,000	3.9	$318,000
Reid Park	$1,400,000	0.6	$2,333,000
Belvedere Park	$3,700,000	13.8	$268,000
Discovery Park	$4,500,000 *	8.0	$562,500
Johnson Park	$5,060,000	20.0	$253,000
Charles White Park	$5,300,000	21.0	$252,380
Right-of Way BMPs**	-------	0.25	$250,000

* Cost does not include O&M.
** A specific project was not used for the cost estimate. Instead various projects were averaged.

Cost were derived by assuming approximately two thirds of the projects implemented will be regional, with the remaining being Right-of-Way projects. Using general assumptions for the projects above, the following costs are anticipated:

[1] Multi-Pollutant TMDL Implementation for the Unincorporated County Area of Los Angeles River: Part 2
[2] Multi-Pollutant TMDL Implementation for the Unincorporated County Area of Los Angeles River: Part 2

- A cost of $2,000,000 per acre foot is anticipated for projects treating less than 1 acre-foot
- A cost of $625,000 per acre foot is anticipated for projects treating between 1 and 10 acre-feet
- A cost of $260,000 per acre foot is anticipated for projects treating more than 10 acre-feet

5.5.1 TOTAL ESTIMATED COSTS OF STRUCTURAL BMPS

The following tables include the total estimated costs of structural BMPs for each City.

CITY OF ARTESIA STRUCTURAL BMP COST ESTIMATE

		POLLUTANT REDUCTION PLAN

6 FINANCIAL STRATEGY

This section outlines the financial strategy to implement the Lower SGR WMP in accordance with the MS4 Permit. The cost estimates provided herein are preliminary and based on the best available information to date. The estimates are also subject to revision as new information becomes available, including as the Watershed Control Measures (WCMs) are refined over the implementation period.

Financing the implementation of the Lower SGR WMP is the greatest challenge confronting the Watershed Group. In the absence of stormwater utility fees, the Participating Agencies have no dedicated revenue stream to pay for implementation of the WMP. In addition to current uncertainties associated with costs and funding, there are multiple uncertainties associated with future risks. The first TMDL compliance dates for the Lower SGR Watershed Group will be the interim metals milestones of 2017, 2020, and the final compliance date of September 30, 2026. Thus, there will be many deadlines that must be met despite limited resources. Member Agencies will need to set priorities and seek funding in order to meet the various compliance deadlines.

Therefore, to address the Lower SGR Water Quality Priorities (WQPs), the Watershed Group is going to pursue a multi-faceted financial strategy to match the multi-faceted Strategy for the Selection and Implementation of WCMs outlined in Chapter 3. In addition, the Watershed Group has coordinated the proposed compliance schedule (see Section 5) with the financial strategy.

The latest Los Angeles and Long Beach MS4 permits have greatly magnified the cost challenges associated with managing stormwater. The absence of a stable stormwater funding mechanism not tied to municipal General Funds is becoming ever more critical. For that reason, the City Manager Committees of the California Contract Cities Association and the League of California Cities, Los Angeles Division, formed a City Managers' Working Group (Working Group) to review stormwater funding options after the LA County proposed Clean Water, Clean Beaches funding initiative failed to move forward. The result was a Stormwater Funding Report that notes, "the Los Angeles region faces critical, very costly, and seriously underfunded stormwater and urban runoff water quality challenges." The Report found that funding stormwater programs is so complex and dynamic, and the water quality improvement measures so costly, that Permittees cannot depend on a single funding option at this time. The City Managers' report includes a variety of recommendations, including: organizational recommendations; education and outreach program recommendations; recommendations for legislation; Clean Water, Clean Beaches recommendations; local funding options; and recommendations for the Regional Water Board[1].

The Watershed Group has considered the recommendations in the Stormwater Funding Report in developing this financial strategy. A critical component of the report is the observation that moving forward with a regional stormwater fee vote (like the LA County Clean Water, Clean Beaches funding

[1]League of California Cities. (2014). Providing Sustainable Water Quality Funding in Los Angeles County. Prepared By City Managers Working Group. Los Angeles County Division May 21, 2014.

initiative) would likely not occur until after June 2015, which means that the first funds would likely not be available until property tax payments are received in 2017. Assuming revenues of approximately $6 million per year available from a funding source based on the proposed Clean Water, Clean Beaches funding initiative, the Watershed Group could expect approximately $60 million to be available over 10 years[2]. However, these amounts may not be sufficient to pay for and maintain expensive stormwater capture and dry-weather low flow diversions to the sanitary sewer if the Watershed Group had to depend on such projects to come into compliance with receiving water limitations (RWLs) and water quality-based effluent limitations (WQBELs) specified in the MS4 Permit.

The Reasonable Assurance Analysis (RAA) for the Lower SGR WMP, indicate that the volume of water required to be captured within the Watershed to comply with RWLs and WQBELs is 118.6 AF.

For cost estimation purposes, this WMP initially assumes that the Lower SGR Watershed could ultimately require the capacity to capture and infiltrate or use 118.6 AF of water. Based on cost estimates for constructing regional and Right-of-Way BMPs, as discussed in Section 5.5, such a requirement could cost the watershed between $34 million and $65 million for construction of these facilities (refer to Section 5.5 for more a detailed cost analysis).

The Watershed Group has been involved in the development of the financial strategy recommendations, and proposes to consider the recommendations of the City Managers Working Group to develop long-term solutions to stormwater quality funding. In the meantime, the Watershed Group will focus on the local funding options presented in the Stormwater Funding Report to secure the needed funding for initial implementation of the WMP.

During the early years of implementation, the Permittees anticipate having to depend largely on local fees such as commercial/industrial inspection fees, General Fund expenditures, and, potentially, Clean Water State Revolving Fund program financing agreements to fund the implementation of the WCMs. The Watershed Group will seek opportunities to leverage the limited funds available. It will do this by financially supporting the efforts of others, such as the California Stormwater Quality Association (CASQA), to seek State approval of true source control measures such as implementation of the Safer Consumer Product Regulations adopted by the Department of Toxic Substances Control in 2013. The Group will also support programs to increase water conservation, reduce dry-weather discharges to the storm drain system, and reduce TSS during wet weather. Successfully accomplishing these efforts could reduce the money needed in the long term to capture and/or treat stormwater discharges to comply with TMDLs and address other WQPs.

Concurrently, the Watershed Group proposes to work with the California Contract Cities, the Los Angeles Division of the League of California Cities, and others to educate elected officials and voters about the

[2] Based on numbers derived for Los Cerritos Channel (LCC) during the development of the LCC WMP using expected annual revenue from a pro rata distribution of funds allocated to the Cities in the LCC Watershed and a possible proportional allocation of funds from the Watershed Authority Groups.

water quality problems facing the region and the need to develop an equitable financing mechanism to fund the programs and facilities necessary to come into compliance with water quality regulations.

Legislative solutions will be necessary to clarify the application of Proposition 218 to fees for the capture and use of stormwater in light of a recent 6th Appellate Court decision and to ensure that any State water bond put on the ballot in fall 2014 contains funding for stormwater quality projects. The Group will also support local and statewide efforts to amend Proposition 218 to have stormwater fees treated in the same manner as water, sewage, and refuse fees. The Watershed Group and/or the Participating Agencies will also seek grants to implement rainwater capture and reuse or capture and infiltrate projects on publicly owned property.

In the long term, financing the WCMs for the Lower SGR Watershed will require establishing dependable revenue streams for local water quality programs. Accomplishing this formidable task will require the cooperation of many entities, including business and environmental organizations and the Regional Board.

7 LEGAL AUTHORITY

MS4 Permit §VI.C.5.b.iv.6 (LA)/ §VII.C.5.h.vi (LB)

This section covers information such as documentation and references/links to water quality ordinances for each participating that demonstrates adequate legal authority to implement and enforce Watershed Control Measures (WCMs) identified in this plan and as required in Section VI.D.5.b.iv.6 of the MS4 Permit. The goal of these WCMs is to create an efficient program that focuses on the watershed priorities by meeting the following objectives:

- Prevent or eliminate non-storm water discharges to the MS4 that are a source of pollutants from the MS4 to receiving waters.
- Implement pollutant controls necessary to achieve all applicable interim and final water quality-based effluent limitations and/or receiving water limitations pursuant to corresponding compliance schedules.
- Ensure that discharges from the MS4 do not cause or contribute to exceedances of receiving water limitations.

The WCMs include the minimum control measures, nonstormwater discharge measures and targeted control measures (i.e. controls to address TMDL and 303(d) listings). As the requirement to incorporate these WCMs is an element of the MS4 Permits, the legal authority to implement them results from each agency's legal authority to implement the NPDES MS4 Permit.

A copy of each participating agency's legal authority certification from their chief legal counsel can be found in Appendix A-7. This certification shall be prepared annually. Table 7-1 includes the section that covers water quality ordinance for each agency with a reference link.

6.47.020 Purpose and Intent (D) - *Reducing pollutants in storm water and urban runoff to the maximum extent practicable in order to achieve water quality standards/receiving water limitations. (Ord. 549 § 1, 2013; Ord. 476 § 1, 2002)*		
La Mirada	Title 13- Water and Sewage, Chapter 13.12, Urban Runoff	http://www.amlegal.com/library/ca/lamirada.shtml
13.12.020 Purpose and Intent (c) - *Reducing pollutants in stormwater and urban runoff to the maximum extent practicable.*		
Lakewood	Article 05 (V) - Sanitation-Health, Chapter 8, Stormwater and Urban Runoff Pollution Control	http://weblink.lakewoodcity.org/weblink8/
5800 - Adoption of the Los Angeles County Stormwater Runoff Pollution Control Ordinance - *Except as otherwise provided in this Chapter, the stormwater runoff pollution control ordinance of the County of Los Angeles contained in Chapter 12.80 of Title 12- Environmental Protection of the Los Angeles County Code relating to control of pollutants carried by stormwater and runoff adopted by the County of Los Angeles on June 9, 1998, is hereby adopted and made a part hereof as though set forth in full. The same shall hereafter constitute the Stormwater and Runoff Pollution Control Ordinance of the City of Lakewood relating to the control of pollutants carried by stormwater and runoff and discharging into receiving water of the United States.*		
Long Beach	Volume II-Title 18-Building and Construction, Chapter 18.61, NPDES and SUSMP Regulations	http://library.municode.com/index.aspx?clientId=16115
18.61.010 Purpose - *The purpose of this chapter is to provide regulations and give legal effect to certain requirements of the National Pollutant Discharge Elimination System (NPDES) permit issued to the City of Long Beach, and the subsequent requirements of the Standard Urban Storm Water Mitigation Plan (SUMSP), mandated by the California Regional Water Quality Control Board, Los Angeles Region*		

(RWQCB). The intent of these regulations is to effectively prohibit non-storm water discharges into the storm drain systems or receiving waters and to require source control BMP to prevent or reduce the discharge of pollutants into storm water to the maximum extent practicable. *The City of Long Beach is a participant member of this watershed group but is under a different MS4 Permit. Certification of legal authority will be in accordance with its MS4 Permit timeline*		
LACFCD	Flood Control District Code, Chapter 21 - Stormwater and Runoff Pollution Control	https://library.municode.com/index.aspx?clientId=16274
21.01 - Purpose and Intent - *The purpose and intent of this chapter is to regulate the stormwater and non-stormwater discharges to the facilities of the Los Angeles County Flood Control District for the protection of those facilities, the water quality of the waters in and downstream of those facilities, and the quality of the water that is being stored in water-bearing zones underground.*		
Norwalk	Title 18 - Environment, Chapter 18.04, Stormwater and Urban Runoff Pollution Control	http://qcode.us/codes/norwalk/
18.04.030 Purpose and Intent (C)- *This chapter is also intended to provide the City with the legal authority necessary to control discharges to and from those portions of the municipal stormwater system over which it has jurisdiction as required by the municipal NPDES permit, and fully and timely comply with the terms of the municipal NPDES permit while the CSWMP and the WMAP are being developed by the permittees under the municipal NPDES permit, and in contemplation of the subsequent amendment of this chapter or adoption by the City of additional provisions of this chapter to implement the subsequently adopted CSWMP and WMAP, or other programs developed under the municipal NPDES permit.*		
Pico Rivera	Title 16- Environment, Chapter 16.04, Stormwater and Urban Runoff Pollution Prevention	http://qcode.us/codes/picorivera
16.01.010 Purpose and Intent (4) - *Reducing pollutant loads in storm water and urban runoff, from land uses and activities identified in the municipal NPDES permit.* *The provisions of this chapter are adopted pursuant to the Federal Water Pollution Control Act, also known as the "Clean Water Act," codified and amended at 33 U.S.C 1251 et seq. The intent of this chapter is to enhance and protect the water quality of the receiving waters of the United States in a manner that is consistent with the Clean Water Act and acts amendatory thereof of supplementary thereto; applicable implementing regulations; the Municipal NPDES permit, and any amendment, revisions, or re-issuance thereof. (Ord. 989 § 1 (part), 2002).*		
Santa Fe Springs	Title V: Public Works- 52, Stormwater Runoff	http://www.amlegal.com/library/ca/santafesprings.shtml
§ 52.01 Purpose and Intent- *The purpose of this chapter is to protect the health, safety and general welfare of the citizens, and to reduce the quantity of pollutants being discharged to the waters of the United States by: (F) Protecting and enhancing the quality of the waters of the United States in a manner consistent with the provisions of the Clean Water Act.*		
Whittier	Title 8-Health and Safety, Chapter 8.36, Stormwater and Runoff Pollution Control	https://library.municode.com/index.aspx?clientId=16695
8.36.030 Purpose and Intent- *The purpose of this chapter is to protect and improve water quality of receiving waters by: (E) reducing pollutant loads in stormwater and urban runoff, from land uses and activities identified in the municipal NPDES permit.*		

8 COORDINATED INTEGRATED MONITORING PROGRAM

The Participating Agencies have developed a customized coordinated integrated monitoring program (CIMP). The CIMP, based on the provisions set forth in Part IV of the MRP (Attachment E) of the MS4 Permit, assesses progress toward achieving the water quality-based effluent limitations and receiving water limitations per the compliance schedules, and progress toward addressing water quality priorities. The customized monitoring program is designed to address the Primary Objectives detailed in Attachment E, Part II.A of the MS4 Permit and includes the following program elements:

- Receiving Water Monitoring
- Storm Water Outfall Monitoring
- Non-Storm Water Outfall Monitoring
- New Development/Re-Development Effectiveness Tracking
- Regional Studies

The CIMP is included in Appendix 8-1.

9 Adaptive Management Process

Adaptive management is the process by which new information about the state of the watershed is incorporated into the WMP. The WMP is adaptively managed following the process described in Permit §IV.C.8. The process is implemented by the participating agencies every two years from the date of WMP approval by the Regional Water Board (or by the Executive Officer on behalf of the Regional Water Board). The purpose of the adaptive management process is to improve the effectiveness of the WMP based on – but not limited to – consideration of the following:

1. Progress toward achieving interim and/or final water quality-based effluent limitations and/or receiving water limitations in §VI.E and Attachments L through R of the MS4 Permit, according to established compliance schedules;
2. Progress toward achieving improved water quality in MS4 discharges and achieving receiving water limitations through implementation of the watershed control measures based on an evaluation of outfall-based monitoring data and receiving water monitoring data;
3. Achievement of interim milestones;
4. Re-evaluation of the water quality priorities identified for the Watershed Management Area (WMA) based on more recent water quality data for discharges from the MS4 and the receiving water(s) and a reassessment of sources of pollutants in MS4 discharges;
5. Availability of new information and data from sources other than the MS4 Permittees' monitoring program(s) within the WMA that informs the effectiveness of the actions implemented by the Permittees;
6. Regional Water Board recommendations; and
7. Recommendations for modifications to the Watershed Management Program solicited through a public participation process.

9.1 Modifications

Based on the results of the adaptive management process, the participating agencies may find that modifications of the WMP are necessary to improve effectiveness. Modifications may include new compliance deadlines and interim milestones, with the exception of those compliance deadlines established in a TMDL.

9.1.1 Reporting

Modifications are reported in the Annual Report, as required pursuant to Part XVIII.A.6 of the Permit Monitoring and Reporting Program (No. CI-6958), and as part of the Report of Waste Discharge (ROWD) required pursuant to Part II.B of Attachment D – Standard Provisions. The background and rational for these modifications are included by addressing the following points:

- Identify the most effective control measures and describe why the measures were effective and how other control measures will be optimized based on past experiences.

- Identify the least effective control measures and describe why the measures were deemed ineffective and how the control measures will be modified or terminated.
- Identify significant changes to control measures during the prior year and the rationale for the changes.
- Describe all significant changes to control measures anticipated to be made in the next year and the rationale for the changes. Those changes requiring approval of the Regional Water Board or its Executive Officer shall be clearly identified at the beginning of the Annual Report.
- Include a detailed description of control measures to be applied to New Development or Re-development projects disturbing more than 50 acres.
- Provide the status of all multi-year efforts that were not completed in the current year and will continue into the subsequent year(s).

9.1.2 IMPLEMENTATION

Modifications are implemented upon approval by the Regional Water Board Executive Officer or within 60 days of submittal if the Regional Water Board Executive Officer expresses no objections.

9.2 RECEIVING WATER LIMITATIONS

The adaptive management process fulfills the requirements in MS4 Permit §V.A.4 to address continuing exceedances of receiving water limitations.

10 REPORTING PROGRAM & ASSESSMENT

10.1 ANNUAL REPORT

PERMIT MRP §XV.A (LA/LB)

Each year on or before December 15th, the participating agencies will submit, either jointly or individually, an annual report to the Regional Water Board Executive Officer. The annual report will present a summary of information that will allow the Regional Board to assess implementation and effectiveness of the watershed management program[1].

The reporting process is intended to meet the following objectives:

- Each agency's participation in one or more Watershed Management Programs.
- The impact of each agency's storm water and non-storm water discharges on the receiving water.
- Compliance with receiving water limitations, numeric water quality-based effluent limitations, and non-storm water action levels.
- The effectiveness of control measures in reducing discharges of pollutants from the MS4 to receiving waters.
- Whether the quality of MS4 discharges and the health of receiving waters is improving, staying the same, or declining as a result watershed management program efforts, and/or TMDL implementation measures, or other Minimum Control Measures.
- Whether changes in water quality can be attributed to pollutant controls imposed on new development, re-development, or retrofit projects.

Annual Report will identify data collected and strategies, control measures and assessments implemented for each watershed within the participating agency's jurisdiction. The report will include summaries for each of the following seven sections as required by the MS4 Permit:

1) Stormwater Control Measures -Summary of New Development/Re-development Projects, actions to comply with TMDL provisions
2) Effectiveness Assessment of Stormwater Control Measures -Summary of rainfall data, provide assessment and compare water quality data, summary to whether or not water quality is improving
3) Non-Stormwater Control Measures -Summary of outfalls screening
4) Effectiveness Assessment of Non-Storm Water Control Measures -Summary of the effectiveness of control measures implemented
5) Integrated Monitoring Compliance Report - Report with summary of all identified exceedances of outfall-based stormwater monitoring data, we weather receiving water monitoring data, dry weather receiving water data and non-storm water outfall monitoring data
6) Adaptive Management Strategies -Summary of effective, less effective control measures

[1] Annual reports will cover summary from previous fiscal year beginning June 1st through July 30th.

7) Supporting Data and Information - Monitoring data summary

The participating agencies will submit annual reports as required by the MS4 Permit. The Regional Board is currently preparing a reporting format. Once available, the reporting form will be incorporated into the WMP as an appendix.

10.1.1 Data Reporting *Permit MRP §XIV.L (LA/LB)*

Analytical data reports will be submitted on a semi-annual basis. Data will be sent electronically to the Regional Water Board's Storm Water site at MS4stormwaterRB4@waterboards.ca.gov. These data reports will summarize:

- Exceedances of applicable WQBELs, receiving water limitations, or any available interim action levels or other aquatic toxicity thresholds.
- Basic information regarding sampling dates, locations, or other pertinent documentation.

10.1.2 Chronic Toxicity Reporting *Permit MRP §XII.K (LA/LB)*

Aquatic toxicity monitoring results will be submitted to the Regional Board on an annual basis as part of the integrated monitoring compliance report as well as in the semi-annual basis data report submittal.

10.2 Watershed Report *Permit MRP §XVII.A (LA/LB)*

The participating agencies will submit biennial watershed reports as required by the MS4 Permit to the Regional Water Board Executive Officer. This biennial report, which will be included in the annual report in odd years, will include information related to the following sections:

- Watershed Management Area
- Subwatershed (HUC-12) Description
- Description of the Permittees Drainage Area within the Subwatershed

Per MS4 Permit § XVII.B, the participating agencies may reference the Watershed Management Program (WMP) in the odd-year report, when the required information is already included or addressed in this WMP, to satisfy baseline information requirements.

The Regional Board is currently preparing a reporting format. Once available, the reporting form will be incorporated into the WMP as an appendix.

10.3 TMDL Reporting *Permit MRP §XIX (LA/LB)*

The participating agencies will also submit an annual report to the Regional Water Board Executive Officer regarding progress of TMDL implementation within the watershed.

The TMDLs that will be addressed in the report are:

- Metals and Selenium
- Harbor Toxics

The Regional Board is currently preparing a reporting format. Once available, the reporting form will be incorporated into the WMP as an appendix.

Watershed Management Program Appendix 1

A-1-1 Definitions, Acronyms and Abbreviations

DEFINITIONS, ACRONYMS AND ABBREVIATIONS

The following are definitions for terms in this Watershed Management Program:

Bacteria Total Maximum Daily Load (TMDL) Dry Weather: Defined in the Bacteria TMDLs as those days with less than 0.1 inch of rainfall and those days occurring more than 3 days after a rain.

Bacteria Total Maximum Daily Load (TMDL) Wet Weather: Defined in the Bacteria TMDLs as a day with 0.1 inch or more of rain and 3 days following the rain event.

Baseline Waste Load Allocation: The Waste Load Allocation assigned before reductions are required. The progressive reductions in the Waste Load Allocations are based on a percentage of the Baseline Waste Load Allocation. The Baseline Waste Load Allocation for each jurisdiction was calculated based on the annual average amount of trash discharged to the storm drain system from a representative sampling of land use areas, as determined during the Baseline Monitoring Program.

Basin Plan: The Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Water Board on June 13, 1994 and subsequent amendments.

Beneficial Uses: The existing or potential uses of receiving waters as designated by the Regional Board in the Basin Plan.

Best Management Practices (BMPs): BMPs are practices or physical devices or systems designed to prevent or reduce pollutant loading from and or volume of stormwater or nonstormwater discharges to receiving waters.

Commercial Development: Any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities; mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

Commercial Malls: Any development on private land comprised of one or more buildings forming a complex of stores which sells various merchandise, with interconnecting walkways enabling visitors to easily walk from store to store, along with parking area(s). A commercial mall includes, but is not limited to: mini-malls, strip malls, other retail complexes, and enclosed shopping malls or shopping centers.

Daily Generation Rate (DGR): The estimated amount of trash deposited within a representative drainage area during a 24hour period, derived from the amount of trash collected from streets and catch basins in the area over a 30-day period.

Disturbed Area: An area that is altered as a result of clearing, grading, and/or excavation.

Effluent Limitation: Any restriction imposed on quantities, discharge rates, and concentrations of pollutants, which are discharged from point sources to waters of the U.S.

Environmentally Sensitive Areas (ESAs): An area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments (California Public Resources Code § 30107.5). Areas subject to stormwater mitigation requirements are: areas designated as Significant Ecological Areas by the County of Los Angeles (Los Angeles County Significant Areas

Study, Los Angeles County Department of Regional Planning (1976) and amendments); an area designated as a Significant Natural Area by the California Department of Fish and Game's Significant Natural Areas Program, provided that area has been field verified by the Department of Fish and Game; an area listed in the Basin Plan as supporting the "Rare, Threatened, or Endangered Species (RARE)" beneficial use; and an area identified by a Permittee as environmentally sensitive.

Estuaries: Estuaries means waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater.

Hillside: Property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25% or greater and where grading contemplates cut or fill slopes.

Hydrologic Unit Code (HUC): A standardized watershed classification system in which each hydrologic unit is identified by a unique hydrologic unit code (HUC).

Illicit Connection: Any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

Illicit Discharge: Any discharge into the MS4 or from the MS4 into a receiving water that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations.

Industrial/Commercial Facility: Any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by either the Standard Industrial Classifications (SIC) or the North American Industry Classification System (NAICS). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

Industrial Park: A land development that is set aside for industrial development. Industrial parks are usually located close to transport facilities, especially where more than one transport modalities coincide: highways, railroads, airports, and navigable rivers. It includes office parks, which have offices and light industry.

Institutional Controls: Programmatic control measures that do not require construction or structural modifications to the MS4. Examples include street sweeping, public education, and clean out of catch basins that discharge to storm drains.

Integrated Pest Management (IPM): An ecosystem-based strategy that focuses on long-term prevention of pests or their damage through a combination of techniques such as biological control, habitat manipulation, modification of cultural practices, and use of resistant varieties.

Low Impact Development (LID): LID consists of building and landscape features designed to retain or filter stormwater runoff.

Low Impact Development (LID) Plan: See "SUSMP" definition.

Maximum Extent Practicable (MEP): The process in choosing effective BMPs and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive.

National Pollutant Discharge Elimination System (NPDES): The national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA §307, 402, 318, and 405.

Natural Drainage System: A natural drainage system is a drainage system that has not been improved (e.g., channelized or armored). The clearing or dredging of a natural drainage system does not cause the system to be classified as an improved drainage system.

New Development: Land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

Nonstormwater Discharge: Any discharge into the MS4 or from the MS4 into a receiving water that is not composed entirely of stormwater.

Not Detected (ND): Sample results which are less than the laboratory's minimum detection level.

Nuisance: Anything that meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal.; (3) occurs during, or as a result of, the treatment or disposal of wastes.

Receiving Water: A "water of the United States" into which stormwater runoff is or may be discharged.

Receiving Water Limitation: Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion.

Redevelopment: Land-disturbing activity that results in the creation, addition, or replacement of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

Significant Ecological Areas (SEAs): An area that is determined to possess an example of biotic resources that cumulatively represent biological diversity, for the purposes of protecting biotic diversity, as part of the Los Angeles County General Plan.

Source Control BMP: Any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent stormwater pollution by reducing the potential for contamination at the source of pollution.

SUSMP: The Los Angeles Countywide Standard Urban Stormwater Mitigation Plan. The SUSMP shall address the Planning and Land Development conditions and requirements of the MS4 Permit.

Wet Season: The calendar period beginning October 1 through April 15.

[1] CTR values for metals are hardness dependent; higher hardness gives higher WQO

[2] Values of 0 represent that the constituent was not detected above the PQL as defined in the Municipal Stormwater Permit. Results are presented in accordance with Method B of the permit

[1] CTR values for metals are hardness dependent; higher hardness gives higher WQO

[2] Values of 0 represent that the constituent was not detected above the PQL as defined in the Municipal Stormwater Permit. Results are presented in accordance with Method B of the permit

Note:
1) blank cell indicates sample was not analyzed
2) -99 indicates concentration below minimum detection level
3) PQL = minimum level
4) Highlighted cells show exceedances
5) Wet weather suspension of fecal coliform objective applies to 2008-09Event06, 2008-09Event09, and 2008-09Event21

Values reported with a "< "are not detected at the method detection level, and reported as <MDL

Values reported with a "<" and a ">" were detected between the method detection limit and reporting limit, they are reported as >MDL& <RL

NS = Not Sampled

*Exceedance of Water Quality Objective

**Not an exceedance due to the High Flow Suspension Basin Plan Amendment (LARQCB 2003).

Values reported with a "< "are not detected at the method detection level, and reported as <MDL

Values reported with a "<" and a ">" were detected between the method detection limit and reporting limit, they are reported as >MDL& <RL

NS = Not Sampled

*Exceedance of Water Quality Objective

**Not an exceedance due to the High Flow Suspension Basin Plan Amendment (LARQCB 2003).

Values reported with a "< "are not detected at the method detection level, and reported as <MDL

Values reported with a "<" and a ">" were detected between the method detection limit and reporting limit, they are reported as >MDL& <RL

NS = Not Sampled

*Exceedance of Water Quality Objective

**Not an exceedance due to the High Flow Suspension Basin Plan Amendment (LARQCB 2003).

^Method detection level exceeds the waer quality benchmark.

Values reported with a "<" and a ">" were detected between the method detection limit and reporting limit, they are reported as >MDL& <RL

NS = Not Sampled

*Exceedance of Water Quality Objective

**Not an exceedance due to the High Flow Suspension Basin Plan Amendment (LARQCB 2003).

^Method detection level exceeds the waer quality benchmark.

Watershed Management Program Appendix 3

A-3-1 MCM Guidance

Public Information and Participation Program

Introduction *Permit §VI.D.5.a (LA)/ §VII.F.1 (LB)*

Each participating city is required to develop and implement a Public Information and Participation Program (PIPP) that includes the requirements listed in Permit §VI.D.5.a (LB §VII.F). This document provides guidance that the participating cities can follow to implement a PIPP in compliance with the Permit.

The objectives of the PIPP are to:

- Measurably increase the knowledge of the target audiences about the MS4, the adverse impacts of stormwater pollution on receiving waters and potential solutions to mitigate the impacts.
- Measurably change the waste disposal and stormwater pollution generation behavior of target audiences by developing and encouraging the implementation of appropriate alternatives.
- Involve and engage a diversity of socio-economic groups and ethnic communities in Los Angeles County to participate in mitigating the impacts of stormwater pollution.

PIPP Implementation *Permit §VI.D.5.b (LA)/§VII.F.2 (LB)*

The PIPP is implemented using the following approaches:

- By participating in a County-wide PIPP,
- By participating in one or more Watershed Group sponsored PIPPs, and
- individually within its jurisdiction.

Cities participating in a County-wide or Watershed Group PIPP provide contact info for their staff responsible for stormwater public education activities to the designated PIPP coordinator. Changes in contact information are provided within 30 days of the date that the change occurred.

Public Participation *Permit §VI.D.5.c (LA)/§VII.F.3 (LB)*

Public Reporting

The means for public reporting of clogged catch basin inlets and illicit discharges/dumping, faded or missing catch basin labels, and general stormwater and non-stormwater pollution prevention information is provided through the use of the countywide 888-CLEAN-LA hotline. In addition, each participating city:

- Includes the reporting information – updated when necessary – in public information and the government pages of the telephone book as they are developed or published.
- Identifies staff or departments who will serve as the contact person(s) and will make this information available on its website.
- Provides current, updated hotline contact information to the general public within its jurisdiction.

Events

Events are organized to target residents and population subgroups. The purpose of the events is to educate and involve the community in stormwater and non-stormwater pollution prevention activities, such as education seminars, clean-ups, and community catch basin stenciling.

Residential Outreach Program

Permit §VI.D.5.d (LA)/§VII.F.4 (LB)

With the exception of item 5, which is no longer an element of the countywide PIP Program, each city implements the following activities for the Residential Outreach Program as part of a countywide program:

1. Conduct stormwater pollution prevention public service announcements and advertising campaigns
2. Prepare public education materials that include information on the proper handling (i.e., disposal, storage and/or use) of:
    a. Vehicle waste fluids
    b. Household waste materials (i.e., trash and household hazardous waste, including personal care products and pharmaceuticals)
    c. Construction waste materials
    d. Pesticides and fertilizers (including integrated pest management (IPM) practices to promote reduced use of pesticides)
    e. Green waste (including lawn clippings and leaves)
    f. Animal wastes
3. Distribute activity specific stormwater pollution prevention public education materials at the following points of purchase:
    a. Automotive parts stores
    b. Home improvement centers / lumber yards / hardware stores/paint stores
    c. Landscaping / gardening centers
    d. Pet shops / feed stores
4. Maintain stormwater websites or provide links to stormwater websites via each participating city's website. This includes educational material and opportunities for the public to participate in stormwater pollution prevention and clean-up activities listed in Part VI.D.4 of the Permit.
5. Provide independent, parochial, and public schools within each participating city's jurisdiction with materials to educate school children (K-12) on stormwater pollution. Material may include videos, live presentations and other information. A useful source of materials to work with, or leverage, is other statewide agencies and associations. These associations include the State Water Board's "Erase the Waste" educational program and the California Environmental Education Interagency Network (CEEIN) to implement this requirement.
6. When implementing the above activities, use effective strategies to educate and involve ethnic communities in stormwater pollution prevention through culturally effective methods.

Industrial/Commercial Facilities Program

Each participating city is required to implement an industrial/commercial facilities program that includes the provisions listed in Permit § VI.D.6 (LB §VII.G). This document provides guidance that the participating cities can follow to implement an industrial/commercial facilities program in compliance with the Permit.

Introduction

Permit § VI.D.6.a (LA)/ §VII.G.1 (LB)

The Industrial/Commercial Facilities Program is designed to prevent illicit discharges into the MS4 and receiving waters, reduce industrial/commercial discharges of stormwater to the maximum extent practicable, and prevent industrial/commercial discharges from the MS4 from causing or contributing to a violation of receiving water limitations. The program consists of the following components:

- Track,
- Educate,
- Inspect and
- Ensure compliance with municipal ordinances at industrial/commercial facilities determined to be critical sources of pollutants in stormwater.

Track Critical Industrial/Commercial Sources

Permit § VI.D.6.b (LA)/ §VII.G.2 (LB)

The critical sources to be tracked are listed in Table ICF-1.

Table ICF-1: Critical Sources

<table>
<tr><th>Facility Category</th><th colspan="2">Facility</th></tr>
<tr><td rowspan="4">Commercial Facilities</td><td colspan="2">Restaurants</td></tr>
<tr><td colspan="2">Automotive service facilities (including those located at automotive dealerships)</td></tr>
<tr><td colspan="2">Retail Gasoline Outlets</td></tr>
<tr><td colspan="2">Nurseries and Nursery Centers (Merchant Wholesalers, Nondurable Goods, and Retail Trade)</td></tr>
<tr><td rowspan="4">Industrial Facilities</td><td colspan="2">USEPA "Phase I" Facilities[1]</td></tr>

<tr><td>General Facilities</td><td colspan="2">All other commercial or industrial facilities determined to potentially contribute a substantial pollutant load to the MS4.</td></tr>
</table>

[1] as specified in 40 CFR §122.26(b)(14)(i)-(xi)
[2] as specified in 40 CFR §122.26(d)(2)(iv)(C)
[3] 42 U.S.C. § 11023

Critical source facilities are tracked in an electronic database management system. The information stored for each critical source in the inventory is listed in Table ICF-2.

Table ICF-2: Inventory Information for Critical Sources

Information Category		Information
General	Name	Facility Name
	Location	Facility address
		Facility latitude and longitude coordinates
		Receiving water
	Contact	Owner/operator name
		Mailing address
		Phone number
		Email (if available)
Business Type		Standard Industrial Classification (SIC) code and/or North American Industry Classification System (NAICS) code
		Narrative description of the activities performed and/or principal products produced
Water quality		Status of exposure of materials to stormwater
		Pollutants generated by facility activities (A-ICF-1)
		Identification of whether the facility is tributary to a waterbody segment with impairments[4] for pollutants that are also generated by the facility.
Prioritization		High, medium or low. The default priority is medium.
NPDES Permit		For applicable facilities, identify coverage under the State Water Board's General NPDES Permit for the Discharge of Stormwater Associated with Industrial Activities (Industrial General Permit) or other individual or general NPDES permits or any waiver issued by the Regional or State Water Board pertaining to stormwater discharges.
		For Industrial General Permit facilities, identify whether the facility has filed a No Exposure Certification with the State Water Board.

Update Inventory

The critical sources inventory is updated at least annually. The update is accomplished through the collection of new information from sources such as field activities and readily available inter/intra-agency records (e.g. business licenses, pretreatment permits, sanitary sewer connection permits and the State Water Resources Control Board's Storm Water Multiple Application and Report Tracking System (SMARTS)).

[4] CWA § 303(d) listed or subject to a TMDL

Prioritization

Prioritizing facilities by their potential water quality impact provides an excellent opportunity to optimize the effectiveness of the Industrial/Commercial Facilities Program. The three inventory fields under the "Water Quality" category of Table ICF-2 provide information that allows for such a facility prioritization. Based on these fields, the following tables establish a method to prioritize all industrial/commercial facilities into three graded tiers – High, Medium and Low. The City may follow an alternative prioritization method provided it is based on water quality impact and results in a similar three-tiered scheme. In order to maintain a minimum inspection frequency equivalent to the mandates of the MS4 Permit, a condition must be applied to the prioritization process. This condition is explained on the following page.

Prioritization factors

Factor	Description
A	Status of exposure of materials and industrial/commercial activities to stormwater
B	Identification of whether the facility is tributary to a waterbody segment with impairments[5] for pollutants that are also generated by the facility
C	Other factors determined by the City, such as size of facility, presence of exposed soil or history of stormwater violations

Utilizing these factors, follow steps 1, 2 and 3 below:

1. Collect necessary information to evaluate factors

Factor	Initial method	Subsequent method
A	Satellite imagery	Results of stormwater inspection
B	Cross reference Table 4 or Table 5* with tributary TMDL/ 303(d) pollutants	Cross reference inspection results with tributary TMDL/ 303(d) pollutants
C	Varies	

* See pages 9 and 10 of Appendix A-3-1 ICF (guidance for the Industrial/Commercial Facilities Program)

2. Evaluate factors

Factor	Result	Score
	Low or no exposure	0
A	Moderate exposure	½
	Significant exposure	1
B	No**	0
	Yes***	1
	Low	0
C	Medium	½
	High	1

** No pollutant generation/impairment matches

*** ≥ 1 pollutant generation/impairment matches

3. Prioritize facilities

		C Score		
		0	**½**	**1**
A×B Score	**0**	Low	Medium	High
	½	Medium	High	High
	1	High	High	High

This method serves only as a guide to prioritization. The City may also prioritize facilities based on a qualitative assessment of factors A, B and C.

Figure ICF-1: Industrial/Commercial Facility Prioritization Scheme

Step 3 may also be expressed by the relationships $A \cdot B + C \geq 1 \rightarrow$ High, $1 > A \cdot B + C > 0 \rightarrow$ Medium and $A \cdot B + C = 0 \rightarrow$ Low. The purpose of multiplying A and B is to scale the impact of the presence of the

[5] CWA §303(d) listed or subject to a TMDL

pollutants at a facility (B) by the likelihood that they will be discharged to the MS4 (A). Factor C quantifies water quality concerns that are independent of A or B and as such is incorporated through addition. The purpose of this numerical approach is to provide consistency to the prioritization process. It is intended solely as a guide. The City may also prioritize facilities based on a qualitative assessment of factors A, B and C as listed in Figure ICF-1.

Prioritization Condition

The facility prioritization impacts the inspection frequency. In fact the main objective of prioritizing the facilities is to adjust the inspection schedule to focus efforts on water quality priorities. The intent is not to reduce the total number of inspections. In order to maintain a total number of inspections in line with the expectations of the MS4 Permit (i.e. result in the same number of average inspections per year as a semi-quinquennial frequency), one additional condition must be imposed:

The total number of low priority facilities is less than or equal to 3 times the number of high priority facilities.

Prioritization condition

Prioritization Frequency

The default priority for a facility is Medium. Facilities will be reprioritized as necessary following the results of routine inspections. The City may also use any readily available information that clarifies potential water quality impacts (e.g., satellite imagery) in order to prioritize a facility before the initial inspection. Reprioritization may also be conducted at any time as new water quality based information on a facility becomes available. During reprioritization, the ratio of low priority to high priority facilities will remain at 3:1 or lower. Figure ICF-2 is a flowchart of the prioritization process.

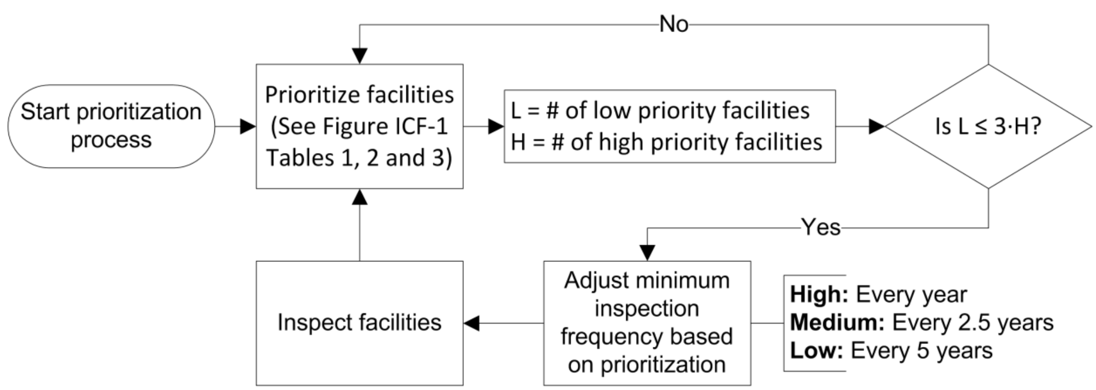

Figure ICF-2: Prioritization Process

Educate Industrial/Commercial Sources

Permit § VI.D.6.c (LA)/ §VII.G.3 (LB)

At least once during the five-year period of the MS4 Permit, the owner/operator of each of the inventoried critical sources is notified of the BMP requirements applicable to the facility/source.

Business Assistance Program

The Business Assistance Program provides technical information to businesses to facilitate their efforts to reduce the discharge of pollutants in stormwater. Assistance is targeted to select business sectors or small businesses upon a determination that their activities may be contributing substantial pollutant loads to the MS4 or receiving water. Assistance may include technical guidance and provision of educational materials. The Program includes at least one of the following components:

- **Technical Guidance** – Provide on-site technical assistance, telephone, or e-mail consultation regarding the responsibilities of businesses to reduce the discharge of pollutants, procedural requirements, and available guidance documents. Guidance methods include but are not limited to:
    - Technical guidance through the critical source inspection program. During an inspection the inspector provides to the business owner/operator 1) on-site technical assistance and 2) contact information for continued consultation. The inspector may also refer staff to relevant fact sheets from the *CASQA Industrial and Commercial BMP Handbook*.
    - Technical guidance initiated with businesses through an informational letter, email, webpage or social media. The notice provides contact information of relevant stormwater staff for business assistance as well as hyperlinks to available guidance documents such as the *CASQA Industrial and Commercial BMP Handbook*.
- **Educational Materials** – Distribute stormwater pollution prevention educational materials to operators of 1) auto repair shops, car wash facilities, restaurants and 2) mobile sources including automobile/equipment repair, washing, or detailing, power washing services, mobile carpet, drape, or upholstery cleaning services, swimming pool, water softener, and spa services, portable sanitary services and commercial applicators and distributors of pesticides, herbicides and fertilizers, if present. Material sources and distribution methods include but are not limited to:
    - Distribution method – The presence of these businesses within an agency's jurisdiction may be determined through business licenses or other readily available inter/intra-agency records.
    - Material sources – Educational materials are available at USEPA's Nonpoint Source (NPS) Outreach Toolbox at http://cfpub.epa.gov/npstbx/index.html. The toolbox is a database of nationwide public education materials that is intended for use by state and local campaigns. The toolbox contains a variety of resources to help develop an effective and targeted outreach campaign.

Inspect Critical Industrial/Commercial Sources

Modified from Permit §VI.D.6.d-e (LA)/ §VII.G.4-5(LB)

Frequency of Inspections

Following the facility prioritization method described in this guidance document, the City will inspect high priority facilities annually, medium priority facilities semi-quinquennially (once every 2.5 years) and low priority facilities quinquennially (once every five years). The frequencies may be altered by the exclusions defined in the following section. The prioritization condition on Page ICF-4 ensures at least the same average number of inspections conducted per year as the semi-quinquennial frequency defined in the MS4 Permit.

The City will conduct the first compliance inspection of industrial/commercial facilities within one year of the approval of the Watershed Management Program by the Executive Officer. There will be a minimum interval of six months between the first and the second mandatory compliance inspections.

Exclusions to the Frequency of Industrial Inspections

Exclusion of Facilities Previously Inspected by the Regional Water Board
The State Water Board's Stormwater Multiple Application and Report Tracking System (SMARTS) database[6] is reviewed at defined intervals to determine if an industrial facility has recently been inspected by the Regional Water Board. The first interval is two years after the effective date of the MS4 Permit (LA: December 28, 2014, LB: March 28,, 2016) and the second interval is four years after the effective date (LA: December 28, 2016, LB: March 28, 2018). If it is determined through the review that the Regional Water Board conducted an inspection of a facility within the prior 24 month period, then the facility does not require an inspection.

No Exposure Verification
The initial inspection identifies those facilities that have filed a No Exposure Certification with the State Water Board. Three to four years after the effective date of the MS4 Permit, a second inspection is performed for at least 25% of the facilities identified to have filed a No Exposure Certification. The purpose of this inspection is to verify the continuity of the no exposure status.

Scope of Inspections

A template inspection form is included as Attachment ICF-A.

Scope of Commercial Inspections
Commercial critical source facilities are inspected to confirm that stormwater and non-stormwater BMPs are effectively implemented in compliance with municipal ordinances. At each facility, inspectors verify that the operator is implementing effective source control BMPs for each corresponding activity. The implementation of additional BMPs is required where stormwater from the MS4 discharges to a significant ecological area (SEA), a water body subject to TMDL provisions[7], or a CWA §303(d) listed impaired water body. For those BMPs that are not adequately protective of water quality standards, additional site-specific controls may be required.

Scope of Mandatory Industrial Facility Inspections
At each industrial critical source the inspector confirms that the facility

- Has a current Waste Discharge Identification (WDID) number for coverage under the Industrial General Permit, and that a Storm Water Pollution Prevention Plan (SWPPP) is available on-site; or
- Has applied for, and has received a current No Exposure Certification for facilities subject to this requirement;
- Is effectively implementing BMPs in compliance with municipal ordinances. Facilities must implement the source control BMPs identified in Table ICF-3, unless the pollutant generating activity does not occur. Additional BMPs must be implemented where stormwater from the MS4

[6] SMARTS is accessible at https://smarts.waterboards.ca.gov/smarts/faces/SwSmartsLogin.jsp
[7] As described in Part VI.E of the MS4 Permit

discharges to a water body subject to TMDL Provisions in Part VI.E of the MS4 Permit, or a CWA § 303(d) listed impaired water body. If the specified BMPs are not adequately protective of water quality standards, additional site-specific controls may be required. For critical sources that discharge to MS4s that discharge to SEAs, operators must implement additional pollutant-specific controls to reduce pollutants in stormwater runoff that are causing or contributing to exceedances of water quality standards.

- Applicable industrial facilities identified as not having either a current WDID or No Exposure Certification are notified that they must obtain coverage under the Industrial General Permit and will be referred to the Regional Water Board per the Progressive Enforcement Policy procedures identified in Part VI.D.2 of the MS4 Permit.

Source Control BMPs

Permit § VI.D.6.f (LA)/ §VII.G.6 (LB)

Effective source control BMPs for the activities listed in Table ICF-3 are implemented at commercial and industrial facilities, unless the pollutant generating activity does not occur:

Significant Ecological Areas (SEAs)

Permit § VI.D.6.g (LA)/ §VII.H (LB)

For critical sources that discharge to MS4s that discharge to SEAs, each Permittee will require operators to implement additional pollutant-specific controls to reduce pollutants in stormwater runoff that are causing or contributing to exceedances of water quality standards.

Progressive Enforcement

Permit § VI.D.6.h (LA)/ §VII.I (LB)

Each Permittee will implement its Progressive Enforcement Policy to ensure that Industrial / Commercial facilities are brought into compliance with all stormwater requirements within a reasonable time period. See Part VI.D.2 of the MS4 Permit for requirements for the development and implementation of a Progressive Enforcement Policy.

Table ICF-3: Source Control BMPs at Commercial and Industrial Facilities

Pollutant-Generating Activity	**BMP Description**	**BMP Fact Sheet***
Unauthorized Non-Storm water Discharges	Effective elimination of non-stormwater discharges	SC-10
Accidental Spills/ Leaks	Implementation of effective spills/ leaks prevention and response procedures	SC-11
Vehicle/ Equipment Fueling	Implementation of effective fueling source control devices and practices	SC-20
Vehicle/ Equipment Cleaning	Implementation of effective equipment/vehicle cleaning practices and appropriate wash water management practices	SC-21
Vehicle/ Equipment Repair	Implementation of effective vehicle/ equipment repair practices and source control devices	SC-22
Outdoor Liquid Storage	Implementation of effective outdoor liquid storage source controls and practices	SC-31
Outdoor Equipment Operations	Implementation of effective outdoor equipment source control devices and practices	SC-32
Outdoor Storage of Raw Materials	Implementation of effective source control practices and structural devices	SC-33
Storage and Handling of Solid Waste	Implementation of effective solid waste storage/ handling practices and appropriate control measures	SC-34
Building and Grounds Maintenance	Implementation of effective facility maintenance practices	SC-41
Parking/ Storage Area Maintenance	Implementation of effective parking/ storage area designs and housekeeping/ maintenance practices	SC-43
Stormwater Conveyance System Maintenance	Implementation of proper conveyance system operation and maintenance protocols	SC-44
Pollutant-Generating Activity	**BMP Description from Regional Water Board Resolution No. 98-08**	
Sidewalk Washing	1. Remove trash, debris, and free standing oil/grease spills/leaks (use absorbent material, if necessary) from the area before washing; and 2. Use high pressure, low volume spray washing using only potable water with no cleaning agents at an average usage of 0.006 gallons per square feet of sidewalk area.	
Street Washing	Collect and divert wash water to the sanitary sewer – publically owned treatment works (POTW). Note: POTW approval may be needed.

Planning and Land Development Program

The Cities are required to implement a Planning and Land Development program that includes the provisions listed in the MS4 Permit (LA MS4 Permit §VI.D.7, LB MS4 Permit §VII.J). This document provides guidance that the participating cities can follow to implement a Planning and Land Development program in compliance with the MS4 Permit.

Introduction *Permit §VI.D.7.a (LA)/§VII.J.1 (LB)*

The Planning and Land Development Program for all New Development and Redevelopment projects subject to the MS4 Permit includes measures to:

- Lessen the water quality impacts of development by using smart growth practices such as compact development, directing development towards existing communities via infill or redevelopment, and safeguarding of environmentally sensitive areas.
- Minimize the adverse impacts from stormwater runoff on the biological integrity of Natural Drainage Systems and the beneficial uses of water bodies in accordance with requirements under CEQA (Cal. Pub. Resources Code §21000 et seq.).
- Minimize the percentage of impervious surfaces on land developments by minimizing soil compaction during construction, designing projects to minimize the impervious area footprint, and employing Low Impact Development (LID) design principles to mimic pre-development hydrology through infiltration, evapotranspiration and rainfall harvest and use.
- Maintain existing riparian buffers and enhance riparian buffers when possible.
- Minimize pollutant loadings from impervious surfaces such as roof tops, parking lots, and roadways through the use of properly designed, technically appropriate BMPs (including Source Control BMPs such as good housekeeping practices), LID Strategies, and Treatment Control BMPs.
- Properly select, design and maintain LID and Hydromodification Control BMPs to address pollutants that are likely to be generated, reduce changes to pre-development hydrology, assure long-term function, and avoid the breeding of vectors.[1]
- Prioritize the selection of BMPs to remove stormwater pollutants, reduce stormwater runoff volume, and beneficially use stormwater to support an integrated approach to protecting water quality and managing water resources in the following order of preference:
    - On-site infiltration, bioretention and/or rainfall harvest and use.
    - On-site biofiltration, off-site groundwater replenishment, and/or off-site retrofit.

[1] Treatment BMPs when designed to drain within 96 hours of the end of rainfall minimize the potential for the breeding of vectors. See California Department of Public Health *Best Management Practices for Mosquito Control in California* (2012) at http://www.westnile.ca.gov/resources.php

Applicability *Permit §VI.D.7.b (LA)/§VII.J.2-3 (LB)*

New Development Projects

The New Development and Redevelopment categories below will require a Standard Urban Stormwater Mitigation Plan (SUSMP), also known as a Low Impact Development (LID) Plan, containing stormwater mitigation measures in compliance with MS4 Permit requirements. Development projects subject to conditioning and approval for the design and implementation of post-construction controls to mitigate stormwater pollution, prior to completion of the project(s), are listed below:

1. All development projects (including single family hillside homes) equal to 1 acre or greater of disturbed area and adding more than 10,000 square feet of impervious surface area
2. Industrial parks with 10,000 square feet or more of surface area
3. Commercial malls with 10,000 square feet or more surface area
4. Retail gasoline outlets with 5,000 square feet or more of surface area
5. Restaurants (SIC 5812) with 5,000 square feet or more of surface area
6. Parking lots with 5,000 square feet or more of impervious surface area, or with 25 or more parking spaces
7. Automotive service facilities (SIC 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) with 5,000 square feet or more of surface area
8. Projects located in or directly adjacent to, or discharging directly to a Significant Ecological Area (SEA), where the development will:
   a. Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and
   b. Create 2,500 square feet or more of impervious surface area
9. Redevelopment projects in subject categories that meet Redevelopment thresholds identified below

Redevelopment Projects

Redevelopment projects subject to agency conditioning and approval for the design and implementation of post-construction controls to mitigate stormwater pollution, prior to completion of the project(s), are:

1. Land-disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site on development categories identified above.
2. Where Redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, the entire project must be mitigated.
3. Where Redevelopment results in an alteration of less than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post-construction stormwater quality control requirements, only the alteration must be mitigated, and not the entire

development.

4. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency Redevelopment activity required to protect public health and safety. Impervious surface replacement, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment, is considered a routine maintenance activity. Redevelopment does not include the repaving of existing roads to maintain original line and grade.

5. Existing single-family dwelling and accessory structures are exempt from the Redevelopment requirements unless such projects create, add, or replace 10,000 square feet of impervious surface area.

Special Provisions

1. Street and road construction of 10,000 square feet or more of impervious surface area
   a. These projects will follow an approved green streets manual to the maximum extent practicable. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects. The Cities will require a Standard Urban Mitigation Plan (SUSMP), also known as a Low Impact Development (LID) Plan, containing stormwater mitigation measures in compliance with the approved green streets manual requirements.

2. Single family hillside homes will require a less extensive plan. To the extent that an agency may lawfully impose conditions, mitigation measures or other requirements on the development or construction of a single-family home in a hillside area as defined in the applicable agency's Code and Ordinances, the Cities will require that during the construction of a single-family hillside home, the following measures are implemented:
   a. Conserve natural areas
   b. Protect slopes and channels
   c. Provide storm drain system stenciling and signage
   d. Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability
   e. Direct surface flow to vegetated areas before discharge unless the diversion would result in slope instability.

New Development/ Redevelopment Project Performance Criteria *Permit §VI.D.7.c (LA)/§VII.J.4 (LB)*

Integrated Water Quality/Flow Reduction/Resources Management Criteria

All New Development and Redevelopment projects identified above will control pollutants, pollutant loads, and runoff volume emanating from the project site by: (1) minimizing the impervious surface area and (2) controlling runoff from impervious surfaces through infiltration, bioretention and/or rainfall harvest and use.

Projects will retain on-site the Stormwater Quality Design Volume (SWQDv) defined as the runoff from the 0.75-inch, 24-hour rain event or the 85th percentile, 24-hour rain event, as determined from the Los Angeles County 85th percentile precipitation isohyetal map[2], *whichever is greater*. Exceptions include technical infeasibility, opportunity for regional groundwater replenishment, local ordinance equivalence, or hydromodification, as described in the sections below.

When evaluating the potential for on-site retention, the Cities will consider the maximum potential for evapotranspiration from green roofs and rainfall harvest and use.

Alternative Compliance for Technical Infeasibility or Opportunity for Regional Groundwater Replenishment

In instances of technical infeasibility or where a project has been determined to provide an opportunity to replenish regional groundwater supplies at an offsite location, the Cities may allow projects to comply with the MS4 Permit through the alternative compliance measures as described below:

1. To demonstrate technical infeasibility, the project applicant must demonstrate that the project cannot reliably retain 100 percent of the SWQDv on-site, even with the maximum application of green roofs and rainwater harvest and use, and that compliance with the applicable post-construction requirements would be technically infeasible by submitting a site-specific hydrologic and/or design analysis conducted and endorsed by a registered professional engineer, geologist, architect, and/or landscape architect. Conditions where technical infeasibility may result including those indicated in

[2] Found at <http://ladpw.org/wrd/publication/engineering/Final_Report-Probability_Analysis_of_85th_Percentile_24-hr_Rainfall1.pdf>

2. Table PLD- **1** below. To utilize alternative compliance measures to replenish groundwater at an offsite location, the project applicant will demonstrate *(i)* why it is not advantageous to replenish groundwater at the project site, *(ii)* that groundwater can be used for beneficial purposes at the offsite location, and *(iii)* that the alternative measures will also provide equal or greater water quality benefits to the receiving surface water than the Water Quality/Flow Reduction/Resource Management Criteria.

Table PLD- 1: Technical Infeasibility Criteria

1.	The infiltration rate of saturated in-situ soils is less than 0.3 inch per hour and it is not technically feasible to amend the in-situ soils to attain an infiltration rate necessary to achieve reliable performance of infiltration or bioretention BMPs in retaining the SWQDv on-site.
2.	Locations where seasonal high groundwater is within 5 to 10 feet of the surface,
3.	Locations within 100 feet of a groundwater well used for drinking water,
4.	Brownfield development sites where infiltration poses a risk of causing pollutant mobilization,
5.	Other locations where pollutant mobilization is a documented concern. Pollutant mobilization is considered a documented concern at or near properties that are contaminated or store hazardous substances underground.
6.	Locations with potential geotechnical hazards
7.	Smart growth and infill or Redevelopment locations where the density and/ or nature of the project would create significant difficulty for compliance with the on-site volume retention requirement.

Alternative Compliance Measures

When a project applicant has demonstrated that it is technically infeasible to retain 100 percent of the SWQDv on-site, or is proposing an alternative offsite project to replenish regional groundwater supplies, the agency will require one of the following mitigation options:

1. On-site Biofiltration

   If using biofiltration due to demonstrated technical infeasibility, then the project must biofiltrate 1.5 times the portion of the SWQDv that is not reliably retained on-site, as calculated by Equation 1 below.

$$B_v = 1.5 * [SWQD_v - R_V] \qquad \textit{Equation 1}$$

   Where:

   Bv = biofiltration volume

   SWQDv = the stormwater runoff from a 0.75 inch, 24-hour storm or the 85th percentile storm[3], *whichever is greater*.

   Rv = volume reliably retained on-site

   The MS4 Permit does not mention flowrate based biotreatment BMPs; however, proprietary biotreatment systems are often sized using flowrate rather than volume. Additionally, in cases where a pump is needed prior to entering the biotreatment BMP, the system requires sizing based on the controlled flow from the pump. Therefore, if it is infeasible to size a biotreatment BMP with volume-based calculations, the flowrate may be substituted in lieu of volume. Similarly, the flow rate must be determined using the design storm of 0.75 inch, 24-hour storm event or the 85th percentile storm[1], whichever is greater.

   Conditions for On-site Biofiltration include the following:

   a. Biofiltration systems will meet the design specifications provided in Attachment H to the MS4 Permit unless otherwise approved by the Regional Water Board Executive Officer.

[3] Found at <http://ladpw.org/wrd/publication/engineering/Final_Report-Probability_Analysis_of_85th_Percentile_24-hr_Rainfall1.pdf>

b. Biofiltration systems discharging to a receiving water that is included on the Clean Water Act section 303(d) list of impaired water quality-limited water bodies due to nitrogen compounds or related effects will be designed and maintained to achieve enhanced nitrogen removal capability. See Attachment H of the MS4 Permit for design criteria for underdrain placement to achieve enhanced nitrogen removal.

2. Offsite Infiltration

Offsite infiltration when implemented will use infiltration or bioretention BMPs to intercept a volume of stormwater runoff equal to the SWQDv, less the volume of stormwater runoff reliably retained on-site, at an approved offsite project and provide pollutant reduction (treatment) of the stormwater runoff discharged from the project site in accordance with the Water Quality Mitigation Criteria. The required offsite mitigation volume will be calculated by Equation 2 below.

$$M_v = 1.0 * [SWQD_v - R_v]$$ *Equation 2*

Where:

M_v = mitigation volume

$SWQD_v$ = runoff from the 0.75 inch, 24-hour storm event or the 85th percentile storm[4], *whichever is greater*

R_v = the volume of stormwater runoff reliably retained on-site.

3. Groundwater Replenishment Projects

Regional projects to replenish regional groundwater supplies at offsite locations may be proposed, provided the groundwater supply has a designated beneficial use in the Basin Plan. Regional groundwater replenishment projects must use infiltration, groundwater replenishment, or bioretention BMPs to intercept a volume of stormwater runoff equal to the SWQDv for New Development and Redevelopment projects, subject to conditioning and approval for the design and implementation of post-construction controls, within the approved project area. The projects must provide pollutant reduction (treatment) of the stormwater runoff discharged from development projects, within the project area, subject to conditioning and approval for the design and implementation of post-construction controls to mitigate stormwater pollution in accordance with the Water Quality Mitigation Criteria.

Regional groundwater replenishment projects being implemented in lieu of onsite controls will mitigate the volume as calculated using Equation 2 above.

Regional groundwater replenishment projects will be located in the same sub-watershed (defined as draining to the same HUC-12 hydrologic area in the Basin Plan) as the New Development or Redevelopment projects which did not implement on-site retention BMPs. Locations outside of the HUC-12 but within the HUC-10 subwatershed area may be considered if there are no opportunities within the HUC-12 subwatershed or if greater pollutant reductions and/or groundwater

[4] Found at <http://ladpw.org/wrd/publication/engineering/Final_Report-Probability_Analysis_of_85th_Percentile_24-hr_Rainfall1.pdf>

replenishment can be achieved at a location within the expanded HUC-10 subwatershed. *The use of a mitigation, groundwater replenishment, or retrofit project outside of the HUC-12 subwatershed is subject to the approval of the Executive Officer of the Regional Water Board*.

4. Offsite Project -Retrofit Existing Development

   Use infiltration, bioretention, rainfall harvest and use and/or biofiltration BMPs to retrofit an existing development, with similar land uses as the New Development or land uses associated with comparable or higher stormwater runoff event mean concentrations (EMCs) than the new development. Comparison of EMCs for different land uses will be based on published data from studies performed in southern California. The retrofit plan will be designed and constructed to:

   a. Intercept a volume of stormwater runoff equal to the mitigation volume (Mv) as described above in Equation 2, except biofiltration BMPs will be designed to meet the biofiltration volume or flowrate as described in Equation 1, and

   b. Provide pollutant reduction (treatment) of the stormwater runoff from the project site as described in the Water Quality Mitigation Criteria.

5. Conditions for Offsite Projects

   Project applicants seeking to utilize these alternative compliance provisions may propose other offsite projects, which the agency in which the project is located may approve if they meet the requirements of this subpart.

   a. Location of offsite projects. Offsite projects will be located in the same sub-watershed (defined as draining to the same HUC-12 hydrologic area in the Basin Plan) as the New Development or Redevelopment project. Locations outside of the HUC-12 but within the HUC-10 subwatershed area may be considered if there are no opportunities within the HUC-12 subwatershed or if greater pollutant reductions and/or groundwater replenishment can be achieved at a location within the expanded HUC-10 subwatershed. *The use of a mitigation, groundwater replenishment, or retrofit project outside of the HUC-12 subwatershed is subject to the approval of the Executive Officer of the Regional Water Board.*

   b. Project applicant must demonstrate that equal benefits to groundwater recharge can be met on the project site.

   c. A prioritized list of potential offsite mitigation, groundwater replenishment and/or retrofit projects will be developed within each agency, and when feasible, the mitigation will be directed to the highest priority project within the same HUC-12 or if approved by the Regional Water Board Executive Officer, the HUC-10 drainage area, as the New Development project.

   d. Infiltration/bioretention will be the preferred LID BMP for offsite mitigation or groundwater replenishment projects. Offsite retrofit projects may include green streets, parking lot retrofits, green roofs, and rainfall harvest and use. Biofiltration BMPs may be considered for retrofit projects when infiltration, bioretention or rainfall harvest and use is technically infeasible.

   e. The agency in which the project is located will develop a schedule for the completion of offsite projects, including milestone dates to identify, fund, design, and construct the projects. Offsite

projects will be completed as soon as possible, and at the latest, within 4 years of the certificate of occupancy for the first project that contributed funds toward the construction of the offsite project, unless a longer period is otherwise authorized by the Executive Officer of the Regional Water Board. For public offsite projects, the agency in which the project is located must provide in their annual reports a summary of total offsite project funds raised to date and a description (including location, general design concept, volume of water expected to be retained, and total estimated budget) of all pending public offsite projects. Funding sufficient to address the offsite volume must be transferred to the agency (for public offsite mitigation projects) or to an escrow account (for private offsite mitigation projects) within one year of the initiation of construction.

f. Offsite projects must be approved by the agency in which the project is located and may be subject to approval by the Regional Water Board Executive Officer, if a third-party petitions the Executive Officer to review the project. Offsite projects will be publicly noticed on the Regional Water Board's website for 30 days prior to approval.

g. The project applicant must perform the offsite projects as approved by either the agency or the Regional Water Board Executive Officer or provide sufficient funding for public or private offsite projects to achieve the equivalent mitigation stormwater volume.

6. Regional Stormwater Mitigation Program

An agency or agency group may apply to the Regional Water Board for approval of a regional or sub-regional stormwater mitigation program to substitute in part or wholly for New and Redevelopment requirements for the area covered by the regional or sub-regional stormwater mitigation program. Upon review and a determination by the Regional Water Board Executive Officer that the proposal is technically valid and appropriate, the Regional Water Board may consider for approval such a program if its implementation meets all of the following requirements:

a. Retains the runoff from the 85th percentile, 24-hour rain event or the 0.75 inch, 24-hour rain event, whichever is greater;

b. Results in improved stormwater quality;

c. Protects stream habitat;

d. Promotes cooperative problem solving by diverse interests;

e. Is fiscally sustainable and has secure funding; and

f. Is completed in five years including the construction and start-up of treatment facilities.

7. Water Quality Mitigation Criteria

All New Development and Redevelopment projects that have been approved for offsite mitigation or groundwater replenishment projects will also provide treatment of stormwater runoff from the project site. These projects will design and implement post-construction stormwater BMPs and control measures to reduce pollutant loading as necessary to:

a. Meet the pollutant specific benchmarks listed in Table PLD2 at the treatment systems outlet or prior to the discharge to the MS4, and

b. Ensure that the discharge does not cause or contribute to an exceedance of water quality standards at the agency's downstream MS4 outfall.

The project proponent may be allowed to install flow-through modular treatment systems including sand filters, or other proprietary BMP treatment systems with a demonstrated efficiency at least equivalent to a sand filter. The sizing of the flow through treatment device will be based on a rainfall intensity of 0.2 inches per hour, or the one year, one-hour rainfall intensity as determined from the most recent Los Angeles County isohyetal map, *whichever is greater*.

Table PLD- 2: Benchmarks Applicable to New Development Treatment BMPs.

Conventional Pollutants					
Pollutant	Suspended Solids mg/L	Total P mg/L	Total N mg/L	TKN mg/L	
Effluent Concentration	14	0.13	1.28	1.09	
Metals					
Pollutant	Total Cd µg/L	Total Cu µg/L	Total Cr µg/L	Total Pb µg/L	Total Zn µg/L
Effluent Concentration	0.3	6	2.8	2.5	23

New developments and redevelopments will not cause or contribute to an exceedance of applicable water quality-based effluent limitations established in the MS4 Permit pursuant to Total Maximum Daily Loads (TMDLs).

8. Hydromodification (Flow/ Volume/ Duration) Control Criteria

All New Development and Redevelopment projects located within natural drainage systems will implement hydrologic control measures, to prevent accelerated downstream erosion and to protect stream habitat in natural drainage systems. The purpose of the hydrologic controls is to minimize changes in post-development hydrologic stormwater runoff discharge rates, velocities, and duration. This will be achieved by maintaining the project's pre-project stormwater runoff flow rates and durations.

Description

Hydromodification control in natural drainage systems will be achieved by maintaining the Erosion Potential (Ep) in streams at a value of 1, unless an alternative value can be shown to be protective of the natural drainage systems from erosion, incision, and sedimentation that can occur as a result of flow increases from impervious surfaces and prevent damage to stream habitat in natural drainage system tributaries[5]. Hydromodification mitigation approaches should meet the criteria below:

a. Hydromodification control may include one, or a combination of on-site, regional or sub-regional hydromodification control BMPs, LID strategies, or stream and riparian buffer restoration measures. Any in-stream restoration measure shall not adversely affect the beneficial uses of the natural drainage systems.

b. Natural drainage systems that are subject to the hydromodification assessments and controls,

[5] See Attachment J of the MS4 Permit, "*Determination of Erosion Potential*"

as described in this section, include all drainages that have not been improved (e.g., channelized or armored with concrete, shotcrete, or rip-rap) or drainage systems that are tributary to a natural drainage system, except as provided in Exemptions to Hydromodification Controls, see below. The clearing or dredging of a natural drainage system does not constitute an "improvement."

c. Until the State Water Board or the Regional Water Board adopts a final Hydromodification Policy or criteria, the Hydromodification Control Criteria described in this section will be implemented to control the potential adverse impacts of changes in hydrology that may result from New Development and Redevelopment projects located within natural drainage systems.

Exemptions to Hydromodification Controls

New Development and Redevelopment projects may be exempt from implementation of hydromodification controls where assessments of downstream channel conditions and proposed discharge hydrology indicate that adverse hydromodification effects to beneficial uses of Natural Drainage Systems are unlikely. Conditions for exemptions include the following:

a. Projects involving replacement, maintenance or repair of an agency's existing flood control facility, storm drain, or transportation network.

b. Redevelopment Projects in the center of urban areas that do not increase the effective impervious area or decrease the infiltration capacity of pervious areas compared to the pre-project conditions.

c. Projects that have any increased discharge directly or via a storm drain to a sump, lake, area under tidal influence, into a waterway that has a 100-year peak flow (Q100) of 25,000 cfs or more, or other receiving water that is not susceptible to hydromodification impacts.

d. Projects that discharge directly or via a storm drain into concrete or otherwise engineered (not natural) channels (e.g., channelized or armored with rip rap, shotcrete, etc.), which, in turn, discharge into receiving water that is not susceptible to hydromodification impacts.

e. LID BMPs implemented on single family homes are sufficient to comply with hydromodification criteria.

Hydromodification Control Criteria

The Hydromodification Control Criteria to protect natural drainage systems are as follows:

a. Except for exemptions described above, projects disturbing an area greater than 1 acre but less than 50 acres within natural drainage systems will be presumed to meet pre-development hydrology if one of the following demonstrations is made:

    i. The project is designed to retain on-site, through infiltration, evapotranspiration, and/or harvest and use, the stormwater volume from the runoff of the 95th percentile, 24-hour storm, or

ii. The runoff flow rate, volume, and velocity for the post-development condition do not exceed the pre-development condition for the 2-year, 24-hour rainfall event and the duration for the post-development condition is not less than the pre-development condition for the 2-year, 24-hour rainfall event. This condition may be substantiated by simple screening models, including those described in Hydromodification Effects on Flow Peaks and Durations in Southern California Urbanizing Watersheds (Hawley et al., 2011) or other models acceptable to the Executive Officer of the Regional Water Board, or

> The MS4 Permit states projects will meet Hydromodification Control Criteria if "*The...duration for the post-development condition* ***do[es] not exceed*** *the pre-development condition for the 2-year, 24-hour rainfall event*." The runoff duration (Tc) is generally associated with longer values resulting in lower concern for hydromodification impacts. Implementation of LID BMPs generally results in runoff not immediately (or not at all) discharging from the site, increasing the time of concentration. Thus, the interpretation presented herein is that Hydromodification Control Criteria would be met if the runoff duration for the post-development condition is **not less than** the pre-development condition for the 2-year, 24-hour rainfall event.

iii. The Erosion Potential (Ep) in the receiving water channel will approximate 1, as determined by a Hydromodification Analysis Study and the equation presented in Attachment J of the MS4 Permit. Alternatively, agencies can opt to use other work equations to calculate Erosion Potential with Executive Officer approval.

b. Projects disturbing 50 acres or more within natural drainage systems will be presumed to meet pre-development hydrology based on the successful demonstration of one of the following conditions:

i. The site infiltrates on-site at least the runoff from a 2-year, 24hour storm event, or

ii. The runoff flow rate, volume, and velocity for the post-development condition does not exceed the pre-development condition for the 2-year, 24-hour rainfall event and the duration for the post-development condition is not less than the pre-development condition for the 2-year, 24-hour rainfall event. These conditions must be substantiated by hydrologic modeling acceptable to the Regional Water Board Executive Officer, or

iii. The Erosion Potential (Ep) in the receiving water channel will approximate 1, as determined by a Hydromodification Analysis Study and the equation presented in Attachment J of the MS4 Permit.

Alternative Hydromodification Criteria

The requirement for Hydromodification Controls will be satisfied by implementing the hydromodification requirements in the County of Los Angeles Low Impact Development Manual (2009) for all projects disturbing an area greater than 1 acre within natural drainage systems.

3. Watershed Equivalence

Regardless of the methods through which applicants implement alternative compliance measures,

the subwatershed-wide (defined as draining to the same HUC-12 hydrologic area in the Basin Plan) result of all development must be at least the same level of water quality protection as would have been achieved if all projects utilizing these alternative compliance provisions had complied with the Integrated Water Quality/Flow Reduction/Resource Management Criteria, described herein.

4. Annual Report

Annual Reports will be provided to the Regional Water Board to include a list of mitigation project descriptions and estimated pollutant and flow reduction analyses (compiled from design specifications submitted by project applicants, as approved. Within 4 years of the MS4 Permit adoption, the Annual Reports will include a comparison of the expected aggregate results of alternative compliance projects to the results that would otherwise have been achieved by retaining on site the SWQDv.

Implementation *Permit §VI.D.7.d (LA)/§VII.J.5 (LB)*

Local Ordinance Equivalence

Alternative requirements in the local ordinances for the agencies of this WMP will provide equal or greater reduction in stormwater discharge pollutant loading and volume as would have been obtained through strict conformance with the Integrated Water Quality/Flow Reduction Resources Management Criteria, Alternative Compliance Measures for Technical Infeasibility, or Opportunity for Regional Groundwater Replenishment sections herein and, if applicable, the Hydromodification (Flow/Volume Duration) Control Criteria section herein.

Project Coordination

A process for effective approval of post-construction stormwater control measures will be developed to include:

a. Detailed LID site design and BMP review including review of BMP sizing calculations, BMP pollutant removal performance, and municipal approval; and

b. An established structure for communication and delineated authority between and among municipal departments that have jurisdiction over project review, plan approval, and project construction through memoranda of understanding or an equivalent agreement.

Maintenance Agreement and Transfer

Prior to issuing approval for final occupancy, the Cities will require that all New Development and Redevelopment projects subject to post-construction BMP requirements, with the exception of simple LID BMPs implemented on single family residences, provide an operation and maintenance plan, monitoring plan, where required, and verification of ongoing maintenance provisions for LID practices, Treatment Control BMPs, and Hydromodification Control BMPs including but not limited to: final map conditions, legal agreements, covenants, conditions or restrictions, CEQA mitigation requirements, conditional use permits, and/ or other legally binding maintenance agreements (see Attachments PLD-A and PLD-B for MCA and MCA Termination sample templates, respectively). Agencies will require maintenance records be kept on site.

Verification at a minimum will include the developer's signed statement accepting responsibility for maintenance until the responsibility is legally transferred; and either:

a. A signed statement from the public entity assuming responsibility for BMP maintenance; or

b. Written conditions in the sales or lease agreement, which require the property owner or tenant to assume responsibility for BMP maintenance and conduct a maintenance inspection at least once a year; or

c. Written text in project covenants, conditions, and restrictions (CCRs) for residential properties assigning BMP maintenance responsibilities to the Home Owners Association; or

d. Any other legally enforceable agreement or mechanism that assigns responsibility for the maintenance of BMPs.

All development projects subject to post-construction BMP requirements will provide a plan for the operation and maintenance of all structural and treatment controls. The plan will be submitted for examination of relevance to keeping the BMPs in proper working order. Where BMPs are transferred to agency for ownership and maintenance, the plan will also include all relevant costs for upkeep of BMPs in the transfer. Operation and Maintenance plans for private BMPs will be kept on-site for periodic review by agency inspectors.

A tracking system and an inspection and enforcement program will be maintained for New Development and Redevelopment post-construction stormwater as shown in Table PLC-3. Enforcement action will be taken per the established Progressive Enforcement Policy as appropriate based on the results of the inspection. See Section for requirements for the development and implementation of a Progressive Enforcement Policy (Appendix A-3-1_PEP).

Table PLD-3: Tracking, Inspection, and Enforcement Program Components

Program	Description	Components	
GIS or other Electronic System	A GIS or other electronic system will be implemented for tracking projects that have been conditioned for post-construction BMPs.	− Municipal Project ID − State WDID No. − Project Acreage − BMP Type and Description − BMP Location (coordinates) − Date of Maintenance Agreement − Date of Acceptance	− Maintenance Records − Inspection Date and Summary − Corrective Action − Date Certificate of Occupancy Issued − Replacement or Repair Date
Inspections[6]	Inspect all development sites upon completion of construction and prior to the issuance of occupancy	Proper installation of: − LID measures, − Structural BMPs,	

[6] The inspection may be combined with other inspections provided it is conducted by trained personnel.

	certificates.	– Treatment control BMPs, and – Hydromodification control BMPs.
Operation and Maintenance[7]	Verify proper operation and maintenance of post-construction BMPs. Inspection at least once every 2 years after project completion.	– Follow a Post-construction BMP Maintenance Inspection checklist (See Attachment PLD-C) – Assess operation and maintenance conditions relating to post-construction BMPs, including BMP repair, replacement, or re-vegetation.

Plan Certification

Each SUSMP/LID Plan should contain proper certifications. The following approach is suggested for SUSMP/LID Plan submittals:

- Form signed by the property owner/applicant stating the category in which the project falls under to easily define the NPDES requirements (see Attachment PLD-D for Form PC sample template).
- Form signed by the property owner/applicant certifying that the BMPs will be implemented, monitored, and maintained per SUSMP/LID Plan requirements (see Attachment PLD-E for Form P1 sample template).
- Form signed and stamped by a California registered civil engineer stating the proposed structural BMPs and certifying the methods and requirements are in compliance with the MS4 Permit requirements (see Attachment PLD-F for Form P2 sample template).

[7] For post-construction BMPs operated and maintained by parties other than the agency in which the BMP(s) is located, the agency will require the other parties to document proper maintenance and operations.

Development Construction Program

The Cities are required to develop, implement and enforce a construction program that includes the provisions listed in MS4 Permit §VI.D.8 (LB §VII.K). This document provides guidance to assist the Cities in implementing a construction program in compliance with the MS4 Permit.

Objectives

Permit §VI.D.8.a (LA)/§VII.K.1 (LB)

The objectives of the construction program are to:

- Prevent illicit construction-related discharges of pollutants into the MS4 and receiving waters.
- Implement and maintain structural and non-structural BMPs to reduce pollutants in stormwater runoff from construction sites.
- Reduce construction site discharges of pollutants to the MS4 to the MEP.
- Prevent construction site discharges to the MS4 from causing or contributing to a violation of water quality standards.

Erosion and Sediment Control Ordinance

Permit §VI.D.8.b (LA)/ §VII.K.1 (LB)

The construction program requires an established, enforceable erosion and sediment control ordinance for all construction sites that disturb soil.

Applicability

Permit §VI.D.8.c (LA)/ §VII.K.1.v (LB)

The construction program addresses construction activity as defined in Table DC-1.

Table DC-1: Definitions

Construction Activity	
Definition	Any construction or demolition activity, clearing, grading, grubbing, or excavation or any other activity that results in land disturbance.
Examples	Grading, vegetation clearing, soil compaction, paving, repaving and linear underground/overhead projects (LUPs) that result in land disturbance.
Exclusions	Emergency construction required to immediately protect public health and safety, *routine maintenance* as defined below and agricultural activities.
Routine Maintenance (construction program exclusion)	
Definition	Projects required to maintain the integrity of structures, including but not limited to the following:
Examples	Maintaining the original line and grade, hydraulic capacity, or original purpose of the facility.
	Performing restoration work to preserve the original design grade, integrity and hydraulic capacity of flood control facilities.
	Performing road shoulder work, regrading dirt/gravel roadways/shoulders and cleaning out ditches.
	Update existing lines (includes replacing with new materials or pipe) and facilities to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.
	Repair leaks
Exclusion	New lines (i.e. not associated with existing facilities and not part of a project to update or replace existing lines) or facilities constructed to comply with applicable codes, standards and regulations.

The greater part of the construction program is dedicated to construction sites that disturb one acre or more of soil (with the exception of agricultural activities). This coincides with the size threshold for coverage under the State Water Resources Control Board's NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities. The program provisions exclusive to sites less than one acre are addressed first.

Construction Sites Less than One Acre *Permit §VI.D.8.d (LA)/§VII.K.1.vi (LB)*

BMPs (< 1 acre)

Through the use of the erosion and sediment control ordinance and/or building permit, construction sites are required have in place an effective combination of erosion and sediment control BMPs from Table DC-2 to prevent erosion and sediment loss and the discharge of construction wastes.

Table DC-2: Applicable Set of BMPs for All Construction Sites

BMP Type	BMP
Erosion Controls	Scheduling
	Preservation of Existing Vegetation
Sediment Controls	Silt Fence
	Sand Bag Barrier
	Stabilized Construction Site Entrance/Exit
Nonstormwater Management	Water Conservation Practices
	Dewatering Operations
Waste Management	Material Delivery and Storage
	Stockpile Management
	Spill Prevention and Control
	Solid Waste Management
	Concrete Waste Management
	Sanitary/Septic Waste Management

Inventory (< 1 acre)

All construction sites with soil disturbing activities that require a permit, regardless of size, are identified and stored in an inventory. Existing permit databases or other tracking systems may be used to file this information. The list of permitted sites is provided to the Regional Water Board upon request.

Inspections (< 1 acre)

Construction sites are inspected on as needed based on the evaluation of the factors that are a threat to water quality. In evaluating the threat to water quality, the following factors are considered: soil erosion potential, site slope, project size and type, sensitivity of receiving water bodies, proximity to receiving water bodies, nonstormwater discharges, past record of noncompliance by the operators of the construction site and any water quality issues relevant to the particular MS4.

Enforcement (< 1 acre)

The Progressive Enforcement Policy (MS4 Permit §VI.D.2) is implemented to ensure that construction sites are brought into compliance with the erosion and sediment control ordinance within a reasonable time period.

Construction Sites One Acre or Greater

Operators of public and private construction sites within a city's jurisdiction are required to select, install, implement, and maintain BMPs that comply with the erosion and sediment control ordinance.

Construction Site Inventory / Electronic Tracking System *Permit §VI.D.8.g (LA)/§VII.K.1.ix (LB)*

An electronic system is used to inventory all issued grading permits, encroachment permits, demolition permits, building permits, or construction permits (and any other municipal authorization to move soil and/ or construct or destruct that involves land disturbance). A database management system or GIS system is recommended. This inventory is continuously updated as new sites are permitted and sites are completed. The inventory / tracking system contains at a minimum the items listed in Table DC-3.

Table DC-3: Inventory Information for Constructions Sites

Information Type		Information
General	Name	Project Name
	Location	Site address and/or latitude and longitude coordinates
		Receiving water
	Contact	Names of owner and contractor
		Mailing addresses of owner and contractor
		Phone numbers of owner and contractor
		Emails (if available) of owner and contractor
Status		Start and end dates
		Permit approval date and anticipated completion date
		Erosion and Sediment Control Plan (ESCP) approval date
		Status of NOI submittal and CGP coverage
		Current construction phase (where feasible)
Size		Size of project and area of disturbance
Water quality		Proximity to waterbodies listed as impaired[1] by sediment related pollutants
		Proximity to waterbodies for which a sediment-related TMDL has been adopted and approved by USEPA
		Status as a significant threat to water quality (based on a consideration of factors listed in Appendix 1 to the CGP)
Inspection		Inspection frequency
Post construction		List of post-construction structural BMPs subject to O&M requirements

Construction Plan Review and Approval Procedures *Permit §VI.D.8.h (LA)/§VII.K.1.x (LB)*

Plan review procedures are developed and implemented such that the following minimum requirements are met:

- Prior to issuing a grading or building permit, each operator of a construction activity within the city's jurisdiction of which the project is located is required to prepare and submit an ESCP prior to the disturbance of land for review and written approval. The construction site operator is prohibited from commencing construction activity prior to receipt of written approval by the city of which the project is located. An ESCP is not approved unless it contains appropriate site-

[1] CWA §303(d) listed or subject to a TMDL

specific construction site BMPs that meet the minimum requirements of the erosion and sediment control ordinance.

- ESCPs must include the elements of a Storm Water Pollution Prevention Plan (SWPPP). SWPPPs prepared in accordance with the requirements of the Construction General Permit can be accepted as ESCPs.
- At a minimum, the ESCP must address the following elements:
    - Methods to minimize the footprint of the disturbed area and to prevent soil compaction outside of the disturbed area.
    - Methods used to protect native vegetation and trees.
    - Sediment/Erosion Control.
    - Controls to prevent tracking on and off the site.
    - Nonstormwater controls (e.g., vehicle washing, dewatering, etc.).
    - Materials Management (delivery and storage).
    - Spill Prevention and Control.
    - Waste Management (e.g., concrete washout/waste management; sanitary waste management).
    - Identification of site Risk Level as identified per the requirements in Appendix 1 of the Construction General Permit.
- The ESCP must include the rationale for the selection and design of the proposed BMPs, including quantifying the expected soil loss from different BMPs.
- The ESCP must be developed and certified by a Qualified SWPPP Developer (QSD).
- All structural BMPs must be designed by a licensed California Engineer.
- The landowner or the landowner's agent must sign a statement on the ESCP as follows (see Attachment DC-A for sample OC-1 template):

  "I certify that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is true, accurate, and complete. I am aware that submitting false and/ or inaccurate information, failing to update the ESCP to reflect current conditions, or failing to properly and/ or adequately implement the ESCP may result in revocation of grading and/ or other permits or other sanctions provided by law."

- Prior to issuing a grading or building permit, the city of which the project is located verifies that the construction site operators have existing coverage under applicable permits, including, but not limited to the State Water Board's Construction General Permit, and State Water Board 401 Water Quality Certification.
- A checklist is used to conduct and document review of each ESCP (see Attachment DC-B for the ESCP Checklist sample template).

BMP Implementation Level *Permit §VI.D.8.i (LA)/§VII.K.1.xi (LB)*

The Cities will implement technical standards for the selection, installation and maintenance of construction BMPs for all construction sites within its jurisdiction.

The BMP technical standards require:

- The use of BMPs that are tailored to the risks posed by the project. Sites are ranked from Low Risk (Risk 1) to High Risk (Risk 3). Project risks are calculated based on the potential for erosion from the site and the sensitivity of the receiving water body. Receiving water bodies that are listed on the Clean Water Act (CWA) Section 303(d) list for sediment or siltation are considered High Risk. Likewise, water bodies with designated beneficial uses of SPWN, COLD, and MIGR are also considered High Risk. The combined (sediment/receiving water) site risk is calculated using the methods provided in Appendix 1 of the Construction General Permit. At a minimum, the BMP technical standards include requirements for High Risk sites as defined in Table DC-7.
- The use of BMPs for all construction sites, sites equal or greater to 1 acre, and for paving projects per Table DC-6 and Table DC-8.
- Detailed installation designs and cut sheets for use within ESCPs.
- Maintenance expectations for each BMP, or category of BMPs, as appropriate.

Permittees are encouraged to adopt respective BMPs from latest versions of the California BMP Handbook, Construction or Caltrans Stormwater Quality Handbooks, Construction Site Best Management Practices (BMPs) Manual and addenda. Alternatively, Permittees are authorized to develop or adopt equivalent BMP standards consistent for Southern California and for the range of activities presented in Tables DC-5 through DC-8.

The local BMP technical standards are readily available to the development community and are clearly referenced within the Cities' stormwater or development services websites, ordinances, permit approval processes and/or ESCP review forms. The local BMP technical standards are also readily available to the Regional Water Board upon request.

Local BMP technical standards are available for the BMPs listed in Tables DC-5 through DC-8.

Table DC-4: Minimum Set of BMPs for All Construction Sites

BMP Type	BMP
Erosion Controls	Scheduling
	Preservation of Existing Vegetation
Sediment Controls	Silt Fence
	Sand Bag Barrier
	Stabilized Construction Site Entrance/Exit
Nonstormwater Management	Water Conservation Practices
	Dewatering Operations
Waste Management	Material Delivery and Storage
	Stockpile Management
	Spill Prevention and Control
	Solid Waste Management
	Concrete Waste Management
	Sanitary/Septic Waste Management

Table DC-5: Additional BMPs Applicable to Construction Sites Disturbing 1 Acre or More

BMP Type	BMP
Erosion Controls	Hydraulic Mulch
	Hydroseeding
	Soil Binders
	Straw Mulch
	Geotextiles and Mats
	Wood Mulching
Sediment Controls	Fiber Rolls
	Gravel Bag Berm
	Street Sweeping and/ or Vacuum
	Storm Drain Inlet Protection
	Scheduling
	Check Dam
Additional Controls	Wind Erosion Controls
	Stabilized Construction Entrance/ Exit
	Stabilized Construction Roadway
	Entrance/ Exit Tire Wash
Non-Storm Management	Vehicle and Equipment Washing
	Vehicle and Equipment Fueling
	Vehicle and Equipment Maintenance
Waste Management	Material Delivery and Storage
	Spill Prevention and Control

Table DC-6: Additional Enhanced BMPs for High Risk Sites

BMP Type	BMP
Erosion Controls	Hydraulic Mulch
	Hydroseeding
	Soil Binders
	Straw Mulch
	Geotextiles and Mats
	Wood Mulching
	Slope Drains
Sediment Controls	Silt Fence
	Fiber Rolls
	Sediment Basin
	Check Dam
	Gravel Bag Berm
	Street Sweeping and/or Vacuum
	Sand Bag Barrier
	Storm Drain Inlet Protection
Additional Controls	Wind Erosion Controls
	Stabilized Construction Entrance/Exit
	Stabilized Construction Roadway
	Entrance/Exit Tire Wash
	Advanced Treatment Systems*
Nonstormwater Management	Water Conservation Practices
	Dewatering Operations (Ground water dewatering only under NPDES Permit No. CAG994004)
	Vehicle and Equipment Washing
	Vehicle and Equipment Fueling
	Vehicle and Equipment Maintenance
Waste Management	Material Delivery and Storage
	Stockpile Management
	Spill Prevention and Control
	Solid Waste Management

*Applies to public roadway projects.

Table DC-7: Minimum Required BMPs for Roadway Paving or Repair Operation (For Private or Public Projects)

#	BMP
1.	Restrict paving and repaving activity to exclude periods of rainfall or predicted rainfall unless required by emergency conditions.
2.	Install gravel bags and filter fabric or other equivalent inlet protection at all susceptible storm drain inlets and at manholes to prevent spills of paving products and tack coat.
3.	Prevent the discharge of release agents including soybean oil, other oils, or diesel to the stormwater drainage system or receiving waters.
4.	Minimize non stormwater runoff from water use for the roller and for evaporative cooling of the asphalt.
5.	Clean equipment over absorbent pads, drip pans, plastic sheeting or other material to capture all spillage and dispose of properly.
6.	Collect liquid waste in a container, with a secure lid, for transport to a maintenance facility to be reused, recycled or disposed of properly.
7.	Collect solid waste by vacuuming or sweeping and securing in an appropriate container for transport to a maintenance facility to be reused, recycled or disposed of properly.
8.	Cover the “cold-mix” asphalt (i.e., pre-mixed aggregate and asphalt binder) with protective sheeting during a rainstorm.
9.	Cover loads with tarp before haul-off to a storage site, and do not overload trucks.
10.	Minimize airborne dust by using water spray or other approved dust suppressant during grinding.
11.	Avoid stockpiling soil, sand, sediment, asphalt material and asphalt grindings materials or rubble in or near stormwater drainage system or receiving waters.
12.	Protect stockpiles with a cover or sediment barriers during a rain.

Construction Site Inspection *Permit §VI.D.8.j (LA)/§VII.K.1.xii (LB)*

The Cities’ legal authority is used to implement procedures for inspecting public and private construction sites. The inspection procedures are implemented as follows:

Inspection Frequency

- Inspect the public and private construction sites as specified in Table DC-8.
- All phases of construction are inspected as follows:
  - Prior to Land Disturbance – Prior to allowing an operator to commence land disturbance, each Permittee shall perform an inspection to ensure all necessary erosion and sediment structural and non-structural BMP materials and procedures are available per the erosion and sediment control plan.
  - During Active Construction, including Land Development[2] and Vertical Construction[3] – In accordance with the frequencies specified in Table DC-8, inspections are performed to ensure all necessary erosion and sediment structural and non-structural BMP materials and procedures are available per the erosion and sediment control plan throughout the construction process.
  - Final Landscaping / Site Stabilization[4] – At the conclusion of the project and as a condition of approving and/or issuing a Certificate of Occupancy, the constructed site is inspected to ensure that all graded areas have reached final stabilization and that all

[2] Activities include cuts and fills, rough and finished grading; alluvium removals; canyon cleanouts; rock undercuts; keyway excavations; stockpiling of select material for capping operations; and excavation and street paving, lot grading, curbs, gutters and sidewalks, public utilities, public water facilities including fire hydrants, public sanitary sewer systems, storm sewer system and/or other drainage improvement.
[3] The build out of structures from foundations to roofing, including rough landscaping.
[4] All soil disturbing activities at each individual parcel within the site have been completed.

trash, debris, and construction materials, and temporary erosion and sediment BMPs are removed.

- Based on the required frequencies above, each construction project is inspected a minimum of three times.

Table DC-8: Inspection Frequencies for Sites One Acre or Greater

<table>
<tr><th>Site</th><th>Inspection Frequency Shall Occur</th></tr>
<tr><td>All sites 1 acre or larger that discharge to a tributary listed by the state as an impaired water for sediment or turbidity under the CWA §303(d)</td><td rowspan="2">(1) when two or more consecutive days with greater than 50% chance of rainfall are predicted by NOAA[5], (2) within 48 hours of a ½-inch rain event and at (3) least once every two weeks</td></tr>
<tr><td>Other sites 1 acre or more determined to be a significant threat to water quality[6]</td></tr>
<tr><td>All other construction sites with 1 acre or more of soil disturbance not meeting the criteria above</td><td>At least monthly</td></tr>
</table>

Inspection Standard Operating Procedures

Standard operating procedures are implemented, and revised as necessary, that identify the inspection procedures followed by the Cities' inspectors (see Attachment DC-C for suggested standard operating procedures). Inspections of construction sites – and the standard operating procedures – include, but are not limited to:

1. Verification of active coverage under the Construction General Permit for sites disturbing 1 acre or more, or that are part of a planned development that will disturb 1 acre or more and a process for referring non-filers to the Regional Water Board.
2. Review of the applicable ESCP and inspection of the construction site to determine whether all BMPs have been selected, installed, implemented, and maintained according to the approved plan and subsequent approved revisions (see Attachment DC-B for the ESCP Checklist sample template).
3. Assessment of the appropriateness of the planned and installed BMPs and their effectiveness.
4. Visual observation and record keeping of nonstormwater discharges, potential illicit discharges and connections, and potential discharge of pollutants in stormwater runoff.
5. Development of a written or electronic inspection report generated from an inspection checklist used in the field (see Attachment DC-D and DC-E for the Large Site and Small Site[7] Inspection Forms, respectively).
6. Tracking of the number of inspections for the inventoried construction sites throughout the reporting period to verify that the sites are inspected at the minimum frequencies listed in Table DC-8.

Enforcement *Permit §VI.D.8.k (LA)/§VII.K.1.xiii (LB)*

The Progressive Enforcement Policy is implemented to ensure that construction sites are brought into compliance with all stormwater requirements within a reasonable time period.

[5] www.srh.noaa.gov/forecast

[6] In evaluating the threat to water quality, the following factors shall be considered: soil erosion potential; site slope; project size and type; sensitivity of receiving water bodies; proximity to receiving water bodies; nonstormwater discharges; past record of non-compliance by the operators of the construction site; and any water quality issues relevant to the particular MS4.

[7] A "large site" refers to a site greater than or equal to 1 acre while a "small site" refers to a site less than one acre.

Permittee Staff Training *Permit §VI.D.8.l(LA)/§VII.K.1.xiv(LB)*

Staff whose primary job duties are related to implementing the construction stormwater program are adequately trained.

The Cities may conduct in-house training or contract with consultants. Training is provided to the following staff positions of the MS4:

- Plan Reviewers and Permitting Staff – Staff and consultants are trained as qualified individuals, knowledgeable in the technical review of local erosion and sediment control ordinance, local BMP technical standards, ESCP requirements, and the key objectives of the State Water Board QSD program. The training is provided either internally to staff or staff is required to obtain QSD certification.
- Erosion Sediment Control/Stormwater Inspectors – Inspectors are either 1) knowledgeable in inspection procedures consistent with the State Water Board sponsored program QSD, 2) a Qualified SWPPP Practitioner (QSP) or 3) a designated person on staff trained in the key objectives of the QSD/QSP programs supervises inspection operations. The training is provided either provided internally to staff or staff is required to obtain QSD/QSP certification. Each inspector is knowledgeable of the local BMP technical standards and ESCP requirements.
- Third-Party Plan Reviewers, Permitting Staff, and Inspectors – If outside parties are utilized to conduct inspections and/or review plans, these staff are trained per the requirements listed above. Outside contractors can self-certify, providing they certify they have received all applicable training required in MS4 Permit §VI.D.8 and have documentation to that effect.

Public Agency Activities Program

Each participating city is required to develop and implement a program for public agency facilities and activities that includes the requirements listed in MS4 Permit §VI.D.9 (LB §VII.L). This document provides guidance to assist the Cities in implementing a public agency activities program in compliance with the MS4 Permit.

Objectives *Permit §VI.D.9.a (LA)/§VII.L.1 (LB)*

The objectives of the Public Agency Activities program are to:

- Minimize stormwater pollution impacts from Permittee-owned or operated facilities.
- Minimize stormwater pollution impacts from public agency activities.
- Identify opportunities to reduce stormwater pollution impacts from areas of existing development.

MS4 Permit requirements for Public Agency Facilities and Activities consist of the following components which will be discussed in more detail in the sections below:

- Public Construction Activities Management
- Public Facility Inventory
- Inventory of Existing Development for Retrofitting Opportunities
- Public Facility and Activity Management
- Vehicle and Equipment Wash Areas
- Landscape, Park, and Recreational Facilities Management
- Storm Drain Operation and Maintenance
- Streets, Roads, and Parking Facilities Maintenance
- Emergency Procedures
- Municipal Employee and Contractor Training

1. Public Construction Activities Management *Permit §VI.D.9.b (LA)/§VII.L.2 (LB)*

Each participating city is required to develop and implement a Development Construction Program that meets the requirements the Development Construction Section of this WMP, and Part VI.D.8 of the LA MS4 Permit at municipally owned or operated (i.e., public or Permittee sponsored) construction projects. In addition, each participating city is required to develop and implement a Planning and Land Development Program that meets the requirements in the Planning and Land Development Section of this WMP, and the MS4 Permit at municipally owned or operated (i.e., public or Permittee sponsored) construction projects.

2. Public Facility Inventory *Permit §VI.D.9.c (LA)/§VII.L.3 (LB)*

The Public Agency Activities Program requires the maintenance of an inventory of all Permittee-owned or operated (i.e., public) facilities that are potential sources of stormwater pollution. The incorporation of facility information into a GIS is recommended. Sources that are tracked include but are not limited to the following:

- Animal control facilities
- Chemical storage facilities
- Composting facilities

- Equipment storage and maintenance facilities (including landscape maintenance-related operations)
- Fueling or fuel storage facilities (including municipal airports)
- Hazardous waste disposal facilities
- Hazardous waste handling and transfer facilities
- Incinerators
- Landfills
- Materials storage yards
- Pesticide storage facilities
- Fire stations
- Public restrooms
- Public parking lots
- Public golf courses
- Public swimming pools
- Public parks
- Public works yards
- Public marinas
- Recycling facilities
- Solid waste handling and transfer facilities
- Vehicle storage and maintenance yards
- Stormwater management facilities (e.g., detention basins)
- All other Permittee-owned or operated facilities or activities that are determined to contribute a substantial pollutant load to the MS4.

The following minimum fields of information are included in the inventory for each Permittee-owned or operated facility:

- Name of facility
- Name of facility manager and contact information
- Address of facility (physical and mailing)
- A narrative description of activities performed and potential pollution sources.
- Coverage under the Industrial General Permit or other individual or general NPDES permits or any applicable waiver issued by the Regional or State Water Board pertaining to stormwater discharges.

The inventory is updated at least once during the 5-year MS4 Permit term. The update are accomplished through collection of new information obtained through field activities or through other readily available inter and intra-agency informational databases (e.g., property management, land-use approvals, accounting and depreciation ledger account, and similar information).

3. Inventory of Existing Development for Retrofit Opportunities

Permit §VI.D.9.d (LA)/§VII.L.4 (LB)

The Public Agency Activities Program requires the development of an inventory of retrofitting opportunities. Retrofit opportunities are identified within the public right-of-way or in coordination with a TMDL implementation plan(s). The goals of the existing development retrofitting inventory are to address the impacts of existing development through regional or sub-regional retrofit projects that

reduce the discharges of stormwater pollutants into the MS4 and prevent discharges from the MS4 from causing or contributing to a violation of water quality standards as defined in the MS4 Permit.

Existing areas of development are screened to identify candidate areas for retrofitting using watershed models or other screening level tools. The areas of existing development identified during the screening process are then evaluated and ranked to prioritize retrofitting candidates. Criteria for this evaluation may include, but is not limited to the following:

- Feasibility, including general private and public land availability;
- Cost effectiveness;
- Pollutant removal effectiveness;
- Tributary area potentially treated;
- Maintenance requirements;
- Landowner cooperation;
- Neighborhood acceptance;
- Aesthetic qualities;
- Efficacy at addressing concern; and
- Potential improvements to public health and safety.

The results of this evaluation are considered in the following programs:

- Highly feasible projects expected to benefit water quality are given a high priority to implement source control and treatment control BMPs in the WMP.
- High priority retrofit projects are considered as candidates for off-site mitigation projects per LA MS4 Permit §VI.D.7.c.iii(4)(d) (LB §VII.J.4.iii(4)).
- Where feasible, the existing development retrofit program is coordinated with flood control projects and other infrastructure improvement programs per LA MS4 Permit §VI.D.9.e.ii(2) (LB §VII.L.5.ii(2)).

Site specific retrofit projects are encouraged through cooperation with private landowners. The following practices are considered in cooperating with private landowners to retrofit existing development:

- Demonstration retrofit projects;
- Retrofits on public land and easements that treat runoff from private
- developments;
- Education and outreach;
- Subsidies for retrofit projects;
- Requiring retrofit projects as enforcement, mitigation or ordinance compliance;
- Public and private partnerships;
- Fees for existing discharges to the MS4 and reduction of fees for retrofit implementation.

4. Public Facility and Activity Management

Permit §VI.D.9.e (LA)/§VII.L.5 (LB)

4.1. Industrial General Permitted Facilities

Permit §VI.D.9.e.i & §VI.D.9.e.v (LA)/§VII.L.5.i (LB)

All Permittee owned or operated facilities where industrial activities are conducted that require coverage are required to obtain coverage under the Industrial General Permit by submitting a Notice of Intent (NOI) to the State Water Resources Control Board (State Board) and preparing a Stormwater

Pollution Prevention Plan (SWPPP). Facilities that may require coverage are listed by category in 40 Code of Federal Regulations (CFR) Section 122.26(b)(14), and include:

- Facilities subject to stormwater effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR Subchapter N)
- Manufacturing facilities
- Mining and oil and gas facilities
- Hazardous waste treatment, storage, or disposal facilities
- Landfills, land application sites, and open dumps that receive industrial waste
- Recycling facilities
- Steam electric generating facilities
- Transportation facilities
- Sewage treatment plants
- Certain facilities if materials are exposed to stormwater

Municipally owned or operated facilities that have obtained coverage under the IGP implement and maintain BMPs consistent with the associated SWPPP, and are therefore not required to implement and maintain the activity specific BMPs as described in the sections below.

4.2. Flood Management Projects *Permit §VI.D.9.e.ii (LA)/§VII.L.5.ii (LB)*

The following measures are implemented for municipally owned or operated flood management projects:

- Procedures are developed to assess the impacts of flood management projects on the water quality of receiving water bodies;
- Existing structural flood control facilities area evaluated to determine if retrofitting the facility to provide additional pollutant removal from stormwater is feasible.

4.3. Contracted Public Agency Activities *Permit §VI.D.9.e.iv (LA)/§VII.L.5.iv (LB)*

Any contractors hired to conduct Public Agency Activities, including, but not limited to the following must be contractually obligated to implement and maintain the activity specific BMPs outlined in the sections below:

- Storm and/or sanitary sewer system inspection and repair,
- Street sweeping,
- Trash pick-up and disposal, and
- Street and right-of-way construction and repair

It is the responsibility of each Permittee to ensure that these BMPs are being properly implemented and maintained through oversight of contracted activities. Example contractor/lessor contract language is provided in attachment PA-A.

4.4. BMPS for Municipal Activities

Permit §VI.D.9.e.iii & Permit §VI.D.9.e.vi (LA)/§VII.L.5.iii & VII.L.5.vi (LB)

Municipal maintenance and field staff are the ones responsible for implementing effective source control BMPs[1], such as those described in Table PA-1 (or an equivalent set of BMPs) when such activities occur at municipally owned or operated facilities and field operations (i.e. project sites). These sites include, but are not limited to the facility types identified in the Public Facility Inventory, and at any area that includes the activities described in Table PA-1, or that have the potential to discharge pollutants in stormwater. The Caltrans Stormwater Quality Handbook Maintenance Staff Guide (Caltrans Handbook)[2] is an additional resource that describes BMPs to prevent the stormwater-related pollutants most likely to come from common maintenance facility operations and field activities. It provides a straightforward working-level approach to implementing BMPs for common maintenance activities by categorizing these activities into Families, and associating each Family with certain types of BMPs in Activity Cut Sheets. The activities described in Sections 5-10 below are representative of typical municipal operations, and correspond to the activities and BMPs listed in Table PA-1. Where appropriate, each section will identify the appropriate Maintenance Activity Family and corresponding Caltrans Activity Cut Sheets from this table for ease of reference.

Although Table PA-1 and the CalTrans Handbook are excellent references for selecting BMPs for some of the most common municipal activities, they may not represent a comprehensive inventory of activities encountered by maintenance staff and field personnel. Likewise, for those BMPs that are not adequately protective of water quality standards, additional site-specific BMPS may be needed. For example, the implementation of additional BMPs is required where stormwater from the storm drain system discharges to a water body subject to a TMDL, a Clean Water Act §303(d) listed water body, or a significant ecological area (SEA). Attachment PA-B contains a map of SEAs in LA County and Attachment K of the LA MS4 Permit contains a matrix of Permittees and TMDLs.

[1] BMP is defined by the California Stormwater Quality Association as "*any program, technology, process, siting criteria, operating method, measure, or device which controls, prevents, removes, or reduces pollution*". Source Control BMPs are operational practices that prevent pollution by reducing potential pollutants at the source. They typically do not require maintenance or construction, and may consist of programmatic controls such as street sweeping. Treatment Control BMPs are methods of treatment to remove pollutants from stormwater, and can include constructed treatment devices such as an infiltration basin.

[2] The handbook is available at http://www.dot.ca.gov/hq/env/stormwater/special/newsetup/_pdfs/management_ar_rwp/CTSW-RT-02-057.pdf and may also be found by entering the words "Caltrans Stormwater Quality Handbook Maintenance Staff Guide" in a web search engine.

Table PA-1: General and Activity Specific BMPs and Their Associated Caltrans Handbook Activity Cut Sheet

Maintenance Activity Family	BMP	Caltrans Activity Cut Sheet Number
General BMPs	Scheduling and Planning	B-4
	Spill Prevention and Control	
	Sanitary/Septic Waste Management	
	Material Use	
	Safer Alternative Products

Storm Maintenance	Minor Slides and Slipouts Cleanup/ Repair	B-78
Management and Support	Building and Grounds Maintenance	B-80
	Storage of Hazardous Materials (Working Stock)	B-82
	Material Storage Control (Hazardous Waste)	B-84
	Outdoor Storage of Raw Materials	B-85
	Vehicle and Equipment Fueling	B-86
	Vehicle and Equipment Cleaning	B-87
	Vehicle and Equipment Maintenance and Repair	B-88
	Aboveground and Underground Tank Leak and Spill Control	B-90

5. Vehicle and Equipment Wash Areas

Permit §VI.D.9.f (LA)/§VII.L.6 (LB)

This section corresponds to Maintenance Activity Family Management and Support and corresponding Caltrans Activity Cut Sheet B-87.

Vehicle and equipment cleaning at a municipal facility may introduce a number of potential pollutants into the storm drain system. Municipal maintenance and field staff are responsible for implementing and maintaining the activity specific BMPs listed in Table PA-1 for all fixed vehicle and equipment washing; including fire fighting and emergency response vehicles. In addition, maintenance and field staff are responsible for preventing discharges of wash water from entering the storm drain system. Table PA-2 shows the potential pollutants associated with vehicle and equipment cleaning.

Table PA-2: Potential Pollutants Generated from Cleaning Activities

Activity	**Potential Pollutants**					
Vehicle and Equipment Cleaning	Sediment	Nutrients	Trash	Metals	Oil & Grease	Organics

Discharges of wash waters to the storm drain system are prevented by implementing the following measures at existing facilities with vehicle or equipment wash areas:

- Wash water is self-contained and hauled away for proper disposal offsite.
- Wash areas are equipped with a clarifier, or an alternative pre-treatment device, and water is plumbed to the sanitary sewer in accordance with applicable waste water provider regulations.
- Wastewater from all new vehicle and equipment wash facilities, or redeveloped or replaced existing facilities is prevented from discharging to the MS4 by equipping the facility with a clarifier, or an alternative pre-treatment device, and plumbing water to the sanitary sewer in accordance with applicable waste water provider regulations, or by self-containing all water water/wash water and hauling to a point of legal disposal.

6. Landscape, Park, and Recreational Facilities Management

Permit §VI.D.9.g (LA)/ §VII.L.7 (LB)

This section corresponds to multiple Activity Cut Sheets within the Slope/Drains/Vegetation, Landscape, Environmental, and Management and Support Families.

Maintenance practices at parks and recreational facilities generally include fertilizer and pesticide applications, vegetation maintenance and disposal, irrigation, swimming pool chemical maintenance and draining, and trash and debris management. All of these maintenance practices have the potential to contribute pollutants to the storm drain system. Municipal maintenance and field staff are responsible for implementing and maintaining the activity specific BMPs listed in Table PA-1for all public right-of-

ways, flood control facilities and open channels, lakes and reservoirs, and landscape, park, and recreational facilities and activites. Table PA-3 shows the potential pollutants associated with recreational facilities..

Table PA-3: Potential Pollutants Generated from Recreational Facilities

Activity	Potential Pollutants				
Vehicle and Equipment Cleaning	Sediment	Nutrients	Trash	Bacteria	Pesticides

6.1 Model Integrated Pest Management Program

Permit §VI.D.9.g.ii & VI.D.9.g.iii (LA)/§VII.L.7.ii & VII.L.7.iii (LB)

An IPM policy is in place to minimize pesticide and fertilizer use, and encourage the use of IPM techniques for Public Agency facilities and activities. The attached IPM Program template (Attachment PA-C), adapted from the Orange County Drainage Area Management Plan (DAMP) IPM Policy developed by the University of California, Division of Agriculture and Natural Resources, provides an example of an effective IPM program. This IPM Program template is based on regulations, management guidelines, and research-based recommendations established by federal, state and local agencies and universities with particular expertise in pest management.

As part of the IPM policy, a commitment and schedule to reduce the use of pesticides that cause impairment t of surface waters is implemented through the following procedures:

- An inventory of all pesticides used by municipal departments, divisions, and operational units is prepared and updated annually.
- Pesticides used by staff and hired contractors are quantified.
- The use of IPM alternatives is demonstrated, where feasible, to reduce pesticide use.

Municipal maintenance and field staff applying pesticides are certified in the appropriate category by the California Department of Pesticide Regulation, or are under the direct supervision of a pesticide applicator certified in the appropriate category.

7. Storm Drain Operation and Maintenance

Permit §VI.D.9.h (LA)/ §VII.L.8 (LB)

This section corresponds to the Litter/Debris/Graffiti Family: Litter and Debris Removal Cut Sheet, pg. B-33, and the Environmental Family: Storm Drain Stenciling Cut Sheet, pg. B-44

The storm drain system functions primarily to collect and convey surface runoff to receiving waters during storms in order to prevent flooding. It is a common municipal activity to maintain the storm drain system so that it functions hydraulically as intended during storms. Municipal maintenance and field staff are responsible for implementing and maintaining the activity specific BMPs listed in Table PA-1 for storm drain operation and maintenance, and ensuring that all material removed from the MS4 does not reenter the system by dewatering solid material in a contained area and disposing of liquid material in accordance with any of the following measures:

- Self-containing and hauling off for legal disposal; or
- Applying to the land without runoff; or
- Equipping with a clarifier or alternative pre-treatment device and plumbing to the sanitary sewer in accordance with applicable waste water provider regulations.

Table PA-4 shows potential pollutants generated during storm drain operation and maintenance.

Table PA-4: Potential Pollutants Generated from Storm Drain Operation and Maintenance

Activity	Potential Pollutants: Sediment	Nutrients	Trash	Metals	Bacteria	Oil & Grease	Organics	Pesticides	Oxygen Demanding Substances
Inspection and Cleaning of Conveyance Structures	×	×	×		×		×		×
Controlling Illicit Connections and Discharges	×	×	×	×	×	×	×	×	×
Controlling Illegal Dumping	×	×	×	×	×	×	×	×	×
Maintenance of Inlet and Outlet Structures	×		×		×	×			

7.1 Catch Basin Cleaning *Permit §VI.D.9.h.iii (LA)/ §VII.L.8.iii (LB)*

There is no preferred method for cleaning catch basins as long as the method used is successful in removing accumulated sediment and debris. The methods used are determined in the field with the goal of minimizing the amount of escaped material, and preventing this material from entering the storm drain system. A template catch basin cleaning log is provided in Attachment PA-D.

7.1.1 Catch Basins Cleaning in Areas not Subject to a Trash TMDL

In areas that are not subject to a trash TMDL, catch basin inlets are prioritized based on the amount of trash generated, and inspected according to the schedule in Table PA-5.

Table PA-5: Inspection Frequencies for Catch Basin Inlets

Trash Generating Frequency	Priority	Inspection Frequency
Consistently generates the highest volumes of trash and/or debris	A	A minimum of three times during the wet season (October-April) and once during the dry season every year
Consistently generates moderate volumes of trash and/or debris	B	A minimum of once during the wet season and once during the dry season every year
Generates low volumes of trash and/or debris	C	A minimum of once per year

An inventory of catch basins is maintained and updated regularly. This inventory includes the following components:

- GPS coordinates of each catch basin
- Priorities for inspection
- Rationale or data to support catch basin priority designations
- Inspection and cleaning records

Catch basins are cleaned as necessary based on the inspections conducted. At a minimum, catch basins determined to be at least 25% full of trash are cleaned out.

7.1.2 Catch Basin Cleaning in Areas Subject to a Trash TMDL

In areas subject to a Trash TMDL, all applicable provisions of LA MS4 Permit Section VI.E (LB Part Part VIII) in conformance with the appropriate TMDL implementation schedule, are implemented. This includes an effective combination of full capture, partial capture, institutional controls, or minimum frequency of assessment and collection as described in LA MS4 Permit Section VI.E (LB Part Part VIII).

7.2 Catch Basin Labels and Open Channel Signage

Permit §VI.D.9.h.vi (LA)/ §VII.L.8.vi (LB)

All municipally owned storm drain inlets are labeled with a "No Dumping, Drains to Ocean" message, and inspected for legibility prior to the wet season (October-April) every year. Catch basins with illegible labels are recorded and re-stenciled or re-labeled within 180 days of inspection. In addition, signs referencing local code(s) that prohibit littering and illegal dumping are posted at designated public access points to open channels, creeks, urban lakes, and other relevant water bodies.

7.3 Trash Management

Permit §VI.D.9.h.iv-v & Permit §VI.D.9.h.vii (LA)/§VII.L.8.iv-v (LB)

The following Trash Management BMPs described below are employed to mitigate the impacts of anthropogenic trash on receiving waters.

7.3.1 Trash Management at Public Events

The following measures are implemented for any event in the public right of way or wherever it is foreseeable that substantial quantities of trash and litter may be generated, including events located in areas that are subject to a trash TMDL:

- Proper management of trash and litter generated; and
- Arrangement for temporary screens to be placed on catch basins; or
- Provide clean out of catch basins, trash receptacles, and grounds in the event area within one business day subsequent to the event.

7.3.2 Trash Receptacles

Covered trash receptacles are located in areas identified as high trash generation areas and maintained and cleaned out as necessary to prevent trash overflow. Examples of areas that may be considered high trash generating areas include:

- High vehicle or pedestrian traffic areas
- Commercial areas
- Industrial areas
- Construction areas
- High density residential areas
- Areas adjacent to vacant lots

7.3.3 Additional Trash Management Practices

In areas that are not subject to a trash TMDL, additional trash management practices will be employed no later than five years after the effective date of the LA MS4 Permit (4 years after the effective date of the LB MS4 Permit). Trash excluders or equivalent devices must be installed on or in catch basins or outfalls to prevent the discharge of trash to the MS4 or receiving waters, unless the installation of such BMP(s) alone will cause flooding (not due to lack of maintenance). Alternatively, additional trash BMPs

that provide substantially equivalent removal of trash may be implemented. Additional BMPs may include, but are not limited to:

- Increased street sweeping
- Adding trash cans near trash generation sites
- Prompt enforcement of trash accumulation
- Increased trash collection on public property
- Increased litter prevention messages or trash nets within the MS4

The BMPs chosen will provide equivalent trash removal performance as excluders, and will be demonstrated though the annual report. When outfall trash capture is provided, revision of the schedule for inspection and cleanout of catch basins will also be reported in the annual report.

The State Water Resources Control Board (State Water Board) is considering the adoption of amendments to the Water Quality Control Plans for Ocean Waters of California and for the Inland Surface Water, Enclosed Bays, and Estuaries of California for Trash (Trash Amendments) citing a strong need for statewide consistency in trash management. The proposed Trash Amendments will include five elements: (1) Water Quality Objective, (2) Prohibition of Discharge, (3) Implementation, (4) Compliance Schedule, and (5) Monitoring, which will outline NPDES Permittee requirements for trash management. The development of the Trash Amendments will continue to be monitored, and any additional required trash management practices in areas not subject to a trash TMDL will be implemented per the guidance provided by these amendments.

7.4 Storm Drain Maintenance

Permit §VI.D.9.h.viii (LA)/ §VII.L.8.viii (LB)

The following BMPs constitute the Storm Drain Maintenance Program:

- Municipally-owned open channels and drainage structures are visually inspected for debris at least annually.
- Trash and debris from is removed from open channel storm drains a minimum of once per year, before the storm season.
- The discharge of contaminants is minimized during MS4 maintenance and clean outs;
- Material removed is properly disposed of by containing and hauling away for legal disposal

7.5 Infiltration from Sanitary Sewer to MS4/Preventive Maintenance

Permit §VI.D.9.h.ix (LA)/§VII.L.8.ix (LB)

Thorough, routine, preventive surveys and maintenance of both municipally owned and operated Storm Drain Systems as well as Sanitary Sewer Systems infiltration and seepage of contaminants from the sanitary sewer system into the storm drain system is prevented. Sanitary Sewer System routine preventative maintenance is described in the Sewer System Management Plan (SSMP), which is a component of the Statewide General Waste Discharge Requirements (WDR) for Sanitary Sewer Systems.

Where necessary, controls implemented to limit infiltration of seepage from sanitary sewers to the MS4 include:

- Adequate plan checking for construction and new development;
- Incident response training for its municipal employees that identify sanitary sewer spills;
- Code enforcement inspections;
- MS4 maintenance and inspections;
- Interagency coordination with sewer agencies; and

- Proper education of its municipal staff and contractors conducting field operations on the MS4 or its municipal sanitary sewer (if applicable).

7.6 Permittee Owned Treatment Control BMPs *Permit §VI.D.9.h.x (LA)/§VII.L.8.x (LB)*

All municipally owned treatment control BMPs, including post-construction BMPs, are regularly inspected and maintained to ensure their proper operation.
Any residual water generated during BMP maintenance is disposed of using one of the following procedures:

- Hauled away and legally disposed of; or
- Applied to the land without runoff; or
- Discharged to the sanitary sewer system; or
- Treated or filtered to remove bacteria, sediments, nutrients, and meet the limitations set in Table PA-6 below prior to discharge to the storm drain system.

Table PA-6: Discharge Limitations for Dewatering Treatment BMPs

Parameter	Units	Limitation
Total Suspended Solids	Mg/L	100
Turbidity	NTU	50
Oil and Grease	Mg/L	10

8. Streets, Roads, and Parking Facilities Maintenance

Permit §VI.D.9.i(LA)/§VII.L.9 (LB)

This section corresponds to multiple Activity Cut Sheets within the Flexible Pavement, Rigid Pavement, Litter/Debris/Graffiti, Traffic Guidance, and Management and Support Families.

Streets and roads may collect litter and debris from nearby activities, as well as from vehicular traffic. They also require routine maintenance that may generate waste materials. Table PA-7 shows potential pollutants generated from street, road, and parking facilities maintenance.

Table PA-7: Potential Pollutants Generated from Street, Road, and Parking Facility Maintenance

	Potential Pollutants						
Activity	Sediment	Trash	Metals	Bacteria	Oil & Grease	Organics	Oxygen Demanding Substances
Street and Road Maintenance	×	×	×		×	×	
Parking Facility Maintenance	×	×	×	×	×	×	×

8.1 Street Sweeping *Permit §VI.D.9.i.i-ii(LA)/§VII.L.9.i-ii (LB)*

Streets and/or street segments are swept according to the following designations:

- Priority A: Streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or debris should be swept at least two times per month.
- Priority B: Streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or debris should be swept at least once per month.
- Priority C: Streets and/or street segments that are designated as generating low volumes of trash and/or debris shall be swept as necessary but in no case less than once per year.

8.2 Road Reconstruction *Permit §VI.D.9.iii (LA)/§VII.L.9.iii (LB)*

Projects that include roadbed or street paving, repaving, patching, digouts, or resurfacing roadbed surfaces implement the following BMPS:

- Restricting paving and repaving activities to exclude periods of rainfall or predicted rainfall unless required by emergency conditions.
- Installing sand bags or gravel bags and filter fabric at all susceptible storm drain inlets and at manholes to prevent spills of paving products and tack coat;
- Preventing the discharge of release agents including soybean oil, other oils, or diesel into the MS4 or receiving waters.
- Preventing non-stormwater runoff from water use for the roller and for evaporative cooling of the asphalt.
- Cleaning equipment over absorbent pads, drip pans, plastic sheeting or other material to capture all spillage and dispose of properly.
- Collecting liquid waste in a container, with a secure lid, for transport to a maintenance facility to be reused, recycled or disposed of properly.
- Collecting solid waste by vacuuming or sweeping and securing in an appropriate container for transport to a maintenance facility to be reused, recycled or disposed of properly.
- Covering the “cold-mix” asphalt (i.e., pre-mixed aggregate and asphalt binder) with protective sheeting during a rainstorm.
- Covering loads with tarp before haul-off to a storage site, and not overloading trucks.
- Minimizing airborne dust by using water spray during grinding.
- Avoiding the stockpiling of soil, sand, sediment, asphalt material and asphalt grindings materials or rubble in or near MS4 or receiving waters.
- Protecting stockpiles with a cover or sediment barriers during a rain.

8.3 Parking Facilities Maintenance *Permit §VI.D.9.iv (LA)/ §VII.L.9.iv (LB)*

Municipally owned parking lots that are uncovered and exposed to stormwater are kept clear of debris and excessive oil buildup by inspecting lots at least 2 times per month and cleaning at least once per month.

9. Emergency Procedures *Permit §VI.D.9.j (LA)/ §VII.L.10 (LB)*

Participating Agencies may conduct repairs of essential public service systems and infrastructure in emergency situations with a self-waiver of the provisions of the MS4 Permit as follows:

- Cities will abide by all other regulatory requirements, including notification to other agencies as appropriate.
- Where the self-waiver has been invoked, Cities will submit to the Regional Water Board Executive Officer a statement of the occurrence of the emergency, an explanation of the

circumstances, and the measures that were implemented to reduce the threat to water quality, no later than 30 business days after the situation of emergency has passed.

Minor repairs of essential public service systems and infrastructure in emergency situations (that can be completed in less than one week) are not subject to the notification provisions. Appropriate BMPs to reduce the threat to water quality will be implemented.

10. Municipal Employee and Contractor Training *Permit §VI.D.9.k (LA)/Permit §VII.L.11 (LB)*

An annual training program on the requirements of the overall stormwater management program is implemented for all municipal field staff whose interactions, jobs, and activities affect stormwater quality prior to June 30 every year. The Cities also ensure that contractors performing privatized/contracted municipal services have appropriate training in the stormwater management program. The goals of the annual training are to:

- Promote a clear understanding of the potential for municipal activities to pollute stormwater
- Identify opportunities to require, implement, and maintain appropriate BMPs in their line of work

In addition to the annual stormwater program training, the Cities implement an annual training program to train all of their employees and contractors who use or have the potential to use pesticides or fertilizers (whether or not they normally apply these as part of their work). Training programs address:

- The potential for pesticide-related surface water toxicity
- Proper use, handling, and disposal of pesticides
- Least toxic methods of pest prevention and control, including IPM
- Reduction of pesticide use

Outside contractors can self-certify, providing they certify they have received all applicable training required in the MS4 Permit and have documentation to that effect.

Illicit Connections & Illicit Discharges Elimination Program

Each participating city is required to develop and implement an Illicit Connections & Illicit Discharge Elimination (IC/ID) Program that includes the requirements listed in Permit §VI.D.10.a (LB §VII.M). This document provides guidance to assist the Cities in implementing an IC/ID program in compliance with the Permit.

Introduction *Permit §VI.D.10.a (LA)/§VII.M.1 (LB)*

Illicit connections and illicit discharges (IC/IDs) as defined in Table ICID-1 are potential significant sources of pollutants into and from the MS4. The Illicit Connection and Illicit Discharge (IC/ID) Program provides a comprehensive process for detecting, investigating and eliminating IC/IDs in an efficient and timely manner. The program consists of the following components:

- Procedures for conducting source investigations for IC/IDs
- Procedures for eliminating the source of IC/IDs
- Procedures for public reporting of illicit discharges
- Spill response plan and
- IC/ID education and training for City staff.

The purpose of this program is to effectively prohibit illicit discharges into the MS4.

Table ICID-1: IC/IDs Defined

Prohibition	Definition	Examples
Illicit Connections	Any man-made conveyance that is connected to the MS4 without a permit, excluding roof drains and other similar type connections.	Unpermitted channels, pipelines, conduits, inlets or outlets that are connected directly to the MS4.
Illicit Discharges	Any discharge into the MS4 or from the MS4 into a receiving water that is prohibited under local, state, or federal statutes, ordinances, codes or regulations. This includes any non-stormwater discharge, except those authorized in MS4 Permit §III.A.10.2.	Sanitary wastewater, Vehicle wash water, wash-down from grease traps, motor oil, antifreeze and fuel spills into or from the MS4.

Legal Authority

Adequate Legal Authority is required to prohibit IC/IDs to the MS4 and enable enforcement capabilities to eliminate the sources of IC/IDs.

Illicit Discharge Source Investigation and Elimination *Permit §VI.D.10.b (LA)/ §VII.M.2 (LB)*

The purpose of the IC/ID Program is accomplished in part by developing clear, step-by-step written procedures for conducting investigations of illicit discharges.

Investigation

Standardized procedures for conducting investigations to identify the source of all suspected illicit discharges are included in as an attachment (Illicit Discharge Investigation and Elimination Guidance). Procedures include the following:

- **Initiation** – Investigate the source of all observed discharges. After becoming aware of an illicit discharge, conduct an investigation to identify and locate the source within 72 hours.
- **Prioritization** – Investigate illicit discharges suspected of being sanitary sewage and/or significantly contaminated first.
- **Tracking** – Track all investigations and document the information listed in Table ICID-2.

Table ICID-2: Recorded Information for Illicit Discharge Investigations

Item	Information
1	Date(s) the illicit discharge was observed
2	Results of the investigation
3	Follow-up of the investigation
4	Date the investigation was closed

Elimination

Standardized procedures to eliminate illicit discharges once the sources are located are included as an attachment. Procedures include the following:

- **Notification** – Immediately notify the responsible party (RP)/parties of the problem and require the responsible party to initiate all necessary corrective actions to eliminate the illicit discharge.
  - If it is determined that an illicit discharge originates within an upstream jurisdiction, notify the upstream jurisdiction and the Regional Board. The Notification is conducted within 30 days of determination and information is collected regarding combined efforts to identify the source.
- **Spill response** – The Spill Response Plan is implemented when the source for illicit discharges cannot be traced to a suspected RP. Permanent solutions to such discharges are described in the following section (Flow Diversion).
- **Follow-up** – Conduct and document follow-up investigations upon notification that an illicit discharge has been eliminated to verify that it has been satisfactorily eliminated and cleaned-up.
- **Enforcement** – Enforcement procedures are included in the Progressive Enforcement Policy. The Progressive Enforcement Policy includes a list of enforcement actions.

Progressive Enforcement Policy

The Progressive Enforcement Policy is implemented to ensure that illicit discharges/ illicit connections are eliminated within a reasonable time period. The procedures are followed when the source of the nature of the discharges is known. Procedures typically include:

- Written warnings for minor violations
- Formal notice of violation with specific actions and time frames for compliance
- Compensation from the RP for any costs related to remediation, inspection, investigation, clean-up and oversight activities
- Cease and desist orders

- Civil penalties (infractions), or referral for criminal penalties or further legal action.

Flow Diversion

In the event that an ongoing illicit discharge cannot be eliminated (following the full execution of legal authority and in accordance with the Progressive Enforcement Policy) or the RPs cannot be identified, the discharge is either treated or diverted to the sanitary sewer. In either instance, the Regional Board is notified within 30 days of such determination. Notification includes the following information:

- Written plan that describes the efforts that have been undertaken to eliminate the discharge.
- Description of actions to be undertaken.
- Anticipated cost and
- Schedule for completion.

Identification and Response to Illicit Connections *Permit §VI.D.10.c (LA)/§VII.M.3 (LB)*

Illicit connections can be concentrated sources of pollutants either through direct discharge or infiltration of sewage or other prohibited discharges into the MS4. To reduce this source of pollutants, the following program is implemented for the identification of illicit connections. Key components of this program include investigating and responding in order to actively prevent and eliminate illicit connections.

Investigation

Standardized procedures for identifying illicit connections are included as an attachment (Illicit Connection Investigation Guidance). Procedures include the following:

- **Initiation** – Investigate within 21 days from the discovery or upon receiving a report of a suspected illicit connection. The elements of the investigation are listed in Table ICID-3.
- **Tracking** – Track all investigations and document the information listed in Table ICID-3.

Response

If the source investigation concludes that a connection to the MS4 is both 1) permitted or documented and 2) discharging only stormwater or nonstormwater allowed under WMP NSWD SECTION or other individual or general NPDES Permits/WDRs, then the investigation is closed and no further action is taken. Upon confirmation of a connection to the MS4 is illicit, one of two options is taken:

1. **Permit or document the connection.** The permitted or documented connection may only discharge stormwater and nonstormwater allowed under WMP NSWD SECTION or other individual or general NPDES Permits/WDRs. Retaining a record of the connection and its investigation qualifies as documentation.
2. **Eliminate the connection.** The connection is eliminated within 180 days of completion of the investigation, using formal enforcement authority if necessary.

Table ICID-3: Recorded Information for Illicit Connection Investigations

Item	Information
1	Any relevant illicit discharge information from Table ICID-2
2	Source of the connection
3	Nature and volume of the discharge through the connection
4	RP for the connection (if identified)
5	Response including any formal enforcement taken

Public Reporting of Non-Stormwater Discharges and Spills *Permit §VI.D.10.d (LA)/§VII.M.4 (LB)*

Central Point of Contact

Public reporting of illicit discharges or water quality impacts associated with discharges into or from MS4s through a central contact point are promoted, publicized, and facilitated. This includes phone numbers and an internet site for complaints and spill reporting. The reporting hotline is provided to staff to leverage the field staff that has direct contact with the MS4 in detecting and eliminating illicit discharges.

The LACFCD, in collaboration with the County, provides the central point of contact and through the 888-CLEAN-LA reporting hotline and internet site.

Open Channels

Signage is posted adjacent to open channels (see MS4 Permit IV.D.9.h.vi.(4)). The signage includes information regarding dumping prohibitions and public reporting of illicit discharges.

Complaints

Written procedures are maintained that document how complaint calls are received, and tracked to ensure that all complaints are adequately addressed in the attached form (Record Keeping & Documentation). Following the adaptive management process outlined in the MS4 Permit, the procedures are periodically evaluated to determine whether changes or updates are needed to ensure that the procedures accurately document the employed methods. After the evaluation, any identified changes will be made to the procedures.

Documentation is maintained for all complaint calls. This includes recording the location of the reported spill or IC/ ID and the actions undertaken in response the complaint, including referrals to other agencies.

Spill Response Plan *Permit §VI.D.10.e (LA)/§VII.M.5 (LB)*

A spill response plan (Attachment ICID-E) is implemented for all sewage and other spills that may discharge into its MS4. The spill response plan identifies agencies responsible for spill response and cleanup, telephone numbers and e-mail address for contacts, and contains the following:

- **Agency Coordination** – Coordinate with spill response teams throughout all appropriate departments, programs and agencies so that maximum water quality protection is provided.
- **Spill Response** – Respond to spills for containment within 4 hours of becoming aware of the

spill, except where such spills occur on private property, in which case respond within 2 hours of gaining legal access to the property. Initiate investigation of all public and employee spill complaints within one business day of receiving the complaint to assess validity.

- **Reporting** – Spills that may endanger health or the environment are reported to appropriate public health agencies and the California Emergency Management Agency (Cal EMA).

Illicit Connection and Illicit Discharge Education and Training *Permit §VI.D.10.f (LA)/§VII.M.6 (LB)*

A training program regarding the identification of IC/IDs is implemented for all municipal field staff, who, as part of their normal job responsibilities (e.g., street sweeping, storm drain maintenance, collection system maintenance, road maintenance), may come into contact with or otherwise observe an illicit discharge or illicit connection to the MS4. Contact information, including the procedure for reporting an illicit discharge, is readily available to field staff.

Applicable Staff

Table ICID-4 is a list of field programs where program staff may come into contact with or otherwise observe an illicit discharge or illicit connection to the MS4. Appropriate field staff, supervising staff and contractors involved in these programs require training in IC/ID identification and reporting following the schedule provided in Table ICID-5.

<u>Contracted Staff</u>
Contractors that provide these municipal services may attend city training or certify to the participating city and retain documentation that staff has received applicable training. Otherwise this provision is accomplished through a contractual requirement for contracted staff to receive the training.

Table ICID-4: Municipal Field Programs

Main Field Program Types	Sub-Category Types/Activities
Lake Management	Fertilizer & Pesticide Management
	Mowing, Trimming/Weeding, Planting
	Managing Landscape Waste
	Controlling Litter
	Erosion Control
	Controlling Illegal Dumping
	Bacteria Control
	Monitoring
Landscape Maintenance	Mowing, Trimming/Weeding, Planting
	Irrigation
	Fertilizer & Pesticide
	Managing Landscape Waste
	Erosion Control
Roads, Streets, and Highways Operations and Maintenance	Sweeping & Cleaning
	Street Repair & Maintenance
	Bridge & Structure Maintenance
Fountains, Plazas, and Sidewalk Maintenance and Cleaning	Surface Cleaning
	Graffiti Cleaning
	Sidewalk Repair
	Controlling Litter
	Fountain Maintenance
Solid Waste Handling	Solid Waste Collection
	Waste Reduction & Recycling
	Hazardous Waste Collection
	Litter Control
Water and Sewer Utility O&M	Water Line Maintenance
	Sanitary Sewer Maintenance
	Spill/Leak/Overflow Control
Fire Department Activities	Emergency/Post-Emergency Fire Fighting Activities
	Fire Fighting Training
	Fire Station Activities

Training Schedule

The training schedule for all applicable staff is listed in Table ICID-5.

Table ICID-5: IC/ID Program Training Schedule

Category	Schedule
Current Staff	Twice during the term of the MS4 Permit
New Staff	Within 180 days of starting employment

Training Elements

The IC/ID elements addressed by the training program are listed in Table ICID-6.

Table ICID-6: Minimum IC/ID Training Program Elements

Item	Information
1	IC/ID identification, including definitions and examples
2	Investigation
3	Elimination
4	Clean-up
5	Reporting
6	Documentation

Documentation

Documentation of training program activities and training modules are retained and made available for review by the Regional Board.

PROGRESSIVE ENFORCEMENT POLICY

STORMWATER ENFORCEMENT GUIDE

INTRODUCTION

This Stormwater Progressive Enforcement Policy (PEP) provides procedures to enforce provisions of the Waste Discharge Requirements for Municipal Separate Storm Sewer System (MS4) Discharges within the Coastal Watersheds of Los Angeles County, except those Discharges Originating from the City of Long Beach MS4 Order No. R4-2012-0175. Pursuant to Section VI.D.2.a of the Order, Permittees are required to develop and implement a PEP to ensure that (1) regulated Industrial/ Commercial facilities, (2) construction sites, (3) development and redevelopment sites with post-construction controls, and (4) illicit discharges are each brought into compliance with all storm water and non-storm water requirements. The PEP provides the City with a guidance for enforcing the MS4 Permit Provisions and identifies enforcement procedures designed to encourage a timely response.

PROGRESSIVE ENFORCEMENT

Progressive enforcement is an escalating series of actions that allows for the efficient and effective use of enforcement. In some situations, an informal response (written warning/inspection report) is sufficient to inform the responsible party that there is a deficiency and to require the responsible party to return to compliance. If violations continue, the enforcement response should be quickly escalated to increasingly more formal and serious actions until compliance is achieved. Progressive enforcement is not appropriate in all circumstances. For example, where there is a situation needing immediate response, immediate issuance of a cleanup and abatement order may be appropriate.

COMPLIANCE CRITERIA

The City conducts on-site compliance inspections and conducts investigations, in response to complaints, under their authority provided in their municipal code and ordinances to verify compliance. Typical noncompliance issues related to stormwater may include:

- Prohibited discharges to the storm drain system.
- Site's existing condition is likely to result in exposure of pollutants to stormwater contact and possible pollutant discharge to the storm drain system such as:
    - Poor housekeeping activities that results in pollutant exposure.
    - Unattended spills and leaks.
    - Uncovered or improperly stored wastes, materials, or other items of concern.
    - Open waste receptacles such as tallow bins, compactors, and trash bins.
    - Leaky or contaminated equipment stored or used outdoors.
    - Track-out of dirt and sediment or other materials to street or outdoor areas.
- Illicit connections to the storm drain system.
- Best Management Practices (BMPs) are not in place to address pollutant generating activities, which may include erosion and sediment controls and post construction controls.

Complaint Response

The City may receive complaints regarding stormwater ordinance from their staff members, public, local agencies, or the Regional Water Board. The City initiates, within one business day,[1] investigation of complaints from facilities within its jurisdiction. The initial investigation includes, at minimum, a limited inspection of the facility to confirm validity of the complaint and to determine if the facility is in compliance with municipal storm water ordinance and, if necessary, to oversee corrective action. Emergency complaints are investigated immediately.

PROGRESSIVE ENFORCEMENT GUIDELINES

Informal Enforcement

The City implements professional judgment regarding the circumstances surrounding an enforcement action and chooses to resolve routine noncompliance quickly and efficiently through informal means that are not accompanied by sanctions (*e.g.*, civil charges or penalties). When deemed appropriate, the City employs the procedures described below to correct noncompliance informally.

Written Warning/ Inspection Report

Under circumstances where an inspection reveals routine noncompliance that can be corrected within a reasonably short time, staff may choose to issue a written warning/inspection report that describes the minor deficiencies/violations and includes a schedule for correcting the noncompliance[2]. The purpose of the written warning is to give the responsible party an opportunity to comply voluntarily and thus avoid sanctions that might be imposed by an escalated enforcement response.

For residential zones, the City employs an informal enforcement process and escalates to formal enforcement actions for those residents that do not comply with stormwater regulations.

Formal Enforcement / Administrative Enforcement

In the event that the City determines, based on an inspection or illicit discharge investigation conducted, that a responsible party has failed to adequately comply with the informal enforcement process within the required timeframe, the City may initiate administrative enforcement actions or will implement enforcement actions as established through authority in its municipal code. The City's goal is to achieve compliance through an extensive inspection program, educational outreach efforts and, if necessary, the initiation of appropriate enforcement action(s). The goal of any enforcement action is to: (1) return the facility to compliance in a timely manner; (2) eliminate economic benefit realized by the noncompliant facility; and (3) punish violators and prevent future noncompliance.

Notice of Violations

Under circumstances where the responsible party has failed to comply with the informal enforcement process or where the violations are significant, the City may choose to issue a Notice of Violation (NOV). The purpose of an NOV is to inform the responsible party of the observed violations, the applicable stormwater municipal codes that the responsible party has failed to comply with and the

[1] The City may comply with the Permit by taking initial steps (such as logging, prioritizing, and tasking) to "initiate" the ingestigation within that one business day. However, the Regional Water Board would expect that the initial investigation, including a site visit, to occur within four business days (per MS4 Order No.R4-2012-0175 Section VI.D.2.b)
[2] The City may choose to issue/write inspection report on site or provide to the responsible party at a later time.

potential consequences of failing to correct the violations. The NOV also gives the responsible party an opportunity to correct the violations described in the NOV within a specified time. Under circumstances where the responsible party fails to adequately respond to the NOV by failing to address or correct the violations noted in the NOV, the severity of the enforcement response will continue to escalate as described below.

Failure to Return to Compliance/ Second Notice of Violation

The City's municipal code stormwater ordinance authorizes assessment of administrative penalties which can be carried out by issuing a Failure to Return to Compliance Notice or second NOV . The second NOV is a stronger enforcement option which may be used in circumstances where the responsible party has failed to comply with the requirements as indicated on the first NOV.

Cease and Desist Order

In the event the City's municipal code stormwater ordinance authorizes a Cease and Desist Order (CDO), the City may issue a CDO, as an alternative to the second NOV, when immediate action by the responsible party is necessary to eliminate a continuing or threatened serious violation of the stormwater ordinance.

Misdemeanors

The City's may escalate enforcement when evidence of noncompliance indicates that the violator of the stormwater ordinance has acted intentionally with intent to cause, allow to continue or conceal a discharge in violation of the ordinance.

Issuance of Citation/Infractions

At the discretion of the City's, and as established through authority in its municipal code, the City may issue citations and/or infractions.

Cost Recovery

In the event that a complaint response or violation requires clean-up and or extensive investigation, the City has the authority, as established in the municipal code, to require the responsible party to reimburse the city or County for all costs incurred by the related violation. Cost recovery fees that may be collected include, but are not limited to, investigation, enforcement, compliance assistance, damage, control, and clean-up.

Abatement

When a responsible party fails to cease or control a nuisance condition that results in or is likely to result in further or continuing violations, the City's may request abatement of conditions on private property if necessary, or in the event of imminent danger to public safely or the environment, the City itself may abate the nuisance condition.

Permit Revocation

Sites violating the stormwater permit may be subject to permit revocation procedures as authorized in the City's municipal code.

City's/District Attorney

Severe or continuing violations should be referred to the City's or District Attorney for consideration of criminal charges.

TIMEFRAMES FOR CORRECTING DEFICIENCIES/VIOLATIONS

Depending upon the nature of the deficiencies/violations observed, City's may specify compliance deadlines for the responsible party in the inspection report or NOV.

- Prohibited discharges: discharges are to be stopped immediately and up to two weeks. The City may require the responsible party to provide a written description of correction, long-term compliance plan.
- Illicit connection: discharge via the illicit connection are to be stopped immediately and up to two weeks. The City may require the responsible party to provide proof that connection was permanently terminated. Re-inspection typically is required.
- Pollutant exposure/prohibited conditions violations: Up to two weeks to correct violations. The City may require the responsible party to provide proof of compliance for the observed violations.

EXTENSIONS OF COMPLIANCE DEADLINES

There are instances when a responsible party is not able to comply with requirements within the time frame specified. The City may grant a reasonable extension to the responsible party if the City determines that an extension is warranted, as follows:

- A request for extension must be received in writing (mail, e-mail, fax, hand delivered, etc.) by the City no later than the last day of the initial specified compliance deadline date.
- The extension request must explain why the extension is needed and warranted, as well as include a summary of actions taken to date by the responsible party to comply with requirements of the NOV.
- No more time is provided than should reasonably be needed for the responsible party to competently correct the noted deficiencies/violations. The City grants shorter extensions during the wet season.

Appropriate reasons to grant an extension may include, but are not limited to:

- Confirmed delays due to contractor or other service provider outside of responsible party's control.
- Extensive corrections involving work that would conceivably take longer than the time frame provided.
- In general, extensions should not be granted to allow the continuation of unauthorized non-storwater discharges.

The City may require an action plan or statement to be submitted by the responsible party within the initial compliance time frame, as a condition of granting an extension. The action plan or statement should specify the corrections that are to be made and specify an anticipated time frame for completion. The action plan or statement should be signed and dated by the responsible party.

REFERRALS TO THE REGIONAL BOARD

The City may refer violations of its municipal storm water ordinance and/or California Water Code section 13260 by industrial and commercial facilities and construction site operators to the Regional Water Board provided that the City has made a good faith effort of applying enforcement procedures to achieve compliance with its own ordinance. At a minimum, the City's good faith effort must be documented with:

- Two follow-up inspections, and
- Two warning letters or notices of violation.

Referral of Violations of the General Industrial/Construction Permits

For those facilities or site operators in violation of municipal stormwater ordinances and subject to the Industrial and/or Construction General Permits (IGP/CGP), the City may escalate referral of such violations to the Regional Water Board (promptly via telephone or electronically) after one inspection and one written notice of violation (copied to the Regional Water Board) to the facility or site operator regarding the violation. In making such referrals, the City shall include, at a minimum, the following documentation:[3]

- Name of the facility or site,
- Operator of the facility or site,
- Owner of the facility or site,
- WDID Number (if applicable),
- Records of communication with the facility/site operator regarding the violation, which shall include at least one inspection report,
- The written notice of violation (copied to the Regional Water Board),
- For industrial sites, the industrial activity being conducted at the facility that is subject to the Industrial General Permit, and
- For construction sites, site acreage and Risk Factor rating.

RECORDS RETENTION

City shall maintain records, per their existing record retention policies, and make them available on request to the Regional Water Board, including inspection reports, warning letters, notices of violations, and other enforcement records, demonstrating a good faith effort to bring facilities into compliance.[4]

Deficiencies/ Violation Degrees

Minor	Moderate	Major
Typically involves conditions that threaten to result in pollutant discharge to the storm system and/or waterways, if not corrected. The immediate threat to human health or the environment is low. **Examples:** **1.** Unattended automotive fluid drips and spills likely to result in moderate discharges to the storm drain system. **2.** Discharge of a moderate amount of car body wet sanding effluent from a single vehicle to outdoor pavement that has not yet impacted the storm drain system. **3.** Unattended spilled restaurant grease on outdoor pavement. Spill appears to be recent, is less than a quart, has not yet impacted the storm drain system and poor housekeeping do not appear to be habitual. **4.** Oily, uncovered engines, or other oily, possibly leaky items stored outside. **5.** Open and missing dumpster and tallow bin lids.	Typically involves less significant pollutant discharges to the storm system and/or receiving waters or conditions that threaten to result in minor to moderate pollutant discharges to the storm system and/or receiving waters. May include small or incidental discharges of hazardous or toxic substances. The violation does not present a major threat to human health and safety, but is likely to result in degradation of receiving water quality. **Examples:** **1.** Discharge of moderate amounts of automotive fluids to storm drain system results from neglected spills and poor housekeeping. **2.** Discharge of moderate amount (less than 20 gallons of diluted effluent) of auto body wet sanding effluent to storm drain system. **3.** More than a quart of spilled restaurant grease on outdoor pavement is neglected, possibly getting tracked out of trash enclosure. Neglect appears to be habitual but so far, impact to storm drain is moderate. **4.** Moderate amount of Oil/fluids leaking from improperly stored engines and parts discharge to storm drain system. **5.** Repeat minor violations may be considered moderate.	Includes significant pollutant discharges to the storm system and/or receiving waters as well as creation of conditions that threaten imminent discharge of significant pollutants to the storm system and/or receiving waters. This also includes, but is not limited to, significant discharges of hazardous or toxic substances. Major violations have the potential to present a major threat to human health or safety and/or the environment. The intent of the violator should be considered: Patterns of willful disregard for safety and the environment, recalcitrance, and repeat violations should contribute to designation of a violation as major, but are not necessary. **Examples:** **1.** Intentional discharge of waste oil to the storm drain. **2.** Discharge of significant volumes of auto body wet sanding effluent to storm drain from work on multiple vehicles, as practice. Especially where repeat violations or evidence of habitual discharge is evident. **3.** Significant amount of spilled restaurant grease is intentionally washed into storm drain, especially if hazardous degreasing agent is used. **4.** Significant amount of Oil/fluids leaking from improperly stored engines and parts discharge to storm drain system, especially if repeat violation. **5.** Repeat moderate violations may be considered major.

MASTER COVENANT AND AGREEMENT

REGARDING ON-SITE BMP MAINTENANCE

The undersigned hereby certifies I am (we are) the owner(s) of the hereinafter legally described real property located in the City of [Insert City], County of Los Angeles, State of California (please give legal description: assessor's ID, tract no., lot no., etc.):

____

Site Address ____

Owner(s) do hereby covenant and agree to and with the City of [Insert City]to maintain all on-site structural Best Management Practices (BMPs) in accordance with the Site Map and the Operations & Maintenance (O&M) Plan set forth in Attachment 1 hereto and incorporated herein by this reference. The specific structural BMPs are listed as follows:

____

____

Owner(s) shall maintain the listed drainage devices above on the property indicated and as shown on plans permitted by the City of [Insert City]in a good and functional condition to safeguard the property owners and adjoining properties from damage and pollution.

Owner(s) hereby consent to inspection of the Property by an inspector authorized by the City Manager, or his or her designee, for the purpose for verifying compliance with the provisions of this Agreement.

Owner(s) shall provide printed educational materials with any sale of the property which provide information on what stormwater management facilities are present, the type(s) and location(s) of maintenance signs that are required, and how the necessary maintenance can be performed.

Owner(s) shall provide actual notice of this Agreement and its terms to any respective successor(s) in interest to the Property prior to transfer of said interest to such successor(s) in interest. This covenant and agreement shall run with the land and shall be binding upon any future owners, encumbrances, their successors, heirs or assigns and shall continue in effect until the City of [Insert City] approves its termination.

STORMWATER PLANNING PROGRAM PRIORITY PROJECT CHECKLIST

FORM PC

Project Name	Owner Name	Developer Name
Project Address	Owner Address	Developer Address
Plan Check #	Owner Phone	Developer Phone

TYPE OF PROJECT

Does the proposed project fall into one of the following categories? Please check Yes/No	YES	NO
PRIORITY PROJECTS		
1. A new project equal to 1 acre or greater of disturbed area and adding more than 10,000 square feet of impervious* surface area		
2. A new industrial park with 10,000 square feet or more of surface area		
3. A new commercial mall with 10,000 square feet or more surface area		
4. A new retail gasoline outlet with 5,000 square feet or more of surface area		
5. A new restaurant (SIC 5812) with 5,000 square feet or more of surface area		
6. A new parking lot with either 5,000 ft^2 or more of impervious* surface or with 25 or more parking spaces		
7. A new automotive service facility (SIC 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) with 5,000 square feet or more of surface area		
8. Projects located in or directly adjacent to, or discharging directly to a Significant Ecological Area (SEA)*, where the development will: a. Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and b. Create 2,500 square feet or more of impervious surface area		
9. Redevelopment*		
SPECIAL PROVISION PROJECTS		
10. Green street* project		
11. Single family hillside* home		

If checked YES, numerical criteria will apply to items 1,2,6-9 and items 3-5 (for project areas of 5,000 ft^2 or more of surface area.) If any of the boxes are checked YES, this project will require the preparation of a Low Impact Development (LID) Plan and a Maintenance Agreement Transfer*

* Defined on back.

Applicant Name

Applicant Signature

Applicant Title

Date

DEFINITIONS:

Impervious are those surfaces that do not allow stormwater runoff to percolate into the ground. Typical impervious surfaces include: concrete, asphalt, roofing materials, etc. However, some specially designed concrete/asphalt do allow water to percolate (pervious).

Hillside means property where the slope is 25% or greater and where grading contemplates cut or fill slopes. Single family hillside homes will require a less extensive plan. During the construction of a single-family hillside home, the following measures are implemented:

a. Conserve natural areas

b. Protect slopes and channels

c. Provide storm drain system stenciling and signage

d. Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability

e. Direct surface flow to vegetated areas before discharge unless the diversion would result in slope instability.

Green Streets means any street and road construction of 10,000 square feet or more of impervious surface area

a. These projects will follow an approved green streets manual to the maximum extent practicable. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects. Stormwater mitigation measures must be in compliance with the approved green streets manual requirements.

Redevelopment means land-disturbing activities that result in the creation, addition, or replacement of 5,000 ft^2 or more of impervious surface area on an already developed site.

Redevelopment does not include routine maintenance activities that are conducted to maintain the original line and grade, hydraulic capacity, or original purpose of facility, nor does it include modifications to existing single family structures, or emergency construction activities required to immediately protect public health and safety.

Significant Ecological Area means an area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and would be disturbed or degraded by human activities and developments. Also, an area designated by the City as approved by the Regional Water Quality Control Board.

Maintenance Agreement and Transfer: All developments subject to LID and site specific plan requirements provide verification of maintenance provisions for Structural and Treatment Control BMPs, including but not limited to legal agreements, covenants, CEQA mitigation requirements, and/or conditional use permits. Verification at a minimum shall include:

- The developer’s and/or owner's signed statement accepting responsibility for maintenance until the responsibility is legally transferred; and
- A signed statement from the public entity assuming responsibility for Structural or Treatment Control BMP maintenance and conduct a maintenance inspection at least once a year; or
- Written conditions in the sales or lease agreement, which requires the recipient to assume responsibility for maintenance and conduct a maintenance inspection at least once a year; or
- Written text in project conditions, covenants and restrictions (CCRs) for residential properties assigning maintenance responsibilities to the Home Owners Association for maintenance of the Structural and Treatment Control BMPs; or
- Any other legally enforceable agreement that assigns responsibility for the maintenance of post-construction Structural or Treatment Control BMPs.

GENERAL PROJECT CERTIFICATION

A completed original of this form must accompany all LID Plan submittals.

Best Management Practices (BMPs) have been incorporated into the design/maintenance/construction of this project to accomplish the following:

1. Minimize impacts from stormwater runoff on the biological integrity of Natural Drainage Systems and water bodies in accordance with requirements under CEQA (Cal. Pub. Resources Code § 21100), CWC § 13369, CWA § 319, CWA § 402(p), CWA § 404, CZARA § 6217(g), ESA § 7, and local government ordinances.

2. Maximize the percentage of pervious surfaces to allow more percolation of stormwater into the ground.

3. Minimize the amount of stormwater directed to impermeable surfaces and to the MS4.

4. Minimize pollution emanating from parking lots through the use of appropriate Treatment Control BMPs and good housekeeping practices.

5. Minimize breeding of Vectors

6. Reduce pollutant loads in stormwater from the development site.

I certify that this Low Impact Development Plan and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gathered/evaluated the information submitted.

Post Construction / Maintenance Certification

As the responsible party, I certify that the proposed BMPs will be implemented, monitored and maintained to ensure their continued effectiveness. In the event of a property transfer, the new owner/lessee will be notified of the BMPs in use at this site and I will include written conditions in the sales or lease agreement, which requires the new owner (or lessee) to assume responsibility for maintenance and conduct a maintenance inspection at least once a year. The information contained herein is, to the best of my knowledge and belief, true, accurate, and complete.

In consideration of the execution of City of [Insert City] approval of the proposed Low Impact Development (LID) Plan including any proposed treatment system, the applicant hereby agrees to indemnify, save and keep the City of [Insert City], its officers, agents and employees free and harmless from and against any and all claims for injury, damage, loss, liability, cost and expense of any nature whatsoever, which the City of [Insert City], its officers, agents, or employees may suffer, sustain, incur, pay out as a result of any and all actions, suits, proceedings, claims and demands which may be brought, made, or filed against the City of [Insert City], its officers, agents or employees by reason of or arising out of, or in any manner connected with any and all operations permitted by this approval. This indemnification extends to further agree that the City of [Insert City]is not responsible for any additional requirements or restrictions due to changes in regulations, policies or enforcement practices of the California Regional Water Quality Control Board, or any other applicable regulatory agencies.

OWNER'S CERTIFICATION
MINIMUM BMPs FOR ALL CONSTRUCTION SITES

FORM **OC1**

PLAN CHECK #________________________

Project Name	______________________	BUILDING/GRADING PERMIT NUMBER	
Project Location	______________________		
Owner Name	______________________	Contractor Name	______________________
Address	______________________	Address	______________________
Phone	______________________	Phone	______________________
FAX/Email	______________________	FAX/Email	______________________

The National Pollutant Discharge Elimination System (NPDES) is the portion of the Clean Water Act that applies to the protection of receiving waters. Under permits from the Los Angeles Regional Water Quality Control Board (RWQCB), certain activities are subject to RWQCB enforcement. To meet the requirements of the Los Angeles County Municipal Stormwater Permit (CAS004001), minimum requirements for sediment control, erosion control and construction activities must be implemented on each project site. Minimum requirements include:

- **EROSION CONTROL:** Erosion from slopes and channels shall be controlled by implementing an effective combination of BMPs, such as the limiting of grading activities during the wet season; inspecting graded areas during rain events; planting and maintenance of vegetation on slopes; and covering erosion susceptible slopes.
- **SEDIMENT CONTROL:** Eroded sediments from areas disturbed by construction and from stockpiles of soil shall be retained on site to minimize sediment transport from the site to streets, drainage facilities and/or adjacent properties via runoff, vehicle tracking or wind.
- **NON-STORMWATER MANAGEMENT:** Non-stormwater runoff from equipment and vehicle washing and any other activity shall be contained at the project site.
- **WASTE MANAGEMENT:** Construction related materials, wastes, spills or residues shall be retained on site to minimize transport from the site to streets, drainage facilities or adjoining properties by wind or runoff. Runoff from equipment and vehicle washing shall be contained at construction sites unless treated to remove sediment and pollutants.

Examples of Minimum BMPs include: (1) Soil piles must be covered with tarps or plastic, (2) leaking equipment must be repaired immediately, (3) refueling must be conducted away from catch basins, (4) catch basins must be protected when working nearby, (5) vacuum all concrete saw cutting, (6) never wash concrete waste into the street, (7) keep the site clean, sweep the gutters at the end of each working day and keep a trash receptacle on site.

As the architect/engineer of record, I have selected appropriate BMPs to effectively minimize the negative impacts of this project's construction activities on stormwater quality. The project owner and contractor are aware that the selected BMPs shall be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activity.

EROSION AND SEDIMENT CONTROL PLAN (ESCP) REVIEW CHECKLIST

These requirements apply to all activities involving soil disturbance with the exception of agricultural activities. Applicable activities include but are not limited to grading, vegetation clearing, soil compaction, paving, re-paving and linear underground/overhead projects (LUPs).

Prior to issuing a grading or building permit, each operator of a construction activity within its jurisdiction must prepare and submit an ESCP prior to the disturbance of land.

ESCP REQUIREMENT	SATISFACTION			COMMENTS
	YES	NO	N/A	
Best Management Practices				
All structural BMPs are designed by a licensed California Engineer.	☐	☐	☐	
Includes Sediment/Erosion Control.	☐	☐	☐	
Includes controls to prevent tracking on and off the site.	☐	☐	☐	
Includes non-stormwater controls (e.g., vehicle washing, dewatering, etc.).	☐	☐	☐	
Includes Materials Management (delivery and storage).	☐	☐	☐	
Includes Spill Prevention and Control.	☐	☐	☐	
Includes Waste Management (e.g., concrete washout/waste management; sanitary waste management).	☐	☐	☐	
Includes methods to minimize the footprint of the disturbed area and to prevent soil compaction outside of the disturbed area.	☐	☐	☐	
Includes methods used to protect native vegetation and trees.	☐	☐	☐	
Includes the rationale for the selection and design of the proposed BMPs, including quantifying the expected soil loss from different BMPs.	☐	☐	☐	
Post-Construction Structural BMPs subject to Operation and Maintenance Requirements are identified.	☐	☐	☐	
Site Plan				
Full sized plans showing the site with all proposed BMPs and water quality notes have been signed and stamped with wet ink application by the appropriate individual.	☐	☐	☐	
Plan includes a title block containing at least the project name, address, and owner.	☐	☐	☐	
All figures, maps, plot plans, etc. have a legend, including a North arrow and scale.	☐	☐	☐	
All facilities are labeled for the intended function.	☐	☐	☐	
All areas of outdoor activity are labeled.	☐	☐	☐	
All structural BMPs are indicated.	☐	☐	☐	
Drainage flow information depicted.	☐	☐	☐	
Project location shown.	☐	☐	☐	
Site boundary indicated.	☐	☐	☐	

Agency Standard Operating Procedures

Each agency will use the suggested language below to develop, implement, and revise as necessary agency-specific Standard Operating Procedures (SOPs) that identify the procedures each agency will follow.

CGP Coverage Verification

- Verification of active coverage under the Construction General Permit for sites disturbing 1 acre or more, or that are part of a planned development that will disturb 1 acre or more and a process for referring non-filers to the Regional Water Board.

Prior to releasing any permits relating to and/or allowing for construction activities on a site resulting in one (1) acre or more of soil disturbance, a Notice of Intent (NOI), a Storm Water Pollution Prevention Plan (SWPPP), and all other Permit Registration Documents (PRDs) must be filed with the Regional Water Resources Control Board (Regional Board) through the State Water Board’s Storm water Multi-Application and Report Tracking System (SMARTS) website and a Waste Discharge ID (WDID) number must be obtained from the Regional Board. This requirement will be included as a condition of approval. In cases where construction activities have commenced on a qualifying site and the project has not yet filed all PRDs (along with an explanation for filing late) with the Regional Board, a Notice of Violation (NOV) will be sent to the responsible person. Any work orders released will be stopped and fines may be enforced. The Regional Board will be notified of the discharger’s non-compliance. Work will not be allowed to commence until the NOI has been accepted by the Regional Board and WDID number issued.

ESCP Review

- Review of the applicable ESCP and inspection of the construction site to determine whether all BMPs have been selected, installed, implemented, and maintained according to the approved plan and subsequent approved revisions.

Prior to issuing a grading or building permit, each operator of a construction activity within its jurisdiction must prepare and submit an Erosion and Sediment Control Plan (ESCP) prior to the disturbance of land. The ESCP Requirement Checklist will be used to ensure required information is submitted by the responsible person. These requirements apply to all activities involving soil disturbance with the exception of agricultural activities. Applicable activities include but are not limited to grading, vegetation clearing, soil compaction, paving, re-paving and linear underground/overhead projects (LUPs).

BMP Assessment

- Assessment of the appropriateness of the planned and installed BMPs and their effectiveness.

Prior to releasing any permits relating to and/or allowing for construction activities on a site resulting in one (1) acre or more of soil disturbance a Qualified SWPPP Practitioner (QSP) must be identified by the developer. Prior to beginning any construction activities, the QSP must review the ESCP and determine if the following requirements are being met:

1. Erosion and sediment controls are incorporated to provide effective reduction or elimination of sediment related pollutants in stormwater discharges and authorized non-stormwater discharges from the site.

2. Sediment controls are designed to intercept and settle out soil particles that have been detached and transported by the force of water.
3. Non-stormwater control BMPs are selected to control sediment on the construction site.
4. Materials and waste management pollution control BMPs are incorporated to minimize stormwater contact with construction materials, wastes and service areas; and to prevent materials and wastes from being discharged off-site.

If the QSP identifies potential problematic areas of the ESCP, a revision to the ESCP must be submitted for review and approval.

Once the BMPs are installed, inspections must be conducted at the frequency identified in the Watershed Management Program (WMP). All BMPs not functioning as intended must be repaired, replaced, or changed to a more effective BMP. Inspection and maintenance procedures must be in accordance with the CASQA handbook.

Discharge Reporting

- Visual observation and record keeping of non-stormwater discharges, potential illicit discharges and connections, and potential discharge of pollutants in stormwater runoff.

Any non-stormwater discharges, potential illicit discharges and connections, and potential discharge of pollutants in stormwater runoff will be tracked and kept on record.

Public reporting of illicit discharges or water quality impacts associated with discharges into or from MS4s within this jurisdiction will be conducted. Multiple modes of communication are in place to allow for complaints and spill reporting. When a complaint is received it will be documented and tracked to ensure that all complaints are adequately addressed.

A Spill Response Plan will be implemented for all sewage and other spills that may discharge into the MS4 within this jurisdiction. Coordination with spill response teams will be observed throughout all appropriate departments, programs, and agencies so that maximum water quality protection is provided. All spill complaints will be investigated within one business day of receiving the complaint and a response to spills for containment will be conducted within 4 hours of becoming aware of the spill, except where such spills occur on private property, in which case the response should be within 2 hours of gaining legal access to the property. Spills that may endanger health or the environment will be reported to appropriate public health agencies and the Office of Emergency Services (OES).

A training program regarding the identification of illicit connections/illicit discharges (IC/IDs) for all municipal field staff, who, as part of their normal job responsibilities (e.g., street sweeping, storm drain maintenance, collection system maintenance, road maintenance), may come into contact with or otherwise observe an illicit discharge or illicit connection to the MS4 will be provided.

Construction Inspection Reporting and Tracking

- Development of a written or electronic inspection report generated from an inspection checklist used in the field.
- Tracking of the number of inspections for the inventoried construction sites throughout the reporting period to verify that the sites are inspected at the minimum frequencies required.

Inspections will be conducted at a frequency listed in the Watershed Management Program (WMP). Inspection checklists and/or reports will be utilized to determine and keep record of whether or not all

BMPs have been selected, installed, implemented, and maintained according to the approved plan and subsequent approved revisions. These checklists/reports will be retained for at least three (3) years following NOT approval.

Example Lease Language for Fixed Facilities

The following is example language that can be inserted into municipal leases:

The Los Angeles Regional Water Quality Control Board (RWQCB) has issued permits which govern stormwater and non-stormwater discharges resulting from municipal activities performed by or for the Coastal Watersheds of Los Angeles County, including the Los Angeles County Flood Control District, the County of Los Angeles, and 84 incorporated cities within the coastal watersheds of Los Angeles County with the exception of Long Beach (collectively referred to as Permittees). The RWQCB Permit is a National Pollutant Discharge Elimination System (NPDES) Permit No. R4-2023-0175. A Copy of the RWQCB Permit is available for review.

In order to comply with the Permit requirements, the Permittees have developed a Watershed Management Program (WMP) which contains Public Agency Facilities and Activities Maintenance Procedures (Maintenance Procedures) with Best Management Practices (BMPs) adopted from the Caltrans Storm Water Quality Handbook Maintenance Staff Guide (Caltrans Handbook) that parties leasing municipally owned properties must adhere to. These Maintenance Procedures contain pollution prevention and source control techniques to minimize the impact of those activities upon dry-weather urban runoff, stormwater runoff, and receiving water quality.

Activities performed at the facility leased under this agreement shall conform to the RWQCB NPDES Permit, the WMP, and the CalTrans Handbook, and must be performed as described within all applicable Maintenance Procedures. The holder of this agreement shall fully understand the Maintenance Procedures applicable to activities conducted at the facility leased under this agreement prior to conducting them and maintain copies of the Maintenance Procedures at the leased facility throughout the agreement duration. The applicable Maintenance Procedures are included as Exhibit ___ of this agreement.

Evaluation of activities subject to WMP requirements performed at the facility leased under this agreement will be conducted by the city to verify compliance with Maintenance Procedures, and may be required through lessor self-evaluation as determined by the city.

Example Contract Language for Field Programs

The following is example language that can be inserted into municipal field program contracts:

The Los Angeles Regional Water Quality Control Board (RWQCB) has issued permits which govern stormwater and non-stormwater discharges resulting from municipal activities performed by or for the Coastal Watersheds of Los Angeles County, including the Los Angeles County Flood Control District, the County of Los Angeles, and 84 incorporated cities within the coastal watersheds of Los Angeles County with the exception of Long Beach (collectively referred to as Permittees). The RWQCB Permit is a National Pollutant Discharge Elimination System (NPDES) Permit No. R4-2023-0175. A Copy of the RWQCB Permit is available for review.

In order to comply with the Permit requirements, the Permittees have developed a Watershed Management Program (WMP) which contains Public Agency Facilities and Activities Maintenance Procedures (Maintenance Procedures) with Best Management Practices (BMPs) adopted from the Caltrans Storm Water Quality Handbook Maintenance Staff Guide (Caltrans Handbook) that parties leasing municipally owned properties must adhere to. These Maintenance Procedures contain pollution prevention and source control techniques to minimize the impact of those activities upon dry-weather urban runoff, stormwater runoff, and receiving water quality.

Work performed under this CONTRACT shall conform to the RWQCB NPDES Permit, the WMP, and the CalTrans Handbook, and must be performed as described within all applicable Maintenance Procedures. The CONTRACTOR shall fully understand the Maintenance Procedures applicable to activities that are being conducted under this CONTRACT prior to conducting them and maintain copies of the Maintenance Procedures throughout the CONTRACT duration. The applicable Model Maintenance Procedures are included as Exhibit ___ of this CONTRACT.

Evaluation of activities subject to WMP requirements performed under this CONTRACT will be conducted to verify compliance with the Maintenance Procedures, and may be required through CONTRACTOR self-evaluation as determined by the city.

INTEGRATED PEST MANAGEMENT (IPM) PROGRAM IMPLEMENTATION GUIDELINES[1] FOR THE CITY OF ______________

General IPM Policy

For the past few decades, the trend in pest management has been to increasingly rely on synthetic chemical pesticides. This management strategy results in the increased use of dangerous chemicals, an increase in the number of pests that can become resistant to the pesticides, as well as lead to new organisms becoming pests. Additionally, some pesticides used for terrestrial pest management have been found in waterways causing problems in the aquatic environment.

Pest control managers are now moving away from their reliance on pesticides and toward an integrated approach that combines limited pesticide use with more environmentally friendly pest control techniques. This system is known as integrated pest management (IPM), a strategy that focuses on the long-term prevention of pests through a combination of techniques, including preventative, cultural, mechanical, environmental, biological, and chemical control tactics (**Figure 1**). Multiple IPM techniques can be utilized simultaneously to control pest populations in the most effective manner possible.

A comprehensive IPM Program and Approach allows for primary focus on pollution prevention by monitoring and preventing pests as well as minimizing heavy pest infestations, which reduces the need for chemicals and/or multiple applications. The goal of the IPM Program is not to eliminate all pests, but to keep their populations at tolerable levels. In an IPM program, pesticides should be applied only when it is determined that pests are approaching damaging levels. Because this requires early detection of the pests, IPM programs utilize monitoring techniques and economic thresholds to determine when to implement control strategies. If possible, a person should be trained and assigned to scout the sites on a regular basis. Pesticides may be part of an IPM program, but they should preferably be used only after pests exceed established thresholds and applied only to the affected area (in the case of disease prevention, some modifications may be allowed). In general, all pest control strategies should be those that are least disruptive to biological control organisms (natural enemies), least hazardous to humans and the environment (including non-target organisms), and have the best likelihood of long-term effectiveness.

[1]Adapted from the Orange County Drainage Area Management Plan Integrated Pest Management Policy Developed by the University of California, Division of Agriculture and Natural Resources

IPM practices are encouraged over the sole use of pesticides as the primary means of pest management (**Table 1**). As a part of their Municipal Activities Program, public agencies and their contractors evaluate the ability to use non-chemical IPM techniques before intensive use of pesticides. This IPM Program template outlines baseline IPM procedures that are required by the Los Angeles County Municipal Separate Storm System Permit (MS4 Permit)[2] along with additional optional IPM techniques that can be employed to implement an effective IPM program.

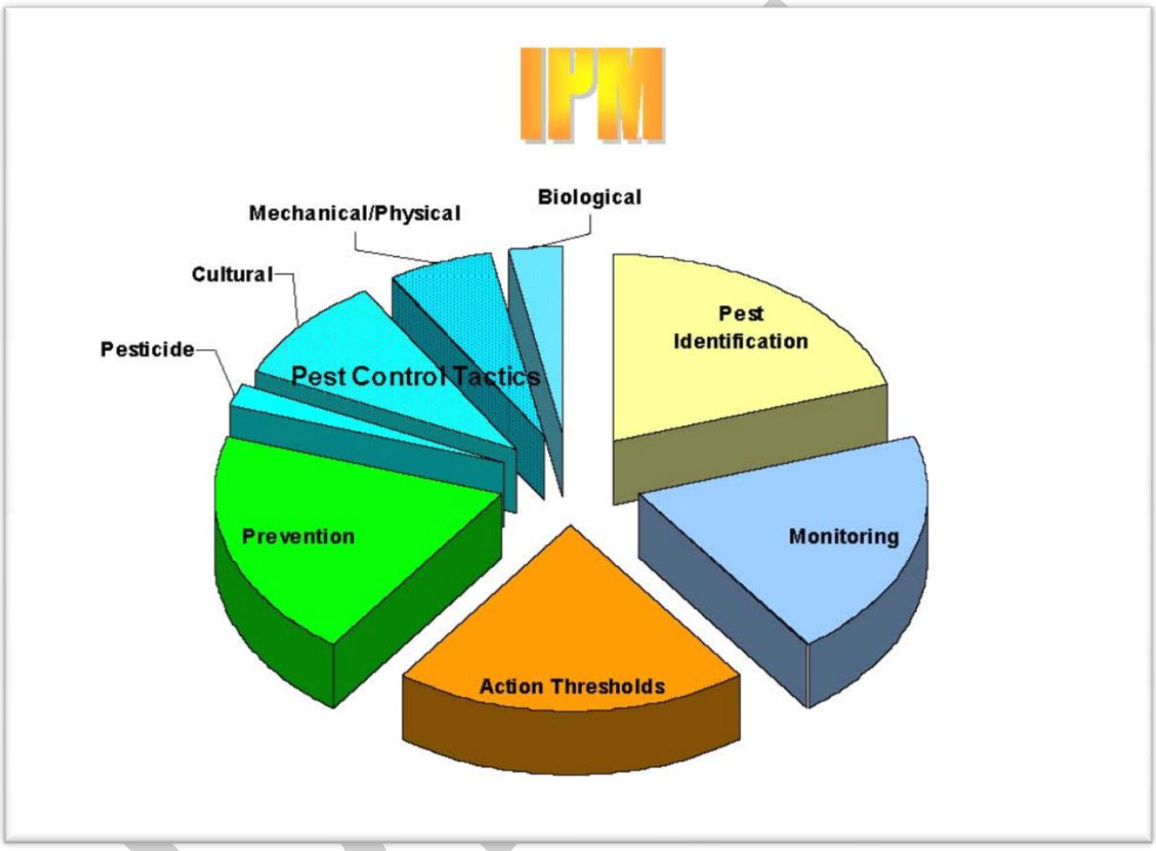

Figure 1 Components of an Integrated Pest Management Program

[2]California Regional Water Quality Control Board Los Angeles Region. 2012. Order No. R4-2012-0175 NPDES Permit No. CAS004001 Waste Discharge Requirements for Municipal Separate Storm Sewer System (MS4) Discharges within the Coastal Watersheds of Los Angeles County, except those Discharges Originating from the City of Long Beach MS4.

Table 1 Advantages and Disadvantages of a Pesticide-Based Program Versus An IPM-Based Pest Control Program

Pesticide Based Pest Control		IPM Based Pest Control	
Advantages	**Disadvantages**	**Advantages**	**Disadvantages**
Quick suppression of pests	Not long-term	Long-term control	It may take longer to see results
	Pest control is reactive	Can be proactive in pest control actions.	Must establish thresholds
	Loss of natural controls. Often get outbreaks of other pests	Reduces disruption of natural enemies	
		Pesticides can be used (only used as a last resort)	Must have knowledge of pesticides and their effects on other organisms.
Labor is only for spraying	Extra work in cleanup	Staff becomes more knowledgeable of pests and injury symptoms	Labor is required for monitoring and regular scouting Training is required to identify pests and natural enemies
Not much preparation or follow-up needed	Need a PCA recommendation	Pest management is more organized	Must maintain a record-keeping system.
	Pesticide safety issues for applicators, public, animals More pesticides in environment Contamination of water bodies from runoff	Less exposure to pesticides Safer to the environment Reduces contamination from runoff	

Implementation Guidelines

Enter Designated IPM Coordinator or IPM Contact Information in Box Below:

IPM Coordinator: Contact Info:

Personnel responsible for the care and maintenance of facilities under the City of ______ agree to implement a suite of basic integrated pest management procedures to meet MS4 Permit requirements[3]. The fundamental basis for the IPM program must include the following as outlined in Permit Part VI.D.9.g:

1. **Pesticides are to be used if monitoring indicates they are needed, and pesticides are applied according to applicable permits and established guidelines.**
2. **Treatments are made with the goal of removing only the target organism.**
3. **Pest controls are selected and applied in a manner that minimizes risks to human health, beneficial non-target organisms, and the environment.**
4. **The use of pesticides, including Organophosphates and Pyrethroids, does not threaten water quality.**
5. **Partnerships with other agencies and organizations are established to encourage the use of IPM.**
6. **A standardized protocol is to be used for the routine and non-routine application of pesticides (including pre-emergents), and fertilizers.**
7. **There is to be no application of pesticides or fertilizers (1) when two or more consecutive days with greater than 50% chance of rainfall are predicted by NOAA34, (2) within 48 hours of a ½-inch rain event, or (3) when water is flowing off the area where the application is to occur. This requirement does not apply to the application of aquatic pesticides or pesticides which require water for activation.**
8. **No banned or unregistered pesticides are stored or applied.**
9. **All staff applying pesticides are certified in the appropriate category by the California Department of Pesticide Regulation, or are under the direct supervision of a pesticide applicator certified in the appropriate category.**
10. **Procedures to encourage the retention and planting of native vegetation to**

[3] In addition to MS4 Permit compliance, there are extensive federal and state laws and regulations that all public agencies must be in compliance with at all times, including the California Food and Agricultural Code (FAC) and the California Code of Regulations, Title 3 (3CCR).

reduce water, pesticide and fertilizer needs are implemented; and

11. Pesticides and fertilizers are stored indoors or under cover on paved surfaces, or use secondary containment.
    a. The use, storage, and handling of hazardous materials are reduced to decrease the potential for spills.
    b. Storage areas are regularly inspected.

In order to implement the above required minimum practices, the following section describes components of an effective IPM Program that can be employed:

- Pest and Symptom Identification
- Prevention
- Monitoring
- Injury Levels and Action Thresholds
- Pest Control Tactics

A number of useful IPM techniques are outlined under each component and further described in Appendix A. These techniques are known to be effective and methods can be selected from each component as necessary to achieve the IPM goals and meet MS4 Permit requirements.

Additional information on the latest IPM techniques including management of new pests in the landscape can be obtained from local UC Cooperative Extension Advisors, UC IPM Regional Advisor, or the Statewide UC IPM Web Site at www.ipm.ucdavis.edu.

Components of an Effective IPM Program

An IPM program is a long-term, multi-faceted system to manage pests (**Figure 1**). Use of pesticides is a short-term solution to pest problems, and should be used only when the other components fail to maintain the pests or their damage below an acceptable level. Successful IPM practitioners are knowledgeable about the biology of the plants and pests, and successful IPM programs primarily use combinations of cultural practices as well as a combination of physical, mechanical and biological controls.

Pest Identification

It is important to learn to identify all stages of common pests at each site. For example, if you can identify weed seedlings, you can control them before they become larger and more difficult to control and before they flower, disseminating seeds throughout the site. It is also important to be sure that a pest is actually causing the problem. Often damage such as wilting is attributed to root disease but may actually be caused by under watering or wind damage. Appendix A lists specific techniques that can be employed to identify pests.

Prevention

Good pest prevention practices are critical to any IPM program, and can be very effective in reducing pest incidence. Numerous practices can be used to prevent pest incidence and reduce pest population buildup such as the use of resistant varieties, good sanitary practices and proper plant culture. Examples of prevention include choosing an appropriate location for planting, making sure the root system is able to grow adequately and selecting plants that are compatible with the site's environment. Appendix A lists specific techniques that can be employed to achieve pest prevention.

Monitoring

The basis of an effective IPM Program is the development and use of a regular monitoring or scouting program. Monitoring involves examining plants and surrounding areas for pests, examining tools such as sticky traps for insect pests and quantitatively or qualitatively measuring the pest population size or injury. This information can be used to determine if pest populations are increasing, decreasing, or staying the same and to determine when to use a control tactic. Weather and other environmental conditions may also play a factor in whether a pest outbreak may occur so it is important to monitor temperature and soil moisture as well.

It is important to use a systematic approach when monitoring, for example you should examine leaves of a similar age each time you check for pests, rather than looking at the older leaves on some plants and younger ones on others. Randomly looking at a plant and its leaves does not allow you to track changes in pest population or damage over time.

It is important to establish and maintain a record-keeping system to evaluate and improve your IPM program. Records should include information such as date of examination, pests found, size and extent of the infestation, location of the infestation, control options utilized, effectiveness of the control options, labor and material costs. Appendix A lists specific techniques that can be employed to in the monitoring of pests.

Injury Levels and Action Thresholds

In order to have a way to determine when a control measure should be taken, injury levels and action thresholds must be set for each pest. An injury level is the level of unacceptable damage. For example, the injury level for a leaf-feeding beetle may be set at 30% of the leaves being damaged. Action thresholds are the set of conditions required to trigger a control action. An example of this would be finding an average of 5 or more beetles on 10 shrubs in a location. Action thresholds are set from previous experience or published recommendations and based on expected injury levels. Injury levels are often set by the public's comments. Appendix A lists specific techniques that can be employed to determine injury levels and action thresholds.

Pest Control Tactics

Integrated pest management programs use a variety of pest control tactics in a compatible manner that minimizes adverse effects to the environment. A combination of several control tactics is usually more effective in minimizing pest damage than any single control method. The type of control that an agency selects will likely vary on a case-by-case basis due to the varying site conditions.

The primary pest control tactics to choose from include:

- Cultural
- Mechanical/Physical
- Biological
- Pesticide

Appendix A lists specific pest control techniques that can be employed.

Cultural Controls

Cultural controls are modifications of normal plant care activities that reduce or prevent pests. In addition to those methods used in the pest preventions, other cultural control methods include adjusting the frequency and amount of irrigation, fertilization, and mowing height. For example, spider mite infestations are worse on water-stressed plants, over-fertilization may cause succulent growth which then encourages aphids, too low of a mowing height may thin turf and allow weeds to become established.

Mechanical/Physical Controls

Mechanical control tactics involve the use of manual labor and machinery to reduce or

eliminate pest problems using methods such as handpicking, physical barriers, or machinery to reduce pest abundance indirectly. Examples include hand-pulling or hoeing and applying mulch to control weeds, using trap boards for snails and slugs, and use of traps for gophers.

The use of physical manipulations that indirectly control or prevent pests by altering temperature, light, and humidity can be effective in controlling pests. Although in outdoor situations these tactics are difficult to use for most pests, they can be effective in controlling birds and mammals if their habitat can be modified such that they do not choose to live or roost in the area. Examples include removing garbage in a timely manner and using netting or wire to prevent bird from roosting.

Biological Controls

Biological control practices use living organisms to reduce pest populations. These organisms are often also referred to as beneficials, natural enemies or biocontrols. They act to keep pest populations low enough to prevent significant economic damage. Biocontrols include pathogens, parasites, predators, competitive species, and antagonistic organisms. Beneficial organisms can occur naturally or can be purchased and released.

The most common organisms used for biological control in landscapes are predators, parasites, pathogens and herbivores.

- <u>Predators</u> are organisms that eat their prey (e.g. Ladybugs).
- <u>Parasites</u> spend part or all of their life cycle associated with their host. Common parasites lay their eggs in or on their host and then the eggs hatch, the larvae feed on the host, killing it (e.g. Tiny stingless wasps for aphids and whiteflies).
- <u>Pathogens</u> are microscopic organisms, such as bacteria, viruses, and fungi that cause diseases in pest insects, mites, nematodes, or weeds (e.g. Bacillus thuringiensis or BT).
- <u>Herbivores</u> are insects or animals that feed on plants. These are effective for weed control. Biocontrols for weeds eat seeds, leaves, or tunnel into plant stems (e.g. goats and some seed and stem borers).

In order to conserve naturally occurring beneficials, broad-spectrum pesticides should be avoided since the use of these types of pesticides may result in secondary pest outbreak due to the mortality of natural enemies that may be keeping other pests under control (Figure 2).

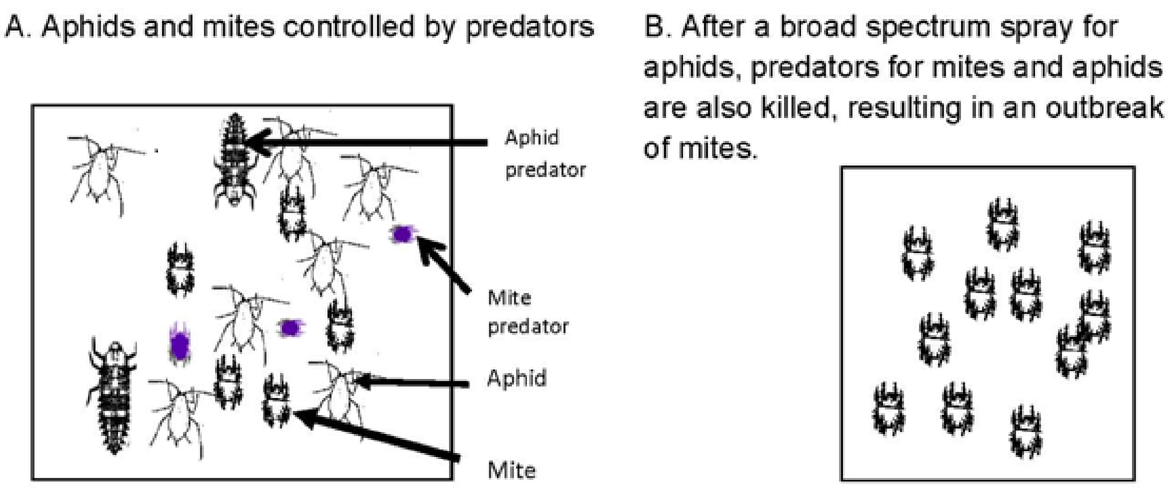

Figure 2 Example of Secondary Pest Outbreak Caused By Use of a Broad Spectrum Insecticide

Pesticide Controls

Any substance used for defoliating plants, regulating plant growth or preventing, destroying, repelling or mitigating any pest, is a pesticide. Insecticides, miticides, herbicides, fungicides, rodenticides and molluscides are all pesticides. Anything with an EPA or DPR registration number on the label is a non-exempt pesticide.

Pesticides should only be used when other methods fail to provide adequate control of pests and just before pest populations cause unacceptable damage. The overuse of pesticides can cause beneficial organisms to be killed and pest resistance to develop. When pesticides must be used, considerations should be made for how to use them most successfully. Avoid pesticides that are broad-spectrum and relatively persistent since these are the ones that can cause the most environmental damage and increase the likelihood of pesticide resistance. Always choose the most specific but least toxic to non-target organisms method.

In addition, considerations should be given to the proximity to water bodies, irrigation schedules, weather (rain or wind), etc. that are secondary factors that may result in the pesticide being moved off-site into the environment. Consideration should be made of the temporary loss of use of an area (application in a park may result in the area being sectioned off).

Appendix A: Optional IPM Techniques to Integrate into IPM Program

The following practices are generally accepted to be effective IPM techniques. These procedures increase the long-term prevention and suppression of pest problems (insects, weeds, diseases, and vertebrates) with the minimum impact on human health, the environment, and non-target organisms. Emphasis is placed on improving cultural practices to prevent problems and utilize alternative control measures instead of broad spectrum pesticides. The following IPM techniques are divided into the following categories:

- General Pesticide Management Practices
- Pest and Symptom Identification
- Prevention
- Monitoring
- Injury Levels and Action Thresholds
- Pest Control Tactics

GENERAL PESTICIDE MANAGEMENT PRACTICES

- Maintain a complete inventory of all pesticides used and the use sites. This inventory should be updated annually.
- If pesticides are necessary, CAUTION-labeled pesticides should be considered before more toxic alternatives.
- Ensure that no banned or unregulated pesticides are stored or applied.
- Restricted use pesticides should only be used when no other alternatives are practical.
- Only small quantities of pesticides should be purchased eliminating the need for stockpiling.
- MSDSs should be regularly updated to reflect new pesticides or label changes to pesticides in storage.
- Pesticides should be used only according to label instructions.
- Weather conditions that could affect application should be considered. For example, wind conditions affect spray drift; rain may wash pesticide off of leaves.
- Pesticides should not be applied where there is a high chance of movement into water bodies; for example, they should not be applied near wetlands, streams, lakes, ponds or storm drains unless it is for an approved maintenance activity.
- In most cases, empty pesticide containers should be triple-rinsed before disposal. Particular information on the proper disposal of the pesticide and its container can be found on the label.

- Pesticide equipment and containers should not be cleaned or rinsed in the vicinity of storm drains or other open water areas.
- Pesticides should be stored in covered areas with cement floors and in areas insulated from temperature extremes.
- Chemicals and equipment should be secured during transportation to prevent tipping or excess jarring.
- Pesticides should be transported completely isolated from people, food and clothing, for example, in the bed of the truck rather than in the passenger compartment.
- Pesticide equipment, storage containers and transportation vehicles should be inspected frequently.
- A plan for dealing with pesticide spills and accidents should be developed.
- Unless their safety is compromised, workers should immediately clean up any chemical spills according to label instructions and notify the appropriate supervisors and agencies.
- Pesticide applications on public property, which take place on school grounds, parks, or other public rights-of-way where public exposure is possible, should be posted with warning signs. The specific criteria for the signage can be found in FAC, section 12978. Pesticide applications by the Department of Transportation on public highway rights-of-way are exempt.

PEST AND SYMPTOM IDENTIFICATION

Insects, Mites, and Snails and Slugs

- Field personnel should be trained to recognize basic pests found in the landscape in the following groups: insects, mites, and mollusks.
- A licensed Pest Control Adviser can be on staff or hired to properly identify a pest and the symptoms caused by the pest.
- Field personnel can be trained to utilize disease life cycles to apply treatments when the organism can be controlled most effectively.
- Field personnel can be trained to distinguish between beneficial insects and actual pests found in the landscape (e.g. parasitizing wasps).
- Unknown samples can be submitted to the Orange County Agricultural Commissioner for identification by the county entomologist or plant pathologist.
- Abiotic or nonliving factors (wind, sunburn, air pollution, etc…) should be considered as possible causes of observed symptoms as well as biotic (living) factors.

Weeds

- Field personnel can be trained to identify common weeds in the landscape.
- Field personnel can be trained to utilize weed life cycles to properly control

weeds such as controlling crabgrass utilizing a pre-emergent herbicide applied in mid-January.

- A licensed Pest Control Adviser can be on staff or contracted to properly identify the pest.

Diseases

- Field personnel can be trained to recognize common diseases or their signs/symptoms in the landscape.
- Field personnel can be trained to utilize disease life cycles to apply treatments when the organism can be controlled most effectively.
- Field personnel can be trained to recognize the difference between biotic and abiotic problems.
- Field personnel can be trained to understand how common diseases are spread throughout the landscape.
- Disease signs and symptoms can be sampled and submitted to the Orange County Agricultural Commissioner for identification by the county plant pathologist.
- A licensed Pest Control Adviser can be on staff or contracted to properly identify the pest.
- Photographs of disease signs and symptoms can be taken and compared to reference guides such as UC IPM's *Pests of Landscape Trees and Shrubs*.

Vertebrates

- Field personnel can be trained to recognize vertebrate pests and the damage they cause in the landscape.
- Field personnel can be trained to utilize vertebrate behavior to properly control the pest most effectively.
- Field personnel can be trained in vertebrate baiting and trapping.
- A licensed Pest Control Adviser can be on staff or contracted to properly identify vertebrate pest.

PREVENTION

Landscape Design Procedures

- Drainage, soil characteristics, water quality and availability should be considered during plant selection.
- Sun exposure, heat, and high temperature conditions should be considered during plant selection.
- Plant material should be selected based on adaptability to local climate conditions, such as those conditions common to a Mediterranean climate.
- Adequate space should be allowed for root growth, especially trees.

- Nursery stock should be inspected and rejected if not healthy (injuries, diseased, circling roots/potbound, poor staking and/or pruning).
- Pest resistant species and cultivars should be selected.
- Plants with similar growth characteristics and irrigation requirements should be grouped together.
- Landscape design should match available irrigation technology to avoid excess water use and to minimize surface runoff.

Site Preparation and Planting Procedures

- Soil drainage properties can be assessed and compacted soils improved prior to planting.
- A soil analysis can be conducted to determine the chemical and physical properties of the existing soil and then appropriate amendments such as organic matter can be added.
- Irrigation should be installed as designed in order to avoid poor uniformity once plants are in place.
- Proper planting procedures should be followed for particular plant species to avoid planting too deeply or too shallow.
- Nursery tree stakes can be removed at planting and replaced with staking that allows trunk to flex; removing these stakes after 1 to 1.5 years.
- A soil probe or other soil moisture measurement device can be utilized to monitor soil moisture levels in existing root ball and surrounding soil during establishment period.

Water Management

- Plants should be examined weekly for symptoms of water stress and to assist in determining irrigation scheduling.
- Soil moisture can be monitored with a soil probe or soil moisture sensors to assist in scheduling irrigation.
- Evapotranspiration (ET) data or 'smart' clock technology can be utilized to schedule irrigation.
- Cyclic irrigation (short-multiple run times) can be employed to minimize surface runoff.
- Low precipitation sprinklers or low-volume systems can be utilized to reduce surface runoff.
- Systems should be inspected monthly to check for leaks, broken pipes, and clogged or broken sprinkler heads.
- Adjust sprinklers to avoid application of water directly to the trunk of trees (can promote disease) or on to concrete surfaces where it can enter storm drains.
- A hotline, email, or other dedicated method can be established for citizens to

report leaks and broken sprinkler heads

Fertilizing Procedures

- To avoid nutrient losses below the root zone, fertilize only when plants are actively growing.
- Fertilizer should not be applied within 48 hours of a rain event to avoid losses below the root zone and in surface runoff.
- Soil analyses can be conducted in order to determine existing nutrient levels in the soil prior to fertilizing.
- Turf grass fertilizer maintenance schedules can be based on UC recommendations found online at UC Guide for Healthy Lawns: http://www.ipm.ucdavis.edu/TOOLS/TURF/MAINTAIN/fertilize.html
- Sports turf grass fertilizer maintenance guidelines can be based on UC recommendations found in *Establishing and Maintaining the Natural Turf Athletic Field (UCR ANR Publication Number: 21617)*.
- Overfertilization, especially of trees and shrubs, should be avoided to ensure plant growth is not excessively succulent making it more susceptible to pest infestations.
- Off-target fertilizer applications or spills should be cleaned up immediately by sweeping up and applying to landscape or turf or replacing in spreader or bag to ensure material does not enter storm drains.

Pruning Procedures

- Damaged or diseased wood should be regularly pruned from landscape plants.
- Trees should be pruned according to standards set forth by a professional tree care organization such as the International Society of Arboriculture.
- Plants too large for a space should be replaced instead of pruning them severely.
- Unnecessary pruning should be avoided as wounds are entry sites for decay and disease organisms.
- The age and species of the plant should be taken into account when determining the time of year to prune. For example, eucalyptus should be pruned in December and January when long-horned beetles are not active.
- Tree height reduction should be discouraged. When deemed necessary by a licensed arborist, the crown reduction method approved by a professional tree care organization should be utilized. Topping should not be done to reduce tree size.

MONITORING FOR PESTS AND PROBLEMS

Insect/Mollusk Monitoring Procedures

- Monthly visual inspections of plants for insects, mites, snail and slug damage,

and recording results is an effective method for tracking changes and easy recall of data.

- Yellow sticky traps can be utilized to assess populations of insects.
- Insects can be dislodged from plants by shaking over a collection surface usually consisting of a clipboard with a white sheet of paper.
- If available for a particular insect, pheromone-baited traps can be utilized.
- Soil-dwelling turf insects can be brought to the surface for monitoring by flushing a specific area of soil (i.e. 2′ x 2′ grid) with plain water or a soapy water mixture.
- The amount of honeydew (aphids) and frass (caterpillars) present can be utilized as an indicator of population levels.

Weed Monitoring Procedures

- Landscapes can be inspected at least 4 times a year (early winter, early spring, summer and early fall) for weeds in order to determine if and when a weed problem exists.
- Site surveys can be utilized to record the location, date, and severity of weed problem for an effective method of tracking changes and easy recall of data.
    - The number of weeds encountered at periodic intervals (e.g. every 1 to 2 feet) can be counted and recorded along a straight line transecting a landscaped, area or within a selected area, for example 4 sq. ft. samples done in random places in a bed or turf area.

Disease Monitoring Procedures

- Landscapes should be regularly checked for conditions, such as overwatering and injuries, which promote disease.
- Landscapes should checked monthly for disease symptoms and signs. Disease prone plants should be checked more frequently.
- Landscape inspections should note date when disease signs and symptoms were first noticed and the current environmental conditions and soil moisture levels as an effective method of tracking changes and easy recall of data.

Vertebrate Monitoring Procedures

- Landscapes can be regularly inspected for vertebrate presence either by damage caused by animal, actual animal sightings, and/or droppings.
- Records can be kept of the absence or presence of actual vertebrates, the damage caused, and/or the presence or absence of droppings.
- Maps can be created and updated at least twice a year, recording areas of high vertebrate damage or signs (such as gopher mounds).

INJURY LEVELS AND ACTION THRESHOLDS

Insect/Mollusk Thresholds and Guidelines

- Insect tolerance levels can be established based on the public's acceptance of damage to the landscape or a certain level of nuisance pests (i.e. ants), the actual plant species in the landscape, and long-term monitoring and knowledge of pests causing the damage.
- Thresholds can be based on levels where reasonable control of the pest can be achieved with minimum impact on the environment.
- Insect monitoring records can be utilized to establish threshold levels for the implementation of control strategies. For example, the threshold for the presence of aphids on a rose garden at City Hall is low, while in a native shrub border it might be considerably higher.

Weed Thresholds and Guidelines

- Weed tolerance levels can be established based on public safety or the public's acceptance and the resources available to manage the landscape at that level.
- Weed monitoring records can be utilized to rank the percentage of the landscape area infested (none, light, moderate, heavy, or very heavy) with weeds.
- Public areas can be ranked according to high, medium, or low level of weed control and management conducted according to levels set for each rank (see Appendix B)

Disease Thresholds and Guidelines

- Disease tolerance levels can be established based on the public's acceptance and the resources available to manage the landscape at the level required.
- Disease monitoring records can be utilized to establish threshold levels for the implementation of control strategies. For example, the threshold for the presence of powdery mildew on roses at City Hall is much lower than the threshold for its presence on Euonymus in a parking lot at a city sports park.

Vertebrate Thresholds and Guidelines

- Vertebrate tolerance levels can be established based on public safety, the public's acceptance and the resources available to manage the landscape at the level required.
- Vertebrate monitoring records can be utilized to establish threshold levels for the implementation of control strategies. For example, the threshold for the presence of gopher mounds in a sport field is zero, while in a native shrub border it might be two before a trapping strategy is implemented.

PEST CONTROL TACTICS

Insect/Mollusk Management Methods

Cultural/Mechanical/Physical Control Methods

- Sticky barriers can be applied to trunks of trees and large shrubs to prevent ants and other wingless invertebrates from plant canopies.
- Small insect infestations can be removed by pruning infested plant parts.
- Copper bands can be installed around base of trees or planting areas where snail and slug infestations are prevalent.
- Plant canopies can be thinned to increase light penetration to expose certain soft-bodied insects (soft-scale) as well as snails and slugs to heat.
- Strong streams of water can be used to dislodge insects such as aphids and whiteflies, from leaves.
- The use of plants that snails and slugs use for shelter should be avoided.
- Avoid irrigating between 5pm and 5am when moisture remains on plant material for several hours.

Biological Control Methods

- Persistent broad-spectrum pesticides should be avoided, especially if biological control of an insect has been established by UC researchers. Examples include parasitoid wasps controlling Eugenia Psyllids, Giant Whitefly, and Ash Whitefly.
- Natural predators (beneficial insects) can be augmented with purchases of additional predators from commercially available resources.

Pesticide Control Methods

- The most selective, rather than broad-spectrum, pesticide should be used.
- If available for controlling a particular insect, biological and botanical pesticides should be selected.
- Insecticidal soaps can be utilized to control infestations of soft-bodied insects such as aphids, thrips, and immature scales.
- Horticultural oils (neem oil and narrow-range refined oils) can be utilized to control infestations of soft-bodied immature and adult insects such as aphids, scales, and whiteflies.
- Pesticides should only utilized when the potential for impacts to the environment, especially water quality, are minimized.
- Equipment should be calibrated prior to the application of the insecticide to avoid excess material being applied to the landscape environment.
- Applicators should be trained to not apply pesticides to hard surfaces and to not allow any pesticide to enter the storm drain system.
- Spot treatments should be utilized rather than broadcast methods.
- Insecticide/fertilizer combinations should only used if it is appropriate timing for BOTH the insecticide application and the fertilizer application.

Weed Management Methods

Cultural, Mechanical, and Physical Control Methods

- Timers can be set to avoid overwatering as weeds establish in areas where soil moisture is excessive.
- Drainage can be managed to avoid wet areas.
- Weeds can be removed from a site prior to planting.
- Mower height can be adjusted to turf species and time of year.
- Mower should be washed after mowing a weedy site.
- Hand-pulling, mowing, trimmers/brushcutters, flaming, hoeing, and rototilling around landscape plants should be the main methods utilized to control annual weeds and young perennial weeds.
- Soil solarization can be utilized to control some annual and perennial weed species.
- Bare soil areas can be covered with a thick layer of mulch to suppress weeds and conserve soil moisture.
- Soil, mulch, and plant material should be weed-free before it is introduced into the landscape.

Pesticide Control Methods

- Spot treatments can be utilized rather than broadcast methods.
- Herbicide/fertilizer combinations should only used if it is appropriate timing for BOTH the herbicide application and the fertilizer application.
- Herbicides should be utilized according to established thresholds (see Appendix B).
- Organically acceptable herbicides (shown to be effective through science-based research) should be used where appropriate.
- Herbicides can be applied to the stage of weed growth most susceptible to the chemical.
- Equipment should be calibrated prior to the application of the herbicide to avoid excess material being applied to the landscape environment.

Disease Management Methods

Cultural, Mechanical, and Physical Control Methods

- Localized areas of diseased plants should be pruned out and disposed of.
- Pathogen-infested plant parts can be removed from the soil surface area to reduce certain pathogens (e.g. Camellia Petal Blight).
- Pruning tools can be sterilized (e.g. a diluted bleach solution) between plants to prevent the spread of pathogen to other plants.
- Proper irrigation and fertilization can be maintained to prevent plant stress, waterlogging, and subsequent susceptibility to disease.
- Soil solarization can be utilized to control soil pathogens in annual beds where it

is most effective.

- Mulch can be kept at least 6” from base of plants to avoid excessive moisture around crown possibly resulting in crown rots and is no deeper than 4”
- Disease-prone plants can be replaced with non-susceptible species.

Pesticide Control Methods

- Preventative fungicides and bactericides should only used where diseases can be predicted from environmental conditions and applied prior to infection or the appearance of symptoms.
- Synthetic fungicides should be used sparingly in the landscape and only in high visibility areas in order to minimize development of resistance.
- Organic fungicides and bactericides should be utilized in combination with cultural, mechanical, and physical control methods in order to improve their effectiveness.
- Copper-based fungicides should only be utilized in situations where its entry into surface runoff and storm drains is virtually impossible and after consultation with PCA and IPM coordinator.
- Mycopesticides, commercially available beneficial microorganisms, should be used where appropriate.
- Fungicides classes can be rotated to avoid resistance.

Vertebrate Management Methods

Cultural and Physical Control Methods

- Groundcovers can be maintained such that they do not harbor rats.
    - Shrubs pruned at least 1 foot from the ground (rats).
    - Sources of drinking water removed (leaky faucets, puddles).
    - Trash cans have lids and are emptied daily (rats).
    - Screens or other barriers installed under structures that have a space between soil and floor (rabbits).
- Habitat modification, based on pest biology can be used to reduce shelter. Trapping can be used for gophers when safe and practical.
- Kill traps used for ground squirrels and rabbits, should be checked daily, and put in places not accessible by children or non-target animals.
- Gas cartridges can be used for ground squirrels according to UC recommendations.

Pesticide Control Methods

- Anti-coagulant baits can be used and applied according to label and UC recommendations.
- Bait should be applied in a manner that non-target animals do not have access to

it.

- Restricted use pesticides should only be applied by or under the direct supervision of an individual with a qualified applicators certificate (QAC). To receive a QAC, a person must take a test administered by Department of Pesticide Regulation (DPR). To obtain test materials, test schedules, and an application, see http://www.cdpr.ca.gov/docs/license/liccert.htm.

Appendix B

Ranking public areas for weeds (or other pest) management:

Areas ranked as **HIGH** may include areas that the public sees and expects to be well-maintained. Examples are entrances to public buildings such as city hall and libraries.

These areas are allowed to use pesticides based on established thresholds.

Areas ranked as **MEDIUM** may include areas the public sees but does not expect a high level of maintenance. Examples are landscaped areas away from the entrance, recreational and picnic areas. These areas can tolerate a higher lever of weeds.

These areas are allowed to use pesticides but the threshold is much higher and pesticides are used infrequently and only after consultation with IPM coordinator.

Areas ranked as **LOW** may include areas the public rarely sees or does not expect a high level of maintenance. Examples are medians, landscaped areas in parking lots, wildlands. These areas can tolerate a higher lever of weeds.

These areas are not allowed to use pesticides except in extreme cases and only after consultation with IPM coordinator.

Illicit Connection Investigations Guidance

Field Screening Techniques

If evidence of an illicit discharge is detected, as described in Section 2, and the source does not appear to be evident or above ground, investigations will be conducted to determine if the discharge is being conveyed through an illicit connection. A good source of information includes *Investigation of Inappropriate Pollutant Entries into Storm Drainage Systems* (EPA/600/R-92/238.1993, Pitt et al). General guidance follows below. These techniques can also be used if a Permittee elects to survey sections of their system for illicit connections.

Document Research

Maps of drainage facilities can be reviewed to locate upstream connections and drainage basins as an initial step to locate potential illicit connections. Other records, such as connection permits and discharge permits, can also be reviewed to determine if legal connections may be the source.

Physical Inspections

Catch basins, manholes and other facilities that can be safely investigated from the surface should be physically checked for evidence of connections. This may be a hard pipe connection, or could be a hose or other conveyance that directs a discharge into the storm drain facility. Identification of connections that exhibit evidence of suspected illicit discharges during routine site inspection (e.g., industrial, commercial or construction). Investigation is conducted to determine if the discharge is being conveyed through an illicit connection when evidence of illicit discharge is detected, and the source does not appear to be evident or above ground.

Facilities that are large enough for personnel to enter can also be physically inspected, however, entry into facilities requires strict adherence to health and safety procedures, including confined space entry procedures. In general, a space is “confined” if it is not intended for human occupancy, has limited openings for entry or exit, and has insufficient natural or mechanical ventilation. Information on safety procedures can be found in many documents, including the *Occupational Safety and Health Guidance Manual*, National Institute for Occupational Safety and Health; *OSHA Safety and Health Standards 29 CFR 1910 (General Industry)*, US Department of Labor, and *Title 8 of the California Code of Regulations, General Industry Safety Order*.

Dye Tests

Dye tests can reveal illicit connections in areas where storm drain flows are unexplained and the Permittee has access to suspect facilities. Typical dye tests consist of the addition of fluorescent dye to a floor drain or waste line from a domestic, commercial or industrial process, followed by monitoring for the dye in downstream storm drains. Permittees should conduct dye testing facility by facility (in each area where unexplained flow exists) until all facilities in the area are tested.

Smoke Tests

Smoke tests can reveal if illicit connections exist, and can reveal their source. Storm drains are sealed via sandbags or other sealing devices (plugs, etc.) and smoking incendiary devices are ignited upstream of the seal. Simultaneous inspections inside area facilities should reveal illicit connections even in the

absence of flow. As illicit discharges are intermittent, smoke tests offer real advantages over other types of illicit discharge source identification methods. However, as many legitimate connections to a storm drain may exist (roof drains, street drains, etc.) smoke may be observed extensively. This may cause some illicit connections to be missed, and create a problem with area businesses and residents as excessive smoke begins to enter private property.

T.V. Inspections

T.V. inspections can reveal if illicit connections exist, but cannot be used to view up the connection to determine the source. Robotized or otherwise mobile television cameras allow visual inspection of storm drains (pipes) too small or dangerous for personnel to enter. Although an excellent method of identifying and documenting illicit connections, T.V. inspections have high costs unless the equipment is already owned or can be borrowed from neighboring agencies.

Guidance Source

Los Angeles County Model Stormwater Quality Management Program, 2003.

Illicit Discharge Investigation and Elimination Guidance

Introduction

Once illicit discharges/disposal are detected and identified, they must be eliminated. Sometimes the source of the spill or discharge/disposal is apparent. The incident can be removed through voluntary cleanup/termination or enforcement procedures, and steps can be taken to prevent its recurrence. These prevention methods can include education and outreach materials for residents and businesses, preventive maintenance practices for infrastructure, vehicles and equipment or additional enforcement.

When the source of the discharge is not apparent, further investigation will be necessary to eliminate it and prevent it from recurring. The following discusses methods that can be used to document the incident, determine the nature of the material, and investigate the source.

Advance Planning

An effective investigation program requires good advance planning. Sufficient staff should be trained to conduct investigations so that qualified staff are available whenever investigations are necessary. Staff should become familiar with illicit discharge investigation and sampling procedures. General guidance follows below to assist with overall planning, but should not be considered complete for proper sampling quality assurance purposes.

Equipment

Appropriate equipment for field investigations may include:

Table 1: Typical Equipment for Investigations

Equipment Type	Equipment
General	Inspection checklist
	Field data log book
	Camera
	Tape measure
	Storm drain system map
	Flashlight
Flow measurement	Ping pong ball or other light floatable
	Stopwatch
Laboratory	Graduated container
	Temperature/pH/conductivity (EC) probe
	Field test kits (e.g., Lamotte test kit)
	12 1-liter amber glass sample bottles
	12 1-liter HDPE sample bottles
	Cooler with ice for sample preservation
	Gloves
	Splash goggles/safety glasses
	Deionized water in wash bottle
First Aid	First aid kit

Data Collection

Before entering the field, the inspection crew should locate information such as the following on a storm drain/street map for areas that will be investigated:

- All known or suspected pollutant generating activities
- Locations of NPDES dischargers
- All locations where storm drains enter open channels
- Catch basins and storm drain manholes

Visual Observation

Visual observation of the storm drain system and/or of activities on the surface can provide information on the source of illicit discharges. It is the simplest method to begin with and the least costly. Evidence of illicit discharges may only consist of visual observations because most illicit discharges are intermittent and will probably not be flowing when inspected. A field inspection crew should investigate the surface drainage system in the vicinity of suspected illicit discharges. This may include accessible areas in the public right-of-way adjacent to residences and businesses, catch basins, open channels near known points of discharge, and upstream manholes.

Photos of visual observations should be taken to aid subsequent data analysis and follow up planning. The following types of visual observations should be recorded on an investigation checklist, such as the one attached:

- Location
- General site description
- Amount, appearance of discharge/disposal
- Stains
- Structural cracking and corrosion
- Vegetative growth
- Nearby facilities with poor outside housekeeping practices
- Pipes/hoses connected to/directed toward drainage system

If the source of the discharge is determined, appropriate methods should be used to eliminate it through voluntary cleanup/termination or enforcement procedures, and steps should be taken to prevent its recurrence.

Sampling and Testing

If flow is observed, and the source of the discharge is not apparent, the crew should collect a sample and measure flow. Several tests should be conducted to determine the nature of the material. This can be compared to records of local facilities and possible pollutant generating activities as an aid in determining the possible sources of the flow.

The sample should be measured for pH, temperature and conductivity (EC). If any of these parameters are abnormal, or strong odors or flow discoloration are detected, the sample should be analyzed. This can be done with a field test kit, which will detect the presence of copper, phenols, detergents, and chlorine. Findings should be recorded on the inspection checklist.

If visual observations are abnormal and/or the field tests detect high concentrations of any constituent, the crew should consider collecting samples for laboratory analysis. The laboratory can usually supply properly cleaned sample bottles and specify either amber glass or plastic (HDPE) bottles depending on the analyses required. If there is enough flow, the field crew should fill several of each type of bottle to obtain enough sample volume for a range of analyses. If there is a limited quantity or sampling is difficult, the field crew should collect as much sample as possible so that the laboratory can run a limited set of analyses. The samples should be placed in a cooler filled with ice and transported to the lab(s) on the same day. Arrangements should be made prior to the field inspection with an analytical laboratory capable of performing the required analyses.

The laboratory analyses run on each sample should be carefully considered. Given the potential high cost for laboratory work, it is prudent to limit the number of analytical parameters (or analytes) tested for each sample. Tests may be selected based on the findings of indicator analyses, visual observations, field tests, and information collected about the types of materials processed, stored and/or spilled within each drainage area.

Spill Prevention Coordination

Procedures

This attachment discusses spill prevention coordination procedures that identify:

- Divisions or sections responsible for responding to reports of spills
- General and specific spill response procedures including responsible division or section
- Spill response training activities
- Activities conducted to improve spill response procedures and equipment

Divisions or Sections Responsible for Responding to Reports of Spills

Identify the divisions or sections responsible for responding to reports of spills and note divisions or sections that respond to specific types of spills such as hazardous materials spills or sewage spills. Also indicate the specific field staff who respond to spills and the level of support they provide to lead emergency response agencies and source of spill investigations.

General and Specific Spill Response Procedures

Describe or reference general spill response procedures involved in responding to complaints and identifying spills through inspections. Include the spill response process from the spill identification stage through clean up and report preparation. Copies of the forms and reports prepared to document spills should also be included. Specific procedures for hazardous materials spills, floods, and sewage spills should be referenced. Contractor support for spill events, if applicable, should also be noted.

Spill Response Training Activities

Provide an overview of all spill response training that is conducted within the various divisions and sections of the agencies.

Activities to Improve Spill Response Procedures and Equipment

List all activities conducted within the implementing agency to improve spill response procedures and update equipment. Explain how improvements are identified, prioritized, and implemented. Include a schedule of how often spill response procedures and equipment are evaluate.

Spill Investigation, Containment and Cleanup

Investigation

Depending on the location of the spill and the type of material, the appropriate department/ agency should be notified. This may include:

- Storm drain maintenance, if the spill reaches the storm drain system
- Street and road maintenance, if the spill is in the public right-of-ways
- Sewer system maintenance, if the material is from the sewage system
- Industrial waste inspection, if the material is from industrial facilities
- Fire Departments/"first responders," if the material may be hazardous
- Contractors for hazardous materials, if the material is hazardous

These departments/agencies should determine the nature of the material and the extent of the spill. If any agency determines there is a chance that the spill involves hazardous materials, then the local Administering Agency will be notified. An example of spill investigation procedures is depicted in Figure D-1. Reporting procedures for hazardous substances are discussed further in Section 5 of this Illicit Connection/Illicit Discharge Elimination model program.

Containment and Cleanup

Once the nature and extent of the spill is determined, the appropriate departments and field superintendents will be notified to contain and clean up the spill. The three types of cleanup scenarios are (1) hazardous, (2) wastewater, and (3) other non-hazardous materials.

Hazardous

Handling procedures regarding releases of hazardous or potentially hazardous substances into the environment are covered in a number of federal and state regulations, including: Comprehensive Environmental Response, Compensation and Liability Act (CERCLA); Superfund Amendments and Reauthorization Act (SARA); Resource Conservation and Recovery Act (RCRA); and multiple bills codified under Division 20 of the California Health and Safety Code. These procedures are well established and are practiced by local hazardous materials response teams - generally a local Fire Department.

Material determined to be hazardous will be contained by the appropriate hazardous material response team. The team will contact an approved contractor for cleanup. Details are contained in the local *Emergency Response Procedures* manual.

Wastewater

Field crews responding to a sewage spill or overflow should contain the spill to prevent entry of the sewage into the storm drain system or natural watercourse. This will involve a coordinated effort between the sewer, street, and storm drain maintenance crews.

To the maximum extent possible, sewage should be prevented from entering the storm drain system by covering or blocking storm drain inlets and catch basins or by containing or diverting the overflow away from open channels and other storm drain fixtures (using sandbags, inflatable dams, etc.).

In the event that raw sewage enters a storm drain catch basin, where possible the sewage should be vacuumed or pumped out of the catch basin. If a sewage overflow enters a storm drain channel, where possible the downstream channel area should be blocked, flushed with potable water and the captured water pumped to a nearby sewer manhole. Any time a sewage spill enters the storm drain system and has the potential to reach coastal waterways, the local agency and L.A. County Dept. of Health Services, Bureau of Environmental Protection must be notified (323) 881-4147.

Once the spill is contained, it should be removed and the area disinfected. Every effort should be made to ensure that the disinfectant is not discharged to the storm drain system, using methods such as those described above.

Other Non-hazardous Materials

Non-hazardous materials should generally be removed by appropriate crews with knowledge of or jurisdiction over the location of the spill, as indicated in Section D.1. Because the situations and materials will vary widely, procedures will vary as well.

All materials should be prevented from entering waterways to the maximum extent possible. Many materials in sufficient quantities can deplete the oxygen level in receiving waters, or smother benthic communities. Typical examples of these materials include landscape waste, milk, flour, and many other organic liquids and solids or fine powders. These materials should generally be removed by first collecting and/or sweeping up all solids and disposing them in a landfill or other approved location. Liquids should be diverted to an area away from waterways where they may be removed with a vacuum truck or can soak into the ground.

Los Angeles County Model Stormwater Quality Management Program, 2003.

Watershed Management Program Appendix 3

A-3-2 Example Vacant Lot Ordinance

For the TSS Reduction Strategy

EXAMPLE VACANT LOT ORDINANCE

For the TSS Reduction Strategy (City of Whittier Municipal Code § 8.08.026)

8.08.026 VACANT LOTS

For the purpose of this section, a vacant lot shall mean any property which is either undeveloped or has an existing on-site building/structure that is either abandoned, vacant and/or is un-leased by the property owner for more than thirty days.

All vacant lots within the city (except those that do not immediately front onto a public street, are less than five feet wide in width or depth, are identified on the city's zoning map as "open space," are used as designated habitat conservation or for active agricultural production) shall be maintained in accordance with the following provisions of this section within thirty days of becoming vacant:

A. Unimproved Vacant Lot Types. Lots that are unimproved due to never having been developed or having become vacant subsequent to the removal of any pre-existing buildings, structures or impervious surfaces shall be subject to the approval of a vacant lot landscape and irrigation plan by the director of parks, recreation and community services and shall be improved and maintained at all times in accordance with the following provisions:

   1. Lots That Are Less Than One-Half Acre. For unimproved vacant lots that are less than one-half acre in size (21,780 square feet), the entire lot shall be improved and maintained in the following manner:

      a) The property owner shall landscape the entire lot using drought tolerate or xeriscape material that requires little to no water after the first three years of growth. Durable, high quality, synthetic turf may also be used as an alternative. The landscape material selected shall be reviewed and approved to the satisfaction of the director of parks, recreation and community services prior to installation, per Section 13.42.120 of the Whittier Municipal Code. The ground cover shall be maintained in good condition at all times.

      b) The lot shall be improved with an operable automatic irrigation system for the ground cover which shall be installed and maintained in good condition by the property owner at all times.

      c) The lot shall be maintained free of litter, weeds, graffiti, debris, including the stockpiling of any material, at all times. Any on-site litter, weeds, debris or stockpiling of material shall be immediately removed by the property owner, upon discovery. The property owner or their designated representative shall be responsible for inspecting the property at reasonable intervals or take other steps to reasonably ensure that no litter, weeds, graffiti, debris or material stockpiling collects or is maintained on the lot.

d) Any dead or dying vegetation as well as any broken, malfunctioning or non-functioning irrigation components on the lot shall be replaced by the property owner within seventy-two hours of their discovery or notification. The property owner shall be responsible for inspecting the property at reasonable intervals, or take other steps to reasonably ensure that there is no dead or dying vegetation nor any broken, malfunctioning or non-functioning irrigation components on the lot.

e) At the discretion of the director of parks, recreation and community services the standards contained in Section 8.08.026(A)(2) (Lots that are one-half acre or greater) may be applied to vacant lots that are one-half acre or less if deemed appropriate to mitigate any one or more of the following circumstances:

   i. To adequately secure the property from illegal dumping or other such illicit activities.
   ii. Because of public safety concerns or hazards associated with the property.
   iii. A declared state or regional drought.

2. Lots That Are One-Half Acre or Greater. For unimproved vacant lots that are one-half acre (21,780 square feet) or greater in size, the entire lot shall be improved and maintained in the following manner:

   a) The property owner shall provide a minimum five-foot wide landscape planter adjacent to all public rights-of-way (except those property lines located immediately adjacent to an alley) that abut their vacant lot.

   b) All landscape planters shall be improved with an operable automatic irrigation system. The landscape material selected shall consist of drought tolerate or xeriscape material that requires little to no water after the first three years of growth. Durable, high quality, synthetic turf may also be used as an alternative. The landscape material selected shall be reviewed and approved to the satisfaction of the director of parks, recreation and community services prior to installation, per Section 13.42.120 of the Whittier Municipal Code. The ground cover shall be maintained in good condition at all times.

   c) All on-site landscaping and irrigation shall be maintained in good condition at all times by the property owner of the lot. Any dead or dying landscaping shall be replaced by the property owner within seventy-two hours of their discovery or notification, including any broken, malfunctioning or non-functioning irrigation components. The property owner shall be responsible for inspecting the property at reasonable intervals or take other steps to reasonably ensure that all of the landscaping and irrigation on the lot is maintained in good condition and there are no broken, malfunctioning or non-functioning irrigation components on the lot.

   d) A six-foot high, view obscuring, decorative perimeter barrier shall be erected around the entire vacant lot, with a minimum five-foot wide perimeter

landscape planter in front of the fencing. In circumstances where the director of parks, recreation and community services finds that a higher perimeter barrier is warranted for adequate security of the site and/or because of unusual topographical circumstances associated with the vacant lot, the perimeter barrier may be constructed up to a maximum of eight feet high. All perimeter barriers shall include a gravel pathway leading to a security gate to provide accessibility to the interior of the lot for the police department or other emergency personnel. A key or security code for the gate shall be provided to the Whittier Police Department by the property owner upon installation and shall be kept up-to-date at all times.

e) All decorative, view obscuring, perimeter barriers shall consist of either painted wood, redwood, woodcrete, green vinyl chain-link fencing with a green windscreen securely attached (along the interior of the fence), or any other durable, aesthetically attractive, material deemed acceptable to the director of parks, recreation and community services. On corner or reversed corner lots, all fencing shall comply with Section 18.64.050 for visual safety.

f) All perimeter barriers shall be maintained in good condition at all times by the property owner. Any on-site graffiti shall be removed by the property owner within seventy-two hours of its discovery or notification. The property owner shall be responsible for inspecting the property at reasonable intervals.

B. Improved Vacant Lots. Vacant lots improved with existing on-site buildings or structures that are vacant, abandoned, or un-leased for thirty days or more (as determined by the director of parks) shall be maintained by the property owner as follows:

1. All existing on-site landscaping and irrigation shall be maintained in good condition at all times and in accordance with the provisions contained in Chapters 8.08, 8.22 and8.24 of this code, including any conditions of approval applied to the site as part of the approved vacant lot landscape and irrigation plan under Section 8.08.026(C).
2. Any dead or dying vegetation as well as any broken, malfunctioning or non-functioning irrigation components for the lot shall be replaced by the property owner within seventy-two hours of their discovery or notification. The property owner or their designated representative shall be responsible for inspecting the property at reasonable intervals, or take other steps to reasonably ensure that there is no dead or dying vegetation nor any broken, malfunctioning or non-functioning irrigation components on the lot.
3. The lot shall be maintained free of litter, weeds, and debris, including the stockpiling of any material, at all times. Any on-site litter, debris or stockpiling of material shall be immediately removed by the property owner, upon discovery or notification. The property owner or their designated representative shall be responsible for inspecting the property at reasonable intervals, or take other steps to reasonably ensure that no litter, weeds, graffiti, debris or material stockpiling collects or is maintained on the lot.

4. All on-site structures shall be maintained in good condition at all times. Damage to any on-site buildings or structures shall be abated within ten days by the property owner upon discovery. An alternative abatement period shall be required, if deemed necessary by the building official, to protect the public health, safety and welfare.
5. The lot shall be adequately secured at all times to prevent illegal dumping, criminal activity, vandalism, graffiti, on-site loitering by the homeless and any/all other attractive nuisances to the satisfaction of the director of parks, recreation and community services and the chief of police.

C. Vacant Lot Landscape and Irrigation Plan. Prior to the issuance of a demolition permit on any lot in which the construction of a new building, structure, parking lot, or impervious surface will not commence within thirty days after demolition, the property owner shall submit a vacant lot landscape and irrigation plan for review and approval of the director of parks, recreation and community services (with the appropriate plan check fees). The director of parks, recreation and community services may impose any reasonable conditions of approval on the vacant lot landscape and irrigation plan to ensure that the lot will be adequately maintained during the time that it is vacant. Upon approval of the plan, the landscape and irrigation improvements to the lot, as specified in the plan, shall be completed to the satisfaction of the director of parks, recreation and community services within thirty days after demolition. A reasonable extension of time may be granted by the director of parks, recreation and community services in those situations when the director, in his or her sole discretion, determines that a good faith effort is being made by the property owner to comply with the provisions of this section.

1. Appeal of Decision.
    a) The decision of the director of parks, recreation and community services to approve, conditionally approve or deny any vacant lot landscape and irrigation plan may be appealed in writing to the city manager within fifteen calendar days. The decision of the city manager shall be final, unless appealed in writing to the city council within fifteen calendar days of the city manager's decision. All decisions of the city council shall be final.
    b) At the sole discretion of the city council, the provisions contained within this ordinance may be made modified, as deemed appropriate, if a finding is made that the legal property owner has demonstrated an extreme financial hardship such as, but not limited to, the filing of bankruptcy, property tax default, their exists over six months of outstanding arrears to the monthly mortgage payment on the property, or any other extreme/unique hardship the city council believes is contrary to the purpose and intent of this ordinance.

D. View Obscuring Barriers and Fencing on Vacant Lots. There shall be no on-site fencing or view obscuring perimeter barriers that screen any vacant lot in any manner that obstructs vehicular and/or pedestrian visibility of the public right-of-way, or interferes with the public's use of the public right-of-way, as determined by the director of public works. The directors of public works and parks, recreation and community services shall approve the location and design of all vacant lot fencing and perimeter barriers prior to the construction of any such fencing or barriers on a vacant lot.

E. The director of parks, recreation and community services shall implement all applicable sections of Chapter 13.42 (Water Conservation in Landscaping), regardless of the size of the vacant lot, to ensure that the approved vacant lot landscape and irrigation plan conserves water to greatest extent possible, while preserving the health of the landscaping approved on the vacant lot.

F. Where a recorded easement on vacant lot exists, the director of parks, recreation and community services may require and/or permit the property owner to use an appropriate ground cover over the easement (i.e., gravel, turf block, paving or some other acceptable material) that would enable a vehicle to drive over the easement. Any impervious surface approved over an easement shall be subject to the prior written approval of the easement holder.

G. Implementation. All vacant lots, regardless of how they became vacant, that are existing at the time of the adoption of the ordinance shall be brought into immediate compliance with all applicable provisions of this section, unless currently landscaped and irrigated under a previously approved vacant lot and landscape and irrigation plan approved by the director of community development or director of parks, recreation and community services prior to the adoption of this current ordinance. A reasonable extension of time may be granted by the director of parks, recreation and community services in those situations when the director, at his or her sole discretion, determines that a good faith effort is being made by the property owner to comply with this section.

H. Noncompliance Declared Nuisance. Failure to comply with any of the applicable requirements in this section shall constitute a public nuisance, as designated in Section 8.08.030, and the city attorney or the district attorney may commence an action or proceeding for civil abatement, removal and enjoinment thereof, in the manner proscribed by law; and shall take other steps and apply to such courts as may have jurisdiction to grant such relief as well as abate or remove the nuisance, including abatement in accordance with the provisions of this chapter.

(Ord. 2906 § 1, 2008)

(Ord. No. 2928, § 1, 6-23-09; Ord. No. 2958, § 3, 10-12-10)

Watershed Management Program Appendix 3

A-3-3 Example Street Sweeping Municipal Code

For the TSS Reduction Strategy

EXAMPLE MUNICIPAL CODE LANGUAGE FOR PRIVATE PARKING LOT SWEEPING

For the TSS Reduction Program (City of Signal Hill Municipal Code § 12.16.060)

12.16.060 ILLICIT DISCHARGES

A. Except as otherwise permitted herein, all non-storm water discharges to the municipal storm drain system are prohibited.
B. No person shall cause, facilitate or permit any illicit discharge to the municipal storm drain system.
C. No person shall cause, facilitate or permit a discharge into an MS4 that causes or contributes to an exceedence of any water quality standard.
D. No person shall cause, facilitate or permit any discharge into an MS4 that causes or threatens to cause a condition of pollution, contamination, or nuisance (as defined in California Water Code § 13050).
E. No person shall cause, facilitate or permit any discharge into an MS4 containing pollutants which have not been reduced to the Maximum Extent Practicable.

⋮ ⋮ ⋮ ⋮ ⋮ ⋮

Q. All owners and operators of industrial and/or commercial motor vehicle parking lots containing more than twenty-five parking spaces shall conduct regular sweeping and other similar measures to minimize the discharge of pollutants and other debris in the municipal storm drain system.

⋮ ⋮ ⋮ ⋮ ⋮ ⋮

V. Any person who violates the terms of this section shall immediately commence all appropriate response action to investigate, assess, remove and/or remediate any pollutants discharged as a result of such violation, and shall reimburse the City or other appropriate governmental agency, for all costs incurred in investigating, assessing, monitoring and/or removing, cleaning up, treating or remediating any pollutants resulting from such violation, including all reasonable attorneys' fees and environmental and related consulting fees incurred in connection therewith.

1. Introduction

The Municipal Separate Storm Sewer System Permit (Permits) for Los Angeles County[1] and the City of Long Beach[2] includes optional provisions for a Watershed Management Program (WMP) that allows permittees the flexibility to customize their stormwater programs to achieve compliance with applicable receiving water limitations (RWLs) and water quality based effluent limitations (WQBELs) through implementation of control measures. A key element of each WMP is the Reasonable Assurance Analysis (RAA), which is used to demonstrate "that the activities and control measures…will achieve applicable WQBELs and/or RWLs with compliance deadlines during the Permit term" (NPDES Permit Order No. R4-2012-0175, Section C.5.b.iv.[5], page 64; NPDES Permit Order No. R4-2014-0024, Section C.5.h.vii.[2]). This report presents the Reasonable Assurance Analysis (RAA) for the Lower Los Angeles River (LLAR), Los Cerritos Channel (LCC), and Lower San Gabriel River (LSGR) WMPs.

While the Permits prescribe the RAA as a quantitative demonstration that control measures (best management practices [BMPs]) will be effective, the RAA also promotes a modeling process to identify and prioritize potential control measures to be implemented by the WMP. In other words, the RAA not only demonstrates the cumulative effectiveness of BMPs to be implemented, it also supports their *selection*. Furthermore, the RAA incorporates the applicable compliance dates and milestones for attainment of the WQBELs and RWLs, and therefore supports BMP scheduling.

On March 25, 2014, the Los Angeles Regional Water Quality Control Board (Regional Board) issued "RAA Guidelines" (LARWQCB 2014) to provide information and guidance to assist permittees in development of the RAA. The approach herein is consistent with the RAA Guidelines.

This report is organized in nine sections, as follows:

- Section 1: Introduction
- Section 2: Applicable Interim and Final Requirements
- Section 3: Modeling System to be used for the RAA
- Section 4: Current/Baseline Pollutant Loading
- Section 5: Estimated Required Pollutant Reductions
- Section 6: Determination of BMP Capacity for RAA
- Section 7: Cumulative Volume Reduction Goals to Achieve Required Reductions
- Section 8: Pollutant Reduction Plan
- Section 9: References

[2] National Pollutant Discharge Elimination System Permit Order No. R4-2014-0024

2. Applicable Interim and Final Requirements

The WMPs for LLAR, LCC, and LSGR follow the process in the Permits and identify the Water Quality Priorities (WQ Priorities) including the highest (Category 1) Water Quality Priorities which are subject to Total Maximum Daily Loads (TMDLs) and WQBELs. Practically all of these TMDLs include associated compliance schedules that are considered in this RAA. The TMDL and WMP milestones/compliance dates establish the pace at which BMPs must be implemented. Traditionally, the approach of TMDL implementation plans has been focused on *final* TMDL compliance, whereas the Permit compliance paths offered to WMPs increase emphasis on *milestones*. In line with the RAA Guidelines, for all final TMDL and TMDL/WMP milestones that occur in the next two Permit cycles, the combination of BMPs expected to result in attainment of the corresponding Permit limits are identified.

The TMDL milestones for the LLAR, LCC, and LSGR WMP areas are shown in Table 2-2 through Table 2-4. The Permits require each WMP to provide reasonable assurance for the TMDL milestones that occur in the current Permit term. If applicable TMDLs do not prescribe a milestone in the current Permits, a milestone must be established. The array of TMDLs creates a potentially complicated sequence based on multiple pollutants, and thus this RAA includes a limiting pollutant analysis. As described in Section 5, the identified limiting pollutant for wet weather is zinc for LLAR, LCC, and LSGR. As such, the wet weather milestones for the Los Angeles River, Los Cerritos Channel, and San Gabriel River Metals TMDLs establish the pace of stormwater BMP implementation. The wet weather milestones established for the current Permits include the following:

- **Lower Los Angeles River:** Achieve 31% of the required reduction by September 30, 2017. This milestone was created for the WMP, as the metals TMDL includes a 25% milestone in 2012 (prior to the current Permit term) and a 50% milestone in 2024 (beyond the current Permit term). Achievement of this milestone for zinc provides reasonable assurance of achieving a similar or greater reduction for other WQ Priorities.
- **Los Cerritos Channel:** Achieve 10% of the required reduction[3] by September 30, 2017. This milestone is directly from the metals TMDL. Achievement of this milestone for zinc provides reasonable assurance of achieving a similar or greater reduction for other WQ Priorities.
- **Lower San Gabriel River:** Achieve 10% of the required reduction by September 30, 2017. This milestone is directly from the metals TMDL. Achievement of this milestone for zinc provides reasonable assurance of achieving a similar or greater reduction for other WQ Priorities.

The pollutant reduction plan to achieve these milestones is described in Section 8, along with the plan to achieve the milestones for the next Permit term (achieve 35% of the required reduction in LCC and LSGR and achieve 50% of the required reduction in LLAR). A summary of the milestones within the current and next Permit terms and final milestone based on final TMDLs are summarized in Table 2-1. The required reductions that form the basis of the milestones are calculated in Section 5.

[3] The interim milestones are expressed in terms of the *required* reduction not total reduction (e.g., if the required reduction to attain final limits is 50%, then the 10% milestone equates to a 5% reduction). These reductions are calculated in Section 5.

Table 2-1. Summary of schedule for interim and final milestones

WMP Area	Milestone 1 (2017)	Milestone 2 (interim date of applicable metals TMDL)	Milestone 3 (final date of applicable metals TMDL)
LLAR	31%	50%	100%
LCC	10%	35%	100%
LSGR	10%	35%	100%

Table 2-2. Schedule of TMDL milestones for the Lower LA River

TMDL	Constituents	Compliance Goal	Weather Condition	Compliance Dates and Compliance Milestone (Bolded numbers indicated milestone deadlines within the current Permit term)[1]									
				2012	**2013**	**2014**	**2015**	**2016**	2020	2024	2028	2032	2037
LAR Nutrients	Ammonia-N, Nitrate-N, Nitrite-N, Nitrate-N+Nitrite-N	Meet WQBELs	All	Pre 2012									
				Final									
LAR Trash	Trash	% Reduction	All	9/30	9/30	9/30	9/30	9/30					
				70%	80%	**90%**	**96.70%**	**100%**					
LAR Metals	Copper, Lead	% of MS4 area Meets WQBELs	Dry	1/11					1/11	1/11			
				50%					75%	100%			
	Copper, Lead, Zinc, Cadmium	% of MS4 area Meets WQBELs	Wet	1/11						1/11	1/11		
				25%						50%	100%		
LA River Bacteria	*E. coli*	Meet WQBELs	Wet and Dry[2]										3/23
													Final
Dominguez Channel and LA/LB Harbors Toxics	Sediment: DDTs, PCBs, Copper, Lead, Zinc, PAHs	Meet WQBELs	All	12/28								3/23	
				Interim								Final	
Long Beach City Beaches and LAR Estuary Bacteria	Total Coliform, Fecal Coliform, Enterococcus	Meet WLAs	All	USEPA TMDLs, which do not contain interim milestones or implementation schedule. The Permits allow MS4 Permittees to propose a schedule in a WMP.									

[1] The Permit term is assumed to be five years from the Los Angeles County Permit effective date or December 27, 2017.

[2] The schedule for attaining the dry weather Bacteria TMDL is not shown in Table 3-2, which is stepwise by reach/segment and depends on whether a Load Reduction Strategy is developed for implementation.

Table 2-3. Schedule of TMDL milestones for Los Cerritos Channel WMP

TMDL	Constituents	Compliance Goal	Weather Condition	Compliance Dates and Compliance Milestone (Bolded numbers indicated milestone deadlines within the current Permit term) [1]									
				2012	**2013**	**2014**	**2015**	**2016**	2017	2020	2023	2026	2032
Los Cerritos Channel Metals	Copper	% Load Reduction or % of MS4 area Meets WQBELs	Dry						9/30	9/30			
									30%	70%	100%		
	Copper, Lead, Zinc	% Load Reduction or % of MS4 area Meets WQBELs	Wet						9/30	9/30			
									10%	35%	70%	100%	
Dominguez Channel and LA/LB Harbors Toxics	Sediment: DDTs, PCBs, Copper, Lead, Zinc, PAHs	Meet WQBELs	All	12/28									3/23
				Interim									Final

[1] The Permit term is assumed to be five years from the Los Angeles County Permit effective date or December 27, 2017.

Table 2-4. Schedule of TMDL milestones for the Lower San Gabriel River WMP

TMDL	Constituents	Compliance Goal	Weather Condition	Compliance Dates and Compliance Milestone (Bolded numbers indicated milestone deadlines within the current Permit term) [1]									
				2012	**2013**	**2014**	**2015**	**2016**	2017	2020	2023	2026	2032
San Gabriel River Metals	Copper, Selenium	% Load Reduction <u>or</u> % of MS4 area Meets WQBELs	Dry						9/30	9/30			
									30%	70%	100%		
	Copper, Lead, Zinc	% Load Reduction <u>or</u> % of MS4 area Meets WQBELs	Wet						9/30	9/30			
									10%	35%	70%	100%	
Dominguez Channel and LA/LB Harbors Toxics	Sediment: DDTs, PCBs, Copper, Lead, Zinc, PAHs	Meet WQBELs	All	12/28									3/23
				Interim									Final

[1] The Permit term is assumed to be five years from the Los Angeles County Permit effective date or December 27, 2017.

3. Modeling System used for the RAA

The Watershed Management Modeling System (WMMS) was used to develop this RAA. WMMS is specified in the Permits as a potential tool to conduct the RAA. The Los Angeles County Flood Control District (LACFCD), through a joint effort with U.S. Environmental Protection Agency (USEPA), developed WMMS specifically to support informed decisions associated with managing stormwater. The ultimate goal of WMMS is to identify cost-effective water quality improvement projects through an integrated, watershed-based approach. The WMMS encompasses Los Angeles County's coastal watersheds of approximately 3,100 square miles, representing 2,566 subwatersheds (Figure 3-1). As described in the following subsections, WMMS is a modeling system that incorporates three tools: (1) the watershed model for prediction of long-term hydrology and pollutant loading, (2) a BMP model, and (3) a BMP optimization tool to support regional, cost-effective planning efforts. A version of WMMS is available for public download from LACFCD.

The version of WMMS to be used for the RAA in the LLAR, LLC, and LSGR WMPs is customized from the public download version, including the following modification/enhancements:

- Updates to meteorological records to represent the last 10 years (per the RAA Guidelines) and to allow for simulation of the design storm;
- Calibration adjustments to incorporate the most recent 10 years of water quality data collected at the nearby mass emission station;
- Application of a second-tier of BMP optimization using System for Urban Stormwater Treatment and Analysis INtegration (SUSTAIN), which replaces the Nonlinearity-Interval Mapping Scheme (NIMS) component of WMMS.
- Optimization of BMP effectiveness for removal of bacteria pollutants (rather than metals only); and
- Updates to Geographic Information System (GIS) layers, as available.

The subwatersheds in the LLAR, LLC, and LSGR WMP areas that are represented by WMMS are shown in Figure 3-2 through Figure 3-4, which include modifications to confine to jurisdictional boundaries included in these WMP areas. Also shown are the "RAA assessment points", which are used to calculate required load reductions (described in Section 5).

3.1. Watershed Model - LSPC

The watershed model included within WMMS is the Loading Simulation Program C++ (LSPC) (Shen et al. 2004; Tetra Tech and USEPA 2002; USEPA 2003). LSPC is a watershed modeling system for simulating watershed hydrology, erosion, and water quality processes, as well as in-stream transport processes. LSPC also integrates a geographic information system (GIS), comprehensive data storage and management capabilities, and a data analysis/post-processing system into a convenient PC-based Windows environment. The algorithms of LSPC are identical to a subset of those in the Hydrologic Simulation Program–FORTRAN (HSPF) model with selected additions, such as algorithms to dynamically address land use change over time. Another advantage of LSPC is that there is no inherent limit to the size and resolution of the model than can be developed, making it an attractive option for modeling the Los Angeles region watersheds. USEPA's Office of Research and Development (Athens, Georgia) first made LSPC available as a component of USEPA's National TMDL Toolbox (http://www.epa.gov/athens/wwqtsc/index.html). LSPC has been further enhanced with expanded capabilities since its original public release.

The WMMS development effort culminated in a comprehensive watershed model of the Los Angeles County Flood Control District that includes the unique hydrology and hydraulics of the system and characterization of water quality loading, fate, and transport for all the key TMDL constituents (LACDPW 2010a, 2010b). Since the original development of the WMMS LSPC model, Los Angeles County personnel have independently updated the model with meteorological data through April 2012.

To support the objectives of the WMPs, jurisdictional boundaries were also intersected with the WMMS LSPC model subwatersheds resulting in a finer resolution spatial unit for modeling. Model land use was then resampled using this subwatershed-jurisdiction intersect, properly distributing land use categories at the jurisdictional level for attributing sources, while maintaining hydrologic connectivity within the watershed model. This refinement introduced a new layer of resolution, facilitating the rollup of modeled results by jurisdiction to better support source attribution and implementation responsibilities among the participating entities.

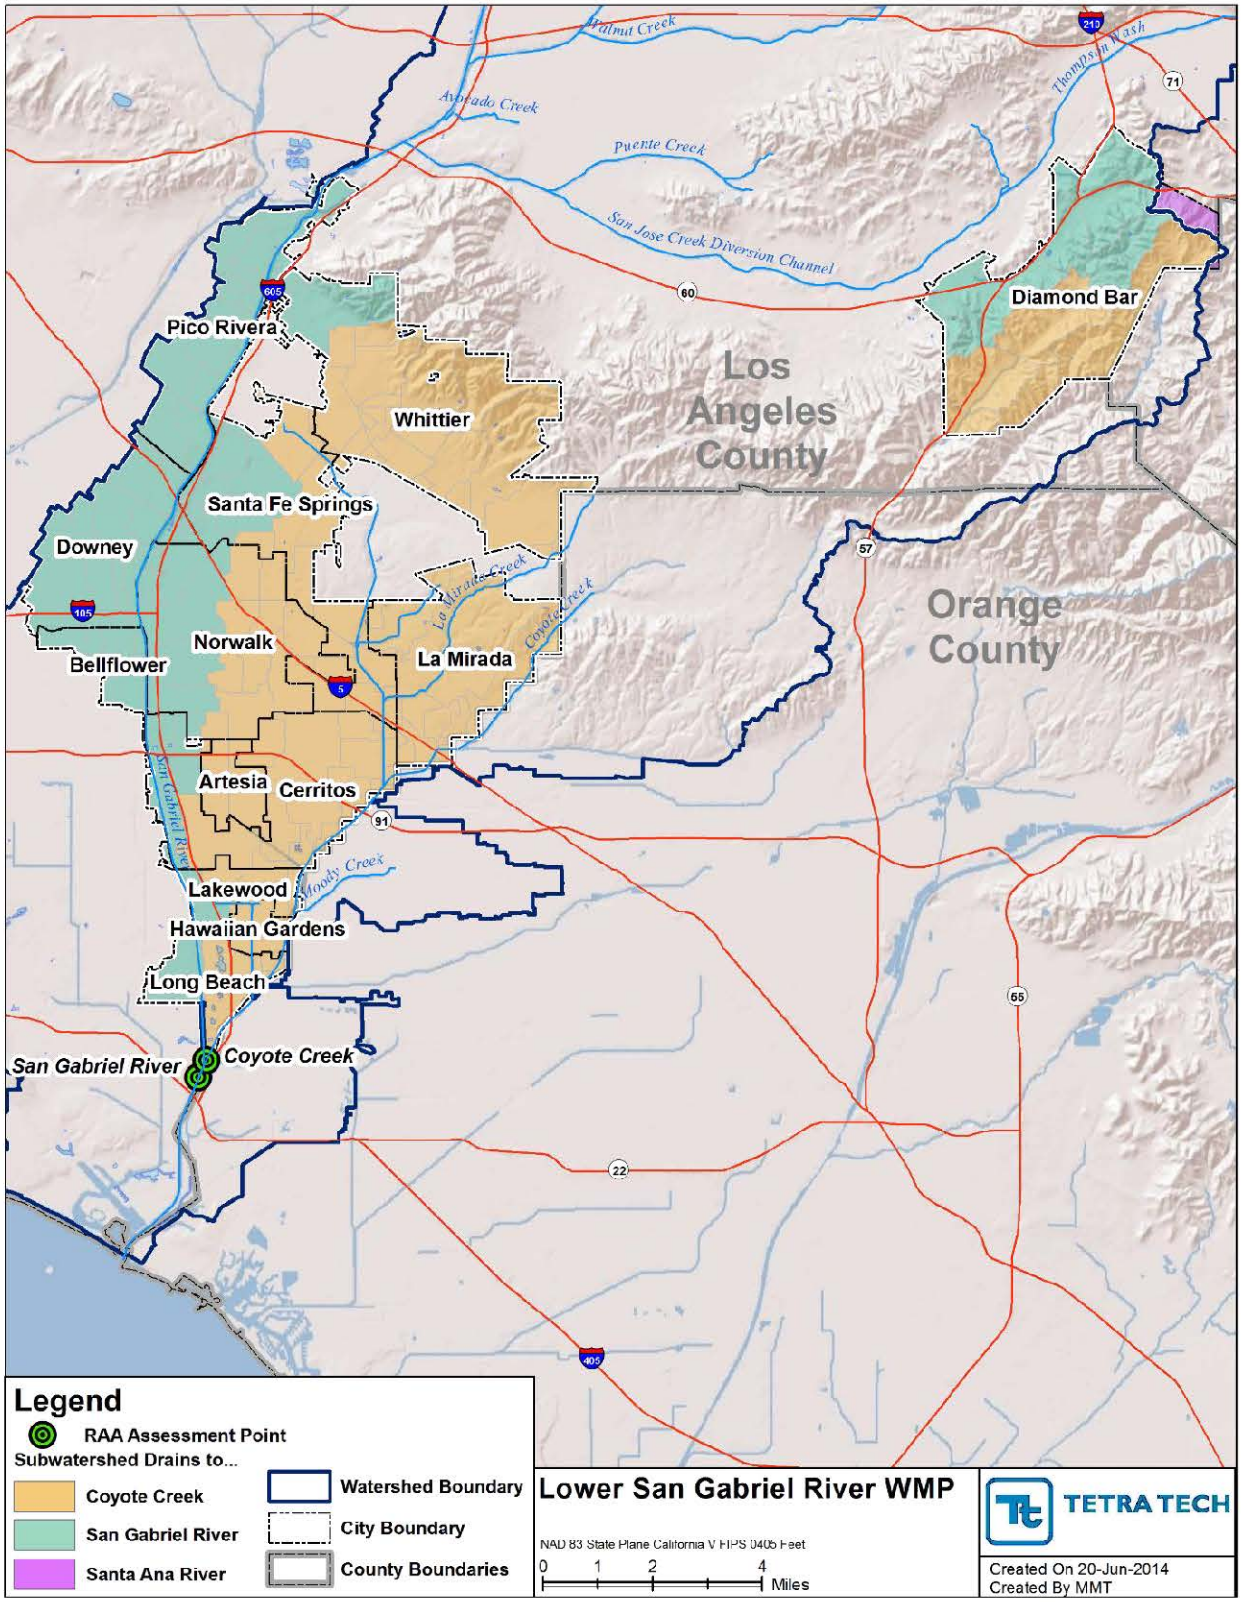

Figure 3-4. Lower San Gabriel River WMP Area subwatersheds represented by WMMS

3.2. Small-Scale BMP Model – SUSTAIN

The System for Urban Stormwater Treatment and Analysis INtegration (SUSTAIN) was developed by USEPA to support practitioners in developing cost-effective management plans for municipal storm water programs and evaluating and selecting BMPs to achieve water resource goals (USEPA, 2009). It was specifically developed as a decision-support system for selection and placement of BMPs at strategic locations in urban watersheds. It includes a process-based continuous simulation BMP module for representing flow and pollutant transport routing through various types of structural BMPs. Users are given the option to select from various algorithms for certain processes (e.g., flow routing, infiltration, etc.) depending on available data, consistency with coupled modeling assumptions, and the level of detail required. Figure 2-3 shows images from the SUSTAIN model user interface and documentation depicting some of the available BMP simulation options in a watershed context.

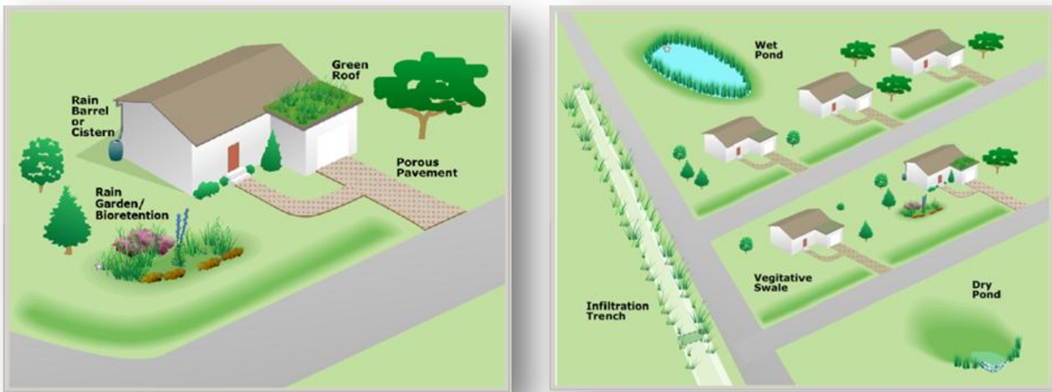

Figure 2-3. SUSTAIN model interface illustrating some available BMPs in watershed settings

SUSTAIN extends the capabilities and functionality of traditionally available models by providing integrated analysis of water quantity, quality, and *cost factors*. The SUSTAIN model in WMMS includes a cost database comprised of typical BMP component cost data from a number of published sources including BMPs constructed and maintained in Los Angeles County. SUSTAIN considers certain BMP properties as "decision variables," meaning that they are permitted to change within a given range during model simulation to support BMP selection and placement optimization. As BMP size changes, so do cost and performance. SUSTAIN runs iteratively to generate a cost-effectiveness curve comprised of optimized BMP combinations within the modeled study area (e.g., the model evaluates the optimal width and depth of certain BMPs to determine the most cost-effective configurations for planning purposes).

3.3. Large-Scale BMP Optimization Tool – NIMS/SUSTAIN

WMMS was specifically designed to dynamically evaluate effectiveness of BMPs implemented in subwatersheds for meeting downstream RWLs while maximizing cost-benefit. WMMS employs optimization based on an algorithm names Nonlinearity-Interval Mapping Scheme (NIMS) to navigate through the many potential scenarios of BMP strategies and identify the strategies that are the most cost effective (Zou et al. 2010). Given the relatively small spatial scale of the WMP area, NIMS was not applied for this study. Instead, a two-tiered approach was applied using the NSGA-II solution technique available in SUSTAIN. For Tier 1, treatment capacities were optimized for each contributing segment, which resulted in unique cost-effectiveness curves for each segment based on available opportunities therein. For Tier 2, the search space was composed of Tier 1 solutions, thereby streamlining the search process. The resulting Tier 2 curve represents the optimal large scale solution because it is comprised of optimized Tier 1 solutions. This approach is especially useful for prioritizing areas for management for scheduling implementation milestones as described in Section 8.

4. Current/Baseline Pollutant Loading

The LSPC model within WMMS was reconfigured and recalibrated specifically for the WMP areas to provide an estimate of current/existing pollutant loads from jurisdictions within the WMPs. Reconfiguration of model subwatersheds was performed to provide specific accounting of loadings from individual jurisdictions. Calibrations were performed to meet specifications of the RAA Guidelines (LARWQCB 2014).

4.1. Model Calibration to Existing Conditions

The LSPC watershed model was originally calibrated for hydrology using a regional approach relying on USGS observed daily streamflow datasets through Water Year (WY) 2006 (LACDPW 2010a). Water Quality was then calibrated using small-scale, land use level water quality monitoring data to develop representative event mean concentrations by land use (LACDPW 2010b). Model performance was also validated at the mass emissions monitoring stations in the context of a county-wide modeling effort. The calibration period for the original WMMS LSPC model began in 1996 and ended in 2006. For the RAA, an analysis was performed to evaluate performance of the LSPC model as it relates to the LLAR, LCC, and LSGR watersheds to understand and benchmark its applicability for use as a baseline condition. The evaluation of monitoring data was extended beyond the original WMMS-LSPC calibration to include the period from 10/1/2001 through 9/30/2011 incorporating both the average year (WY 2008) and 90th percentile (WY 2003) year.

Data available for the LACDPW water quality and hydrologic monitoring stations, S10 and F319 were used to reexamine simulated water quality and hydrology conditions in LA River. The two stations are co-located just south of the West Wardlow Road overpass and drain approximately 800 square miles, or nearly the entire LA River watershed. The monitoring stations were selected for comparison due to their location near the outlet of the LA River watershed, which encompasses the aggregate contributions of all upstream pollutant sources. The selected flow gage, F319, was also used to calibrate the WMMS LSPC model and, therefore, links the current and previous efforts. Water quality and hydrologic records for WYs 2003–2011 were compared to the simulated watershed model output to determine the necessary model parameter adjustments to establish an up-to-date model calibration. The locations of these two gages are presented in Figure 4-1. Statistical summaries and flow regime analysis of the water quality monitoring datasets from the Los Angeles River mass emission station S10 are presented in Attachment E.

Watershed model simulation of existing water quality conditions for the LCC watershed were evaluated for WYs 2003–2011 using data collected at the City of Long Beach Stearns Street monitoring location, just north of interstate 405. The water quality monitoring location is positioned at the WMP hydrologic outlet and captures the cumulative watershed loading effects impacting water quality conditions in this 27 square mile portion of the LCC watershed. No flow monitoring data are available in the watershed, thus simulated flow conditions could not be evaluated against observed data for LCC. The location of the water quality monitoring is presented in Figure 4-1 below and statistical summaries of the monitoring dataset are presented in Attachment E.

For the LSGR, hydrology was re-assessed at two monitoring locations using available data from WYs 2001-2011 The two monitoring locations selected include USGS 11087020 San Gabriel River at Whittier Narrows Dam CA and the LACDPW streamflow gage F354 located along Coyote Creek south of Spring Street (coincident with mass emission station S13). The USGS gage was selected for continuity with the development and calibration of the original WMMS LSPC modeling system. The primary monitoring location selected to calibrate water quality for LSGR was the LA County mass emission station S14. The San Gabriel River Monitoring Station is located below San Gabriel River Parkway in Pico Rivera. At this location the upstream tributary area is 450 square miles (LACDPW 2013). A second mass emission station, the Coyote Creek Monitoring Station (S13) located below Spring Street in the lower San Gabriel River watershed was also used to validate the water quality calibration. The locations of these two gages are presented below in Figure 4-1. Statistical summaries and flow regime analysis of the water quality monitoring datasets from the San Gabriel River and Coyote Creek mass emission stations S14 and S13 are presented in Attachment E.

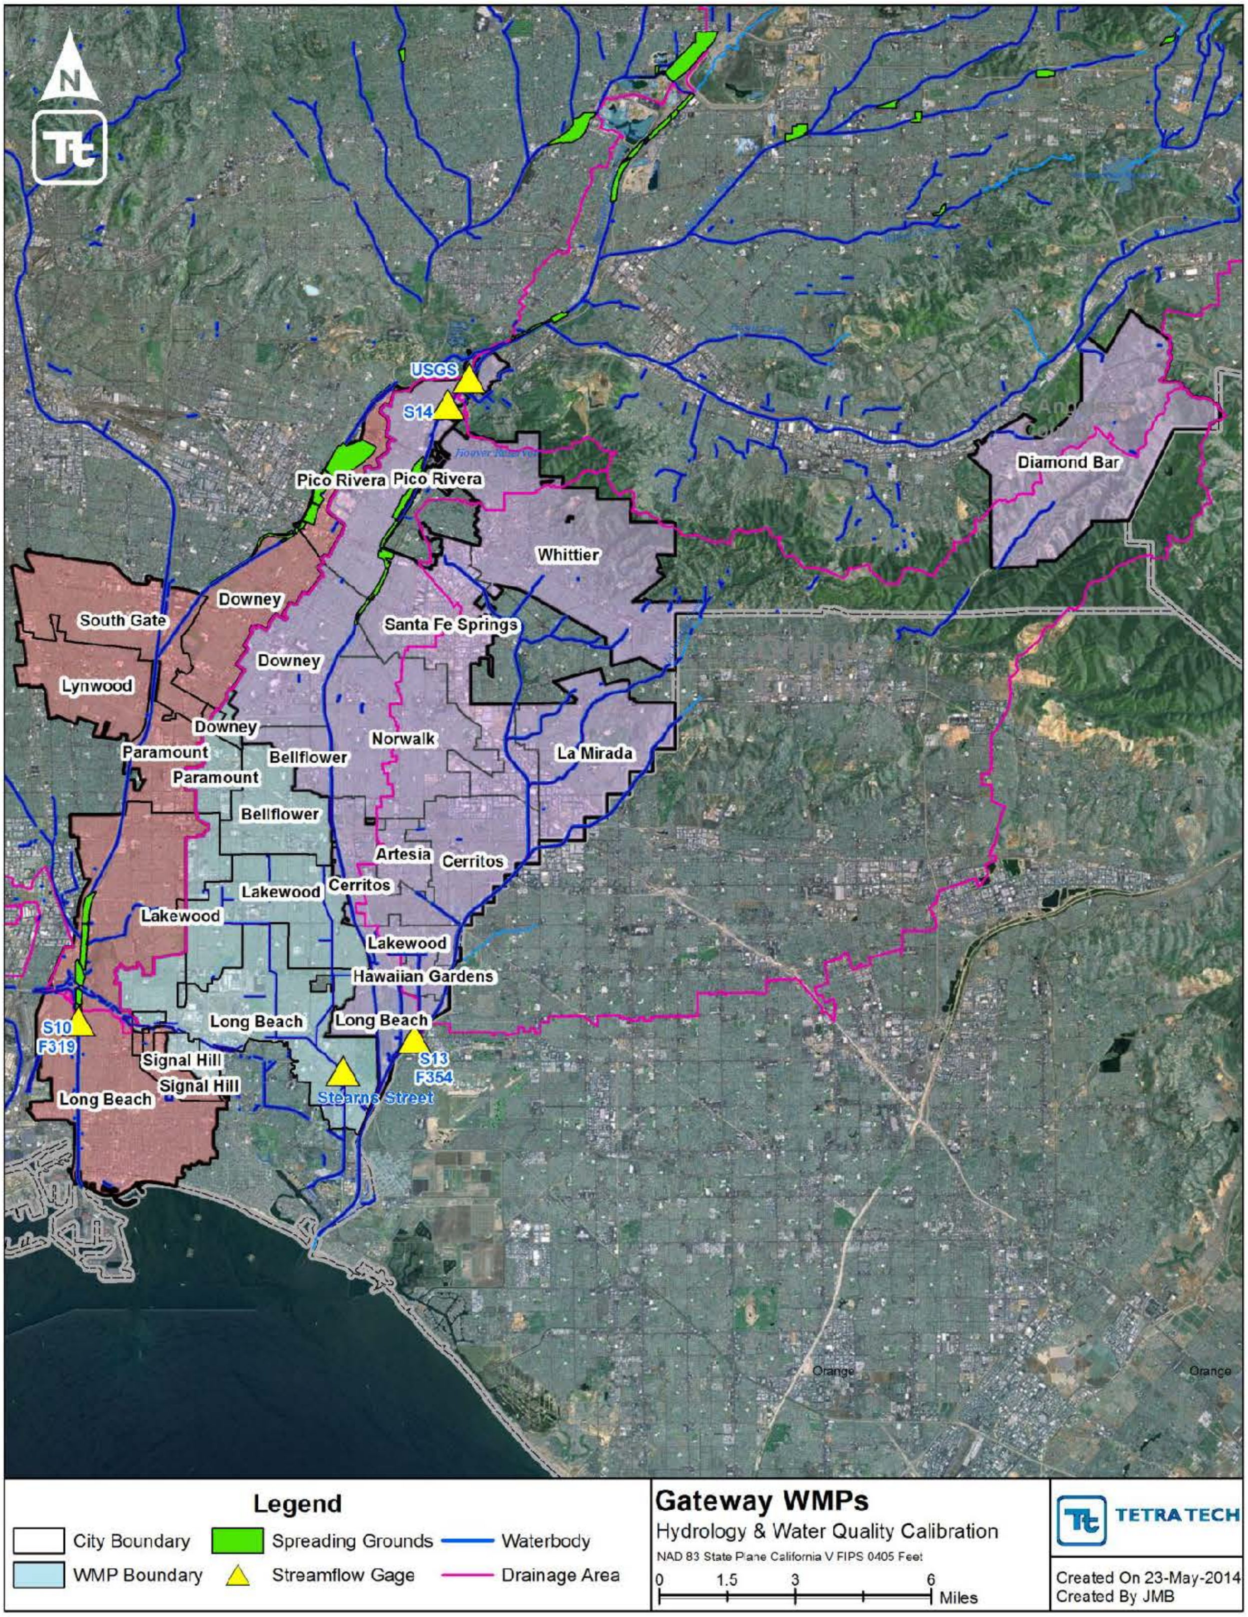

Figure 4-1. WMP groups hydrology and water quality calibration sites.

To demonstrate the ability to predict the effect of watershed processes and management actions, model calibration and validation are necessary and critical steps in any model application. Acceptable model calibration criteria for

benchmarking an RAA were developed by the Regional Board and are listed below in Table 4-1 (LARWQCB 2014). The objectives of establishing model assessment criteria are to ensure the calibrated model reflects all the model conditions and properly utilizes the available modeling parameters, thus yielding meaningful results. The lower bound of "Fair" level of agreement listed in Table 4-1 is considered a target tolerance for the model calibration process.

Table 4-1. Model assessment criteria from the RAA Guidelines

Constituent Group	Percent Difference Between Modeled and Observed		
	Very Good	Good	Fair
Hydrology / Flow	0 – 10	>10 – 15	>15 – 25
Sediment	0 – 20	>20 – 30	>30 – 40
Water Quality	0 – 15	>15 – 25	>25 – 35
Pesticides / Toxics	0 – 20	>20 – 30	>30 – 40

4.1.1. Hydrology Calibration

Table 4-2 and Table 4-3 present the hydrology calibration assessment for the Lower Los Angeles River and Lower San Gabriel River gages, respectively. Nash-Sutcliffe efficiency is a correlation coefficient commonly used in hydrological modeling to measure how well a model predicts temporal variation. A value of 1.0 means a perfect match between modeled and observed. A value of 0 means that the computed mean of observed data is as good a predictor as the model. A negative value means that the data-mean is a better predictor than the model. Because the Regional Board guidance only required annual average flow volume metric, evaluating Nash-Sutcliffe helped to demonstrate that the model also performed well at predicting *intra-annual* flow variablilty.

Table 4-2. Summary of model hydrology calibration performance for Lower Los Angeles River

Water Quality Parameter	Model Period	Hydrology Parameter	Modeled vs. Observed Volume (% Error)	Regional Board Guidance Assessment
In-stream flow at Los Angeles River below Wardlow Road (LA DPW F319)	10/1/2002 – 9/30/2011	Flow Volume	8.72	Very Good
		Nash-Sutcliffe	0.680	n/a

Table 4-3. Summary of model hydrology calibration performance for Lower San Gabriel River

Water Quality Parameter	Model Period	Hydrology Parameter	Modeled vs. Observed Volume (% Error)	Regional Board Guidance Assessment
In-stream flow at SAN GABRIEL R AB WHITTIER NARROWS DAM CA (USGS 1108702)	10/1/2001 – 9/30/2011	Flow Volume	-3.31	Very Good
		Nash-Sutcliffe	0.64	n/a
Coyote Creek near Spring Street (LA DPW F354)	10/1/2003 – 9/30/2011	Flow Volume	-6.17	Very Good
		Nash-Sutcliffe	0.62	n/a

4.1.2. Water Quality Calibration

Water quality calibration for the LLAR, LCC, and LSGR incorporated sampling from LA County mass emission stations at S10 (LA River), Strearns Street (LCC), and S13 and S14 along Coyote Creek and the San Gabriel River, respectively. The updated observed concentration data collected at these sites were used to refine the calibration and benchmark model performance. Daily observed loads were calculated by multiplying observed concentration and daily observed flow. Daily loads were estimated for LCC using simulated flows due to the lack of observed data. The percent error between this daily observed load and the daily modeled load was then calculated for each constituent. The results of this evaluation at the two gages are presented in Table 4-4 through Table 4-7.

Table 4-4. Summary of model performance by constituent at the Los Angeles River (S10) monitoring location

Water Quality Parameter	Sample Count	Modeled vs. Observed Load (% Error)	Regional Board Guidance Assessment
Total Sediment	91	-6.8	Very Good
Total Copper	58	-3.4	Very Good
Total Zinc	58	-18.1	Good
Total Lead	52	-0.1	Very Good
Fecal Coliform	57	-5.1	Very Good
Total Nitrogen	58	-4.0	Very Good
Total Phosphorous	57	6.9	Very Good

Table 4-5. Summary of model performance by constituent at Los Cerritos Channel (Stearns St.) monitoring location

Water Quality Parameter	Sample Count	Modeled vs. Observed Load (% Error)	Regional Board Guidance Assessment
Total Sediment	85	2.7	Very Good
Total Copper	57	-2.1	Very Good
Total Zinc	56	1.5	Very Good
Total Lead	57	2.2	Very Good
Fecal Coliform	55	1.0	Very Good
Total Nitrogen	56	17.5	Good
Total Phosphorous	56	-0.4	Very Good

Table 4-6. Summary of model performance by constituent at the San Gabriel River (S14) monitoring location

Water Quality Parameter	Sample Count	Modeled vs. Observed Load (% Error)	Regional Board Guidance Assessment
Total Sediment	45	8.57	Very Good
Total Copper	42	-9	Very Good
Total Zinc	44	16.1	Very Good
Total Lead	44	-3.97	Very Good
Fecal Coliform	43	1.85	Very Good
Total Nitrogen	*Not evaluated at this location*		
Total Phosphorous	44	-2.27	Very Good

Table 4-7. Summary of model performance by constituent at the Coyote Creek (S13) monitoring location

Water Quality Parameter	Sample Count	Modeled vs. Observed Load (% Error)	Regional Board Guidance Assessment
Total Sediment	42	1.28	Very Good
Total Copper	27	-28.9	Fair
Total Zinc	27	-32.44	Fair
Total Lead	25	-1.58	Very Good
Fecal Coliform	24	-34.48	Fair
Total Nitrogen	*Not evaluated at this location*		
Total Phosphorous			

Two fecal coliform samples were removed from the observed dataset at the San Gabriel River S14 mass emission station prior to performing the load calculation. These two samples appear to be outliers in the dataset with concentration values 10-100x greater than the remaining samples. These observations occurred on 10/17/2005 and 10/13/2009.

For pollutants not explicitly represented in the WMMS LSPC model, and for dry weather analysis, 90th percentile concentrations were calculated based on observed monitoring data at the LACDPW mass emission sites. The 90th percentile concentration was used for compliance with the Regional Board RAA guidelines (LARWQCB 2014). A summary of the 90th percentile concentrations for each constituent and waterbody are presented below in Table 4-8. For subsequent load reduction analyses, these concentrations were assumed for all wet or dry weather conditions they were assigned to represent existing conditions within their respective watersheds.

Table 4-8. 90th percentile concentrations assumed for non-modeled pollutants

Waterbody	Pollutant	Wet Weather	Dry Weather	90th Percentile Concentration	Units
Los Angeles River (S10)	DDT	●		0.005[1]	ug/L
	PCBs	●		0.0325[1]	ug/L
	PAHs	●		0.835[1]	ug/L
	Cadmium	●		4.8	ug/l
	Copper		●	25.68	ug/l
	Lead		●	3.43	ug/l
	E. coli		●	19,600	MPN/100 mL
Los Cerritos Channel (Stearns)	DDT	●		0.005[1]	ug/L
	PCBs	●		0.0325[1]	ug/L
	PAHs	●		0.835[1]	ug/L
	Copper		●	25.4	ug/l
	E. coli		●	14,200	MPN/100 mL
San Gabriel River (S14)	DDT	●		0.005[1]	ug/L
	PCBs	●		0.0325[1]	ug/L
	PAHs	●		0.835[1]	ug/L
	Copper		●	29.89	ug/l
	Selenium		●	4.77	ug/l
	E. coli		●	2,190	MPN/100 mL
Coyote Creek (S13)	DDT	●		0.005[1]	ug/L
	PCBs	●		0.0325[1]	ug/L
	PAHs	●		0.835[1]	ug/L
	Copper		●	28.54	ug/l
	E. coli		●	11,500	MPN/100 mL

[1] DDT, PCBs and PAHs were below MDL, so concentrations were assumed half MDL.

4.2. Current Best Management Practices/Minimum Control Measures

It is important to note the model calibration incorporates local stormwater BMPs implemented through late 2012 into the baseline condition. The only BMPs/control devices that were explicitly incorporated into the baseline model were the Dominguez Gap basins. All other BMPs, which individually were assumed to have a small effect on water quality at the watershed scale, are implicitly represented in the baseline condition. BMPs implemented in 2013 can be categorized as WMP implementation measures and their volume/load reductions are a component of the pollutant reduction plan for attaining interim and final milestones.

5. Estimated Required Pollutant Load Reductions

This section provides a description of the process for identifying critical conditions and calculating required load reductions to meet interim and final limitations.

5.1. Selected Average (Interim) and Critical (Final) Conditions

The RAA Guidelines specify that average conditions shall be used to establish load reductions for interim milestones and critical conditions shall be used to establish load reductions for final limits. In addition, the Permits provide two pathways for addressing WQ Priorities (see Figure 5-1):

- Volume-based: Retain the standard runoff volume from the 85th percentile, 24-hour storm
- Load-based: Achieve the necessary pollutant load reductions to attain Permit limits

Both types of numeric goals were evaluated as part of this RAA.

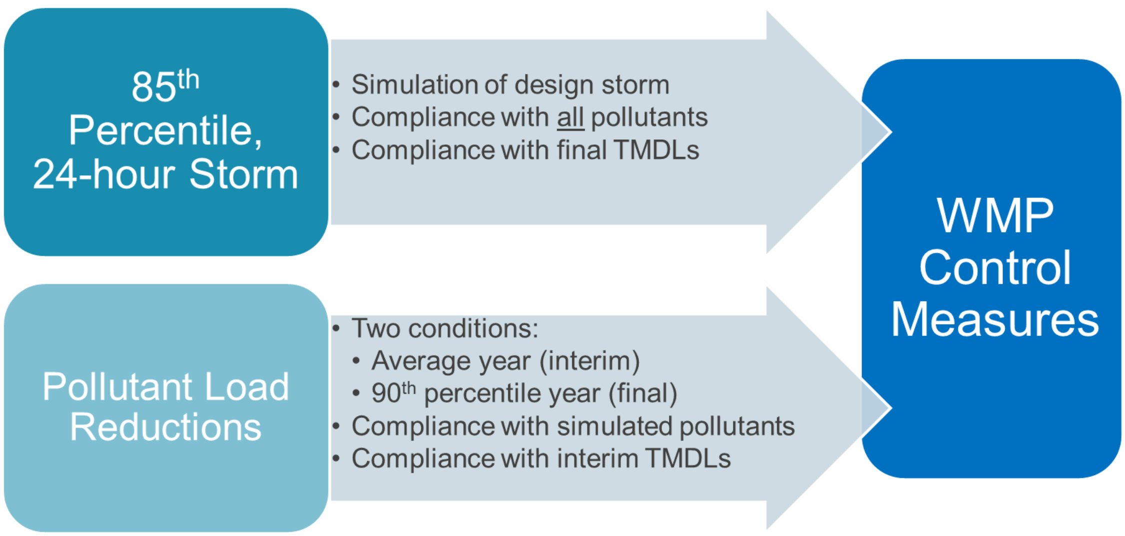

Figure 5-1. Two Types of Numeric Goals and WMP Compliance Paths according to the Permits

5.2. Representative Conditions for Wet Weather

Two approaches were considered and ultimately used in the RAA to represent wet weather critical conditions: the 90th percentile wet year and 85th percentile, 24-hour (design) storm, as described in the following subsections.

5.2.1. Average and 90th Percentile Wet Years

This RAA is based on continuous simulation, and a "representative" year-long time period was selected to represent average and critical conditions, which allows the modeling to capture the variability of rainfall and storm sizes/conditions. For LLAR, LCC, and LSGR, WY2008 was selected as the representative year for average conditions and WY2003 was selected as the representative year for the 90th percentile critical wet conditions.

To select these average and critical years for the RAA, the following steps were taken:

1. **Calculated key rainfall metrics for the last 25-years:** the average and critical years were identified by aggregating data from available rain gages across the entire Los Angeles River and San Gabriel River watersheds (LCC is in between, so the analysis for LLAR and LSGR also applies to LLC). For

comparison, other regional watersheds were also analyzed and presented. The two key metrics evaluated were: (1) total annual rainfall, and (2) average rainfall per wet day (with wet days defined as days with rainfall totals greater than 0.1 inches). The first is clearly an indicator of volume, while the second is an indicator of rainfall intensity. To evaluate long-term conditions, the analysis covered 25 water years (WY) from 1987 through 2011—the total rainfall for each precipitation gage was area-weighted and aggregated into annual totals by water year (i.e. previous October through current September).

2. **Selected years from the most recent 10-years that are most representative of average and 90th percentile**: per the RAA Guidelines, the most recent 10-year period represented in the available data were used to develop the RAA. Table 5-1 and Table 5-2 show average rainfall volumes and intensities (inches per wet day), respectively, for the most recent 10 years compared against the entire 25-years. Both the average and 90th percentile values were compared across the 10- and 25-year records. For the San Gabriel River, 2007-08 is a representative average year based on both the rainfall volume (Table 5-1) and intensity (Table 5-2) metrics. Because BMP performance is typically intensity-dependent, average rainfall per wet day (Table 5-2) was selected as a better metric for use in determining the 90th percentile than annual average rainfall (Table 5-1), which led to selection of 2002-03 as the critical year.

It should be noted that wet weather conditions were also reflective on the definition of dry/wet days. As described in Section 5, for analysis of non-bacteria pollutants (including the limiting pollutant zinc) days with greater than 90th percentile daily average flow were flagged as "wet," which aligns with the critical condition used for the LAR and LSGR metals TMDLs.

5.2.2. 85th Percentile, 24-hour Storm

The design storm is identified in the RAA Guidelines as an acceptable critical condition, and capture of design storm volumes by BMPs is a specified compliance metric in the Permits for TMDLs. The design storm was evaluated and used as a wet weather critical condition for the RAA. As described above, the design storm is a volume-based standard. Each subwatershed within each WMP area has a unique 85th percentile runoff volume, due to varying rainfall amounts and land characteristics (imperviousness, soils, slope, and the like). The rainfall depths associated with the 85th percentile, 24-hour storm are shown in Figure 5-2, based on rolling 24-hour intervals for the 25-year period between October 1, 1987 and September 30, 2011. Within the WMP area, the 85th percentile rainfall depth values range between 0.72 and 1.08 inches.

To determine the "standard volume" associated the design storm, initial conditions were set in LSPC to reflect representative conditions at the start of the simulation, along with regionally derived infiltration rates, and 85th percentile rainfall depths were used as rainfall boundary conditions. At each location the storm distribution presented in Figure 5-3 was used to temporally distribute the 24-hour rainfall volumes (LACDPW 2006). The model was then run to predict the associated runoff volumes for each subwatershed in the WMP area. Those runoff volumes represent the volumes that would need to be retained in order to attain the numeric goals associated with the 85th percentile, 24-hour storm.

Shown in Figure 5-4 are the rainfall depths and runoff depths (runoff volume divided by subwatershed area) associated with the design storm for each subwatershed in the WMP areas. About 50 percent of the subwatersheds in all three WMP areas experiences 0.4 inches or more of runoff under the 85th percentile, 24-hour storm, while about 10 percent of the area experiences about 0.55 inches or more of runoff. Figure 5-5 summarizes the total design storm volumes (in acre-feet) for each jurisdiction. The runoff depths for each subwatershed in the WMP area are graphically shown in Figure 5-6, Figure 5-7, and Figure 5-8.

Table 5-1. Average Rainfall Depths (Water Years 2002–2011 vs. 25-year Average and 90th Percentile)

Year	Average Rainfall Totals (in./year)				
	Ballona Creek	Dominguez Channel	Malibu Creek	San Gabriel River	Los Angeles River
2001-02	25.4	19.1	28.1	30.6	30.5
2002-03	17.1	13.9	20.8	23	20.4
2003-04	10.2	8.1	9.2	13.7	11.2
2004-05	39.3	28.4	42.6	49.6	46.7
2005-06	14.1	9.8	16.9	17.9	17.5

5.2.3. Representative Conditions for Dry Weather

Although clearly defined definitions exist for wet periods, definitions for dry periods are less clearly defined. Wet weather periods are either defined in terms of rainfall or instream flow. For bacteria, a wet day is one with a rainfall total greater than 0.1 inches plus the three subsequent days, while metals criteria define wet days as those with instream flow above the 90th percentile. One seemingly intuitive way of defining a dry period is simply to use the "non-wet" days represented as the inverse of wet days. However, summary of model results indicate some residual influence of wet weather among the "non-wet" days. This presents some challenges for estimating loads and evaluating dry weather compliance because BMP planning would be better served by choosing design conditions that are more influenced by natural background baseflow and/or anthropogenic activities such as point source discharges or dry weather runoff from irrigation (instead of post-rain event interflow).

The RAA Guidelines recommend using the most recent 10 years of data for modeling scenarios to ensure that the plans are based on a representative range of wet and dry conditions. Regional precipitation and instream flow patterns are highly variable; therefore, a representative dry period is one that consistently represents minimal influence to wet weather conditions. To identify a representative dry period, the analysis covered 25 WYs from 1987 through 2011. The following steps were taken:

1. The total rainfall for each precipitation gage in the study area was summarized and classified into wet and non-wet periods according to the bacteria criteria definition for wet weather (i.e. days with rainfall > 0.1 inches plus the three subsequent days).
2. Dry periods were evaluated on a monthly time scale. Table 5-3 shows the average number of consecutive 30-day dry periods, counted by month of the associated mid-interval date, for each of the rainfall gages within the three WMP areas over the 25 years of rainfall evaluated. The color-ramp indicates relative dryness, with red being driest. Table 5-3 indicates that on average, the months of June, July, and August are the driest months in the year, averaging 24-30 consecutive dry intervals. Note that because this table counts mid-interval dates by month, values approaching 30 actually indicate continuous dry intervals approaching 60 days (15 days on either side of the 30 day interval).
3. Select periods within the average and critical year were identified for dry weather simulations. The areal coverage or non-wet intervals in the two selected representative years (2008 and 2003) were compared against the 10-year period (2001-2011) and the long-term 25-year period (1998-2011). Figure 5-9, Figure 5-10, and Figure 5-11 show the selected representative dry period against summaries of non-wet weather conditions in the LLAR, LCC, and LSGR WMP areas, respectively. Within the two selected years, the 45-day period between 8/17 and 9/30 was found to be the most representative of dry weather conditions because (1) no rainfall occurred at any of the gages throughout all three WMP areas, (2) it was during a time of the year that was historically shown to experience the least amount of spatially-weighted rainfall in a year, and (3) it was late in the summer following an extended period of no rainfall for both 2003 and 2008.

The identified periods between 8/17 and 9/20 during the average and critical years were used for subsequent dry weather simulations for the dry weather component of the RAA.

Table 5-3. Consecutive 30-day Dry Periods per month by WMP and rainfall gage (10/1/1987 – 9/30/2011)

WMP	StaID	Average Number of Consecutive 30-Day Dry Intervals Per Month (10/1/1987 – 9/30/2011)

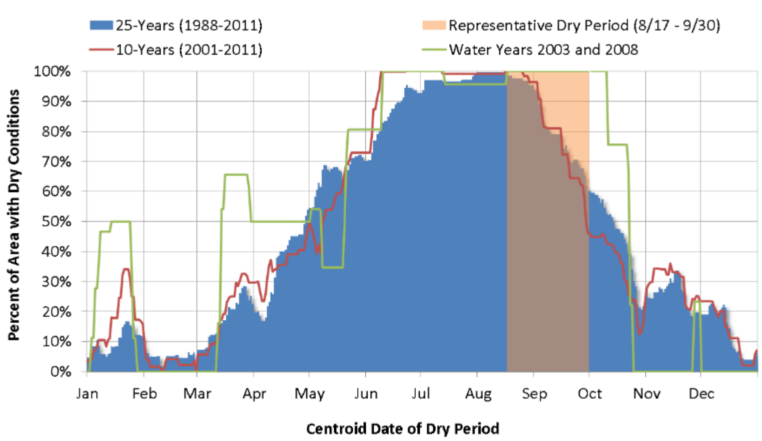

Figure 5-11. Spatiotemporal summary of non-wet weather conditions in the Lower San Gabriel River WMP area.

5.3. Calculated Required Pollutant Reductions to Achieve Final Limits

Using the average storm year (2007-08) and 90th percentile storm year (2002-03), required pollutant reductions were calculated for attainment of interim and final limitations, respectively, applicable to each WMP area. Per the RAA Guidelines, the percent reduction used to determine the control measures necessary to attain interim milestones shall be based on the average year, while the control measures for attainment of the final limits are based on the 90th percentile year.

Required load reductions were evaluated at RAA Assessment Points located at the bottom-most discharge from each WMP areas (shown in Figure 3-2 through Figure 3-4). The RAA Assessment Points represent locations where the collective discharge from each jurisdiction with each WMP area can be assessed to contribute to pollutant loads to the receiving waters. Pollutant loads outside of the WMP areas are not considered in this loading analysis at the RAA Assessment Points, although in reality other loads exist. However, transport of pollutant loads from individual jurisdictions within the WMP areas are considered, including the effect of LACFCD infrastructure and other hydraulic features that can impede flows and associated pollutant loads to the location of the RAA Assessment Points. The result is an accounting system that provides reasonable tracking and estimation of required load reductions throughout each individual WMP area so that meaningful goals can be set for BMP implementation planning.

Applicable targets for wet and dry conditions for Category 1 WQ Priorities (corresponding to the TMDLs within each watershed) are listed in Table 5-4 and Table 5-5, respectively. These targets were used to establish the daily "exceedance load" and daily "allowable load". The differences in these loads, as predicted by LSPC, were tracked across the average year and 90th percentile year and used to calculate the required pollutant reduction. While Category 1 WQ Priorities were emphasized, targets were also applied for Category 2 and Category 3 WQ Priorities. In particular, to provide a comprehensive WMP planning approach, copper, lead, zinc and *E. coli* were assessed for all RAA assessment points (even if a TMDL is not applicable).

For bacteria targets, it should be noted that Allowable Exceedance Days and high flow suspension (HFS) days were incorporated (if applicable) into the percent reduction calculation. The approach of the LA River Bacteria TMDL was used to align Exceedance Days and HFS days. The HFS applies to LLAR and LSGR but not LCC (and thus HFS days were not incorporated into the required reduction calculation for LCC). For LSGR and LCC, a bacteria TMDL has not been adopted but the RAA Guidelines state that targets and critical conditions from other TMDLs in the region should be utilized. If the Allowable Exceedance Days were removed from the percent reduction calculations for LSGR and LCC, the required reductions would increase.

Table 5-4. Applicable wet weather TMDL targets for Category 1 WQ Priorities

WMP Area	Waterbody	Pollutant	Target	Source
LLAR	LAR Reach 1 (freshwater)	Cd kg/d	2.8×10^{-9} X daily storm volume (L) - 1.8	WQBEL
	LAR Reach 1 (freshwater)	Cu kg/d	1.5×10^{-8} X daily storm volume (L) - 9.5	WQBEL
	LAR Reach 1 (freshwater)	Pb kg/d	5.6×10^{-8} X daily storm volume (L) - 3.85	WQBEL

5.3.1. Wet-Weather Required Pollutant Reductions

The wet weather pollutant baseline loading and reduction targets for average and critical conditions are summarized in Table 5-6 and Table 5-7 respetively (all WMP areas) and shown graphically in Figure 5-12 through Figure 5-15 (individual WMP areas). These analyses were used to determine the limiting pollutant. The limiting pollutant is defined as the pollutant requiring the greatest load reduction, and BMPs implemented to achieve the limiting pollutant reductions are protective of other pollutant reductions (e.g., sediment or volume reductions). In Table 5-6. Wet-weather pollutant baseline loading by WMP area with analysis of limiting pollutants

WMP	Year[1]	Organics (kg)				Metals (kg)		Bacteria (Billion #)[1]
		DDT	PCB	PAH	TCu [2]	TPb	TZn [3]	E-Coli
Lower Los Angeles River (LLAR)	2003	0.12	0.77	19.80	2,437	2,464	11,153	2.78E+07
	2008	0.09	0.61	15.59	1,935	1,968	8,878	5.46E+07
Los Cerritos Channel (LCC)	2003	0.07	0.45	11.60	1,611	1,719	7,481	2.55E+08
	2008	0.05	0.35	9.13	505	386	2,607	2.40E+08
Lower San Gabriel River (LSGR)	2003	0.06	0.42	10.80	768	544	3,805	2.06E+06
	2008	0.05	0.33	8.50	393	337	2,512	1.98E+06
Coyote Creek (CC)	2003	0.11	0.71	18.20	1,640	1,197	8,373	6.57E+05
	2008	0.09	0.56	14.33	839	736	5,450	6.72E+06

Color ramps highlight potentially limiting (Red) vs. pollutants determined to be non-limiting for this analysis (Blue)

1. LLAR, LSGR, CC bacteria loads are for bacteria wet-days and exclude high flow suspension (HFS) days.
   LCC bacteria loads are for bacteria wet-days
2. Red box: Organics managed through sediment and associated metals reduction. Organic load reductions above influenced by assigned concentrations at half the MDLs (monitoring data below MDLs), and therefore are suspect and not considered limiting. Cu is not limiting after brake-pad reductions
3. Blue Box: Zinc is limiting pollutant for the 90th percentile year
4. Metals loads are for wet-weather days (90th percentile flow and greater)
5. Organics are summarized on an annual basis

Table 5-7, the red color gradient highlights limiting pollutants, with a deeper red generally indicating a more limiting pollutant. Zinc was identified as the limiting pollutant for each WMP area[4]. The determination of limiting pollutant considered implementation actions to control the pollutant – for example, Senate Bill 346 will result in significant reductions of copper loading from brake pads. Because total source control measures are not on the horizon for zinc, it becomes the limiting pollutant instead of copper. The evaluation of copper and organics as limiting pollutants and rationale for their exclusion is described below.

Although DDT and PCBs were estimated to have high load reduction requirements to meet WQBELs, they were not identified as limiting pollutants because the maximum detection limits (MDLs) used for the analysis heavily affected the calculated required reductions. Rather than use LSPC for reduction calculations, monitoring data were used directly and many reported concentrations for DDT, PCBs, and PAHs were below MDLs, so concentrations were assumed in the model to equal half the MDL. The MDL is above the target leading to non-detects requiring reductions. Of course, toxics will be addressed by control measures implemented for zinc. The Dominguez Channel and Greater Los Angeles and Long Beach Harbor Waters Toxic Pollutants TMDL states that

[4] In LSGR, a higher percent reduction for bacteria was calculated for the average year than the 90th percentile (see Figure 5-14). Although total annual rainfall in 2008 and 2003 were virtually identical over the entire SGR watershed (20.5 and 20.4 inches/year, respectively), 2003 had fewer wet days than 2008, resulting in relatively more intense events on average (about 18 percent higher). As a result, 2003 had more HFS days than 2008—exceedances during HFS days are not considered when computing the required load reduction, lowering the required reduction.

“implementation of other TMDLs in the watershed may contribute to the implementation of this TMDL,” and implementation of the effective TMDLs in Los Angeles River and San Gabriel River are integrated within Phase I of the implementation of the toxics TMDL (LARWQCB and USEPA 2011). As a result, DDT, PCBs, and PAHs were not represented in Figure 5-12 through Figure 5-15.

Although copper was calculated to have a higher required reduction than zinc, the effect of Senate Bill 346 is expected to reduce those reductions without any implementation of structural control measures. The Brake Pad Partnership was formed in 1999 as a collaboration of cities, industry, and other entities to address the lack of information and research regarding the impact of brake debris material in the environment. After its formation, the Brake Pad Partnership commissioned several technical studies to better quantify the fate and transport of copper to San Francisco Bay including a detailed source assessment. Overall findings of the study estimated that of the anthropogenic sources of copper, approximately 35 percent are attributed to brake pad releases (BPP 2010). Even if the reduction was only half of this amount, the adjustment to the required copper reduction would still result in zinc being the limiting pollutant in LLAR, LCC, and LSGR.

After excluding organics and total copper for the reasons described previously, total zinc becomes the limiting pollutant in each of the WMP areas during the 90th percentile year. In other words, reductions of zinc during WMP implementation will drive reduction of other pollutants, particularly because the pollutant reduction plan emphasizes sediment control (other pollutants are typically transported with sediment) and retention/infiltration rather than pollutant treatment.

Plots showing the differences between the baseline loads, allowable loads, and exceedance loads are shown in Attachment F.

Table 5-6. Wet-weather pollutant baseline loading by WMP area with analysis of limiting pollutants

WMP	Year[1]	Organics (kg)				Metals (kg)		Bacteria (Billion #)[1]

Coyote Creek (CC)	2003	75.9%	46.8%	0.0%	37.5%	0.0%	28.3%	19.1%
	2008	91.3%	76.8%	0.0%	22.7%	0.0%	30.4%[4]	59.2%

Color ramps highlight potentially limiting (Red) vs. pollutants determined to be non-limiting for this analysis (Blue)

1. Average year is 2008 and 90th percentile year is 2003
2. Red box: Organics managed through sediment and associated metals reduction. Organic load reductions above influenced by assigned concentrations at half the MDLs (monitoring data below MDLs), and therefore are suspect and not considered limiting. Cu is not limiting after brake-pad reductions
3. Blue Box: Zinc is limiting pollutant for the 90th percentile year
4. Bacteria reduction target is lower in 2003 than 2008 because more days were classified as HFS

[5] For the Diamond Bar jurisdiction of the San Gabriel River WMP area, a portion flows to the Santa Ana River. Since this area is open space and therefore not associated with MS4 runoff, no reductions were determined necessary. Loadings for the 90th percentile year from this area are 1.16 kg/year of total Cu, 0.87 kg/year of total Pb, 5.21 kg/year of total Zn, and 4.91×10^{12} #/year of E-coli.

[6] Note that the Los Cerritos Channel TMDLs for Metals requires no reduction of Pb.

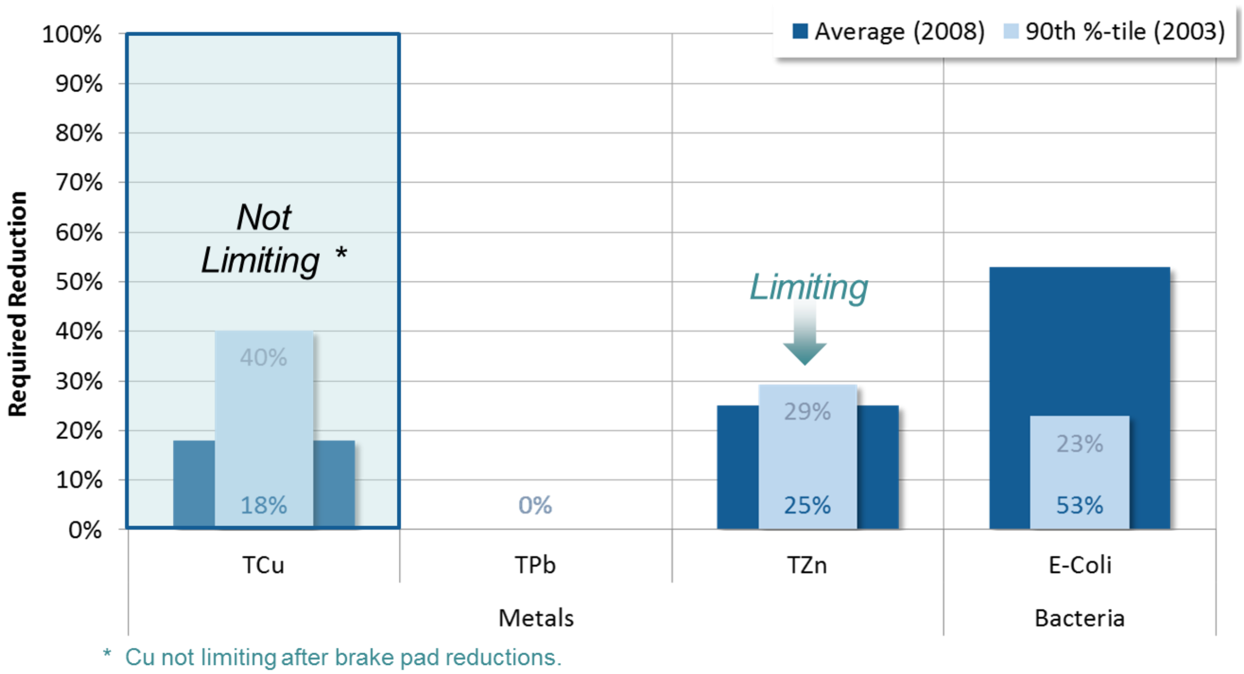

Figure 5-14. Wet-weather pollutant reduction targets and limiting pollutant for Lower San Gabriel River.

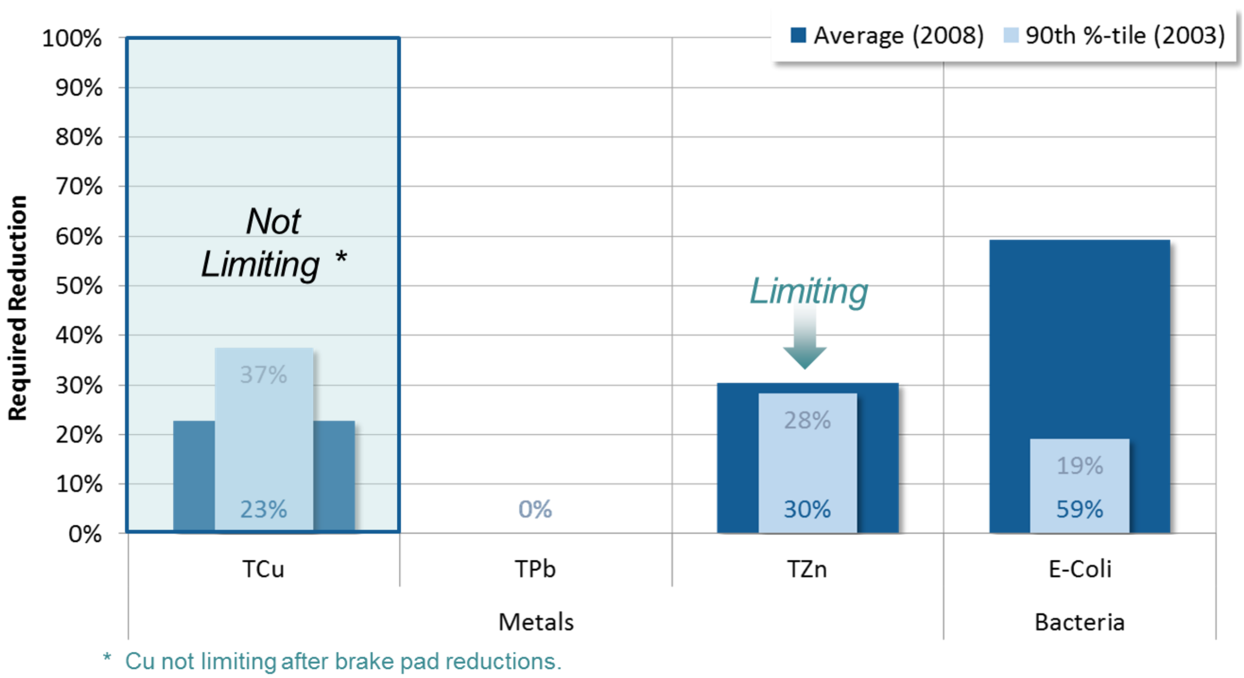

Figure 5-15. Wet-weather pollutant reduction targets and limiting pollutant for Coyote Creek.

5.3.2. Dry-Weather Pollutant Reduction Targets

Using the representative dry-weather period of August 17 through September 30, as defined in Section 5.2.3, modeled instream flow was multiplied by the observed dry weather concentrations to get existing conditions loads, which are shown in Table 5-8. Likewise, target concentrations were also multiplied by modeled instream flow to get allowable load for each waterbody, which is shown in Table 5-9. Finally, Table 5-10 summarizes dry-weather reduction targets for each listed segment for both the average year and the 90th percentile year.

For dry weather, bacteria is the limiting pollutant (not zinc) because the required reductions are much higher than other pollutants. Reductions of bacteria during WMP implementation will drive reductions of other pollutants.

Table 5-8. Modeled existing condition dry-weather loads by water body

Existing Condition		Dry Weather Flow (cfs)		Existing Load (kg/day or MPN/day)		
Waterbody	Pollutant	2003	2008	2003	2008	Mean
LAR Reach 1 (freshwater)	Cu ug/L	99.97	65.63	6.28	4.12	5.20

6. Determination of Potential BMP Capacity for RAA

The process for determining the necessary cumulative BMP capacity depends on the type of numeric goal being addressed. As shown in Figure 6-1, the volume-based (design storm) approach, necessary BMP capacity was determined through a design storm analysis. For the load-based (pollutant reduction), the analysis leveraged the optimization routines in the customized WMMS. An initial step in the RAA was a comparison of the volume reductions required by the load-based and volume-based numeric goals, to support selection of the wet weather critical conditions.

For LLAR, LCC, and LSGR, the 90th percentile WY (2002-03) weather was selected as the critical condition for wet weather.

Details on the analyses performed to determine potential BMP treatment capacity are provided in Attachment A. The attachment describes the approach for incorporating nonstructural BMPs, accounting for the effect of LACFCD infrastructure, and separating the contribution from non-MS4 sources.

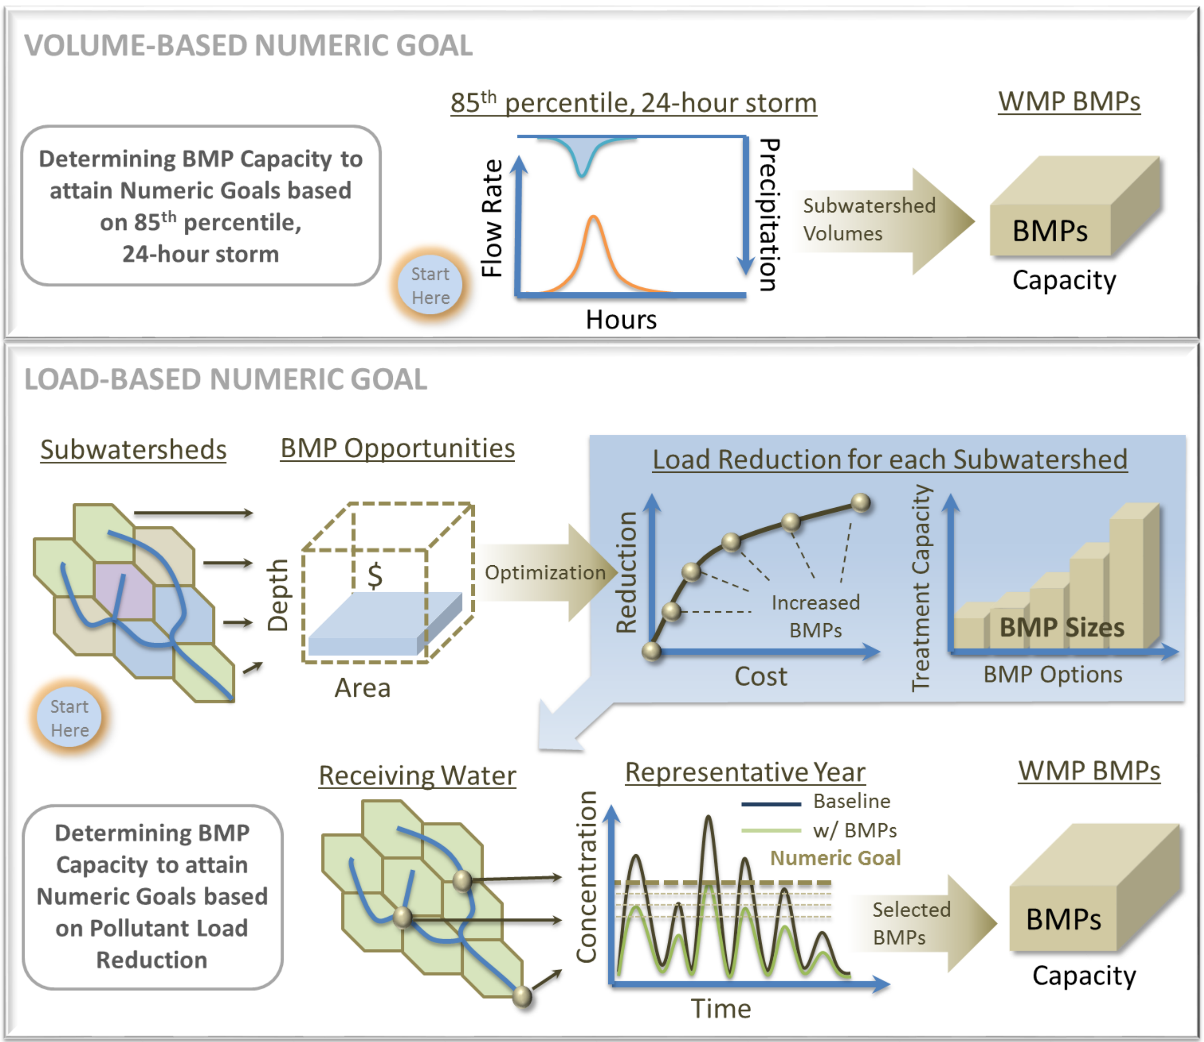

Figure 6-1. Illustration of Process for Determining Required BMP Capacities for the WMP using Volume-Based (top panel) and Load-Based (bottom panel) Numeric Goals.

7. Cumulative Volume Reduction Goals to Achieve Required Pollutant Reductions

The first output of the RAA is a series of “volume reduction goals” for each subwatershed and jurisdiction in the WMP area. WMMS was used to determine the stormwater retention volumes for each subwatershed that would achieve the required load reductions, as reported in this section. These calculated runoff reduction volumes for each subwatershed are a surrogate compliance metric for the responsible agencies. It should be noted that upon implementation, opportunities may arise where flow-through BMPs may provide similar ultimate pollutant load reduction, and may replace the need to implement volume-based reduction BMPs.

These volumes also form the basis for selection of BMPs to achieve those volume reductions, as described in Section 9 and Attachment A.

7.1. Volume Reductions for Structural BMPs

Structural BMPs were modeled using the assumptions outlined in Attachment A. BMP capacities were optimized across the entire study area to achieve the final milestone pollutant reduction requirements at each of the assessment points. Instead of summarizing optimization results in terms of BMP capacity, which is really specific to the network described in Attachment A, the results were summarized as required *annual* wet-weather retention volume (in acre-feet). This provides a volumetric basis that is (1) closely related to load reduction and (2) readily transferable as a control target for parallel BMP modeling at a finer resolution. Because the volumes were isolated to wet days, it is also not skewed by dry-weather runoff retention. The following subsections provide more details about the wet- and dry-weather analysis components.

7.1.1. Wet Weather

Using the structural BMP routing network in WMMS (described in Attachment A), the required *annual* wet-weather retention volume (in acre-feet) were calculated using the critical year time series. For milestones, the percent reduction was based on average year targets while final limits were based on critical year targets. The reported annual volumes are (1) based on required load reductions and (2) ready for BMP modeling at a finer resolution. A 10 percent load reduction was assumed to result from implementation of all nonstructural control measures outlined in the WMPs, setting the foundation of WMP implementation, and structural control measures provide additional load reduction.

Table 7-1 through Table 7-4 present incremental and cumulative retention volumes required to achieve each load reduction milestone by jurisdiction. The milestones are based on the metals TMDLs as described in Section 2. In order to calculate the incremental volume reductions for each milestone, optimization was performed for each jurisdiction to (1) emphasize BMP implementation in subwatersheds that volume reduction could most cost effectively reduce pollutants and (2) establish a cost-effective sequence of subwatersheds for each jurisdiction to achieve the milestones over time. In other words, WMMS was used to develop an implementation schedule that provides early gains in receiving water quality.

Table 7-1. Annual volume reduction goals to achieve interim and final milestones for Lower Los Angeles River WMP by jurisdiction

Jurisdiction	Total Critical Year Storm Volume Target (acre-ft/year)		
	Milestone	Incremental	Cumulative[1]
Downey	31%	143.8	143.8
	50%	221.7	365.5
	Final	360.5	726.0
Lakewood	31%	14.3	14.3

7.1.2. Dry Weather

Dry-weather reductions from non-structural BMPs were calculated using flow from representative dry period (Section 5.2) of 8/17/2003 through 9/30/2003 and 90th percentile concentrations calculated from observed data (Section 5.2.1). Similar to wet weather, a 10% load reduction is assumed to result from the cumulative effect of nonstructural BMPs. Also, the effects of a 25% reduction in irrigation of urban grass was explicitly simulated in the model to estimate the resulting associated reduction of dry weather flows at the RAA Assessment Points. Irrigation was modeled as artificial rainfall within the LSPC model as a function of the potential evapotranspiration of urban grass. Once irrigation was reduced 25%, this directly impacted a large portion of the nonstormwater discharges drivin primarily from over irrigation and impacts on dry weather flows were significant. The projected effect of non-structural and irrigation controls on dry weather flow and loads is presented in Table 7-5. Since *E. Coli* is the limiting dry weather pollutant with required reductions in excess of 90%, the remaining volume reduction not controlled by non-structural measures will be treated by the structural BMPs described in the previous section.

Table 7-5. Projected dry weather reductions from non-structural control measures

Watershed	Constituent	Quantity (Volume or Mass)			Percent Reduction Achieved	
		Baseline	NM	NS	NM	NS
Lower Los Angeles River	Flow (M Gal.)	198.3	178.5	86.6	10.0%	56.4%
	Copper (kg)	19.28	17.35	8.42	10.0%	56.4%
	Lead (kg)	2.58	2.32	1.12	10.0%	56.4%
	E. Coli (Billion MPN)	147,166	132,449	64,230	10.0%	56.4%
Los Cerritos Channel	Flow (M Gal.)	133.6	120.2	56.3	10.0%	57.8%
	Copper (kg)	12.84	11.56	5.42	10.0%	57.8%
	E. Coli (Billion MPN)	71,808	64,627	30,277	10.0%	57.8%
Lower San Gabriel River	Flow (M Gal.)	163.3	147.0	71.2	10.0%	56.4%
	Copper (kg)	18.48	16.63	8.06	10.0%	56.4%
	Selenium (kg)	2.95	2.65	1.29	10.0%	56.4%
	E. Coli (Billion MPN)	13,540	12,186	5,903	10.0%	56.4%
Coyote Creek	Flow (M Gal.)	213.4	192.0	88.4	10.0%	58.6%
	Copper (kg)	23.05	20.75	9.55	10.0%	58.6%
	E. Coli (Billion MPN)	92,887	83,599	38,491	10.0%	58.6%

NM: Non-modeled non-structural practices achieve 10% reduction

NS: Non-structural 25% irrigation reduction practices achieve an additional approximately 60% reduction

8. MS4 Volume Reduction Goals to Achieve Required Pollutant Reductions

Each jurisdiction in the Group's WMP area is subject to stormwater runoff from non-MS4 facilities. In particular, Caltrans roads and facilities regulated by nontraditional or general industrial permits contribute to the runoff volume for each subwatershed. It will be important for these entities to retain their runoff and/or eliminate their cause/contribution to receiving water exceedances. The runoff from these non-MS4 facilities was therefore estimated and subtracted from the cumulative volume reduction goal (Section 7) to establish the MS4 responsible targets as described in Attachment A.

8.1. Summary of MS4 Responsible Reduction Goals

Runoff volumes estimated for non-MS4 permitted areas and Caltrans were subtracted from the reduction target to generate the required MS4 treatment capacity shown in Table 8-1 through Table 8-4.

9. Pollutant Reduction Plan

The BMPs used to achieve the MS4 volume reduction goals in Section 8 are not, per se, a component of the Permit compliance determination. Instead, over time each agency will report and demonstrate that the *cumulative* effect of projects implemented over time add up to the required reductions for interim milestones and final targets (reported as "MS4 Compliance Target"). However, the initial scenario of BMPs for WMP implementation (referred to as a Pollutant Reduction Plan in the RAA Guidelines) and their costs may be the most beneficial outcome of the WMP. A detailed WMP implementation scenario is presented in Attachment B, broken down by jurisdiction and subwatershed. The volume reductions are separated among right-of-way (ROW) BMPs and Low Impact Development (LID) on public parcels (in combination with nonstructural BMPs).

The Pollutant Reduction Plan is considered an "initial" scenario because over time, through adaptive management, the responsible agencies will likely "shift" among different types of BMPs (e.g., increase implementation of green streets and reduce implementation of regional BMPs) or substitute alterative BMPs altogether (e.g., implement dry wells instead of green streets). These shifts will be supported by analyses to show the substituted BMPs provide an equivalent volume reduction as the replaced BMPs.

9.1. Existing/Planned Regional Control Measures

Existing regional BMPs play an integral part in measuring the current reductions and need for future control measures. The annual volume or load removed from the existing and planned regional control measures were subtracted from the MS4 responsible runoff to determine the remaining treatment volume required. Detailed information for the existing and planned regional control measures is found in Attachment A.

The existing and planned regional control measure information was provided for the Lower Los Angeles River and Lower San Gabriel River. The jurisdictions that were impacted are listed with the associated annual reduction provided by these facilities in Table 9-1 and Table 9-2.

Table 9-1. Lower Los Angeles River Critical Year Existing/Planned Regional BMP Runoff Volume Reductions

Downey	87.3	24.0	63.3

9.2. Future Control Measures for Attainment of Interim and Final Limits

The Pollutant Reduction Plans for wet and dry weather illustrate the sequencial BMP implementation strategy to attain all interim and final limits. Within each of the jurisdictions, the subwatershed subareas were individually prioritized and associated with milestones on the basis of cost-effectiveness for zinc removal. The optimization modeling results presented in Section 7 and Figure 9-1, Figure 9-2 and Figure 9-3 shown below identify the prioritization of subwatershed implementation based on the most effective combination of BMPs. The implementation schedule outlined in the Pollutant Reduction Plans for wet and dry weather are based upon this prioritization. The plans are presented in the following subsections.

9.2.1. Wet Weather

The interim and final targets are presented in total acre-feet per year that requires treatement through structural BMPs (less the non-MS4 and existing regional volumes as described in Sections 8 and 9.1). To properly capture the annual volume, BMPs are sized to the minimum volume needed to capture the target annual volume. Thus, the BMPs are presented as a volume (acre-feet) that has the ability to capture the required annual total to meet compliance.

An overall jurisdictional summary table is presented in Table 9-3 that outlines the required BMP volume to achieve compliance in the associated WMP group. The BMP volumes are the sum of existing distributed BMPs, potential green street BMPs, LID on public parcels, and remaining BMP volume that must be implemented as regional (or other) projects as necessary to meet the annual volume reduction target.

Table 9-4 through Table 9-7 outlines the jurisdiction-wide BMP volume targets necessary to meet the annual volume interim and final limits established in Section 8. Each distributed BMP was associated with a jurisdictional subwatershed and the associated implementation schedule, thus summing their impact across different interim goals. The remaining BMP volume after accounting for existing distributed BMPs is spread across right-of-way BMPs, LID on public parcels, and remaining BMP volume including potential regional projects. Priority was given to LID on public parcels, followed by right-of-way BMPs and finally other BMPs. The incremental column shows the total additional BMP volume required for each milestone while the cumulative measures the total BMP volume required by each milestone to hit the final compliance targets. Deatiled discussion on how the BMPs in the right-of-way and LID on public parcels were determined is found in Attachment A. Detailed tables are provided in Attachment B for each jurisdiction and associated subwatersheds. Detailed tables describing the existing distributed BMPs are found in Attachment D.

9.2.2. Dry Weather

Dry weather reductions are attained through a combination of non-structural practices and structural BMPs as they are implemented as part of the wet weather attainment of limits. As wet-weather BMPs are implemented, they serve to remove the dry-weather flows thus meeting the compliance set forth to achieve dry-weather reductions. As a summary of the dry weather analysis, Table 9-8 through Table 9-11 outline the jurisdiction-wide attainment of interim and final milestones for dry weather. The reduction from implemented BMPs compares the actual dry-weather reduction versus the compliance target.

1. Determination of BMP Treatment Capacity

The process for determining the necessary cumulative BMP capacity depends on the type of numeric goal being addressed. As shown in Figure 1-1, the volume-based (design storm) approach, necessary BMP capacity was determined through a design storm analysis. For the load-based (pollutant reduction), the analysis leveraged the optimization routines in the customized WMMS. An initial step in the RAA was a comparison of the volume reductions required by the load-based and volume-based numeric goals, to support selection of the wet weather critical conditions.

This appendix describes key analyses conducted to determine the potential capacity of different BMPs including non-structural BMPs. In addition, it describes the approach for non-MS4 sources.

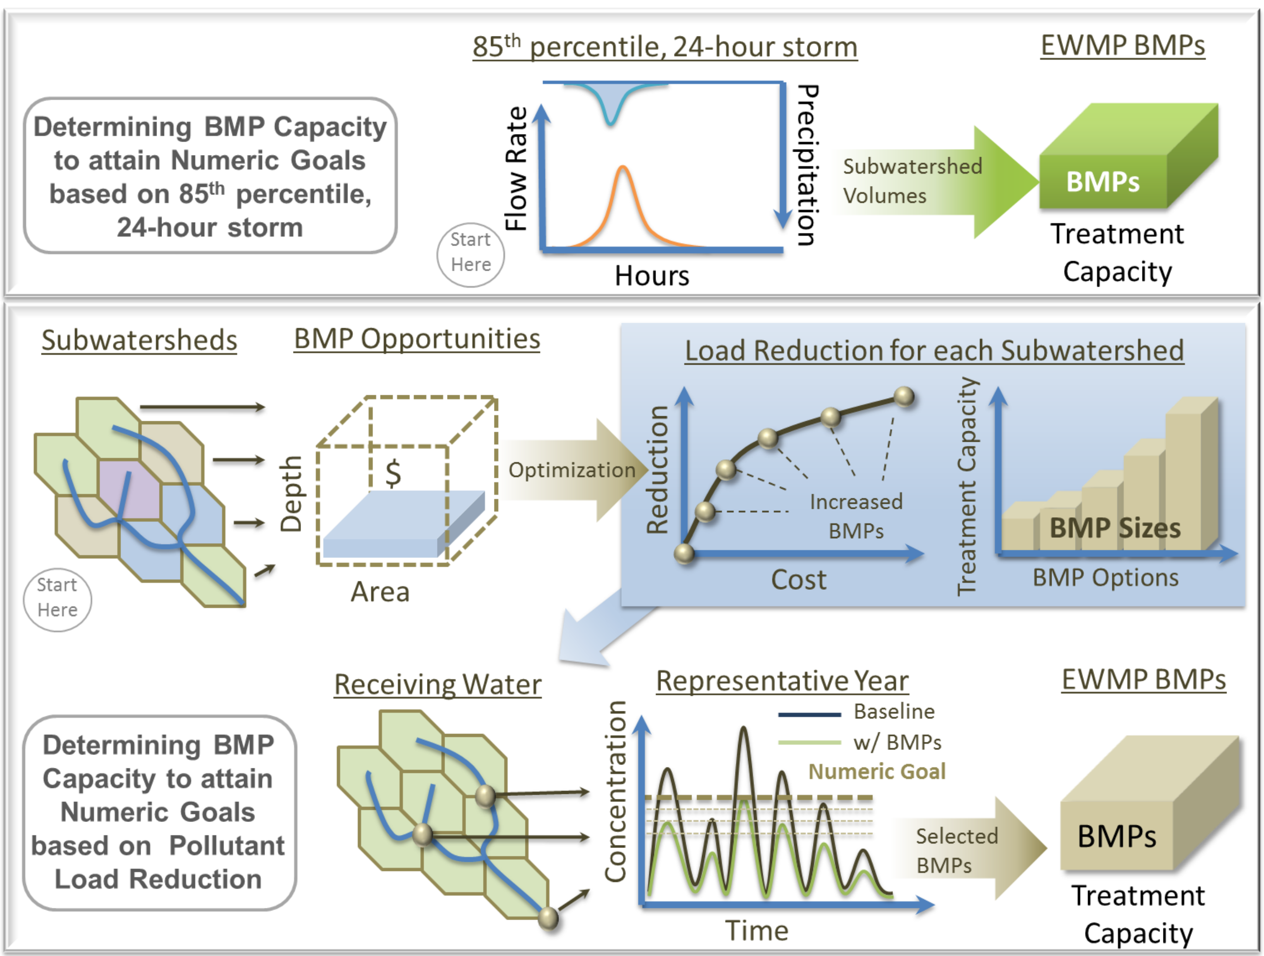

Figure 1-1. Illustration of Process for Determining Required BMP Capacities for the WMP using Volume-Based (top panel) and Load-Based (bottom panel) Numeric Goals.

1.1. Load Reduction Optimization Modeling Analysis

During development of WMMS, distributed BMPs were modeled at the subwatershed-scale using a generalized BMP treatment train. Depending on the land use type, different types of BMPs were applied. The three generalized BMP pathways were: (1) transportation, (2) residential, and (3) commercial/industrial/institutional. A conceptual schematic of the BMP network and pathways is presented in Figure 1-2 (LACDPW 2011).

For the RAA, subwatershed-scale SUSTAIN models were developed using the WMMS modeling assumptions. Each BMP from the treatment train described in Figure 1-2 was configured consistently with modeling performed during development of the WMMS system and followed the Regional Board RAA guidelines. A summary of key BMP parameters used for RAA modeling are presented in Table 1-1. Background infiltration rates were changed from those used during WMMS development (0.5 inches per hour) to site-specific infiltrations rates provided in the Los Angeles County Hydrology Manual and associated spatial datasets (LACDPW 2006). These rates also deviate somewhat from the values suggested in the RAA Guidelines (0.1 – 0.3 inches per hour); however, the data are locally-derived, published and reliable which provides adequate justification for their use.

First, SUSTAIN models were configured using the existing condition watershed model runoff timeseries and land use distributions as inputs, and benchmarked against the aggregated LSPC model results to establish baseline consistency. Second, using the SUSTAIN configuration with the respective BMP opportunities per pathway (as presented in Figure 1-2) in each subwatershed, optimization runs were formulated to maximize zinc reduction (i.e. the limiting target pollutant) while minimizing total estimated implementation cost. This resulted in a matrix of high-resolution cost-effectiveness curves for each subwatershed. Finally, a Tier-II optimization framework was configured to collectively optimize target load reductions at the downstream assessment point, with an added equitability constraint to ensure that each jurisdiction shared proportionally in the reduction effort. For the Tier-II optimization, instead of the decision variables being individual BMPs within a network like before, they were comprised of individual solutions taken off the cost-effectiveness curves at each subwatershed. The primary objective was to quantify the stormwater retention volume and load reductions provided by the collective actions occurring within each contributing jurisdiction tributary to the assessment point.

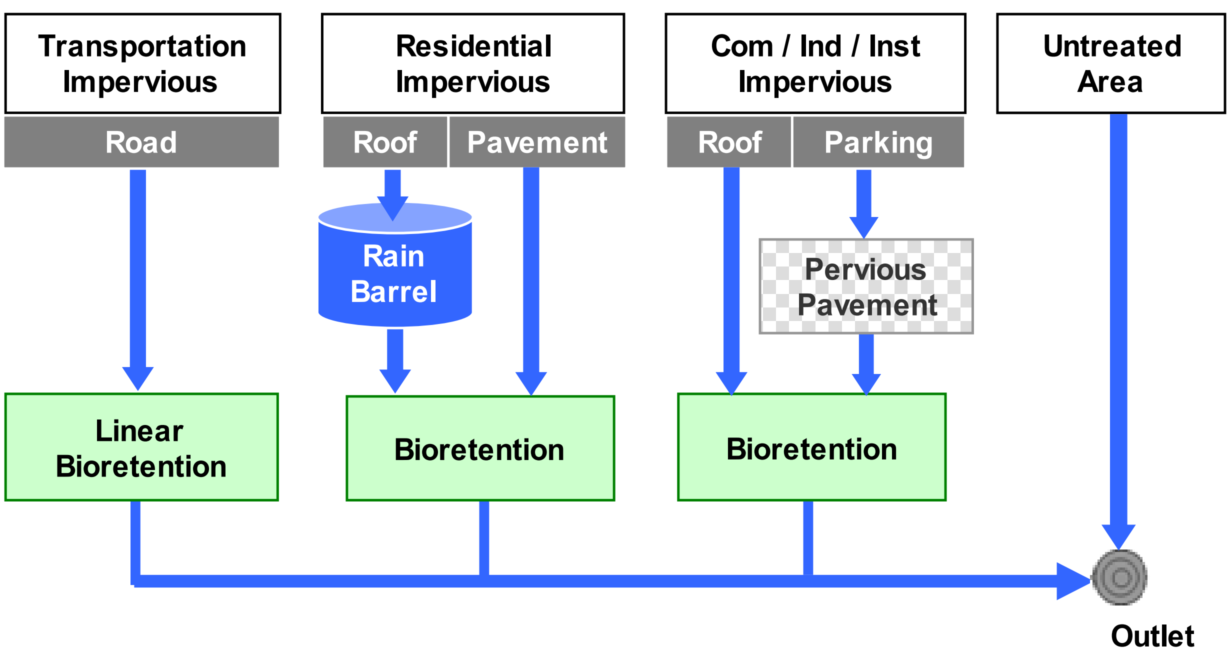

Figure 1-2. Conceptual schematic of the WMMS aggregate BMP treatment train (LACDPW 2011b).

Table 1-1. BMP parameters used in the load reduction modeling analysis

Constituent Group	Rain Barrel	Bioretention	Porous Pavement
Media Infiltration Rate (in/hr)	n/a	0.1 – 0.9	0.1 – 0.9
Substrate Layer Porosity (fraction)	n/a	0.4	0.4
Substrate Layer Field Capacity (fraction)	n/a	0.3	0.055
Substrate Layer Wilting Point (fraction)	n/a	0.1	0.05
Underdrain Gravel Porosity (fraction)	n/a	0.5	0.45
Vegetative Parameter, A (unitless)	n/a	0.6	1.0
Background Infiltration Rate (in/hr)	n/a	0.1 – 0.9	0.1 – 0.9
First Order Decay Rate (1/day)[1]	0.2 – 0.8	0.2 – 0.8	0.2 – 0.8
Underdrain Filtration Rate (%)[1]	n/a	0.5 – 0.9	0.5 – 0.9

1. Rates vary by pollutant and the type of BMP soil media

1.2. BMP Capacity Analysis for the Rights-of-Way

A key consideration for WMP implementation is the potential BMP capacity that could be provided by rights-of-way (ROW). In order to highlight the potential structural BMP implementation approaches to meet the volume targets, a BMP opportunity analysis was conducted. Two broad categories of BMPs – ROW BMPs and LID on public parcels – were used to describe the networks of BMPs needed to meet the target reductions.

This section describes how right-of-ways were evaluated for opportunities to locate BMPs and evaluate the key components that affect the ability of the ROW BMP networks to be effective: space available in the ROW, types of BMPs to site in the ROW, drainage areas that could potentially be treated by ROW BMPs, and estimated BMP infiltration rates.

Stormwater BMPs in the ROW are treatment systems arranged linearly within the street ROW and are designed to reduce runoff volumes and improve runoff water quality from the roadway and adjacent parcels. Implementing BMPs in the ROW provides an opportunity to meet water quality goals by locating BMPs in areas owned or controlled by a municipality to avoid the cost of land acquisition or establishing an easement. Implementing BMPs in the ROW allows for direct control of construction, maintenance, and monitoring activities by the responsible jurisdiction. Bioretention and permeable pavement are typically best suited for implementation in the ROW

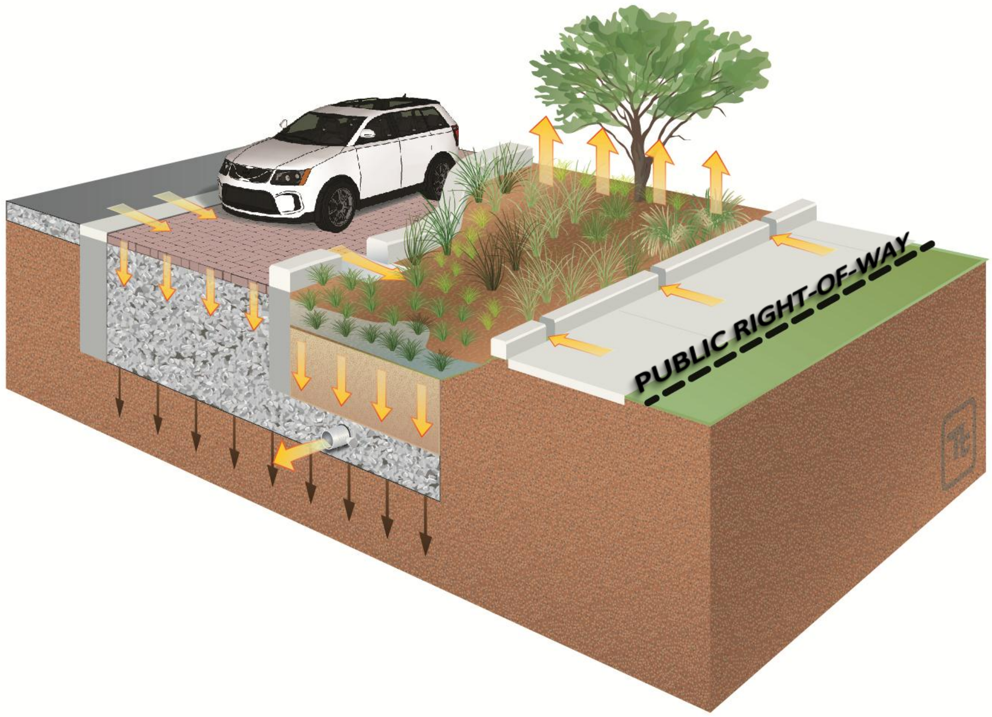

Figure 1-3. Conceptual schematic of ROW BMPs with an underdrain (Arrows indicate water pathways).

Not all roads are suited for ROW BMP retrofits; therefore, screening is required to eliminate roads where ROW BMP retrofits are impractical or infeasible due to physical constraints. While ROW BMP retrofits can be implemented in a variety of settings, the physical characteristics of the road itself such as the road type, local topography, and depth to groundwater can significantly influence the practicality of designing and constructing these features. A screening protocol was established to identify realistic opportunities for retrofits based on the best available GIS data. The opportunities identified during this process provide the foundation for the engineering analysis to determine the volume of stormwater that can be treated by ROW BMP retrofits in the subject watersheds. This section describes the data and the screening process used to identify the best available roads for ROW BMP retrofits.

1.2.1. Data Used

To evaluate BMP opportunities and available implementation areas, several key data sets were processed and formatted. Table 1-2 outlines the data set names, formats, descriptions, and sources.

Table 1-2. Summary of Data

Data Set	Format	Description	Source
Parcels	GIS Shapefile	Outlines property boundaries and sizes	Los Angeles County (LAC) Assessor
Roads	GIS Shapefile	Shows street centerline network & classification by Topologically Integrated Geographic Encoding and Reference (TIGER)	LAC GIS Portal
Land Use	GIS Shapefile	Subdivides the region into predefined land use categories with similar runoff properties. Each individual land use feature identifies the associated percent impervious coverage.	LAC WMMS Model
Subwatersheds	GIS Shapefile	Defines drainage areas to selected outlet points	LAC WMMS Model
Slopes	GIS Shapefile	Classifies regions by the slope category	LAC WMMS Model
Soils	GIS Shapefile	Outlines spatial extents of dominant soil types	LAC GIS Portal
Jurisdictions	GIS Shapefile	Establishes city and county boundaries	LAC GIS Portal
Drainage Network	GIS Shapefile	Identifies stormwater structure layout and conveyance methods	LAC GIS Portal
Groundwater Contours	GIS Shapefile	Illustrates groundwater depth as measured from the surface	LAC BOS
Soil Runoff Coefficient Curves	PDF File	Curves characterize effect of rainfall intensity on runoff coefficient per soil type	Hydrology Manual Appendix C (LADPW 2006)
Aerial Imagery	Layer File	Orthoimage of entire region	ESRI Maps & Data Imagery
Runoff Rates	Time Series	Hourly runoff for land uses for the continuous simulation model	LAC WMMS Model

1.2.2. ROW BMP Screening

High traffic volumes, speed limits, slopes, and groundwater tables, impact the feasibility of ROW BMP implementation. Road classification data contains information typically useful for determining if the street is subject to high traffic volumes and speeds, and Census TIGER road data provides the best available road classification information for the study area. Table 1-3 shows the Master Address File (MAF)/TIGER Feature Classification Codes (MTFCC) deemed appropriate for ROW BMP retrofit opportunities. Only roads with the MTFCCs listed in Table 1-3 can be considered for ROW BMP retrofits in this screening analysis. All other roads are screened out.

Table 1-3. ROW BMP MTFCC

MTFCC	Description
S1400	Local neighborhood road, rural road, city street
S1730	Alley
S1780	Parking lot road

In addition to the screening of road types, opportunities were further screened to remove segments that have steep slopes. BMP implementation on streets with grades greater than 10 percent present engineering challenges that substantially reduce the cost effectiveness of the retrofit opportunity. From the available slope information, roads were considered as retrofit opportunities if the slope was less than 10 percent.

The final screen applied to the roads is the depth to groundwater. Implementing ROW BMPs in areas where the groundwater table is high is not recommended due to the fact that the BMPs are rendered ineffective due to their storage capacity being seriously diminished with groundwater inflow. From the groundwater contours provided, roads were eliminated as opportunities if the depth to groundwater was less than 10 feet. Attachment C highlights the areas identified with groundwater depths of 10 feet or less. The highlighted areas provide a starting point for elimination, however it should be noted that further evaluation may be necessary based on local knowledge of areas with high groundwater tables or daylighting of perched groundwater layers as identified by the jurisdictions.

The results of the ROW BMP screening are presented in Attachment C. Attachment C shows the roads available for retrofit (highlighted in green) versus all of the roads within the study area. An overall watershed map and individual jurisdictional maps for each watershed show all the identified retrofit opportunities. The maps indicate that a majority of the roads within each jurisdiction pass through the screening as potential retrofits. It should be noted that due to the coarse nature of the road classification data, only freeways, highways, and major roads were eliminated in the classification screening process. In practice, retrofitting every street that passed through the screening will likely not be feasible and adaptive management strategies will be necessary in the future to further refine the road classification data layer to more accurately identify road types suitable for ROW BMP retrofits.

The screened opportunities were used as the basis to evaluate the potential runoff volume reduction provided by ROW BMP implementations. In the following section, an engineering assessment is presented that determines the ROW BMP contributing drainage areas and the overall volume reductions achieved through ROW BMP implementation.

1.2.3. ROW BMP Configuration

The three most important assumptions necessary to evaluate BMP volume reduction performance are (1) the physical BMP configuration assumptions, (2) the contributing drainage area characteristics, and (3) the in-situ soil infiltration rates. By understanding the area draining to the BMPs and the volume capacity and function of the BMPs, an assessment can be performed to evaluate the potential of ROW retrofit BMPs to capture the required runoff volume in each subwatershed. This section summarizes the information and processes used to establish BMP configuration assumptions to be used for the runoff analysis presented in the following section.

1.2.4. BMP Assumptions Based on Green Streets

ROW BMPs consists of multiple types and combinations of stormwater treatment options. A well-established and often utilized ROW BMP is green streets. Green streets provide multiple benefits for pollutant and volume reduction and have been implemented in locations throughout the nation. In the future and as updates are made to the WMP, other ROW BMPs may be incorporated to achieve the required volume reductions.

Green streets typically consist of bioretention areas between the curb and sidewalk (herein referred to as the parkway) and/or permeable pavement within the parking lane. Prior to evaluating green street BMP treatment capacity, it is imperative to establish a configuration that can be assumed for typical implementation watershed-wide. This establishes the parkway space needed for the BMPs (plan view) and also determines the hydraulic function and storage capacity of the subsurface systems.

Bioretention systems are surface and subsurface water filtration systems, which use vegetation and underlying soils to store, filter, and reduce runoff volume while removing pollutants. Figure 1-4 represents a typical bioretention system incorporated into a green street design. Bioretention systems consist of a ponding depth and engineered soil media depth to treat runoff. Table 1-4 outlines typical widths, depths, and soil parameters associated with green street bioretention cells. Green streets were assumed to have no underdrains because the

WMP emphasizes low impact development and stormwater volume reduction to achieve pollutant load reductions.

Driveways and utilities limit the road length that can be converted into a green street. From past experience and aerial imagery review in the local watersheds, it was determined that 30 percent of the road length could be considered as the maximum possibility for conversion into bioretention area. This factor was used to limit the total length of potential green street bioretention areas. The parameters outlined above and in the table below were assumed to be the typical green street BMP implementation configuration for the screening analysis and the BMP treatment capacity evaluation described in the next section.

Table 1-4. BMP Design and Modeling Parameters for Subsequent Analyses

Component	Design Parameter	Value
Ponding Area	Depth	0.8 feet
	Width	4.0 feet
Media Layer	Depth	3.0 feet
	Porosity	0.4
Overall Profile	Effective Depth[1]	2.0 feet

[1] Effective depth is the maximum equivalent depth of water stored within the bioretention area less the depth displaced by soil media (vertical summation of surface ponding depth and void storage depth)

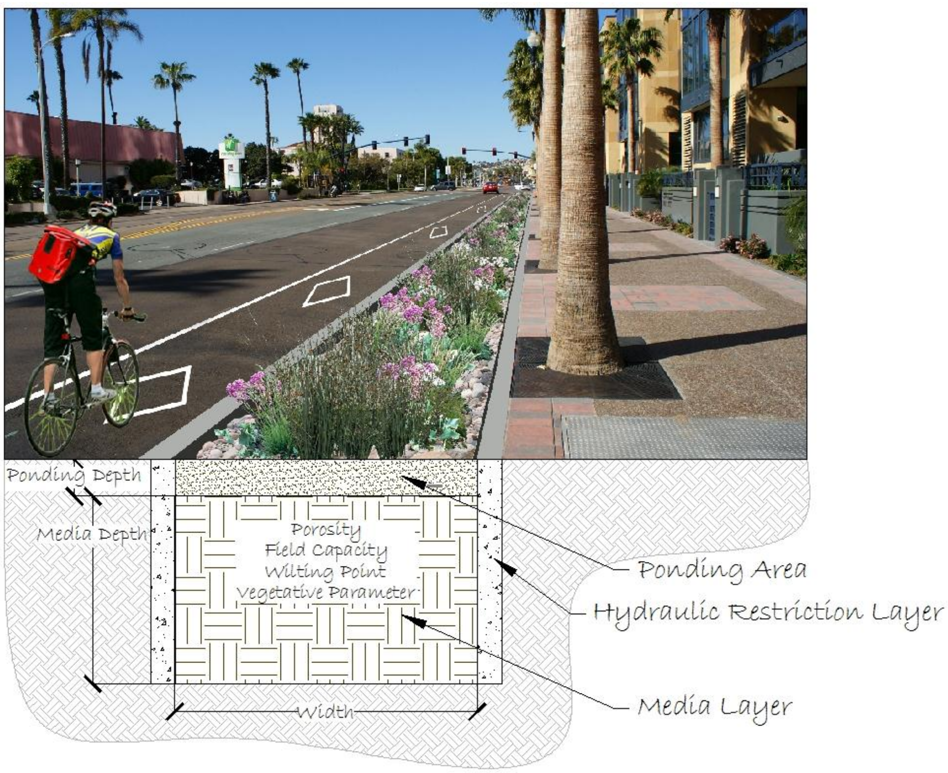

Figure 1-4. Typical bioretention section view (City of San Diego 2011).

Contributing Drainage Area Analysis

The purpose of this analysis was to realistically represent the area, type, and impervious coverage of land draining to potential green streets throughout the entire watershed. This is a critical step in WMP development because it predicts what volume of runoff can be assumed treated by green streets and what remaining (untreated) runoff must be routed to regional BMPs or addressed in other ways. The following engineering analyses were performed at a subwatershed-scale within the limits of available data and resources to estimate the maximum potential green street treatment capacity; given more detailed street-by-street drainage area data, the assumptions and results presented herein could be refined in future efforts to optimize green street treatment capacity. Figure 1-5 illustrates a simplified routing schematic used to represent the available runoff flow pathways to green street and regional BMPs throughout the watershed. The following subsections explain how each representative drainage area illustrated in Figure 1-5 was characterized.

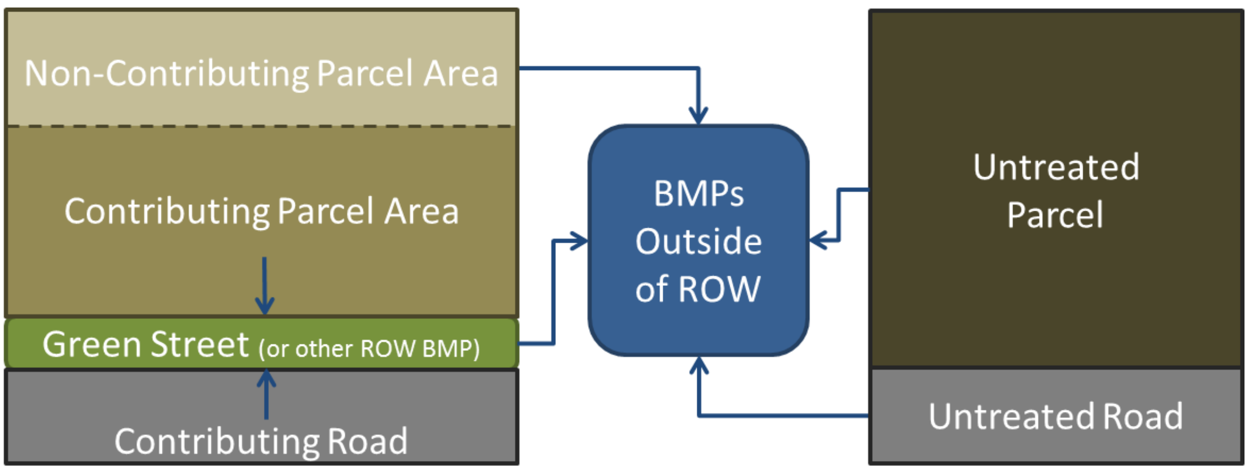

Figure 1-5. Green streets model schematic (arrows denote direction of runoff routing; figure not to scale).

Typical Parcel Size & Street Frontage Analysis

The nature of the green street analysis requires an understanding of typical parcel sizes and how much of the parcel drains to the ROW. Much of the runoff from parcels and the road drains to the ROW and is conveyed downstream through curb, gutter, and pipes. By identifying the typical parcel size, frontage length, and associated road area that drains to a candidate right-of-way area (Figure 1-6) the total area draining to potential green street retrofit opportunities was extrapolated throughout the watershed. For purposes of this study, only the high-density residential, multifamily residential, commercial, institutional, and industrial land uses were considered as contributing substantial runoff to the ROW (all other land uses contain minimal impervious area and thus contribute insubstantial runoff to the ROW).

The typical parcel size for each land use was determined by identifying all parcels for each land use. Once all the parcels were selected, the median parcel size for each land use was calculated and tabulated. This method evaluated thousands of parcels throughout the entire watershed and provided the most accurate depiction of the typical parcel size for each land use based on available data. Results are shown in Table 1-5.

Each parcel is adjacent to a portion of the ROW where the green street would be implemented. A subset of parcels approximate to the median parcel size for each land use was selected to determine the average frontage length. The portion of the selected parcels that was in contact with the ROW was measured using desktop analysis tools and averaged between all parcels of the same land use. Results are shown in Table 1-5.

Road area draining to green streets constitutes a substantial component of the total impervious drainage area. To establish road drainage areas, typical road widths were defined by sampling representative road segments located in each land use. Widths were measured from curb-to-curb using aerial orthoimagery and reported to the nearest even integer. The median sampled road width for each land use was calculated and compared with the City of Los Angeles Standard Street Dimensions (City of Los Angeles Bureau of Engineering 1999) for validation. To predict the resulting contributing road areas, the previously measured frontage length was multiplied by half the road width. Roads were assumed to be crowned; therefore, only half of the width would drain to one side of the road. Results are shown in Table 1-5.

As discussed in Section 1.2.4, only 30 percent of the frontage length could be converted into bioretention area. This factor was multiplied by the frontage length and used in limiting the total length of bioretention available within the model, as presented in Table 1-5.

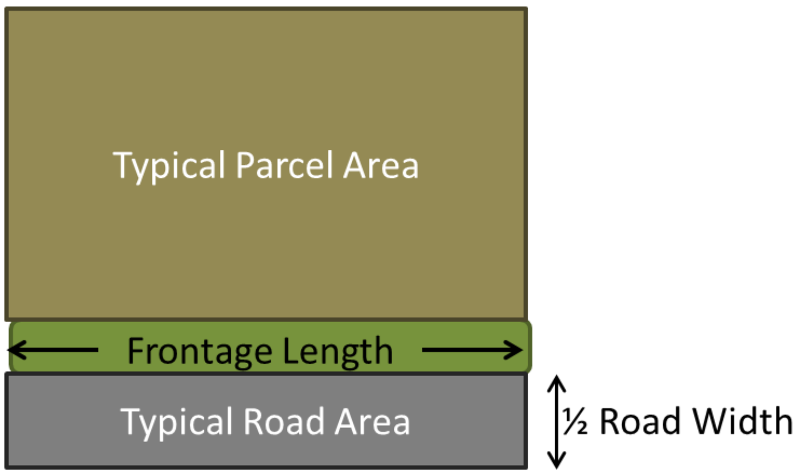

Figure 1-6. Typical parcel area, road width, road area, and frontage length schematic (figure not to scale)

Table 1-5. Typical parcel area, road area, and frontage length

Land Use	Typical Parcel Area (ft^2)	Frontage Length (ft)	Typical Road Width (ft)	Typical Road Area (ft^2)	BMP Length (ft)
High-density Residential	6,528	57	38	1,083	17
Multifamily Residential	13,526	60	30	900	18
Commercial	12,429	100	63	3,150	30
Institutional	38,215	143	37	2,646	43
Industrial	26,467	117	46	2,691	35
Other Land Use (Open Space, Vacant, etc.)	n/a[1]	100	40	2,000	30

[1] assumed not draining to ROW

Contributing Parcel Area Analysis

Many parcels will not always entirely drain to the ROW because portions can be retained on-site or flow onto an adjacent property. The actual volume of water that can be treated by a green street BMP was determined by identifying the typical proportion of the parcel that drains to the ROW (as shown in context of the model

schematic in Figure 1-7). This step also determines the area, and associated runoff, that is *not* expected to drain to green streets and is routed directly to downstream regional facilities or other practices (herein referred to as non-contributing parcel area).

The contributing areas to the green street BMPs were found using random sampling and identifying the surrounding parcel drainage patterns. Parcels were selected using a random number generator and drainage areas were determined on a desktop analysis using topography, aerial imagery, and drainage infrastructure features. The average contributing percentage was identified by evaluating multiple sites. Table 1-6 shows the percent contributing areas by land use that were determined from this analysis.

The impervious coverage of contributing parcel areas was also characterized during this step so that runoff could be simulated and routed to green streets in each land use. This was performed by tabulating the imperviousness data from the WMMS Model for each individual land use feature. The area-weighted mean impervious coverage was then calculated for each land use type. Results are tabulated for each land use in Table 1-6.

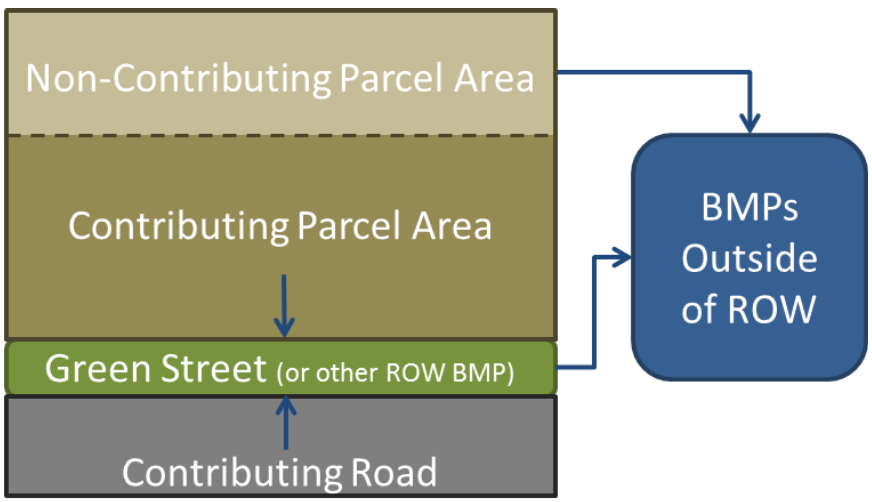

Figure 1-7. Parcel contributing area to ROW (impervious varies by land use; arrows denote direction of runoff routing; figure not to scale).

Table 1-6. Contributing area percentage by land use

Land Use	Contributing to ROW	Non-contributing to ROW	Percent Impervious
High-density Residential	80%	20%	36%
Multifamily Residential	80%	20%	60%
Commercial	80%	20%	90%
Institutional	80%	20%	72%
Industrial	35%	65%	66%
Other Land Use (Open Space, Vacant, etc.)	0%	100%	n/a

Untreated Roads Tabulation

Untreated roads consist of roadways with steep slopes, classifications not suited for green street implementation, or adjacent to open space or vacant parcels. Untreated road and associated adjacent parcel area that will ultimately drain to other BMPs was tabulated using available GIS data and screening results from Section 1.2.2 (conceptually illustrated in Figure 1-8).

Because green streets are implemented in the linear environment of the transportation corridor, it was assumed that the percentage of parcel area draining to green streets would be proportional to the percentage of suitable roads for green streets (as identified in Section 1.2.2) in each subwatershed. In other words, parcels associated with unsuitable roads were assumed to bypass green street treatment and routed directly to other facilities (these areas are defined herein as *untreated parcels*). The total treated and untreated parcel areas were reconciled with the total areas of each land use (per subwatershed) in the WMMS Model for validation and consistency.

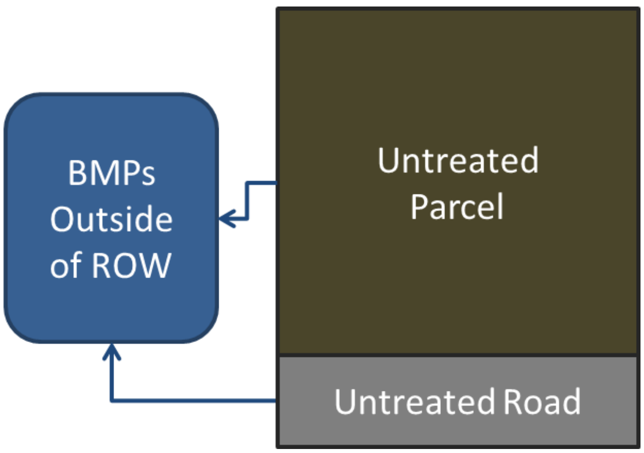

Figure 1-8. Schematic depicting untreated parcel and untreated road runoff routing (arrows denote direction of runoff routing; figure not to scale).

Summary of Contributing Drainage Areas

Results of the preceding analyses are presented in Figure 1-9. Areas that were assumed *un*treated by green streets include unsuitable roads and adjacent parcels, portions of suitable parcels that do not drain to the ROW, and predominantly pervious parcels (Open Space, Vacant, etc.), as discussed in preceding subsections; runoff from these untreated areas is assumed routed directly to regional facilities. Note that contributing areas are not necessarily proportional to contributing runoff due to variation in impervious coverage; runoff routing resulting from the preceding analyses is presented in the following section.

Given more detailed street-by-street engineering analyses, the potential area treated by green streets could be optimized, but the results below represent realistic estimates based on sound engineering judgment and currently available data and resources. Adaptive management strategies could target specific land uses that tend to bypass green street treatment (e.g. runoff, and associated treatment capacity, generated by industrial areas could be addressed through relevant industrial permits or onsite BMPs). Additional discussion on adaptive management strategies is provided in Section 8 of the main report.

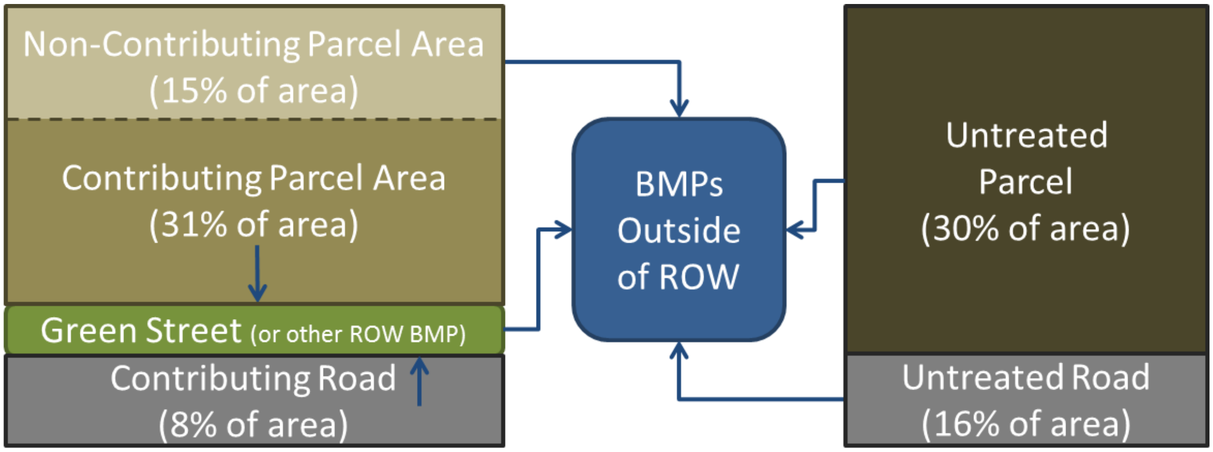

Figure 1-9. Schematic characterizing approximate distribution of routing to BMPs in the ROW for all WMP areas (arrows denote direction of runoff routing; figure not to scale).

BMP Infiltration Rates by Subwatershed

The purpose of performing the subwatershed infiltration rate analysis was to assign an average green street BMP infiltration rate to each subwatershed using soils data. Infiltration rates were assigned at the subwatershed level, which is the finest resolution at which the model performs hydrologic and water quality computations.

Soil data coverage provided through the LACDPW categorized soil unit areas into soil types. Runoff coefficient curves reported in the Hydrology Manual were developed by LACDPW for each soil type using double ring infiltrometer tests performed on areas of homogeneous runoff characteristics (LACDPW 2006). LADPW employed a sprinkling-type infiltrometer to perform the tests in each homogeneous area.

Runoff coefficient curves represent the response of the runoff coefficient (defined as the ratio of runoff to rainfall from a land area) to varying rainfall intensities. Each curve displays an inflection point representing the rainfall intensity at which substantial runoff initiates. According to LADPW (2006), each curve was assigned a minimum runoff coefficient of 0.1, “indicating that there is some runoff even at the smallest rainfall intensities.” If it is assumed that substantial runoff initiates when the intensity of rainfall is greater than the soil’s inherent infiltration rate, then the infiltration rate can be assumed equal to the rainfall intensity at the inflection point (less the assumed minimum runoff).

As demonstrated conceptually in Figure 1-10, the inflection point, and subsequently calculated infiltration rate, for each unique soil type in the WMP areas were identified using the runoff coefficient curves in Appendix C of the *Hydrology Manual* (LADPW 2006). Subwatershed areas were then intersected with the soil type coverage to calculate an area-weighted infiltration rate. Attachment C shows the distribution of the infiltration rates.

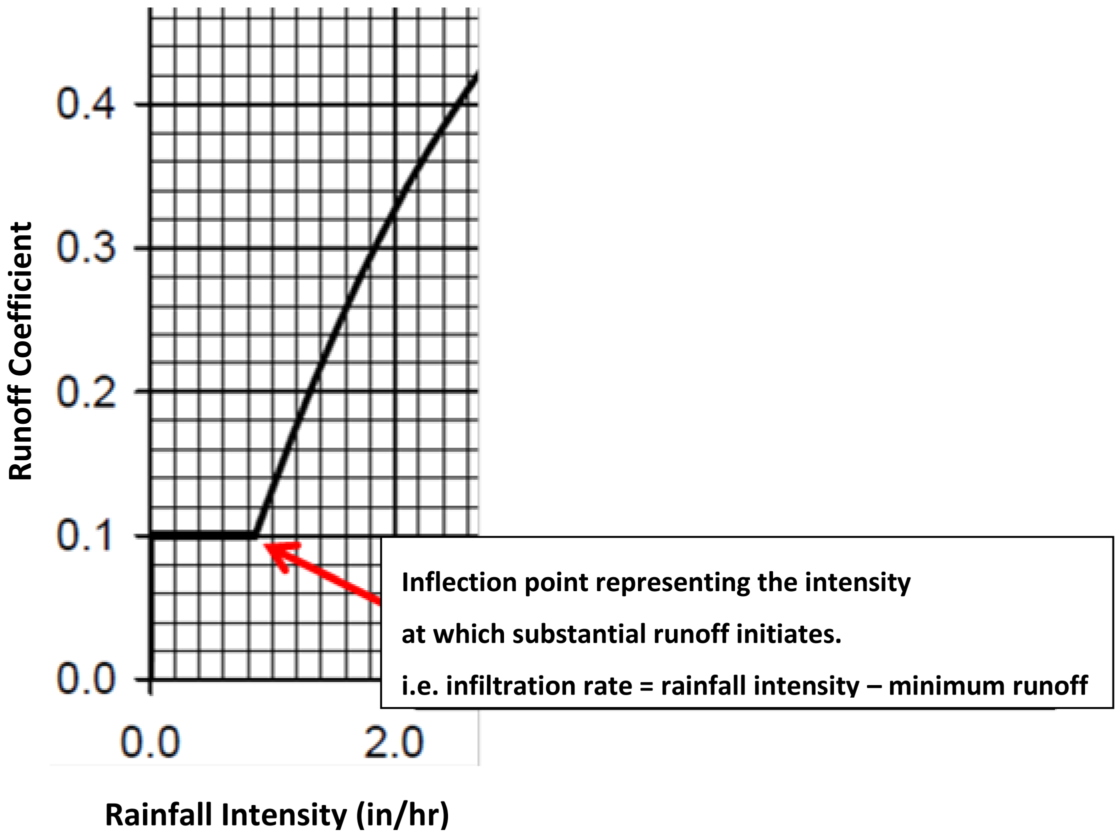

Figure 1-10. Example determination of runoff coefficient inflection point for an arbitrary soil type in Appendix C of LACDPW (2006).

1.3. LID on Public Parcels Assessment

Retrofitting public parcels with LID can be an efficient strategy for reducing stormwater runoff. This method allows municipalities the flexibility to prioritize and schedule stormwater projects to coincide with improvements that are already on the books (such as scheduled parking lot resurfacing, utility work, and public park improvements). Implementing LID on public parcels also allows municipalities the freedom to construct, inspect, and maintain BMPs without the need to purchase private property or to create stormwater easements.

The spatial extent of public parcels in each subwatershed was identified by selecting all parcels labeled as public by their assessors identification number (AIN). A total of 7,052 acres of public land was identified during this process (7% of the total WMP area). Each public parcel was assumed to implement BMPs that would treat the 85th percentile, 24-hour storm. The BMP volume was assumed to equal the 85th percentile, 24-hour storm depth times the impervious area.

LID retrofits are not feasible in all locations due to steep slopes, soil contamination hazards, and other constrains. The total runoff to be retained on public parcels was therefore discounted by 30% in order to provide a more realistic goal; this estimate was made in the lack of more detailed data, based on past LID screening exercises performed in Los Angeles County. The discount factor should be refined as actual public project sites are screened and prioritized.

1.4. Existing, Planned, and Potential BMPs

Existing and planned BMPs throughout the WMP areas were identified by the jurisdictions. These BMPs will provide capacity to reduce the annual storm runoff volume and demonstrate progress towards achieving the target runoff volume reduction.

1.4.1. Modeled Existing/Planned Subwatershed-Scale Regional BMPs

Regional BMPs that treat large portions of, or entire, subwatersheds (i.e. those with drainage areas larger than 50 acres) were modeled to quantify the impact to the upstream jurisdictions. The modeling approach and predicted performance for these specific sites is detailed in the following subsections. It is important to note that modeling was performed at a planning level coincident with the resolution of the subwatershed-scale WMMS model. Limited data were available to represent the sites, so conservative engineering assumptions were applied where appropriate. The calculated equivalent volume reductions from the BMPs can be refined during the adaptive management process once detailed design and monitoring data become available for the sites.

DeForest Wetlands Project

The DeForest Wetlands Project is located along the east bank of the Los Angeles River in the City of Long Beach and is comprised of approximately 34 acres of restored terrestrial and freshwater habitat and recreational amenities. The Project provides both groundwater recharge and surface water quality improvement. Site and modeling details are listed in Table 1-7.

Table 1-7. DeForest Wetlands Project details

Parameter	Value	Unit	Notes, Assumptions
Site Overview			
WMP Area	Lower Los Angeles River		
Location	City of Long Beach		
Status	In Development		
Compliance Targets for Contributing Subwatersheds[1]	**248.7**	**ac-ft/yr**	Subwatershed 486066
	247.6	**ac-ft/yr**	Subwatershed 486068
Given Details			
Drainage Area	1490	ac	Delineated in GIS using WMMS subwatershed boundaries
Average Annual Infiltration Volume	15-35	ac-ft/yr	Per Section 3 of the WMP
Average Annual Treated Volume	800-1000	ac-ft/yr	Per Section 3 of the WMP; assumed volume is fully treated by wetland pollutant removal mechanisms prior to discharge; assumed treated volume is in addition to infiltration volume
Annual Runoff Volume Entering Wetland[1]	1589	ac-ft/yr	WMMS output
Annual Zinc Load Entering Wetland[1]	1808	lb Zn/yr	WMMS output
Wetland Zinc Effluent Concentration	20	µg/L	Upper limit of 95% confidence interval for wetland channels, per RAA Guidelines (LARWQCB 2014)
Modeling Results			
Estimated Annual Zinc Load Reduced by Infiltration[1]	17.1	lb Zn/yr	Assumed loading associated with minimum average infiltrated runoff; assumed load sequestered in sediments and/or sorbed to underlying soils
Estimated Annual Zinc Load Reduced by Wetland Functions[1]	535	lb Zn/yr	Reduction associated with treated volume; calculated by subtracting average effluent load associated with minimum treated volume from annual influent loading
Estimated Zinc Load Reduction	30.5%		

Relative to Annual Runoff[1]			
Estimated Zinc Load Reduction Relative to Compliance Target[1]	97.7%		
Estimated Equivalent Annual Volume Reduction[1]	**243.1**	**ac-ft/yr**	Subwatershed 486066
	242.0	**ac-ft/yr**	Subwatershed 486068

[1] Indicated annual volumes are referenced to the critical year

Dominguez Gap Wetlands Project

The Dominguez Gap Wetlands Project consists of two treatment wetlands situated on the east and west banks of the Los Angeles River that features habitat and recreational amenities. The East Basin is a 37-ac facility that is dewatered manually by a pump. The West Basin primarily functions as an infiltration basin and is approximately 15 acres. Table 1-8 and Table 1-10 characterize the site and modeling details of the East and West Basins, respectively.

Table 1-8. Dominguez Gap East Wetlands Project – East Basin details

Parameter	Value	Unit	Notes, Assumptions
Site Overview			
WMP Area	Lower Los Angeles River		
Location	City of Long Beach		
Status	Complete		
Compliance Targets for Contributing Subwatersheds[1]	**346.9**	**ac-ft/yr**	Subwatershed 486014
	14.3	**ac-ft/yr**	Subwatershed 446014
Given Details			
Drainage Area	2075	ac	Delineated in GIS using WMMS subwatershed boundaries
Maximum Volume Treated per Storm Event	71	ac-ft	Per Section 3 of the WMP; assumed volume is fully treated by wetland pollutant removal mechanisms prior to discharge
Maximum Annual Volume Treated[1]	526	ac-ft/yr	Based on storm events recorded for critical year; assumed all storm event runoff volume treated up to 71 ac-ft
Annual Runoff Volume Entering Wetland[1]	913	ac-ft/yr	WMMS output
Annual Zinc Load Entering Wetland[1]	934	lb Zn/yr	WMMS output
Wetland Zinc Effluent Concentration	20	µg/L	Upper limit of 95% confidence interval for wetland channels, per RAA Guidelines (LARWQCB 2014)
Modeling Results			
Annual Zinc Load Reduced by Infiltration[1]	unknown	lb Zn/yr	Site soil information or monitored data required
Annual Zinc Load Reduced by Wetland Functions[1]	202	lb Zn/yr	Reduction associated with treated volume; calculated by subtracting average effluent load associated with minimum treated volume from annual influent loading
Zinc Load Reduction Relative to Annual Runoff[1]	22%		
Zinc Load Reduction Relative to Compliance Target[1]	55%		
Equivalent Annual Volume Reduction[1]	**191.7**	**ac-ft/yr**	Subwatershed 486014

Discovery Park Infiltration Basin

An existing infiltration basin located at 12400 Columbia Way in the City of Downey treats runoff from approximately 51 acres (5% of the subwatershed in which the site is located). Field observations indicate that the facility has capacity to infiltration runoff at a rate of 2 in/hr (equivalent to approximately 4 ac-ft/day) in addition to detention storage. Table 1-11 reports the simplified modeling assumptions for this BMP – upon further evaluation of as-built conditions, the associated volume reduction can be refined during the adaptive management process.

Table 1-11. Discovery Park Infiltration Basin details

Parameter	Value	Unit	Notes, Assumptions
Site Overview			
WMP Area	Lower San Gabriel River		
Location	City of Downey		
Status	Complete		
Compliance Targets for Treated Subwatersheds[1]	**80.6**	**ac-ft/yr**	Subwatershed 245115
Given Details			
Drainage Area	51	ac	
Observed Infiltration Rate	4	ac-ft/day	Per Gerald Green, personal communication, 2014, February 2
Percentage of Subwatershed Contributing to BMP	5%		
Approximate Runoff Volume Draining to BMP[1]	44	ac-ft/yr	WMMS
Modeling Results			
Equivalent Annual Volume Reduction[1]	**24**	**ac-ft/yr**	Assumed constant infiltration over entire footprint, applied to each time step of model runoff output draining to park

[1] Indicated annual volumes are referenced to the critical year

Parque Dos Rios

Parque Dos Rios is located at the confluence of the Los Angeles River and Rio Hondo River. An approximately 30-ac area between the freeway and the Los Angeles River will be converted to an infiltration basin to treat additional upstream area. Currently, the site is self-retaining open space and is characterized in the baseline model as such. No further runoff volume reductions were calculated for this site; as design details are finalized for the infiltration basin improvements, associated volume reductions can be applied towards upstream jurisdictional compliance targets.

1.4.2. Identified Parcel-Scale Regional and Distributed BMPs

The jurisdictions within the WMP areas compiled detailed lists of BMPs intended to treat areas smaller than 50 acres. As with the preceding regional BMPs, these strategies represent progress towards achieving the compliance target in each respective jurisdiction. The distributed BMPs are listed in Attachment D and can be applied towards meeting the compliance targets in each jurisdiction.

The WMP groups have identified additional potential regional BMPs and these are listed in Section 3 for LCC and Section 4 for LLAR and LSGR of the respective WMP.

1.5. Non-MS4 Facility Runoff

Each jurisdiction is the Group's WMP area is subject to stormwater runoff from non-MS4 facilities. In particular, Caltrans roads and facilities regulated by nontraditional or general industrial permits contribute to the runoff volume for each subwatershed. It will be important for these entities to retain their runoff and/or eliminate their cause/contribution to receiving water exceedances. The runoff from these non-MS4 facilities was therefore estimated and subtracted from the treatment target as described below.

1.5.1. Non-MS4 Permitted Areas

Non-MS4 permitted areas were identified based on the address list of permittees on the State Water Resources Control Board (SWRCB) website. Using the address information, corresponding parcel areas were selected using the LA County Assessor Parcel Viewer and the associated GIS Shapefile. The percentage of permitted land use area relative to the total land use area was calculated and the associated non-MS4 permitted area runoff as extracted from the WMMS runoff response output.

1.5.2. Caltrans

The design storm runoff generated by Caltrans facilities was estimated using WMMS land use data. Areas labeled as Transportation consist of freeways and other extensive transportation facilities that tend to fall under Caltrans jurisdiction (versus areas labeled as Secondary Roads, which are managed by local transportation departments); these areas were assumed to be Caltrans facilities. Runoff from Transportation land uses, less runoff from any overlapping non-MS4 permitted areas identified above, was extracted from the WMMS model output for each subwatershed.

1.6. Institutional BMPs and Minimum Control Measures

It is challenging to accurately quantify most institutional BMP and minimum control measure (MCM) benefits in terms of pollutant load reductions because they generally require extensive survey and monitoring information to quantify. In addition, nonstructural BMPs may target pollutants, land uses, or populations, resulting in different load reductions depending on the implementation technique. A number of MCMs are outlined in each WMP, representing an array of practices to most effectively address pollutants at their source or affect their transport. For the purposes of the RAA, a 10% reduction was assumed to represent the cumulative impact of these practices during both wet and dry conditions. Another explicitly modeled nonstructural BMP was a goal to reduce 25% of irrigation of urban vegetation, a goal that can result from a myriad of practices ranging from public education, enforcement, incentive programs, creative water rate structures, etc. The 25% reduction in irrigation was modeled directly in LSPC and is the primary driver for dry weather flow reductions. Pollutant load reductions from these nonstructural BMPs were subtracted from loads simulated in the baseline model to quantify progress towards meeting the watershed numeric goals. Results of both the 10% reduction for collective MCMs, in addition to irrigation reduction, are presented in Section 7 of the main RAA report for both wet and dry conditions.
