# **Appendix III**

## **Lab and Field QC Results**

## Table of Contents

---

Table III -1. ESJWQC sample results including field blanks (FB) and field duplicates (FD) for organic analysis.....	1
Table III -2. ESJWQC laboratory quality assurance (LABQA) results for organic analysis.....	76
Table III -3. ESJWQC sample results including field blanks (FB), field duplicates (FD) and travel blanks (TB) for inorganic analysis including physical parameters, nutrients, metals and bacteria. ....	179
Table III -4. ESJWQC laboratory quality assurance (LABQA) results for inorganic analysis including physical parameters, nutrients, metals and bacteria. ....	216
Table III -5. ESJWQC water toxicity testing results. ....	283
Table III -6. ESJWQC sediment toxicity testing results.....	285

**Table III -1. ESJWQC sample results including field blanks (FB) and field duplicates (FD) for organic analysis.**

Expected values for field duplicates are the associated environmental sample result. Samples are sorted by station name, sample type code, sample date, and analyte.

Station Name	Sample Type Code	Sample Replicate	Sample Date	Sample Time	Method Name	Analyte	Result	Unit	Qualifier Code	MDL	RL	Expected Value	RPD	Quality Assurance	Data Acceptability Criteria	Lab Comments

**Table III -2. ESJWQC laboratory quality assurance (LABQA) results for organic analysis.**

Results include blanks (LabBlank), matrix spikes (MS), and laboratory control spikes (LCS) for organic analysis. LABQA was performed for samples collected during the 2008 irrigation season and results are sorted by sample type, station name, sample date, and analyte. For laboratory control samples, the sample date is equal to the extraction date; some LABQA samples may appear to be duplicates due to multiple batches run on the same date.

**Table III -3. ESJWQC sample results including field blanks (FB), field duplicates (FD) and travel blanks (TB) for inorganic analysis including physical parameters, nutrients, metals and bacteria.**

Expected values for field duplicates are the associated environmental sample result. Samples are sorted by station name, sample type code, sample date, and analyte.

**Table III -4. ESJWQC laboratory quality assurance (LABQA) results for inorganic analysis including physical parameters, nutrients, metals and bacteria.**

Results include blanks (Lab Blank), matrix spikes (MS), and laboratory control spikes (LCS) for inorganic analysis. LABQA was performed for samples collected during the 2008 irrigation season and results are sorted by sample type, station name, sample date, and analyte. For laboratory control samples, the sample date is equal to the extraction date or analysis date; some LABQA samples may appear to be duplicates due to multiple batches run on the same date. Non Ag Waiver QA samples are samples from other projects included to meet batch requirements.

**Table III -5. ESJWQC water toxicity testing results.**

Results are for *Ceriodaphnia dubia*, *Pimephales promelas* and *Selenastrum capricornutum* field duplicates (FD) samples collected during the 2008 irrigation season. Data are sorted by station name, species and sample date. Data acceptability criteria is RPD <25.

Station Name	Sample Type Code	Sample Date	Sample Time	Matrix	Toxicity Start Date	Species	Toxicity End Point	Control Mean	Sample Mean	Percent Control	Toxicity Significance	Toxicity Test Comments
Deadman Creek @ Gurr Rd	FD	09/30/08	10:30	water	10/01/08	<i>Ceriodaphnia dubia</i>	Survival (%)	100	100	100	NSG	FD RPD 0

# **Appendix IV Pesticide Use Reports**

## Table of Contents

Bear Creek @ Kibby Rd .....	1
Pesticide Use Reports for metal exceedances in the water column .....	1
Irrigation 5 (8/26/08) - copper exceedance.....	1
Pesticide Use Reports for water column toxicity.....	1
Irrigation 1 (4/29/08) - <i>Selenastrum capricornutum</i> toxicity.....	1
Irrigation 1 RS (5/7/08) - <i>Selenastrum capricornutum</i> toxicity.....	6
Pesticide Use Reports for sediment toxicity .....	11
Irrigation 5 (8/28/08) – <i>Hyaella azteca</i> toxicity.....	11
Irrigation 5 RS (10/2/08) – <i>Hyaella azteca</i> toxicity.....	18
Black Rascal Creek @ Yosemite Rd .....	24
Pesticide Use Reports for metal exceedances in the water column .....	24
Irrigation 1 (4/29/08) - copper exceedance.....	24
Pesticide Use Reports for sediment toxicity .....	26
Irrigation 5 (8/28/08) – <i>Hyaella azteca</i> toxicity.....	26
Cottonwood Creek @ Rd 20 .....	30
Pesticide Use Reports for metal exceedances in the water column .....	30
Irrigation 1 (4/29/08) - copper exceedance.....	30
Irrigation 5 (8/26/08) - copper exceedance.....	37
Pesticide Use Reports for water column toxicity.....	40
Irrigation 1 (4/29/08) - <i>Selenastrum capricornutum</i> toxicity.....	40
Irrigation 1 RS (5/7/08) - <i>Selenastrum capricornutum</i> toxicity.....	55
Cottonwood Creek @ Hwy 145.....	67
Pesticide Use Reports for metal exceedances in the water column .....	67
Irrigation 3 MPM (6/24/08) - copper exceedance.....	67
Deadman Creek @ Hwy 59 .....	70
Pesticide Use Reports for pesticide exceedances in the water column .....	70
Irrigation 5 MPM (8/5/08) - chlorpyrifos exceedance.....	70
Irrigation 6 MPM (9/9/08) - chlorpyrifos exceedance.....	73
Pesticide Use Reports for water column toxicity.....	75
Irrigation 1 (4/29/08) - <i>Selenastrum capricornutum</i> toxicity.....	75
Irrigation 1 RS (5/7/08) - <i>Selenastrum capricornutum</i> toxicity.....	83
Pesticide Use Reports for sediment toxicity .....	90
Irrigation 5 (8/28/08) – <i>Hyaella azteca</i> toxicity.....	90
Dry Creek @ Rd 18 .....	108
Pesticide Use Reports for metal exceedances in the water column .....	108
Irrigation 1 (4/29/08) - copper exceedance.....	108
Irrigation 2 (5/27/08) - copper exceedance.....	112
Irrigation 3 (6/24/08) - copper exceedance.....	115
Irrigation 4 (7/29/08) - copper exceedance.....	118
Irrigation 5 (8/26/08) - copper exceedance.....	120
Pesticide Use Reports for sediment toxicity .....	122
Irrigation 5 (8/28/08) – <i>Hyaella azteca</i> toxicity.....	122
Dry Creek @ Rd 22 .....	138
Pesticide Use Reports for metal exceedances in the water column .....	138

Irrigation 1 MPM (4/29/08) - copper exceedance.....	138
Irrigation 2 MPM (5/27/08) - copper exceedance.....	140
Irrigation 3 MPM (6/24/08) - copper exceedance.....	142
Irrigation 4 MPM (7/29/08) - copper exceedance.....	144
Irrigation 5 MPM (8/26/08) - copper exceedance.....	144
Irrigation 6 MPM (9/30/08) - copper exceedance.....	146
Dry Creek @ Rd 28 ½ .....	148
Pesticide Use Reports for metal exceedances in the water column .....	148
Irrigation 4 MPM (7/29/08) - copper exceedance.....	148
Dry Creek @ Wellsford Rd .....	150
Pesticide Use Reports for pesticide exceedances in the water column .....	150
Irrigation 4 (7/22/08) - chlorpyrifos exceedance.....	150
Pesticide Use Reports for sediment toxicity .....	153
Irrigation 5 (8/28/08) – <i>Hyalella azteca</i> toxicity.....	153
Dry Creek @ Waterford Rd .....	168
Pesticide Use Reports for pesticide exceedances in the water column .....	168
Irrigation 4 MPM (7/22/08) - chlorpyrifos exceedance.....	168
Irrigation 5 MPM (8/19/08) - chlorpyrifos exceedance.....	171
Duck Slough @ Gurr Rd.....	173
Pesticide Use Reports for pesticide exceedances in the water column .....	173
Irrigation 1 (4/29/08) - carbofuran exceedance.....	173
Pesticide Use Reports for sediment toxicity .....	175

**Bear Creek @ Kibby Rd**

**Pesticide Use Reports for metal exceedances in the water column**

**Irrigation 5 (8/26/08) - copper exceedance.**

No reported use for three months prior to sampling. Last reported use was on 4/22/08.

**Pesticide Use Reports for water column toxicity**

**Irrigation 1 (4/29/08) - *Selenastrum capricornutum* toxicity.**

### Pesticide Use Reports for pesticide exceedances in the water column

#### Irrigation 1 (4/29/08) - carbofuran exceedance.

There was no reported use of carbofuran within four weeks prior to the exceedance. Applications that occurred within eight weeks prior to the exceedance are shown below.

Commodity	Date Applied	Product Name	Active Ingredient	Application Method	Quantity Used	Unit	Treated Acres	TRS	Chemical Type
ALFALFA	3/8/2008	FURADAN 4F INSECTICIDE-NEMATICIDE	CARBOFURAN	G	6.25	GA	25	8S14E14	INSECTICIDE

Figure 35. Location of pesticide use for Duck Slough @ Gurr Rd – Irrigation 5 SED RSS

***Duck Slough @ Hwy 59***

**Pesticide Use Reports for metal exceedances in the water column**

**Irrigation 6 MPM (9/30/08) - copper exceedance.**

No reported use for three months prior to sampling. Last reported application was on 6/2/08.

## Duck Slough @ Hwy 99

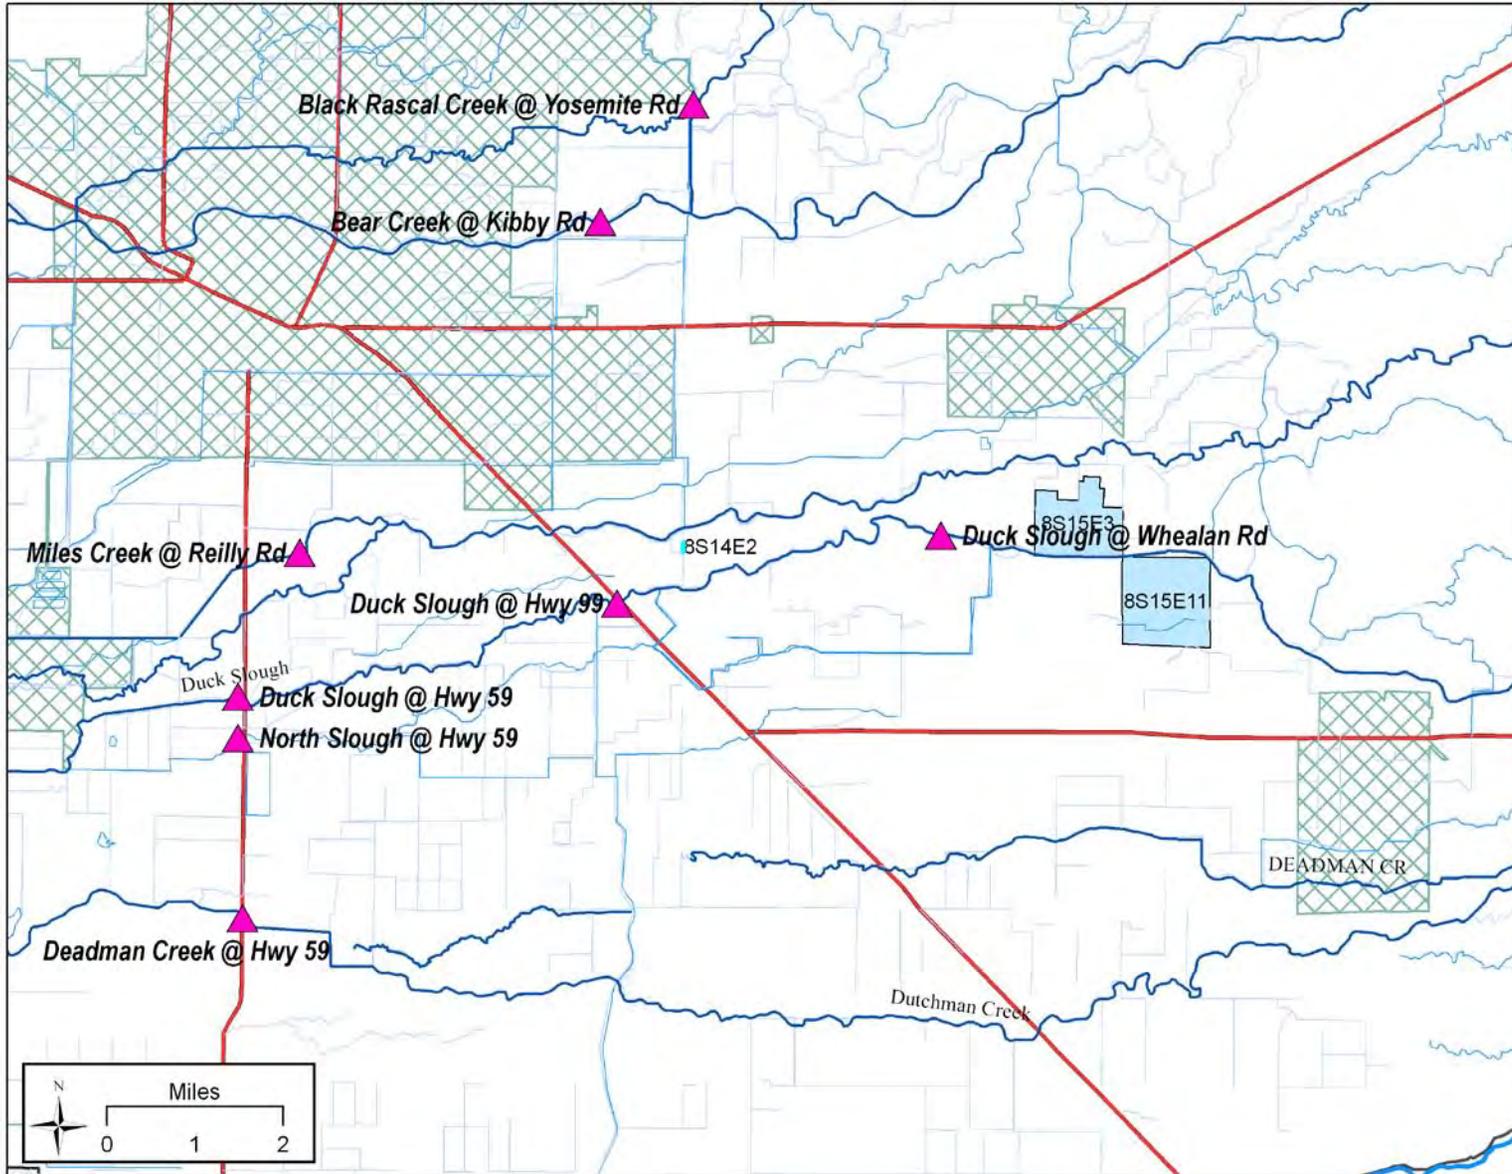

### Pesticide Use Reports for pesticide exceedances in the water column

#### Irrigation 6 (9/30/08) - chlorpyrifos exceedance.

No reported use of chlorpyrifos within four weeks prior to the exceedance. Applications within eight weeks prior to the exceedance are shown.

Figure 57. Location of chlorpyrifos use for Highline Canal @ Lombardy – Irrigation 5

**Irrigation 5 (8/19/08) - malathion exceedance.**

No reported use in 2008.

**Irrigation 5 (8/19/08) – methyl parathion exceedance.**

No reported use within four weeks prior to the exceedance. Last reported use occurred on June 24, 2008.

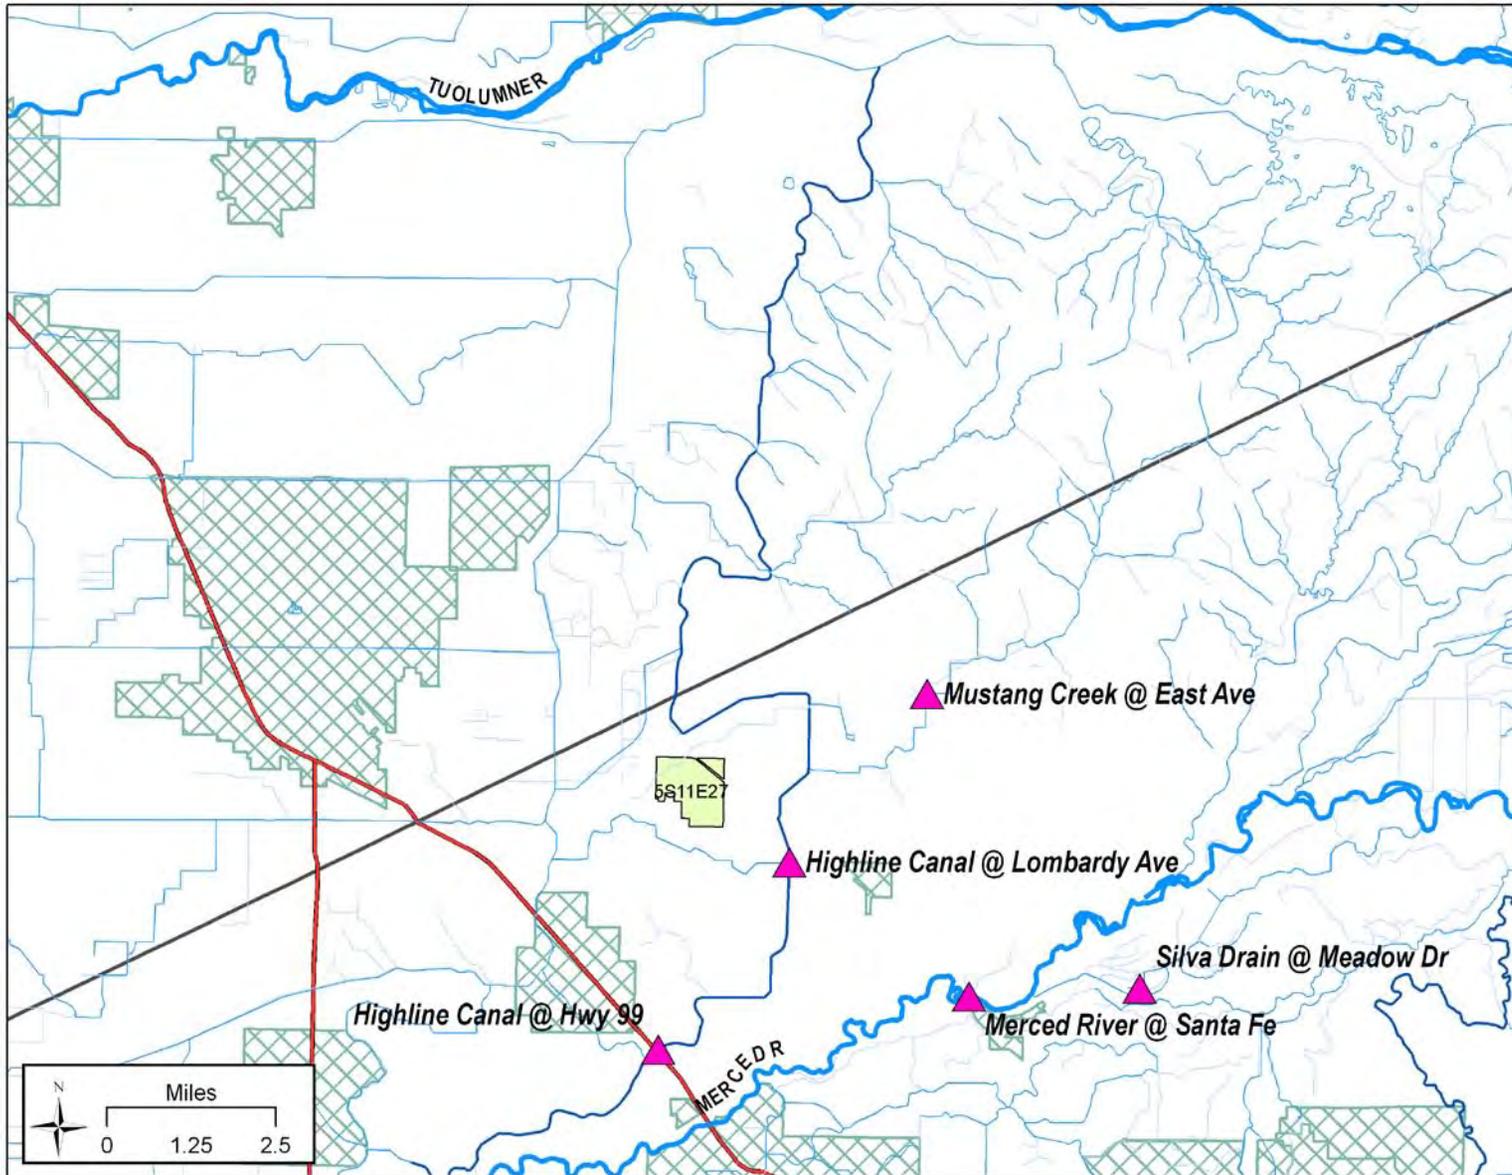

## Pesticide Use Reports for metal exceedances in the water column

### Irrigation 5 (8/19/08) – copper exceedance.

There were no copper applications within 12 weeks prior to the exceedance. Within 16 weeks prior to the exceedance, one application occurred on May 25, 2008 (shown below).

Commodity	Date Applied	Product Name	Active Ingredient	Application Method	Quantity Used	Unit	Treated Acres	TRS	Chemical Type

## **Pesticide Use Reports for metal exceedances in the water column**

### **Irrigation 4 (7/29/08) – copper exceedance.**

There was no copper applied within 12 weeks prior to the exceedance. The last copper applications occurred on January 17, 2008.

**Irrigation 5 (8/26/08) – copper exceedance.**

No reported use after January 2008

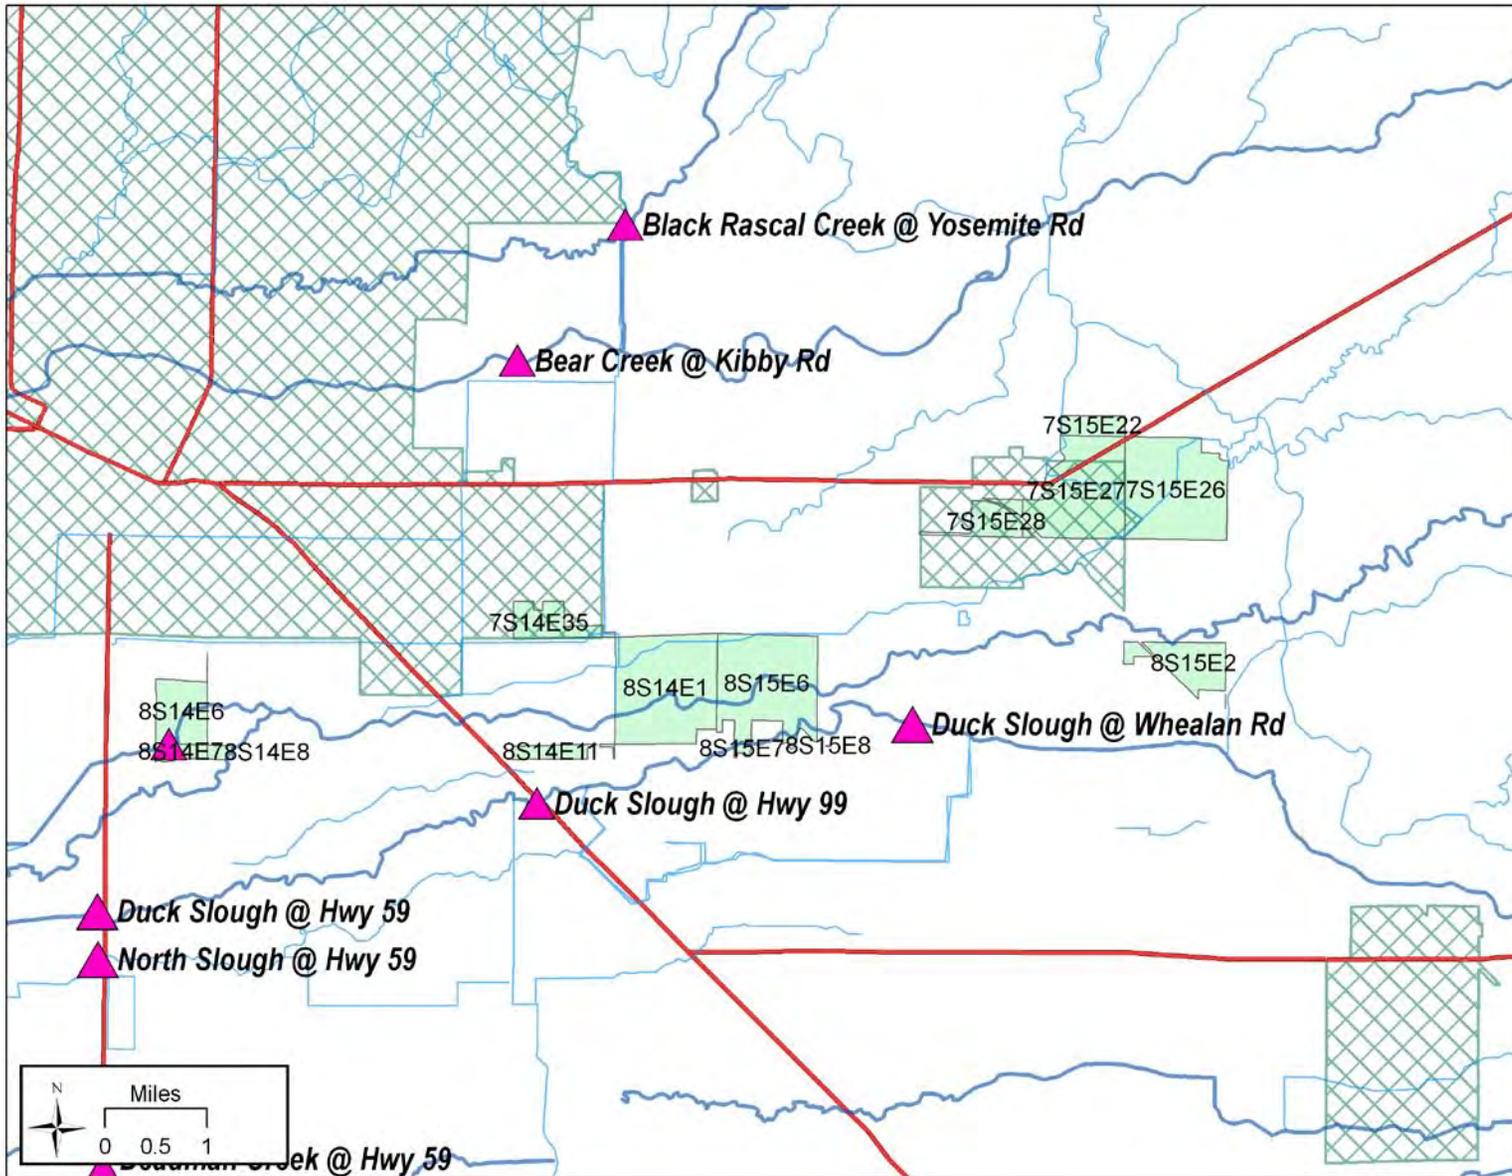

**Pesticide Use Reports for toxicity in the water column**

**Irrigation 1 (4/29/08) – *Selenastrum capricornutum* toxicity.**

## ***ESJWQC Exceedance Reports 2008***

**Sent:** Wednesday, April 23, 2008 at 11:39 AM

**From:** K Callinan <kcallinan@mlj-llc.com>

**To:** Dania Huggins <dhuggins@waterboards.ca.gov>

**Cc:** Parry Klassen <pklassen@unwiredbb.com>, Mike Johnson <mjohnson@mlj-llc.com>, Melissa Turner <mturner@mlj-llc.com>, Francisca Johnson <fjohnson@mlj-llc.com>, Lara Reising <ltreising@gmail.com>, kcallinan@mlj-llc.com

**Subject:** Field Exceedance Report - Irrigation1 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation1\_table\_042308.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On April 22, 2008, normal and management plan monitoring was conducted in the ESJWQC region for the first irrigation season sampling event. Ambient water samples were collected from these sites for water toxicity and chemistry analyses. During the sampling field parameters were measured, however the Mustang Creek @ East Ave site was dry and field parameters were not taken. Five exceedances of the receiving water quality trigger limit (WQTL) for electrical conductivity (EC) and five exceedances of the WQTL for dissolved oxygen (DO) were experienced during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as a scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. With the exception of the exceedances experienced at the new Prairie Flower Drain management plan monitoring site (upstream of the normal monitoring site), all exceedances in this report have been addressed in management plans or previous communication reports. The field exceedances experienced at management plan monitoring sites will be addressed in the subwatershed management plans and will not be included in communication reports. As a result, a Communication Report will not be submitted for these exceedances.

Mike Johnson

**Subject:** Toxicity Exceedance Report - Irrigation1 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation1\_table\_042808.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On April 22, 2008, sampling was conducted in the ESJWQC region for the first irrigation season sampling event. Toxicity results were received from the laboratory on April 28, 2008. Toxicity to *Selenastrum* was experienced in samples collected from six sites. See attached Table 1 for details on these exceedances. Toxicity Identification Evaluations have been initiated for all samples that experienced 50% or greater reduction relative to the control.

b.) Follow-up sampling will be conducted tomorrow, April 29, 2008. The results from the resampling event will indicate whether the toxicity is persistent at these sites.

c.) All exceedances in this report have been or will be addressed in management plans or previously scheduled communication reports and therefore follow-up reporting is not required.

**Subject:** Field Exceedance Report - Irrigation1 NM, RS, MPM 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation1&RS&MPM\_table\_043008.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On April 29, 2008, samples were collected for normal monitoring, resampling and management plan monitoring in the ESJWQC region for the first irrigation season event. Ambient water samples were collected from these sites for water toxicity and/or chemistry analyses. During the sampling field parameters were measured, however the Ash Slough @ Ave 21 and Berenda Slough @ Ave 18 ½ sample sites were dry and field parameters were not taken. During this event, four exceedances of the receiving water quality trigger limit (WQTL) for electrical conductivity (EC), two exceedances of pH and five exceedances of dissolved oxygen (DO) were measured across six of the Coalition sample sites. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as a scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the normal monitoring sites experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source.

The high pH measured at the Black Rascal Creek and Dry Creek sites may be due to particular inputs into the water bodies or natural conditions, among other possible sources. Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. The pH exceedance measured at Black Rascal Creek occurred for the first time during Coalition monitoring at that site, and as a result a Communication Report will be submitted to follow-up on that exceedance by July 3, 2008. The pH exceedance measured at Dry Creek @ Rd 22 (management plan monitoring site) will be addressed in the relevant subwatershed Management Plan and will not be included in a communication report.

**Subject:** ESJWQC Toxicity Exceedance Report- Irrigation1 NM, RS 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation1RS\_050508.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-

up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On April 29, 2008, normal monitoring and toxicity resampling (for monitoring conducted on April 22, 2008) was conducted in the ESJWQC region for the first irrigation season sampling event. Toxicity results for this event were received from the laboratory on March 5, 2008. Toxicity to *Selenastrum* was experienced in samples collected from six normal monitoring sites and four resampling sites. See attached Table 1 for details on these exceedances. Toxicity Identification Evaluations have been initiated for all normal monitoring samples that experienced 50% or greater reduction relative to the control.

b.) Follow-up sampling for normal monitoring sites that experienced toxicity will be conducted on Wednesday, March 7, 2008. The results from the resampling event will indicate whether the toxicity is persistent at these sites.

c.) The *Selenastrum* toxicity experienced at Cottonwood Creek, South Slough and Bear Creek during this sampling event occurred for the first time during Coalition monitoring, and as a result a Communication Report will be submitted for these exceedances by July 9, 2008. Cottonwood Creek @ Rd 20 and Bear Creek @ Kibby Rd were not supposed to be tested for *Selenastrum* toxicity since these sites were approved to have this constituent dropped from monitoring by the Executive Officer on December 14, 2007. Due to a laboratory error, these samples were analyzed for *Selenastrum* toxicity during this irrigation season and resulted in significant toxicity. A TIE is being conducted on both samples and resampling will occur. In addition, due to these exceedances, the Coalition will continue to monitor for *Selenastrum* toxicity at these two locations during the rest of the irrigation season (May-September). If you have any questions about this and/or if there is another course of action that you wish for us to pursue, please feel free to contact me.

Mike Johnson

**Subject:** Field Exceedance Report - Irrigation2 MPM 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation2\_MPM\_table\_050808.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On May 7, 2008, management plan monitoring was conducted at five sites in the ESJWQC region for the second irrigation season sampling event. Ambient water samples were collected for water toxicity and chemistry analyses. During the sampling field parameters were measured, however the Ash Slough @ Ave 21 site was dry and field parameters were not taken. One exceedance of the receiving water quality trigger limit (WQTL) for pH was experienced during this sampling event. See attached Table 1 for details on these exceedances. The raw data for the field exceedance is available upon request as a scanned field sheet.

b) Immediate follow-up sampling will not be conducted. Coalition sampling will occur again for normal monitoring on May 20 and 27, 2008 and field parameters will be measured again at that time.

c) Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source. The high pH experienced at Highline Canal may be due to a particular input into the water body or natural conditions of the water body itself, among other possible sources. The pH exceedance at Highline Canal @ Hwy 99 has been dealt in the subwatershed Management Plan and previous Communication Reports. As a result, a Communication Report will not be submitted for this exceedance.

MPM – management plan monitoring

**Sent: Friday, May 16, 2008 at 10:17 AM**

**From:** K Callinan <kcallinan@mlj-llc.com>

**To:** Dania Huggins <dhuggins@waterboards.ca.gov>

**Cc:** Parry Klassen <pklassen@unwiredbb.com>, Mike Johnson <mjohnson@mlj-llc.com>, Melissa Turner <mturner@mlj-llc.com>, Francisca Johnson <fjohnson@mlj-llc.com>, Lara Reising <ltreising@gmail.com>, kcallinan@mlj-llc.com

**Subject:** Toxicity Exceedance Report - Irrigation1 RS 2008 (and MPM report of no toxicity)

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation1\_RS\_table\_051608.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On May 7, 2008, management plan monitoring and toxicity resampling were conducted in the ESJWQC region. Toxicity results for these samples were received from the laboratory on May 15, 2008. Management plan monitoring for toxicity was conducted at three sites, of which none experienced toxicity. However toxicity was experienced in all five of the resamples that were collected as follow-up to *Selenastrum* toxicity experienced during the first irrigation season sampling event on April 29, 2008. See attached Table 1 for details on these exceedances. Samples from this event were accidentally discarded by the laboratory prior to the initiation of Toxicity Identification Evaluations and as a result TIEs were not conducted in two samples (Deadman Creek @ Hwy 59 and Duck Slough @ Hwy 99) for which the tests were triggered. The laboratory has implemented new procedures with their staff to avoid such a mishap in the future.

b.) Samples that experienced toxicity during this event were collected as resamples to follow-up on toxicity from the normal monitoring event, therefore additional follow-up sampling will not be conducted. Coalition sampling will occur again for the second irrigation season event on May 20, 2008.

c.) The *Selenastrum* toxicity experienced at Cottonwood Creek, South Slough and Bear Creek during the normal monitoring event occurred for the first time during Coalition monitoring, and as a result a Communication Report will be submitted for these exceedances by July 9, 2008. Results from the resampling event will be discussed in this report.

**Subject:** Field Exceedance Report - Irrigation2 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation2\_table\_052108.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On May 20, 2008, normal and management plan monitoring was conducted in the ESJWQC region for the second irrigation season sampling event. Ambient water samples were collected from these sites for water toxicity and chemistry analyses. During the sampling field parameters were measured, however the Mustang Creek @ East Ave site was dry and field parameters were not taken. One exceedance of the receiving water quality trigger limit (WQTL) for pH, five exceedances of electrical conductivity (EC) and five exceedances of dissolved oxygen (DO) were experienced during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as a scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source. The high pH experienced at Livingston Drain @ Robin Ave may be due to a particular input into the water body or natural conditions of the water body itself, among other possible sources. DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. With the exception of the exceedances experienced at the new Prairie Flower Drain management plan monitoring site (upstream of the normal monitoring site), all exceedances in this report have been addressed in management plans or previous communication reports. The field exceedances experienced at management plan monitoring sites will be addressed in the subwatershed management plans and will not be included in communication reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Pesticide Exceedance Report - Irrigation1 2008

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation1\_table\_052308.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On April 15, 2008 sampling was conducted in the ESJWQC region for the first irrigation season monitoring event. Data were received from the laboratory on May 22, 2008. One exceedances of DDT was experienced during this monitoring event. See attached Table 1 for details on this exceedance.

b. Follow-up sampling for this pesticide exceedance will not be conducted. Monitoring for the second irrigation event occurred on May 20, 2008, and results from this monitoring event will indicate if the exceedance in this report is persistent.

c. The exceedance of DDT was a first-time exceedance at the Hatch Drain @ Tuolumne Rd sample site and as a result a Communication Report will be submitted for this exceedance by July 29, 2008.

**Subject:** Re: Pesticide Exceedance Report - Irrigation1 2008

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation1\_table\_052308\_amended.doc

Dear Dania,

I am submitting an amended exceedance report due to a misreported sample date from the email sent on May 23, 2008, reporting on pesticide exceedances from the first irrigation season sampling event. In this report, sampling was shown to occur on 4/15/08, however sampling actually occurred on 4/22/08. An amended report is provided below and an amended table of exceedances is attached.

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On April 22, 2008 sampling was conducted in the ESJWQC region for the first irrigation season monitoring event. Data were received from the laboratory on May 22, 2008. One exceedances of DDT was experienced during this monitoring event. See attached Table 1 for details on this exceedance.

b. Follow-up sampling for this pesticide exceedance will not be conducted. Monitoring for the second irrigation event occurred on May 20, 2008, and results from this monitoring event will indicate if the exceedance in this report is persistent.

c. The exceedance of DDT was a first-time exceedance at the Hatch Drain @ Tuolumne Rd sample site and as a result a Communication Report will be submitted for this exceedance by July 29, 2008.

**Subject:** Toxicity Exceedance Report - Irrigation2 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation2\_table\_052708.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On May 20, 2008, normal monitoring and management plan monitoring were conducted in the ESJWQC region for the second irrigation season sampling event. Toxicity results were received from the laboratory today, May 27, 2008. Toxicity to *Selenastrum* was experienced in samples collected for normal monitoring from five sites. There was no toxicity experienced in the samples collected for management plan monitoring. See attached Table 1 for details on these exceedances.

b.) Follow-up sampling will be conducted today, May 27, 2008. The results from the resampling event will indicate whether the toxicity is persistent at these sites.

c.) All exceedances in this report have been or will be addressed in management plans or previously scheduled communication reports and therefore follow-up reporting is not required.

**To:** Dania Huggins <dhuggins@waterboards.ca.gov>

**Cc:** Parry Klassen <pklassen@unwiredbb.com>, Mike Johnson <mjohnson@mlj-llc.com>, Melissa Turner <mtturner@mlj-llc.com>, Francisca Johnson <fjohnson@mlj-llc.com>, Lara Reising <ltreising@gmail.com>, kcallinan@mlj-llc.com

**Subject:** Field Exceedance Report - Irrigation2 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation2\_table\_052808.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On May 27, 2008, normal monitoring, management plan monitoring and resampling were conducted in the ESJWQC region for the second irrigation season sampling event. Ambient water samples were collected for water toxicity and chemistry analyses. During the sampling field parameters were measured, however the Berenda Slough along Ave 18 ½, Ash Slough @ Ave 21, Berenda Slough @ Rd 19 and South Slough @ Quinley Rd sites were dry and field parameters were not taken at these sites. Exceedances of the receiving water quality trigger limits (WQTL) for pH, electrical conductivity (EC) and dissolved oxygen (DO) were experienced during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source. The high pH experienced at Livingston Drain @ Robin Ave may be due to a particular input into the water body or natural conditions of the water body itself, among other possible sources. DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. The EC exceedance experienced at the Deadman Creek @ Gurr Rd

sample site occurred for the first time during Coalition monitoring and as a result a Communication Report will be submitted for this exceedance by July 31, 2008.

**Subject:** Metals, Nutrients, E. coli, Physical Paramters Exceedance Report - Irrigation1 2008

**Attachments:** ESJWQC\_08\_ER\_Ecoli\_Metals\_Nut\_Tbl\_Irrigation1\_053008\_final.xls

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedance.

a.) On April 22, 2008 regular monitoring and management plan monitoring was conducted in the ESJWQC region for the first 2008 irrigation monitoring event. Water was collected for analysis of physical parameters, nutrients, metals and bacteria. Exceedances of receiving water limitations for *E. coli*, total dissolved solids (TDS), color, ammonia, nitrate and metals were experienced. Final data were received from the laboratory on May 27, 2008. The sites, sampling dates and exceedances are provided in an excel spreadsheet attached to this email with the exceedance trigger listed under each constituent in the column headers. Raw data are available upon request.

b.) Follow-up sampling will not be conducted for these exceedances. The second irrigation season event occurred on May 20 and 27, 2008. Results from this monitoring event should indicate where water quality exceedances included in this report are persistent.

c.) First-time exceedances at normal monitoring sites were experienced at Hatch Drain @ Tuolumne Rd (lead) and Silva Drain @ Meadow Dr (ammonia). As a result, a Communication Report will be submitted for these exceedances by August 4, 2008. All other exceedances in this report have been or will be addressed in Management Plans or previously scheduled Communication Reports and do not require follow-up reporting.

**Subject:** Toxicity Exceedance Report - Irrigation2 RS 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation2\_RS\_table\_060208.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On May 27, 2008, resampling was conducted in the ESJWQC region for the second irrigation season sampling event. Toxicity results were received from the laboratory today, June 2, 2008. Of the five sites that were sampled to test for persistent *Selenastrum* toxicity, one site showed toxicity. See attached Table 1 for details on this exceedance.

b.) This sampling event was conducted as follow-up to toxicity experienced in previous samples, therefore additional follow-up sampling will not be conducted. Sampling will occur again at these sites for the third irrigation season event on June 17 and 24, 2008.

c.) The exceedance provided in this report has been or will be addressed in a management plan or previously scheduled communication report and therefore follow-up reporting is not required.

**Subject:** Field Exceedance Report - Irrigation3 MPM 2008  
**Attachments:** ESJWQC\_08\_ER\_field\_irrigation3MPM\_060308.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On June 03, 2008, management plan monitoring were conducted in the ESJWQC region for the second irrigation season sampling event. Ambient water samples were collected for management plan constituent analysis at six locations (Table 1 attached). During the sampling field parameters were measured at all sites except at Ash Slough @ Avenue 18 which was dry. Exceedances of the receiving water quality trigger limits (WQTL) for pH were experienced during this sampling event at Livingston Drain @ Robin Ave and Highline Canal @ Hwy 99. See attached Table 2 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. Normal monitoring will be conducted on June 17 and 24, 2008 for the ESJWQC at which time field parameters will be measured for.

c) Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source. The high pH experienced at Livingston Drain @ Robin Ave and Highline Canal @ Hwy 99 may be due to a particular input into the water body or natural conditions of the water body itself, among other possible sources. Both of these sites are currently under Management Plans for pH and therefore a communication report will not be submitted.

Mike Johnson

**Subject:** Metals, E. coli, Physical Parameters Exceedance Report - Irrigation1 2008

**Attachments:** ESJWQC\_08\_ER\_Ecoli\_Metals\_Nut\_Tbl\_Irrigation1\_060908\_final.xls

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedance.

a.) On April 29, 2008 regular monitoring and upstream management plan monitoring was conducted in the ESJWQC region for the first 2008 irrigation monitoring event. Water was collected for analysis of physical parameters, nutrients, metals and bacteria. Exceedances of receiving water limitations for *E. coli*, color and metals were experienced. Final data were received from the laboratory on June 9, 2008. The sites, sampling dates and exceedances are provided in an excel spreadsheet attached to this email with the exceedance trigger listed under each constituent in the column headers. Raw data are available upon request.

b.) Follow-up sampling will not be conducted for these exceedances. The second irrigation season monitoring event occurred on May 20 and 27, 2008. Results from this monitoring event should indicate where water quality exceedances included in this report are persistent.

c.) First-time exceedances were experienced at Black Rascal Creek @ Yosemite Rd (cadmium, copper and lead) and Deadman Creek @ Hwy 59 (arsenic). As a result, a Communication Report will be submitted for these exceedances by August 15, 2008. All other exceedances in this report have been or will be addressed in Management Plans or previously scheduled Communication Reports and do not require follow-up reporting.

**Subject:** Pesticide Exceedance Report - Irrigation1 2008

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation1\_table\_061308.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On April 29, 2008 normal monitoring and upstream management plan monitoring were conducted in the ESJWQC region for the first irrigation season sampling event. Data were received from the laboratory on June 12, 2008. Exceedances of carbofuran, dieldrin and diuron were detected in samples collected during this event. See attached Table 1 for details on these exceedances.

b. Follow-up sampling for these pesticide exceedance will not be conducted. Monitoring for the second irrigation event occurred on May 20 and 27, 2008, and results from this monitoring event will indicate if the exceedances in this report are persistent.

c. The exceedances of carbofuran at Duck Slough @ Gurr Rd and dieldrin at Deadman Creek @ Gurr Rd were experienced for the first time and as a result a Communication Report will be submitted for these exceedances by August 18, 2008.

**From:** K Callinan <kcallinan@mlj-llc.com>

**To:** Dania Huggins <dhuggins@waterboards.ca.gov>

**Cc:** Parry Klassen <pklassen@unwiredbb.com>, Mike Johnson <mjohnson@mlj-llc.com>, Melissa Turner <mtturner@mlj-llc.com>, Francisca Johnson <fjohnson@mlj-llc.com>, Lara Reising <ltreising@gmail.com>, kcallinan@mlj-llc.com

**Subject:** Field Exceedance Report - Irrigation3 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation3\_table\_061808.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On June 17, 2008, normal and management plan monitoring were conducted in the ESJWQC region for the third irrigation season sampling event. Ambient water samples were collected from these sites for water toxicity and chemistry analyses. During the sampling field parameters were measured, however the Mustang Creek @ East Ave site was dry and field parameters were not taken. One exceedance of the receiving water quality trigger limit (WQTL) for pH, five exceedances of electrical conductivity (EC) and three exceedances of dissolved oxygen (DO) were experienced during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as a scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source. The high pH experienced at Livingston Drain @ Robin Ave is typical and may be due natural conditions of the water body, among other possible sources. DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. All exceedances in this report have been addressed in management plans or previous communication reports. The field exceedances experienced at management plan monitoring sites will be addressed in the subwatershed management plans and will not be included in communication reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Toxicity Exceedance Report - Irrigation3 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation3\_table\_062408.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On June 17, 2008, normal monitoring was conducted in the ESJWQC region for the third irrigation season sampling event. Toxicity results were received from the laboratory yesterday, June 23, 2008. Toxicity to *Pimephales* was experienced in samples collected from the Silva Drain @ Meadow Drive site. See attached Table 1 for details on this exceedance.

b.) Follow-up sampling is being conducted today, June 24, 2008. The results from the resampling event will indicate whether the toxicity is persistent at this site.

c.) The toxicity reported herein occurred for the first time during Coalition monitoring at this site and as a result a Communication Report will be submitted for this exceedance by August 27, 2008.

**Subject:** E. coli, Metals, Nutrients and Physical Parameters Exceedance Report - Irrigation2 2008

**Attachments:** ESJWQC\_08\_ER\_Ecoli\_Metals\_Nut\_Tbl\_Irrigation2\_070108\_final.xls

Dear Susan,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedance.

a.) On May 20 and 27, 2008 regular monitoring was conducted in the ESJWQC region for the second 2008 irrigation monitoring event. Water was collected for analysis of physical parameters, nutrients, metals and bacteria.

Exceedances of receiving water limitations for *E. coli*, color and metals were experienced. Final data were received from the laboratory on July 1, 2008. The sites, sampling dates and exceedances are provided in an excel spreadsheet attached to this email with the exceedance trigger listed under each constituent in the column headers. Raw data are available upon request.

b.) Follow-up sampling will not be conducted for these exceedances. The third irrigation season monitoring event occurred on June 17 and June 24, 2008. Results from this monitoring event should indicate where water quality exceedances included in this report are persistent.

c.) First-time exceedances were experienced at Black Rascal Creek @ Yosemite Rd (nickel) and Deadman Creek @ Gurr Rd (TDS). As a result, a Communication Report will be submitted for these exceedances by September 4, 2008. All other exceedances in this report have been or will be addressed in Management Plans or previously scheduled Communication Reports and do not require follow-up reporting.

**Subject:** Field Exceedance Report - Irrigation4 2008 MPM

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation4\_MPM\_table\_070908.doc

Dear Susan,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On July 8, 2008 management plan monitoring was conducted in the ESJWQC region for the fourth irrigation season sampling event. Ambient water samples were collected for water toxicity and chemistry analyses. During the sampling field parameters were measured. Exceedances of the receiving water quality trigger limits (WQTL) for pH and dissolved oxygen (DO) were experienced during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source. The high pH experienced at Livingston Drain @ Robin Ave is typical and may be due natural conditions of the water body. The high pH detected at Highline Canal has also occurred in the past and may also be due to natural conditions or a direct input, among other possible sources. DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). All exceedances in this report have been addressed in management plans or previous communication reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Field Exceedance Report - Irrigation4 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation4\_table\_072308.doc

Dear Susan,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On July 22, 2008 normal monitoring and upstream management plan monitoring was conducted in the ESJWQC region for the fourth irrigation season sampling event. Ambient water samples were collected for water toxicity and chemistry analyses. During the sampling field parameters were measured. Exceedances of the receiving water quality trigger limits (WQTL) for electrical conductivity (EC) and dissolved oxygen (DO) were experienced during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). All exceedances in this report are being addressed in Management Plans or have been discussed in previous Communication Reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Pesticide Exceedance Report - Irrigation2 2008

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation2\_table\_072508.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On May 27, 2008 normal monitoring and upstream management plan monitoring were conducted in the ESJWQC region for the second irrigation season sampling event. Initial data were received from the laboratory on July 11, 2008. A discrepancy between the primary and the confirmation column resulted in a revision of the final report. Those results were provided on July 24, 2008. One exceedance of cyanazine was detected in samples collected during this event. See attached Table 1 for details on this exceedance.

b. Follow-up sampling for this pesticide exceedance will not be conducted. Monitoring for the third irrigation event occurred on June 17 and 24, 2008, and results from this monitoring event will indicate if the exceedance in this report is persistent.

c. The exceedance of cyanazine at the Cottonwood Creek site was experienced for the first time and as a result a Communication Report will be submitted for this exceedances by September 29, 2008.

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation3\_table\_072808.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On June 17, 2008 normal monitoring and upstream management plan monitoring were conducted in the ESJWQC region for the third irrigation season sampling event. Data were received from the laboratory on July 23, 2008. One exceedance of chlorpyrifos was detected in the field duplicate sample collected from Livingston Drain @ Robin Ave. Chlorpyrifos was not detected at a level above the water quality trigger limit in the complimentary grab sample from the same site. See attached Table 1 for details on this exceedance.

b. Follow-up sampling for this pesticide exceedance will not be conducted. Monitoring for the fourth irrigation event occurred on July 22 and 29, 2008, and results from this monitoring event will indicate if the exceedances in this report are persistent.

c. The exceedance of chlorpyrifos at Livingston Drain @ Robin Ave has been addressed in a management plan or a previous communication report. As a result, a Communication Report will not be submitted for this exceedance.

**Subject:** Metals, E.coli, Nutrients and Physical Parameter Exceedance Report - Irrigation3 2008

**Attachments:** ESJWQC\_08\_ER\_Ecoli\_Metals\_Nut\_Tbl\_Irrigation3A\_072808\_final.xls  
ESJWQC\_08\_ER\_Ecoli\_Metals\_Nut\_Tbl\_Irrigation3B\_072808\_final.xls

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedance.

a.) **On June 17 and 25, 2008** regular monitoring and management plan monitoring were conducted in the ESJWQC region for the third 2008 irrigation monitoring event. Water was collected for the analysis of physical parameters, nutrients, metals and bacteria. Final data for this event were received from the laboratory on July 21 and 23, 2008. Exceedances of receiving water limitations for *E. coli*, total dissolved solids (TDS), color, ammonia, nitrate and metals were detected. A discrepancy in the data is apparent in the results for copper between the grab and field duplicate samples collected on June 17, 2008. The field duplicate sample is being re-run by the laboratory and an amended report will be provided to the Coalition shortly. These results and an explanation of the discrepancy will be provided in the next Coalition Annual Monitoring Report. The sites and exceedances are provided in two excel spreadsheets, separated by sampling date, attached to this email. Raw data are available upon request.

b.) Follow-up sampling will not be conducted for these exceedances. Results from the fourth irrigation season event, occurring this month, should indicate where water quality exceedances included in this report are persistent.

c.) First-time exceedances at normal monitoring sites were experienced at Bear Creek @ Kibby Rd (arsenic), South Slough @ Quinley Rd (copper and lead), Livingston Drain @ Robin Ave (nitrate) and Silva Drain @ Meadow Dr (cadmium and copper). As a result, a Communication Report will be submitted for these exceedances by September 30, 2008. All other exceedances in this report have been or will be addressed in Management Plans or previously scheduled Communication Reports and do not require follow-up reporting.

**Subject:** Toxicity Exceedance Report - Irrigation4 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation4\_table\_072808.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On July 22, 2008, normal monitoring and management plan monitoring was conducted in the ESJWQC region for the fourth irrigation season sampling event. Toxicity results were received from the laboratory today, July 28, 2008. Toxicity to *Ceriodaphnia dubia* and *Selenastrum capricornutum* was experienced in samples collected during this event. See attached Table 1 for details on these exceedances.

b.) Follow-up sampling will be conducted tomorrow, July 29, 2008. The results from the resampling event will indicate whether the toxicity is persistent at these sites.

c.) All of the toxicity exceedances included in this report have been addressed in Management Plans or previous Communication Reports. As a result, follow-up reporting is not required for these exceedances.

**Subject:** Copper Exceedance Report - Irrigation4 MPM 2008

**Attachments:** ESJWQC\_08\_ER\_Copper\_Tbl\_Irrigation4\_MPM\_073008\_final.xls

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedance.

a.) On July 8, 2008 management plan monitoring was conducted in the ESJWQC region for the fourth 2008 irrigation monitoring event. Water was collected from two sites for analysis of copper. One exceedance of the receiving water limitation for copper was detected at the Livingston Drain @ Robin Ave sample site. Final data were received from the laboratory on July 28, 2008. Details on this exceedance is provided in an excel spreadsheet attached to this email. Raw data are available upon request.

b.) Follow-up sampling will not be conducted for this exceedance. Normal monitoring for the fourth irrigation season event occurred on July 22 and 29, 2008. Results from those days of monitoring should indicate whether the water quality exceedance included in this report is persistent.

c.) The exceedance in this report is being addressed in the Coalition Management Plan and therefore does not require follow-up reporting.

MPM- management plan monitoring

**Sent: Thursday, July 31, 2008 at 8:57 AM**

**From:** K Callinan <kcallinan@mlj-llc.com>

**To:** Dania Huggins <dhuggins@waterboards.ca.gov>

**Cc:** Parry Klassen [pklassen@unwiredbb.com](mailto:pklassen@unwiredbb.com), Mike Johnson [mjohnson@mlj-llc.com](mailto:mjohnson@mlj-llc.com), Melissa Turner <mtturner@mlj-llc.com>, Francisca Johnson [fjohnson@mlj-llc.com](mailto:fjohnson@mlj-llc.com), Lara Reising [ltreising@gmail.com](mailto:ltreising@gmail.com), K Callinan <kcallinan@mlj-llc.com>

**Subject:** Field Exceedance Report - Irrigation4 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation4\_table\_073108.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On July 29, 2008, normal monitoring, management plan monitoring and toxicity resampling were conducted in the ESJWQC region for the fourth irrigation season sampling event. Ambient water samples were collected from these sites for water toxicity and chemistry analyses. During the sampling field parameters were measured. Two exceedances of the receiving water quality trigger limit (WQTL) for specific conductivity (EC) and nine exceedances of dissolved oxygen (DO) were experienced during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as a scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). All exceedances in this report have been addressed in management plans or previous communication reports and do not require follow-up reporting. The field exceedances experienced at management plan monitoring sites will be addressed in the subwatershed management plans and will not be included in communication reports.

**Subject:** Toxicity Exceedance Report - Irrigation4 RS 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation4\_RS\_table\_080308.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On July 29, 2008, resampling was conducted in the ESJWQC region for the fourth irrigation season sampling event. Toxicity results were received from the laboratory today, August 3, 2008. Toxicity to *Ceriodaphnia dubia* and *Selenastrum capricornutum* was experienced in samples collected during this event. See attached Table 1 for details on these exceedances.

b.) This sampling event was conducted as follow-up to toxicity experienced in previous samples, therefore additional follow-up sampling will not be conducted. Sampling will occur again at these sites for the fifth irrigation season event on August 19 and 26, 2008.

c.) The exceedances provided in this report have been or will be addressed in a management plan or previously scheduled communication report and therefore follow-up reporting is not required.

**Subject:** Field Exceedance Report - Irrigation5 MPM 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation5\_MPM\_table\_080508.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On August 5, 2008 management plan monitoring was conducted in the ESJWQC region for the fifth irrigation season sampling event. Ambient water samples were collected for water toxicity and chemistry analyses. During the sampling field parameters were measured. Exceedances of the receiving water quality trigger limits (WQTL) for dissolved oxygen (DO) were detected at four sites during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). All exceedances in this report have been addressed in management plans or previous communication reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Field Exceedance Report - Irrigation5 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation5\_table\_082008.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On August 19, 2008, normal monitoring and management plan monitoring was conducted in the ESJWQC region for the fifth irrigation season sampling event. Ambient water samples were collected for water toxicity and chemistry analyses. During the sampling field parameters were measured. Exceedances of the receiving water quality trigger limits (WQTL) for electrical conductivity (EC), pH and dissolved oxygen (DO) were detected during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed in this report experience toxicity and require re-sampling, field parameters will then be measured again at those sites.

c) DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source.

The high pH experienced at both Highline Canal sites may be due to temporary natural conditions of the water body, among other possible sources. Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. All exceedances in this report have been addressed in management plans or previous communication reports. The field exceedances experienced at management plan monitoring sites will be addressed in the subwatershed management plans and will not be included in Communication Reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Pesticide Exceedance Report - Irrigation4 MPM 2008

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation4\_MPM\_table\_082508.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On July 22, 2008 normal monitoring and upstream management plan monitoring were conducted in the ESJWQC region for the fourth irrigation season sampling event. Samples were collected for the analysis of chemistry and toxicity. Pesticide data were received from the laboratory on August 25, 2008. One exceedance of chlorpyrifos was detected in samples collected during this event. See attached Table 1 for details on this exceedance.

b. Follow-up sampling for this pesticide exceedance will not be conducted. Management Plan Monitoring for chlorpyrifos occurred again at this site on August 19, 2008, and results from this monitoring event will indicate if the exceedance in this report is persistent.

c. The exceedance of chlorpyrifos at the Dry Creek site is a result of follow-up monitoring for the purpose of Management Plans. This exceedance will further be addressed in the updated Coalition Management Plan and therefore a Communication Report will not be submitted for this exceedance.

Mike Johnson

**Subject:** Toxicity Exceedance Report - Irrigation5 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation5\_table\_082608.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-

up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On August 19, 2008, normal monitoring and management plan monitoring were conducted in the ESJWQC region for the fifth irrigation season sampling event. Toxicity results were received from the laboratory today, August 26, 2008. Toxicity to *Selenastrum capricornutum* occurred in samples collected from one site during this event. See attached Table 1 for details on this exceedance.

b.) Follow-up sampling will be conducted today, August 26, 2008. The results from the resampling event will indicate whether the toxicity is persistent at the site.

c.) The toxicity exceedance included in this report has been addressed in Management Plans or previous Communication Reports. As a result, follow-up reporting is not required for this exceedance.

**Subject:** Field Exceedance Report - Irrigation5 & RS 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation5\_table\_082708.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On August 26, 2008 normal monitoring, upstream management plan monitoring and resampling were conducted in the ESJWQC region for the fifth irrigation season sampling event. Ambient water samples were collected for water toxicity and chemistry analyses. During the sampling field parameters were measured. Exceedances of the receiving water quality trigger limits (WQTL) for electrical conductivity (EC) and dissolved oxygen (DO) were detected during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). All exceedances in this report are being addressed in Management Plans or have been discussed in previous Communication Reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Field Exceedance Report - Irrigation5 Sediment 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation6Sed\_table\_082908.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On August 28, 2008 sediment monitoring were conducted in the ESJWQC region. Sediment samples were collected for sediment toxicity and during the sampling field parameters were measured. Exceedances of the receiving water quality trigger limits (WQTL) for pH, electrical conductivity (EC) and dissolved oxygen (DO) were detected during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. These sites were visited for water quality monitoring during the last two weeks and field parameter exceedances previously reported. These sites will again be visited in September.

c) Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source. The high pH experienced at Livingston Drain site may be due to temporary natural conditions of the water body, among other possible sources, resulting in a pH level just slightly above the WQTL. DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). All exceedances in this report are being addressed in Management Plans or have been discussed in previous Communication Reports. As a result, a Communication Report will not be submitted for these exceedances.

Mike Johnson

**Table 1.** Field parameter water quality trigger limit exceedances experienced during sediment monitoring (Sediment) fifth ESJWQC irrigation sampling event on August 28, 2008.

**Subject:** Re: Field Exceedance Report - Irrigation5 Sediment 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation\_sediment\_table\_082908\_amended.doc

Dear Dania,

Upon review of our exceedance data, we noticed that in the Field Exceedance Report submitted on August 29, 2008, the table of exceedances was jumbled. Attached I have included an amended table of field exceedances for the sediment monitoring event that occurred on August 28, 2008. As reported on August 29, 2008, all of the exceedances in this report have occurred previous to the August 28, 2008 monitoring event and therefore do not require a Communication Report. Please let us know if you have any questions on these exceedances.

Sincerely,

Krista

**Table 1.** Amended table of field parameter water quality trigger limit exceedances detected during irrigation sediment monitoring (Sediment) on August 28, 2008.

Sample Site	Sample Type	Sample Date	pH (pH units)	Electrical Conductivity (uS/cm)	Dissolved Oxygen (mg/L)

**Subject:** Pesticide Exceedance Report - Irrigation5 MPM 2008  
**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation5\_MPM\_table\_90208.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On August 5, 2008 management plan monitoring was conducted in the ESJWQC region for the fifth irrigation season sampling event. Samples were collected for the analysis of chemistry and toxicity. Pesticide data were received from the laboratory on August 27, 2008. Two exceedances of chlorpyrifos were detected in samples collected during this event. See attached Table 1 for details on this exceedance.

b. Follow-up sampling for this pesticide exceedance will not be conducted. Normal monitoring occurred at these sites on August 19 or 26, 2008, and results from this monitoring event will indicate whether the exceedances in this report are persistent.

c. The exceedances of chlorpyrifos at the Silva Drain and Deadman Creek sites are a result of follow-up monitoring for the purpose of Management Plans. These exceedances will be further addressed in the updated Coalition Management Plans and therefore a Communication Report will not be submitted for these exceedances.

**Subject:** Field Exceedance Report - Irrigation6 MPM 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation6\_MPM\_table\_091008.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On September 9, 2008 management plan monitoring was conducted in the ESJWQC region for the sixth irrigation season sampling event. Ambient water samples were collected for management plan constituent analysis and field parameters were measured at all sites. Exceedances of the receiving water quality trigger limits (WQTL) for dissolved oxygen (DO) and pH were detected during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source. The high pH experienced at three sites during this monitoring event may be due to temporary natural conditions of the water bodies, among other possible sources. All exceedances in this report have been addressed in management plans or previous communication reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Re: Field Exceedance Report - Irrigation6 MPM 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation6\_MPM\_table\_091008\_amended.doc

Dear Dania,

Attached is an amended table of field exceedances for the Irrigation6 MPM event. One exceedance at the Highline Canal @ Hwy 99 site was left out of the report (accidentally submitted along with the SJCDWQC report). I apologize for the mistake.

Sincerely,

Krista

**Table 1.** Field parameter water quality trigger limit exceedances detected during management plan monitoring (MPM) for the sixth ESJWQC irrigation sampling event on September 9, 2008.

Sample Site	Sample Type	Sample Date	Dissolved Oxygen (mg/L)	pH (pH units)
Deadman Creek @ Hwy 59	MPM	9/9/08	3.37	
Black Rascal Creek @ Yosemite Rd	MPM	9/9/08	4.18

**Subject:** Pesticide Exceedance Report - Irrigation4 2008

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation4\_table\_091208.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On July 22, 2008 normal monitoring and upstream management plan monitoring were conducted in the ESJWQC region for the fourth irrigation season sampling event. Data for the normal monitoring samples

were received from the laboratory on September 11, 2008. Exceedances of chlorpyrifos and dimethoate were detected during this monitoring event. See attached Table 1 for details on these exceedances.

b. Follow-up sampling for these pesticide exceedances will not be conducted. Monitoring for the fifth irrigation event occurred on August 19 and 26, 2008, and results from this monitoring event will indicate if the exceedances in this report are persistent.

c. All of the exceedances in this report have been addressed in Management Plans or previous Communication Reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Toxicity Exceedance Report - Irrigation5 RS 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation5\_RS\_table\_091508.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-

up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On August 26, 2008, resampling was conducted in the ESJWQC region for the fifth irrigation season sampling event. Toxicity results were received from the laboratory today, September 15, 2008. Toxicity to *Selenastrum capricornutum* was detected in samples collected during this event. See attached Table 1 for details on this exceedance.

b.) This sampling event was conducted as follow-up to toxicity detected in previous samples, therefore additional follow-up sampling will not be conducted. Sampling will occur again at these sites for the sixth irrigation season event on September 23 and 30, 2008.

c.) The exceedances provided in this report have been or will be addressed in a management plan or previously scheduled communication report and therefore follow-up reporting is not required.

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation4B\_table\_091608.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On July 29, 2008 normal monitoring and upstream management plan monitoring were conducted in the ESJWQC region for the fourth irrigation season sampling event. Data for the normal monitoring samples were received from the laboratory on September 15, 2008. Exceedances of chlorpyrifos were detected during this monitoring event. See attached Table 1 for details on these exceedances.

b. Follow-up sampling for these pesticide exceedances will not be conducted. Monitoring for the fifth irrigation event occurred on August 19 and 26, 2008, and results from this monitoring event will indicate if the exceedances in this report are persistent.

c. The chlorpyrifos exceedance detected at the South Slough @ Quinley Rd sample site was detected for the first time and as a result a Communication Report will be submitted for this exceedance by November 20, 2008. The remainder of the exceedances in this report have been addressed in Management Plans or previous Communication Reports.

**Subject:** Metals, E. coli, Physical Parameters and Nutrients Exceedance Report - Irrigation5 2008

**Attachments:** ESJWQC\_08\_ER\_Ecoli\_Metals\_Nut\_Tbl\_Irrigation5\_092408\_final.xls

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedance.

a.) On August 19 and 26, 2008 regular monitoring and management plan monitoring were conducted in the ESJWQC region for the fifth 2008 irrigation monitoring event. Water was collected for the analysis of physical parameters, nutrients, metals and bacteria. Final data for these samples were received from the laboratory on September 22, 2008. Exceedances of receiving water

limitations for *E. coli*, physical parameters, nutrients and metals were detected. The sites and exceedances are provided in an excel spreadsheet attached to this email. Raw data are available upon request.

b.) Follow-up sampling will not be conducted for these exceedances. Results from the sixth irrigation season event, occurring this month, should indicate where water quality exceedances included in this report are persistent.

c.) An exceedance of lead was detected at the Silva Drain @ Meadow Dr sampling site for the first time. As a result, a Communication Report will be submitted for this exceedance by December 2, 2008. All other exceedances in this report have been or will be addressed in Management Plans or previously scheduled Communication Reports and do not require follow-up reporting.

**Subject:** Field Exceedance Report - Irrigation6 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigatio6\_table\_092408.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On September 24, 2008 normal monitoring and upstream management plan monitoring were conducted in the ESJWQC region for the sixth irrigation season sampling event. Ambient water samples were collected for water toxicity and chemistry analyses. During the sampling field parameters were measured. Exceedances of the receiving water quality trigger limits (WQTL) for electrical conductivity (EC), pH and dissolved oxygen (DO) were detected during this sampling event. See attached Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source. The high pH detected at the Livingston Drain site is not uncommon and may be due to natural conditions of the water body, among other possible sources. DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). All exceedances in this report are being addressed in Management Plans or have been discussed in previous Communication Reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Sediment Toxicity Exceedance Report - Irrigation 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation\_sediment\_table\_092608.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedance.

a) On August 28, 2008 sampling was conducted in the ESJWQC region for the 2008 irrigation season sediment sampling event. Sediment toxicity data on these samples was received from the laboratory today, September 26, 2008. Significant toxicity to *Hyalella azteca* was found in samples collected from fifteen sites. See the attached Table 1 for details on these exceedances. The Coalition has not yet received the raw data for these tests.

b) Follow-up sampling for these exceedances will be conducted on Thursday, October 2, 2008. Field parameters will also be measured at sites that experienced exceedances in dissolved oxygen, electrical conductivity, or pH during the initial sediment sampling event. Results from the resampling will indicate whether sediment toxicity is persistent at any of these sites.

c) The Coalition will review Pesticide Use Reports for the site subwatersheds in which these exceedances were found. Pesticides with a high Koc (organic carbon partition coefficient) will be reviewed to determine if applications occurred in the relevant site subwatersheds during months prior to the sediment sampling. Chemicals with a high Koc bind to organic material and sediment and thus have a higher probability of causing sediment toxicity. Sediment toxicity occurred for the first time at Duck Slough @ Hwy 99, Bear Creek @ Kibby Rd, Black Rascal Creek @ Yosemite Rd, Deadman Creek @ Hwy 59 and Westport Drain @ Vivian Rd. As a result, a Communication Report will be submitted for these exceedances by December 4, 2008.

**Subject:** Toxicity Exceedance Report - Irrigation6A 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation6A\_table\_100108.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

- a.) On September 23, 2008, normal monitoring and management plan monitoring were conducted in the ESJWQC region for the sixth irrigation season sampling event. Toxicity results were received from the laboratory on September 29, 2008. Toxicity to *Selenastrum capricornutum* occurred in samples collected from one site during this event. See attached Table 1 for details on this exceedance.
- b.) Follow-up sampling was conducted on September 30, 2008. The results from the resampling event will indicate whether the toxicity is persistent at the site.
- c.) The toxicity exceedance included in this report has been addressed in Management Plans or previous Communication Reports. As a result, follow-up reporting is not required for this exceedance.

**Cc:** Parry Klassen [pklassen@unwiredbb.com](mailto:pklassen@unwiredbb.com), Mike Johnson [mjohnson@mlj-llc.com](mailto:mjohnson@mlj-llc.com), Melissa Turner <mturner@mlj-llc.com>, Francisca Johnson [fjohnson@mlj-llc.com](mailto:fjohnson@mlj-llc.com), Lara Reising [ltreising@gmail.com](mailto:ltreising@gmail.com), K Callinan <kcallinan@mlj-llc.com>

**Subject:** Field Exceedance Report - Irrigation6 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation6\_table\_100108.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a) On September 30, 2008 normal monitoring, upstream management plan monitoring and resampling were conducted in the ESJWQC region for the sixth irrigation season sampling event. Ambient water samples were collected for water toxicity and chemistry analyses. During the sampling field parameters were measured. Exceedances of the receiving water quality trigger limits (WQTL) for electrical conductivity (EC), pH and dissolved oxygen (DO) were detected during this sampling event. See attached

Table 1 for details on these exceedances. Raw data for the field exceedances are available upon request as scanned field sheets.

b) Immediate follow-up sampling will not be conducted. If any of the sites listed above experience toxicity in the samples collected during this event and require re-sampling, field parameters will then be measured again at those sites.

c) Measures of EC are consistently high at some sites in the ESJWQC Coalition region. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water or drain water from irrigated agricultural lands. DO exceedances are common in the Coalition region due to low flow as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). All exceedances in this report are being addressed in Management Plans or have been discussed in previous Communication Reports. As a result, a Communication Report will not be submitted for these exceedances.

**Subject:** Pesticide Exceedance Report - Irrigation5 2008

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation5\_table\_100208.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On August 19 and 26, 2008 normal monitoring and upstream management plan monitoring were conducted in the ESJWQC region for the fifth irrigation season sampling event. Data were received from the laboratory on September 30 and October 1, 2008. Exceedances of chlorpyrifos, DDE, DDT, malathion and methyl parathion were detected during this event. See attached Table 1 for details on this exceedance.

b. Follow-up sampling for these pesticide exceedances will not be conducted. Monitoring for the sixth irrigation event occurred on September 23 and 30, 2008, and results from this monitoring event will indicate if the exceedances in this report are persistent.

c. First time exceedances occurred at Highline Canal @ Lombardy Rd (DDE, DDT, malathion, methyl parathion), Hilmar Drain @ Central Ave (DDE) and Prairie Flower Drain @ Crows Landing Rd (malathion). A Communication Report will be submitted for these exceedances by December 10, 2008. All other exceedances in this report have occurred prior to this event and are dealt with in Management Plans or previous Communication Reports.

**Subject:** Field Exceedance Report - Irrigation Sediment RS 2008

**Attachments:** ESJWQC\_08\_ER\_field\_irrigation\_sediment\_RS\_table\_100308.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On October 2, 2008 sediment resampling was conducted in the ESJWQC region at sites that experienced toxicity in the original samples collected on August 28, 2008 for the irrigation season monitoring event. During the sampling field parameters were measured. Exceedances of receiving water limitations for field parameters were experienced in dissolved oxygen (DO), electrical conductivity (EC) and pH. See attached Table 1 for details. If you wish to see the raw data for these exceedances, the field sheets can be provided as scanned pdfs upon request.

b.) Follow-up sampling will not be conducted for these exceedances. Field parameters will be measured again at Coalition monitoring sites for the first Fall season event on October 21, 2008.

c.) DO exceedances are common in the Coalition region due to low flow, high water temperatures, as well as possible high levels of biological oxygen demand in the test drains (though this may not be the case for all samples). Sites sampled in previous events have also experienced frequent DO exceedances. Elevated levels of electrical conductivity are well documented in the Coalition region and have been consistently detected at some of the sampling sites. Potential sources of salts and metals (detected in the field as conductivity) include upstream surface water, ground water, or drain water from irrigated agriculture. Exceedances in pH occur occasionally and intermittently in the Coalition region and are difficult to source. Elevated pH in a water body may be due to a particular input or natural conditions of the water body itself, among other possible sources. The exceedance of pH detected at Silva Drain @ Meadow Dr occurred for the first time during this sampling event. As a result a Communication Report will be submitted for this exceedance by December 11, 2008. All other exceedances listed in the attached table have been addressed in previous Communication Reports or Management Plans and therefore do not require follow-up reporting.

**Subject:** Toxicity Exceedance Report - Irrigation6 RS 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation6\_RS\_table\_100608.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues: a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a.) On September 30, 2008, normal monitoring and toxicity resampling were conducted in the ESJWQC region for the sixth irrigation season sampling event. Toxicity results were received from the laboratory today, October 6, 2008. Toxicity to *Selenastrum capricornutum* was detected in the resample from Hilmar Drain @ Central Ave. Toxicity did not occur in any of the samples collected for normal monitoring during this event. See attached Table 1 for details on this exceedance.

b.) This sampling event was conducted as follow-up to toxicity experienced in previous samples, therefore additional follow-up sampling will not be conducted.

c.) The toxicity exceedance included in this report has been addressed in Management Plans or previous Communication Reports. As a result, follow-up reporting is not required for this exceedance.

**Subject:** Pesticide Exceedance Report - Irrigation6 MPM 2008

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation6\_MPM\_table\_100808.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On September 9, 2008 Management Plan Monitoring was conducted in the ESJWQC region for the sixth irrigation season sampling event. Samples were collected for the analysis of chemistry and toxicity. Two sites were sampled for the analysis of chlorpyrifos and pesticide data were received from the laboratory today, October 8, 2008. One exceedance of chlorpyrifos was detected in samples collected during this event. See attached Table 1 for details on this exceedance.

b. Follow-up sampling for this pesticide exceedance will not be conducted. Management Plan Monitoring for chlorpyrifos may occur again at this site during the 2009 irrigation season to determine if management practices have been effective in eliminating the exceedance.

c. The exceedance of chlorpyrifos at the Deadman Creek site is a result of follow-up monitoring for the purpose of Management Plans. This exceedance will further be addressed in the updated Coalition Management Plan and therefore a Communication Report will not be submitted for this exceedance.

Dear Dania,

The table that I sent on October 8, 2008 with the ESJWQC Exceedance Report for pesticides (sample date 9/9/08) contained an incorrect site name (Deadman Creek along Hoffman Ln). Attached is an amended table with the correct site name, Deadman Creek @ Hwy 59. I am sorry for this typo.

Sincerely,

Krista

**Subject:** Sediment Toxicity Exceedance Report - Irrigation RS 2008

**Attachments:** ESJWQC\_08\_ER\_toxicity\_irrigation\_sediment\_RS\_table\_102808.doc

Dear Dania

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedance.

a) On October 2, 2008 resampling was conducted in the ESJWQC region for the 2008 irrigation sediment sampling event. Toxicity analysis data was received from the laboratory today, October 28, 2008. Sediment toxicity to *Hyalella azteca* was retested at 15 sites. Of the 15 sites, 10 tested toxic to *Hyalella* again. See Table 1 for details on the exceedances. The Coalition has not yet received the raw data for these tests.

b) This sampling event was conducted as follow-up to sediment toxicity experienced in previous samples, therefore additional follow-up sampling will not be conducted. Coalition sediment sampling will occur again during the storm season event of 2009.

c) The Coalition will review Pesticide Use Reports for the site subwatersheds in which these exceedances were found. Pesticides with a high  $K_{oc}$  (organic carbon partition coefficient) will be reviewed to determine if applications occurred in the relevant site subwatersheds during months prior to the sediment sampling. Chemicals with a high  $K_{oc}$  bind to organic material and sediment and thus have a higher probability of causing sediment toxicity. Sediment toxicity occurred for the first time at Duck Slough @ Hwy 99 and Bear Creek @ Kibby Rd. As a result, a Communication Report will be submitted for these exceedances by December 4, 2008.

**Subject:** Metals, Nutrients, E. coli and Physical Parameters Exceedance Report - Irrigation6 2008

**Attachments:** ESJWQC\_08\_ER\_Ecoli\_Metals\_Nut\_Tbl\_Irrigation6\_102908\_final.xls

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an Exceedance Report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedance.

a.) On September 23 and 30, 2008 regular monitoring and management plan monitoring were conducted in the ESJWQC region for the sixth 2008 irrigation monitoring event. Water was collected for the analysis of physical parameters, nutrients, metals and bacteria. Final data for this event were received from the laboratory on October 23 and 27, 2008. Exceedances of receiving water limitations for *E. coli*, total dissolved solids (TDS), ammonia, nitrate and metals were detected. The sites and exceedances are provided in an excel spreadsheet attached to this email. Raw data are available upon request.

b.) Follow-up sampling will not be conducted for these exceedances. Monitoring occurred again at some of these sites for the first Fall monitoring event on October 21, 2008.

c.) All exceedances in this report have been or will be addressed in Management Plans or previously scheduled Communication Reports and do not require follow-up reporting. As a result, a Communication Report will not be submitted for these exceedances. An ESJWQC Management Plan Update will be submitted by April 1, 2009 and will further address the exceedances in this report.

**Subject:** Pesticide Exceedance Report - Irrigation6 2008

**Attachments:** ESJWQC\_08\_ER\_Pesticide\_Irrigation6\_table\_110508.doc

Dear Dania,

As required in the Monitoring and Reporting Program (Order No. R5-2005-0833) for Coalition Groups, an exceedance report is being submitted to address the following issues a) the exceedances, b) the follow-up monitoring, and c) any analysis or other actions the Coalition Group may take to address the exceedances.

a. On September 23 and 30, 2008 normal monitoring and upstream Management Plan monitoring were conducted in the ESJWQC region for the sixth irrigation season sampling event. Samples were collected for the analysis of chemistry and toxicity, and pesticide data were received from the laboratory on November 4, 2008. One exceedance of chlorpyrifos was detected in samples collected during this event. See attached Table 1 for details on this exceedance.

b. Follow-up sampling for this pesticide exceedance will not be conducted. Samples will be collected again for the analysis of pesticides at sites in the ESJWQC on November 11, 2008.

c. The exceedance of chlorpyrifos at the Duck Slough site has occurred prior to this event and therefore a Communication Report is not required for this exceedance. Follow-up actions to address this exceedance will be included in the Coalition Management Plan. A Management Plan update will be submitted on April 1, 2009.

## East San Joaquin Water Quality Coalition

1201 L Street  
Modesto, CA 95354

[www.esjcoalition.org](http://www.esjcoalition.org)

July 3, 2008

Dania Huggins  
Irrigated Lands Conditional Waiver Program  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive, #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting the formal Communication Report for field parameter exceedances that occurred during the first 2008 irrigation season sampling event reported on April 30, 2008 (see Table 1 below). Only exceedances that were experienced for the first time at a sample site are included in this report.

**Table 1.** Field exceedance detected in receiving waters on April 29, 2008 during the first irrigation season monitoring event.

Sample Site	Sample Date	Season	pH (pH units)
Black Rascal Creek @ Yosemite Rd	4/29/08	Irrigation	8.75

### 1. Follow-up monitoring and analyses conducted.

Follow-up sampling for field parameter exceedances did not occur at this site. However, field parameters were measured again during the second and third irrigation monitoring events and there were no field exceedances detected at this site. The lack of persistence of the exceedance at Black Rascal Creek indicates that the basic pH detected was due to temporary conditions in the water body. If this exceedance is experienced a second time, it will then be addressed in the management plan for that site.

### 2. Actions taken to identify the source of the exceedance.

#### pH

pH dynamics in surface waters are not well understood and can vary diurnally with photosynthetic rates and changes in the concentration of CO<sub>2</sub> and O<sub>2</sub> in the water. Control of pH in surface waters is a function of the balance between the buffering capacity of the water, inputs of organic acids from soil leaching, and the relative amount

of photosynthesis. In an attempt to understand the underlying mechanism behind the pH in Coalition surface waters, a preliminary analysis was undertaken to determine the statistical relationship between pH and dissolved oxygen (DO), hardness, temperature and specific conductance (EC). Multiple regression analyses were performed using pH as the response variable and DO, hardness, temperature, and EC as the predictor variables. Neither hardness nor EC were statistically significant predictors of pH. DO and temperature were significant predictors of pH.

**Table 2.** Analysis of Variance Detail Section

Model Term	DF	R2	Sum of Squares	Mean Square	F-Ratio	Probability Level
Intercept	1		18070.37	18070.37		
Model	2	0.2316	20.01485	10.00743	47.168	0.0000
DO	1	0.2124	18.35932	18.35932	86.532	0.0000
Temperature	1	0.0683	5.901083	5.901083	27.813	0.0000
Error	313	0.7684	66.40851	0.2121678		
Total(Adjusted)	315	1.0000	86.42336	0.2743599		

However, the adjusted coefficient of determination was only 0.23 indicating that 23% of the variation in pH was accounted for by the variation in DO or temperature. The estimated model is:

$$\text{pH} = 6.3395 + .0899 * \text{DO} + 2.4807\text{E-}02 * \text{Temp}$$

The equation indicates that raising temperature or the concentration of dissolved oxygen raises pH. This result, coupled with the lack of significance of hardness, suggests that pH dynamics in surface waters in the Coalition region are controlled by photosynthetic rate and the production of dissolved oxygen rather than the buffering capacity of the water. Interestingly, EC was predictable from hardness indicating that the levels of EC in the surface waters in the Coalition region are primarily a function of CaCO<sub>3</sub>, which dissociates to Ca<sup>2+</sup> and CO<sub>3</sub><sup>2-</sup>. These analyses suggest that the primary cation in the surface waters is Ca which is from natural sources. Further analyses will be presented in the Management Plan.

**3. Complete analytical results**

Complete analytical results in the form of field sheets in pdf format are too large to send by email with this report, but can be provided upon request.

**4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

Because this exceedance was detected for the first time at this site and may be due to natural fluctuations in the creek, no follow-up actions will be taken to address this

exceedance at this time. If a second exceedance of pH is detected at the Black Rascal Creek sample site, then the exceedance will be addressed in a Management Plan for the site subwatershed.

Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style. To the right of the signature is a vertical red line.

Michael L. Johnson, Technical Program Manager

**Subject:** Toxicity Communication Report - Irrigation1 2008

**Attachments:** ESJWQC\_08\_CR\_Toxicity\_Irrigation1\_070908\_final.doc

Dear Susan,

Attached is a Communication Report for samples that tested toxic to *Selenastrum* sp. for the first time during the first irrigation season monitoring event on April 29, 2008 and reported on May 6 and 16, 2008. The final laboratory report relevant to these exceedances can be accessed on the MLJ-LLC Sharepoint.

<http://sharepoint.mlj-llc.com/mlj-db/database/forms/allitems.aspx> (username: ftpuser, password: Aqua2007!) Go to the "Regional Board Documents" folder and the lab report can be found in "Communication Report Files." The lab report is named "ESJ\_08\_Irr1\_Report" and will show today's date.

Let us know if you have any questions on this report.

Sincerely,

Krista

**East San Joaquin Water Quality Coalition**  
 1201 L Street  
 Modesto, CA 95354  
**www.esjcoalition.org**

June 9, 2008

Susan Fregien  
 Irrigated Lands Conditional Waiver Program  
 Central Valley Regional Water Quality Control Board  
 11020 Sun Center Drive, #200  
 Rancho Cordova, CA 95670-6114

Dear Susan,

We are submitting the formal Communication Report for toxicity exceedances reported on May 6, 2008 that occurred in water samples collected from ESJWQC sample sites on April 29, 2008 (see Table 1 below). Only toxicity exceedances that occurred for the first time at sample site are included in this report.

**Table 1.** ESJWQC toxicity in normal monitoring (NM) samples collected during the first 2008 irrigation sampling event conducted on April 29, 2008. Only first time toxicity exceedances at a sample site are shown.

Sample Site	Sample Type	Sample Date	Season	<i>Selenastrum capricornutum</i> (% growth compared to control)
Bear Creek @ Kibby Rd	NM	4/29/08	Irrigation	4*
Cottonwood Creek @ Rd 20	NM	4/29/08	Irrigation	5*
South Slough @ Quinley Rd	NM	4/29/08	Irrigation	2*

\*Toxicity Identification Evaluation conducted.

**1. Follow-up monitoring and analyses conducted**

A Toxicity Identification Evaluation (TIE) was performed to further analyze the *Selenastrum* toxicities experienced in samples collected from Bear Creek @ Kibby Rd, Cottonwood Creek @ Rd 20 and South Slough @ Quinley Rd. Re-sampling for all toxicities occurred on May 7, 2008 and results indicate that the *Selenastrum* toxicity was persistent at the Bear Creek and Cottonwood Creek sites.

**Table 2.** ESJWQC toxicity in re-samples (RS) collected on May 7, 2007 as follow-up to toxicity during the first 2008 irrigation sampling event.

Sample Site	Sample Type	Sample Date	Season	<i>Selenastrum capricornutum</i> (% growth compared to control)
Bear Creek @ Kibby Rd	RS	5/7/08	Irrigation	21
Cottonwood Creek @ Rd 20	RS	5/7/08	Irrigation	4

**2. Actions taken to identify the source of the exceedances.**

The analysis of pesticides, metals and/or physical parameters exceedances that are associated with toxicity may help to determine the likely source(s) of toxicity at a sample site. In addition, for samples that undergo TIE testing and/or dilution series analysis, results from these tests can be evaluated along with chemistry data to identify the source(s) of toxicity with more certainty. These actions are described below.

**Bear Creek @ Kibby Rd**

Toxicity to *Selenastrum* occurred in samples collected from the Bear Creek @ Kibby Rd site. Follow-up sampling for toxicity occurred one week after the initial samples were collected and toxicity was persistent at this site. Sample toxicity did not persist through the TIE; therefore none of the treatments were able to provide useful information regarding the cause of toxicity. There were no exceedance-level detections of pesticides or metals relevant to the toxicity in these samples. It is possible that a constituent not tested by the Coalition is the cause of toxicity. Pesticide Use Reports (PURs) data from the period prior to the sampling event will be evaluated for all pesticides that are known to cause *Selenastrum* toxicity.

**Cottonwood Creek @ Rd 20**

Toxicity to *Selenastrum* occurred in samples collected from the Cottonwood Creek @ Rd 20 site. Follow-up re-sampling for toxicity occurred one week after the initial samples were collected and toxicity was persistent at this site. Results from the TIE indicated that the cause of toxicity was a non-polar organic and cationic metal constituent. An exceedance of copper was also detected at this site and may have been the cause (in part or in full) of toxicity in these samples. It is possible that constituent(s) not tested by the Coalition contributed to the toxicity. PUR data from the period prior to the sampling event will be evaluated for all pesticides that are known to cause *Selenastrum* toxicity.

**South Slough @ Quinley Rd**

Toxicity to *Selenastrum* occurred in samples collected from the Cottonwood Creek @ Rd 20 site. Follow-up re-sampling for toxicity occurred one week after the initial samples were collected and toxicity did not occur in the re-samples. Results from the TIE

indicated that the majority of toxicity was caused by cationic chemicals, while non-polar organics may have been responsible for a portion of the toxicity. There were no exceedance-level detections in pesticides or metals relevant to the toxicity in these samples. It is possible that a constituent not tested by the Coalition is the cause of toxicity. PUR data from the period prior to the sampling event will be evaluated for all pesticides that are known to cause *Selenastrum* toxicity.

**3. Complete analytical results**

A summary of the analytical results are provided electronically in pdf format along with this report.

**4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

**Table 3.** Time Schedule

Action	Anticipated Completion Date
Obtain PURs	July 30, 2008
Contact Growers in Watersheds	Variable
Perform Management Practices Survey	Complete (update to occur 12/31/08)
Outreach/BMP Education	Variable
Management Plan	Not yet scheduled

Justification for dates:

**Obtain PURs** – PURs for applications that occurred in the site subwatersheds in this report are not yet available for the months of April and May from the County Agricultural Commissioner’s Office. Data should be available to the Coalition within the next month and will be reviewed for applications relevant to these exceedances once they are received.

**Contact growers in the watersheds** – A proactive outreach strategy is being implemented by the Coalition, and current outreach is occurring based on exceedances from the 2007 irrigation season. Mailings were sent to Coalition members within the site subwatersheds where pesticide exceedances occurred during the previous season. In addition, outreach meetings have occurred on a site subwatershed basis where exceedances occurred during the previous year’s monitoring. These outreach activities are structured to remind growers just prior to the application period to use management practices this season that will help to reduce their discharge. Information on the 2008 irrigation season exceedances and management practices to address these exceedances will be provided to growers at the beginning of the 2009 irrigation season.

**Perform management practices survey** – BMP surveys have been provided to growers through mailings and at grower meetings. Results from these surveys were compiled and provided with the December 31, 2007 SAMR. For growers that do not currently

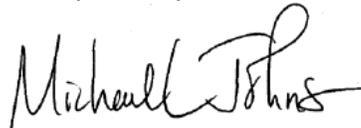

have a survey on record, a survey will be provided to them with the Coalition Semi-Annual Report by December 2008.

**Outreach/ BMP Education** – Current outreach activities are occurring to address exceedances detected during the 2007 irrigation season. Management practices that can be implemented to reduce the chance of discharge this season are discussed at grower meetings or provided in mailings. A grower meeting was held on June 18, 2008 with growers in Stanislaus County that are located in close proximity to waterways. A mailing was also sent out to growers located in site subwatersheds where detections of chlorpyrifos occurred during the 2007 irrigation season. The Coalition meeting to address the exceedances in this report is planned to occur in the late winter/early spring of 2009, just prior to the time when herbicides and metals would be applied for terrestrial and aquatic weed control.

**Management Plan** – An updated Management Plan will be submitted for all subwatersheds that have experienced two or more exceedances in one constituent. A time schedule for these Management Plans has not yet been determined.

Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style with a large, prominent "M" and "J".

Michael L. Johnson, Technical Program Manager

Dania Huggins  
 Irrigated Lands Conditional Waiver Program  
 Central Valley Regional Water Quality Control Board  
 11020 Sun Center Drive, #200  
 Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting a formal Communication Report for the pesticide exceedances reported on May 23, 2008 that have not been addressed in a Management Plan or previous Communication Report (see Table 1 below). Sampling occurred at this site on April 22, 2008 during the first irrigation sampling event of 2008.

**Table 1.** Pesticide exceedance from the ESJWQC region for samples collected during the first irrigation sampling event on April 22, 2008. The water quality trigger limit is listed below the constituent header.

Site Name	Sample Type	Sample Date	Season	DDT
				0.00059 µg/L
Hatch Drain @ Tuolumne Rd	FD	4/22/08	Irrigation	0.023*

FD = Field Duplicate

\*Detection of DDT occurred only in the field duplicate sample and there was no detection of DDT in its complimentary grab sample (laboratory minimum detection limit for DDT is 0.007 µg/L).

**1. Follow-up monitoring and analyses conducted.**

No follow-up sampling was conducted as a result of the pesticide exceedance. The second irrigation season sampling event occurred on May 13, 2008 and results from that monitoring event indicated that the exceedance was not persistent at the site. Further discussion on the exceedance is provided below.

**2. Actions taken to identify the source of the exceedance.**

DDT was detected at exceedance levels for the first time at the Hatch Drain @ Tuolumne Rd sample site during this monitoring event. Laboratory analyses of water samples detected DDT in the field duplicate sample but not in the grab sample. DDT has an extremely high  $K_{oc}$  which indicates that it binds to sediments. It is possible that the

field duplicate could have been contaminated with sediment mobilized from the drain during collection of the grab sample. DDT is an organochlorine pesticide that was used abundantly in the past, but is not currently registered for agricultural use. Due to the long half-life, DDT and its breakdown products, DDD and DDE, are still found in Coalition water bodies. Current agricultural pesticide applications are not the source of these exceedances and PUR data will not be evaluated to follow-up on the detections in the Hatch Drain. If additional exceedances of DDT occur at this site, then the exceedances will be addressed through actions stated in the Hatch Drain subwatershed management plan.

### **3. Complete analytical results**

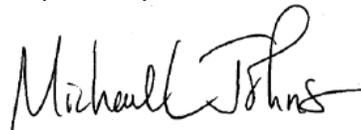

Analytical results for these exceedances are attached to the transmittal message. These results include all organochlorine data reports for this monitoring event provided to the Coalition by the analytical laboratory. QC and calibration data are included in the data reports.

### **4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

Because this exceedance was detected for the first time at this site and is not a result of current agricultural practices, no follow-up actions will be taken to address this exceedance at this time. If a second exceedance of DDT is detected in the Hatch Drain, then the exceedance will be addressed in a Management Plan for the site subwatershed.

Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style with a large, looped initial "M".

Michael L. Johnson, Technical Program Manager

**Subject:** Field Communication Report - Irrigation2 2008

**Attachments:** ESJWQC\_08\_CR\_Field\_Irrigation2\_073108\_final.doc

Dear Dania,

Attached is a Communication Report for one field exceedance detected during irrigation season monitoring on May 27, 2008. The raw data for this exceedance can be found in the form of field sheets on the MLJ-LLC Sharepoint website at: <http://sharepoint.mlj-llc.com/mlj-db/database/forms/allitems.aspx> (username: ftpuser, password: Aqua2007!). Please let us know if you have any questions on this report.

## East San Joaquin Water Quality Coalition

1201 L Street  
Modesto, CA 95354

[www.esjcoalition.org](http://www.esjcoalition.org)

July 31, 2008

Dania Huggins  
Irrigated Lands Conditional Waiver Program  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive, #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting the formal Communication Report for field parameter exceedances that occurred during the second 2008 irrigation season sampling event reported on May 28, 2008 (see Table 1 below). Only the exceedance that was experienced for the first time at a sample site is included in this report.

**Table 1.** Field exceedance detected in receiving waters on May 27, 2008 during the second irrigation season monitoring event.

Sample Site	Sample Date	Season	EC ( $\mu\text{S}/\text{cm}$ )
Deadman Creek @ Gurr Rd	5/27/08	Irrigation	801

### 1. Follow-up monitoring and analyses conducted.

Follow-up sampling for field parameter exceedances did not occur at this site. However, field parameters were measured again during the third and fourth irrigation monitoring events and there were no additional exceedances of conductivity (EC) detected at this site. The lack of persistence of the exceedance at Deadman Creek indicates that the EC detected was due to temporary conditions in the water body. If this exceedance is experienced a second time, it will then be addressed in the management plan for that site.

### 2. Actions taken to identify the source of the exceedance.

#### EC

Elevated conductivity may be due to anthropogenic factors, as well as natural soil geological conditions. Irrigation water can originate from surface storage facilities or ground water. Water entering the drains comes from seepage into the drains from

shallow ground water, direct discharge from surface irrigation return flows or rainfall events, and discharge from field drains. At this point it is uncertain what the source of EC is at the location sampled in Deadman Creek. Field measures at the Deadman Creek @ Hwy 59 sample site, located upstream of Deadman Creek @ Gurr Rd, also showed elevated levels of conductivity, but not beyond the exceedance trigger limit. If additional exceedances occur, EC will be addressed in the management plan for the site subwatershed.

### **3. Complete analytical results**

Complete analytical results in the form of field sheets in pdf format are too large to send by email with this report, but are available on the MLJ-LLC Sharepoint website.

### **4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

Because this exceedance was detected for the first time at this site and may be due to natural fluctuations in the creek, no follow-up actions will be taken to address this exceedance at this time. If a second exceedance of EC is detected at the Deadman Creek @ Gurr Rd sample site, then the exceedance will be addressed in a Management Plan for the site subwatershed.

Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style. To the right of the signature is a vertical green line.

## East San Joaquin Water Quality Coalition

1201 L Street  
Modesto, CA 95354  
www.esjcoalition.org

August 4, 2008

Dania Huggins  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting the formal Communication Report for the ammonia and metals exceedances reported on May 30 and June 12, 2008 (see Table 1). Only exceedances that occurred for the first time at a sample site are included in this report. Sampling occurred at these sites on April 22 and 29, 2008 for the first irrigation season monitoring event.

**Table 1.** Ammonia and metals exceedances detected for the first time at a sample site during the first irrigation monitoring event on April 22 and 29, 2008. Where water quality trigger limits for metals are calculated based on hardness, the limit is shown in parenthesis.

Site Name	Sample Date	Ammonia	Arsenic	Cadmium	Copper	Lead
		1.5 mg/L	10 µg/L	0.04 µg/L	(variable based on hardness)	2.5 (or variable based on hardness)
Hatch Drain @ Tuolumne Rd	4/22/08					3.9
Hatch Drain @ Tuolumne Rd (FD)	4/22/08					4.0
Silva Drain @ Meadow Dr	4/22/08	4.1				
Black Rascal Creek @ Yosemite Rd	4/29/08			0.08J	8 (7.7)	2.4 (2.39)
Deadman Creek @ Hwy 59	4/29/08		16			

### 1. Follow-up monitoring and analyses conducted.

No immediate follow-up sampling was performed. Results were not received from the laboratories until after the next event of sampling occurred. Samples were collected as part of normal monitoring for the analysis of metals and nutrients on May 20 and 27, and results from those samples were reported on July 5, 2008. Exceedance level detections of cadmium and lead were found to be persistent at the Black Rascal Creek

@ Yosemite Rd site, as well as arsenic at the Deadman Creek @ Hwy 59 site. Exceedances that occur more than once at a site will be addressed through a subwatershed Management Plan.

## **2. Actions taken to identify the source of the exceedance.**

### **Ammonia**

Ammonia can enter a water body through two sources, direct discharge from agricultural fertilizers or animal waste, or from discharges from waste water treatment plants. Ammonia in fertilizer is typically converted to nitrite and then nitrate in soils over a short period of time and discharge of fertilizer would have to be immediate to detect ammonia in the receiving water body. There are no waste water inputs to Silva Drain, however there are several dairies upstream of the sample site that may have contributed to this exceedance. If additional exceedances of ammonia are detected at this site, then further actions may be taken to source the exceedances through the Coalition Management Plan.

### **Arsenic**

Arsenic is found in sodium cacodylate which is applied by agriculture for broadleaf weed control and as a cotton defoliant. The registrations on many products with this active ingredient have been cancelled. However, there are four products currently registered for use on citrus, for weed control around ditches, for use on ornamental plants, for nonagricultural weed control, and for weed control around buildings, driveways, sidewalks, rights-of-way, and fencerows. Several products are available for use by homeowners and nonagricultural users (e.g. county road maintenance) ([http://www.pesticideinfo.org/List\\_Products.jsp?Rec\\_Id=PC34358&Chem\\_Name=Sodium%20cacodylate&PC\\_Code=012502](http://www.pesticideinfo.org/List_Products.jsp?Rec_Id=PC34358&Chem_Name=Sodium%20cacodylate&PC_Code=012502)) and the product may have been purchased for use by local homeowners for use on their property. California Department of Pesticide Regulation records indicate minimal use of sodium cacodylate across the Coalition region between 1996 and 2006, and in the Deadman Creek @ Hwy 59 site subwatershed, there is no record of any sodium cacodylate application.

### **Cadmium**

Elevated concentrations of cadmium in a water body may be a result of agricultural application of phosphate fertilizer, but also may arise from the erosion of soils and bedrock, atmospheric deposition, discharge from industrial operations or leakage from landfills and contaminated sites (e.g. disposal of NiCd batteries). Cadmium has high tendency to adsorb to sediments and persists indefinitely in the environment. The exceedance detected in the Black Rascal Creek @ Yosemite Rd sample site occurred for the first time during Coalition monitoring. The source of cadmium at this site is not certain. Cadmium is not likely to be related to agricultural discharges practices, however if additional exceedances are experienced, then those exceedances will be addressed in a Management Plan for the Black Rascal Creek site subwatershed.

## Copper

Copper is commonly applied throughout the Coalition region and is considered an organic herbicide, fungicide, and algaecide. Copper is known to contribute to the toxicity of *Selenastrum sp.* by acting as an herbicide and reducing growth of the algae. Copper Als include copper, copper hydroxide, copper sulfate and copper sulfate pentahydrate. Copper can also become available to water bodies through the weathering of rocks and soils that naturally contain metals. Since copper does not degrade, it is possible that applications can cause exceedances several months after application. PUR data will be provided in the next Annual Monitoring Report.

## Lead

Lead is a legacy of any of a number of potential sources including deposition from leaded gasoline, disposal of lead-containing products such as paints, electronic components, and batteries, and old applications of lead arsenate pesticides. Currently, there are no pesticides applied that contain lead, although lead arsenate was used in the past. Lead arsenate was used generally only until the 1960s and has been banned on all food crops since 1991. Currently, the most probable source is contaminated soils that originated from old pesticide applications, disposal of products containing lead, or the deposition of automobile exhaust along roadways. Contaminated soils may have caused contaminated sediment and that sediment may be moved into the water body during storm events. Lead is predominantly particulate bound and not bioavailable in that form. Major roads and highways within subwatersheds may contribute to the leaching of lead into the waterways. In addition, disposal of lead paint in the vicinity, burial of old buildings with lead paint, or leaching lead from lead arsenate deposition could all be contributors to lead detections. The source(s) of lead in the Hatch Drain and Black Rascal Creek are not certain, but are not likely a result of agricultural management practices.

### 3. Complete analytical results

Analytical results are appended electronically to the transmittal message. These results include all data reports provided to the Coalition by the analytical laboratory. QC data are included in the data reports.

### 4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.

**Table 3.** Time Schedule

Action	Anticipated Completion Date
Obtain PURs	August 30, 2008
Contact Growers in Watersheds	Variable
Perform Management Practices Survey	Complete (update to occur 12/31/08)
Outreach/BMP Education	Variable
Management Plan	Not yet scheduled

Justification for dates:

**Obtain PURs** – PURs for applications that occurred in the site subwatersheds in this report are not yet available for the months of April and May from the County Agricultural Commissioner’s Office. Data should be available to the Coalition within the next month and will be reviewed for applications relevant to these exceedances once they are received.

**Contact growers in the watersheds** – A proactive outreach strategy is being implemented by the Coalition, and current outreach is occurring based on exceedances from the 2007 irrigation season. Mailings were sent to Coalition members within the site subwatersheds where exceedances occurred during the previous season. In addition, outreach meetings have occurred on a site subwatershed basis where exceedances occurred during the previous year’s monitoring. These outreach activities are structured to remind growers just prior to the application period to use management practices to reduce their discharge. Information on the 2008 irrigation season exceedances and management practices to address these exceedances will be provided to growers at the beginning of the 2009 irrigation season.

**Perform management practices survey** – BMP surveys have been provided to growers through mailings and at grower meetings. Results from these surveys were compiled and provided with the December 31, 2007 SAMR. For growers that do not currently have a survey on record, a survey was provided with the call for membership renewal in the spring of 2008, and if that is unsuccessful will be provided to them with the Coalition Semi-Annual Report by December 2008.

**Outreach/ BMP Education** – Current outreach activities are occurring to address exceedances detected during the 2007 irrigation season. Management practices that can be implemented to reduce the chance of discharge this season are discussed at grower meetings or provided in mailings. The Coalition meeting to address the exceedances in this report is planned to occur in the late winter/early spring of 2009, just prior to the time when any products with metals would be applied.

**Management Plan** – An updated Management Plan will be submitted for all subwatersheds that have experienced two or more exceedances in one constituent. A time schedule for these Management Plans has not yet been determined.

Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style and is positioned to the left of a vertical line that extends downwards from the top of the signature area.

Michael L. Johnson, Technical Program Manager

 Modesto, CA 95354  
**www.esjcoalition.org**

August 18, 2008

Dania Huggins  
 Irrigated Lands Conditional Waiver Program  
 Central Valley Regional Water Quality Control Board  
 11020 Sun Center Drive, #200  
 Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting a formal Communication Report for the pesticide exceedances reported on June 13, 2008 that have not been addressed in a Management Plan or previous Communication Report (see Table 1 below). Sampling occurred at this site on April 29, 2008 during the first irrigation sampling event of 2008.

**Table 1.** Pesticide exceedance from the ESJWQC region for samples collected during the first irrigation sampling event on April 29, 2008. The water quality trigger limit is listed below the constituent header.

Site Name	Sample Type	Sample Date	Season	Carbofuran	Dieldrin
				0 µg/L*	0.00014 µg/L
Deadman Creek @ Gurr Rd	NM	4/29/08	Irrigation		0.028
Duck Slough @ Gurr Rd	NM	4/29/08	Irrigation	0.052	

\*Carbofuran is a prohibited discharge pesticide and any detected amount of carbofuran in a sample is considered an exceedance.

**1. Follow-up monitoring and analyses conducted.**

No follow-up sampling was conducted as a result of the pesticide exceedances. The second irrigation season sampling occurred at these two site on May 27, 2008 and results from that monitoring event indicated that the exceedance was not persistent at these sites. Further discussion on the exceedance is provided below.

**2. Actions taken to identify the source of the exceedance.**

Dieldrin was detected at exceedance levels for the first time at the Deadman Creek @ Gurr Rd sample site during this monitoring event. Dieldrin is an organochlorine

insecticide that is not currently registered for agricultural use. Dieldrin was widely used in the past to control insects on cotton, corn and citrus crops, however was banned from agricultural use in 1974. Dieldrin was also used to control locusts and mosquitoes, as a wood preserve, and for termite control. All products containing dieldrin were banned from use in 1987. Dieldrin is a persistent, bioaccumulative, and toxic (PBT) pollutant targeted by EPA (<http://www.epa.gov/opptintr/pbt/>).

There was no associated toxicity in this sample. If additional exceedances of dieldrin occur at this site, then the exceedance will be addressed through actions stated in the Deadman Creek subwatershed management plan.

Carbofuran was also detected at exceedance levels at the Duck Slough @ Gurr Rd sample site during the first irrigation season monitoring event on April 29, 2008. Carbofuran is a prohibited discharge pesticide and any detection of the constituent in a water sample is considered an exceedance. It is a restricted use pesticide and has minimal use in California on crops such as artichokes, grapes and ornamentals. A systemic, broad spectrum N-methyl carbamate insecticide and nematicide, carbofuran is highly toxic to *Ceriodaphnia dubia*. There was no toxicity detected in these samples. Pesticide Use Report (PUR) data for the Duck Slough @ Gurr Rd site subwatershed are not yet available, however once they are received from the Agricultural Commissioner's Office they will be reviewed for applications relevant to this detection. If additional exceedances of carbofuran are detected at this site, then actions will be taken to address the exceedances in the Coalition Management Plan.

**3. Complete analytical results**

Analytical results for these exceedances are attached to the transmittal message. These results include all carbamate and organochlorine data reports for this monitoring event provided to the Coalition by the analytical laboratory. QC and calibration data are included in the data reports.

**4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

**Table 2.** Time Schedule

Action	Anticipated Completion Date
Obtain PURs	August 30, 2008
Contact Growers in Watersheds	Variable
Perform Management Practices Survey	Complete (update to occur 12/31/08)
Outreach/BMP Education	Variable
Management Plan	Not yet scheduled

Justification for dates:

**Obtain PURs** – PURs for applications that occurred in the site subwatersheds in this report are not yet available for the months of April and May from the County Agricultural Commissioner’s Office. Data should be available to the Coalition within the next month and will be reviewed for applications relevant to these exceedances once they are received.

**Contact growers in the watersheds** – A proactive outreach strategy is being implemented by the Coalition, and current outreach is occurring based on exceedances from the 2007 irrigation season. Mailings were sent to Coalition members within the site subwatersheds where pesticide exceedances occurred during the previous season. In addition, outreach meetings have occurred on a site subwatershed basis where exceedances occurred during the previous year’s monitoring. These outreach activities are structured to remind growers just prior to the application period to use management practices this season that will help to reduce their discharge. Information on the 2008 irrigation season exceedances and management practices to address these exceedances will be provided to growers at the beginning of the 2009 irrigation season.

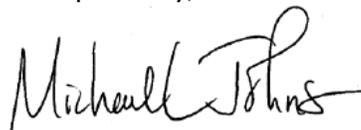

**Perform management practices survey** – Best Management Practices (BMP) surveys have been provided to growers through mailings and at grower meetings. Results from these surveys were compiled and provided with the December 31, 2007 Semi-Annual Monitoring Report (SAMR). For growers that do not currently have a survey on record, a survey will be provided to them with the Coalition SAMR by December 2008.

**Outreach/ BMP Education** – Current outreach activities are occurring to address exceedances detected during the 2007 irrigation season. Management practices that can be implemented to reduce the chance of discharge this season are discussed at grower meetings or provided in mailings. A grower meeting was held on June 18, 2008 with growers in Stanislaus County that are located in close proximity to waterways and an additional meeting was held in Merced County on July 21, 2008 to discuss exceedances from the past and management practices to address the exceedances. A mailing was also sent out to growers located in site subwatersheds where detections of chlorpyrifos occurred during the 2007 irrigation season. The Coalition meeting to address the exceedances in this report is planned to occur in the late winter/early spring of 2009, just prior to the time when herbicides and metals would be applied for terrestrial and aquatic weed control.

**Management Plan** – An updated Management Plan will be submitted for all subwatersheds that have experienced two or more exceedances in one constituent. A time schedule for these Management Plans has not yet been determined.

Let us know if further explanation or documentation is necessary.

Respectfully,

Michael L. Johnson, Technical Program Manager

August 27, 2008

Dania Huggins  
 Irrigated Lands Conditional Waiver Program  
 Central Valley Regional Water Quality Control Board  
 11020 Sun Center Drive, #200  
 Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting the formal Communication Report for a toxicity exceedance reported on June 24, 2008 that occurred in water samples collected from ESJWQC sample sites on June 17, 2008 (see Table 1 below). Only the toxicity exceedance that occurred for the first time at sample site is included in this report.

**Table 1.** ESJWQC toxicity in normal monitoring (NM) samples collected during the third 2008 irrigation sampling event conducted on June 17, 2008. Only the first time toxicity exceedance for this monitoring event is shown.

Sample Site	Sample Type	Sample Date	Season	<i>Pimephales promelas</i> (% survival compared to control)
Silva Drain @ Meadow Dr	NM	6/17/2008	Irrigation	82

**1. Follow-up monitoring and analyses conducted**

Re-sampling for *Pimephales* toxicity at Silva Drain @ Meadow Dr occurred on June 24, 2008 and results indicated that the *Pimephales* toxicity was not persistent at that site.

**Table 2.** ESJWQC results from re-sampling (RS) on June 24, 2008 as follow-up to toxicity.

Sample Site	Sample Type	Sample Date	Season	<i>Pimephales promelas</i> (% growth compared to control)
Silva Drain @ Meadow Dr	RS	6/24/08	Irrigation	100*

\*Sample is not toxic.

## 2. Actions taken to identify the source of the exceedances

Toxicity to *Pimephales* occurred in samples collected from the Silva Drain @ Meadow Dr site although the level of toxicity did not drop below 20%. Follow-up sampling for toxicity occurred one week after the initial samples were collected and toxicity was not persistent at this site. *Pimephales* mortality relative to the control was less than 50% and therefore did not trigger a Toxicity Identification Evaluation. However, an exceedance of ammonia (13 µg/L) was also detected in the Silva Drain @ Meadow Dr sample water during this event. *Pimephales* is known to be sensitive to ammonia in water, and it is likely that the toxicity detected at this site is due to the elevated level of ammonia. *E. coli* was also detected at this site, at the highest level detectable (>2400 MPN/100mL), indicating that the source of ammonia may be fecal matter. In the Silva Drain @ Meadow Dr site subwatershed there is irrigated pasture just adjacent to the sample site and dairies are found upstream. Drainage water from the pasture is a possible source of fecal contamination at the sample site. The elevated ammonia and *E. coli* suggest that livestock waste was the cause of the exceedance.

Pesticides applications that may also be relevant to this toxicity will be reviewed through Pesticide Use Reports (PURs), in the case that a pesticide not tested by the Coalition may be responsible for the toxicity. These data are not available for Merced County at this time, but will be provided with the next Coalition AMR.

## 3. Complete analytical results

A summary of the analytical results are provided electronically in pdf format along with this report.

## 4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.

**Table 3.** Time Schedule

Action	Anticipated Completion Date
Obtain PURs	October 30, 2008
Contact Growers in Watersheds	Variable
Perform Management Practices Survey	Complete (update to occur 3/1/09)
Outreach/BMP Education	Variable
Management Plan	Not yet scheduled

Justification for dates:

**Obtain PURs** – PURs for applications that occurred in the site subwatersheds in this report are not yet available for the months of April and May from the County Agricultural Commissioner’s Office. Data should be available to the Coalition within the

next month and will be reviewed for applications relevant to these exceedances once they are received.

**Contact growers in the watersheds** – A proactive outreach strategy is being implemented by the Coalition, and current outreach is occurring based on exceedances from the 2007 irrigation season. Mailings were sent to Coalition members within the site subwatersheds where pesticide exceedances occurred during the previous season. In addition, outreach meetings have occurred on a site subwatershed basis where exceedances occurred during the previous year’s monitoring. These outreach activities are structured to remind growers just prior to the application period to use management practices this season that will help to reduce their discharge. Information on the 2008 irrigation season exceedances and management practices to address these exceedances will be provided to growers at the beginning of the 2009 irrigation season.

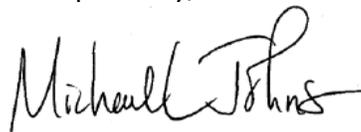

**Perform management practices survey** – Best Management Practices (BMPs) surveys have been provided to growers through mailings and at grower meetings. Results from these surveys were compiled and provided with the December 31, 2007 Semi Annual Monitoring Report (SAMR). For growers that do not currently have a survey on record, a survey will be provided to them with the Coalition SAMR by December 2008.

**Outreach/ BMP Education** – Current outreach activities are occurring to address exceedances detected during the 2007 irrigation season. Management practices that can be implemented to reduce the chance of discharge this season are discussed at grower meetings or provided in mailings. The Coalition meeting to address the exceedances in this report is planned to occur in the late winter/early spring of 2009, just prior to the time when herbicides and metals would be applied for terrestrial and aquatic weed control.

**Management Plan** – An updated Management Plan will be submitted on September 30, 2008 for all subwatersheds that have experienced two or more exceedances in one constituent.

Let us know if further explanation or documentation is necessary.

Respectfully,

Michael L. Johnson, Technical Program Manager

**Attachments:** ESJWQC\_08\_CR\_Field\_Irrigation3\_082808\_final.doc

Dear Dania,

Attached is a Communication Report for one field exceedance detected for the first time during the third irrigation monitoring event on June 24, 2008. The field sheets relevant to this exceedance are available on the MLJ-LLC sharepoint website. Go to <http://sharepoint.mlj-llc.com/mlj-db/database/forms/allitems.aspx> (username: ftpuser, password: Aqua2007!).

Please let us know if you have any questions on this report.

## East San Joaquin Water Quality Coalition

1201 L Street  
Modesto, CA 95354

[www.esjcoalition.org](http://www.esjcoalition.org)

August 28, 2008

Dania Huggins  
Irrigated Lands Conditional Waiver Program  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive, #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting the formal Communication Report for field parameter exceedances that occurred during the third 2008 irrigation season sampling event reported on June 25, 2008 (see Table 1 below). Only the exceedance that was experienced for the first time at a sample site is included in this report.

**Table 1.** Field exceedance detected in receiving waters on May 27, 2008 during the second irrigation season monitoring event.

Sample Site	Sample Date	Season	Dissolved Oxygen (mg/L)
Miles Creek @ Reilly Rd	6/24/08	Irrigation	4.76

### 1. Follow-up monitoring and analyses conducted.

Follow-up sampling for field parameter exceedances did not occur at this site. However, field parameters were measured again at this site during the fourth and fifth irrigation monitoring events and showed persistently low levels of dissolved oxygen (DO) at the site. The persistence of low DO at Miles Creek may be due natural conditions in the water body. Because additional exceedances were detected in Miles Creek, DO will be addressed in the management plan for that site subwatershed.

### 2. Actions taken to identify the source of the exceedance.

#### Dissolved Oxygen

Exceedances of the DO water quality trigger limit (WQTL) are common and have been present throughout the Coalition region since monitoring was implemented. DO and pH are expected to vary diurnally and can exceed the WQTL as a result of natural processes in the water column such as changing water temperature, photosynthesis and respiration. Changes in DO can be exacerbated by the addition of nutrients which

stimulate production of organic material. The organic material eventually dies and is broken down by microbial activity. The respiration of the bacteria during the breakdown process is termed Biological Oxygen Demand (BOD).

The Coalition conducted a special study in 2007 which attempted to determine if BOD contributed to the low DO in samples from the subwatersheds. The results of this study were included in Appendix VIII of the December 30, 2007 Semi Annual Monitoring Report. The majority of the samples contained no measurable BOD. The reasons for this could be the long holding time prior to initiation of the test or already depleted DO concentrations in the water column. BOD and Total Organic Carbon (TOC) were positively correlated and TOC was used as a surrogate for BOD in a multiple regression analysis. Water temperature, BOD, and nitrate in the water column were all significant predictors of DO. As water temperature and BOD increased, DO decreased. As nitrate increased, DO increased; although the explanation for this relationship is not clear. It is clear that both water temperature and BOD are significant factors causing the decrease in DO although other, as yet unknown factors are also important.

### **3. Complete analytical results**

Complete analytical results in the form of field sheets in pdf format are too large to send by email with this report, but are available on the MLJ-LLC Sharepoint website.

### **4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

Because this exceedance was detected for the first time at this site and may be due to natural fluctuations in the creek, no follow-up actions will be taken to address this exceedance at this time. This exceedance will be addressed in a Management Plan for the site subwatershed.

Let us know if further explanation or documentation is necessary.

Respectfully,

Michael L. Johnson, Technical Program Manager

## East San Joaquin Water Quality Coalition

1201 L Street  
Modesto, CA 95354  
www.esjcoalition.org

September 4, 2008

Dania Huggins  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting the formal Communication Report for physical parameters and metals exceedances reported on July 5, 2008 (see Table 1). Only exceedances that occurred for the first time at a sample site are included in this report. Sampling occurred at these sites on May 27, 2008 for the second irrigation season monitoring event.

**Table 1.** TDS and metals exceedances detected for the first time at a sample site during the second irrigation monitoring event on May 27, 2008.

Site Name	Sample Date	Nickel	TDS
		12 µg/L	450 mg/L
Black Rascal Creek @ Yosemite Rd	5/27/08	14	
Deadman Creek @ Gurr Rd	5/27/08		520

### 1. Follow-up monitoring and analyses conducted.

No immediate follow-up sampling was performed. Results were not received from the laboratories until after the next event of sampling occurred. Samples were collected as part of normal monitoring for the analysis of metals and nutrients on June 17 and 24, and results from those samples were reported on July 28, 2008. Neither of the exceedances included in this report were detected again at those sites. If additional exceedances do occur during future monitoring events then they will be addressed through a subwatershed Management Plan.

### 2. Actions taken to identify the source of the exceedance.

#### Nickel

Nickel was detected in samples collected from the Black Rascal Creek site during the May 27, 2008 monitoring event. Nickel is a naturally occurring metal that is found in

native soils within the Coalition region. It is also applied by agriculture as a foliar nutrient on crops such as cotton and pecans to improve nitrogen utilization when nitrogen is applied as urea. The amount of nickel applied in the Coalition region is unknown but because urea is not the most commonly used form of nitrogen fertilization, its use is assumed to be low. Nickel is also a constituent in fertilizers originating with wastes from industry and sewage treatment plants. It can also be released into the environment from the disposal of nickel-cadmium batteries. In addition to the nickel exceedance at the Black Rascal Creek site, exceedances of cadmium (0.1 µg/L) and lead (5.5 µg/L) also occurred (these will be addressed in the Coalition Management Plan). According to the field observations there was no observed flow in the creek at the time of sampling and the sample water was very turbid, with less than four inches of visibility. Metals associated with sediments may have been found in the water column and due to the fact that the samples were not filtered, the concentration of metals in the sample water may have been elevated. The particular sources of these metals are unknown, however if additional exceedances occur in the site subwatershed then they will be addressed in the Coalition Management Plan.

### **Total Dissolved Solids**

TDS describes all solids (usually mineral salts) that are dissolved in water and are frequently associated with exceedances of EC. Besides the TDS exceedance, field results from Deadman Creek @ Gurr Rd show that EC also measured above the water quality trigger limit (801 µS/cm). Potential sources of EC and TDS are minerals leached from soils by upstream surface water and ground water, or drain water from irrigated agriculture. There are two general sources of EC (or TDS) in agricultural landscapes; fertilizers and native soils. A commercial fertilizer can be made up of dozens of different chemicals, each of which ionize and contribute to the EC of the solution. Different brands of fertilizer can use different chemicals to make up the total formula indicating that there will not be a universal signal for fertilizer-generated EC or TDS.

Deadman Creek @ Gurr Rd is located in Sandy Mush Country, close to the San Joaquin River where depth to ground water tends to be very shallow. Data developed by the Modesto and Turlock Irrigation Districts suggests that the exceedances of TDS/EC to the north of this site are a function of ground water. Geologically, the ground water from both the east and west side of the Valley moves toward the San Joaquin River trough, the low point in the Valley that is naturally high in salts. The movement of water down gradient toward the San Joaquin River creates a shallow ground water table, as evidenced by the numerous wetlands that are in the vicinity of the river. This shallow ground water appears to be the cause of the salinity problems in many ESJWQC water bodies close to the river. It is unknown if shallow ground water is the cause of the elevated TDS at this location and at this time.

### **3. Complete analytical results**

Analytical results are appended electronically to the transmittal message. These results include all data reports provided to the Coalition by the analytical laboratory. QC data are included in the data reports.

**4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

**Table 3.** Time Schedule.

Action	Anticipated Completion Date
Obtain PURs	Not Applicable
Contact Growers in Watersheds	Variable
Perform Management Practices Survey	Complete (update to occur 12/31/08)
Outreach/BMP Education	Variable
Management Plan	September 30, 2008

Justification for dates:

**Obtain PURs** – Because the exceedances in this report are not active ingredients of pesticides, PUR data are not relevant to this report.

**Contact growers in the watersheds** – A proactive outreach strategy is being implemented by the Coalition, and current outreach is occurring based on exceedances from the 2007 irrigation season. Mailings were sent to Coalition members within the site subwatersheds where exceedances occurred during the previous season. In addition, outreach meetings have occurred on a site subwatershed basis where exceedances occurred during the previous year’s monitoring. These outreach activities are structured to remind growers just prior to the application period to use management practices to reduce their discharge. Information on the 2008 irrigation season exceedances and management practices to address these exceedances will be provided to growers at the beginning of the 2009 irrigation season.

**Perform management practices survey** – BMP surveys have been provided to growers through mailings and at grower meetings. Results from these surveys were compiled and provided with the December 31, 2007 SAMR. For growers that do not currently have a survey on record, a survey was provided with the call for membership renewal in the spring of 2008, and if that is unsuccessful will be provided to them with the Coalition Annual Report by December 2008.

**Outreach/ BMP Education** – Current outreach activities are occurring to address exceedances detected during the 2007 irrigation season. Management practices that can be implemented to reduce the chance of discharge this season are discussed at grower meetings or provided in mailings. The Coalition meeting to address the exceedances in this report is planned to occur in the late winter/early spring of 2009, just prior to the time when any products with metals would be applied.

**Management Plan** – An updated Management Plan will be submitted on September 30, 2008 for all subwatersheds that have experienced two or more exceedances in one constituent up to September 2007.

Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style with a vertical red line to its right.

## East San Joaquin Water Quality Coalition

1201 L Street  
Modesto, CA 95354  
[www.esjcoalition.org](http://www.esjcoalition.org)

September 29, 2008

Dania Huggins  
Irrigated Lands Conditional Waiver Program  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive, #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting a formal Communication Report for the pesticide exceedance reported on July 25, 2008 that has not been addressed in a Management Plan or previous Communication Report (see Table 1 below). Sampling occurred at this site on May 27, 2008 during the second irrigation event of 2008.

**Table 1.** Pesticide exceedance from the ESJWQC region for samples collected during the second irrigation sampling event on May 27, 2008. The water quality trigger limit is listed below the constituent header.

Site Name	Sample Type	Sample Date	Season	Cyanazine
				1.0 µg/L
Cottonwood Creek @ Rd 20	NM	5/27/2008	Irrigation	1.1

NM – Normal Monitoring

### 1. Follow-up monitoring and analyses conducted.

No follow-up sampling was conducted as a result of the pesticide exceedance. The third irrigation season sampling event occurred on June 24, 2008 and results from that monitoring event indicated that the exceedance was not persistent at the site. Further discussion on the exceedance is provided below.

### 2. Actions taken to identify the source of the exceedance.

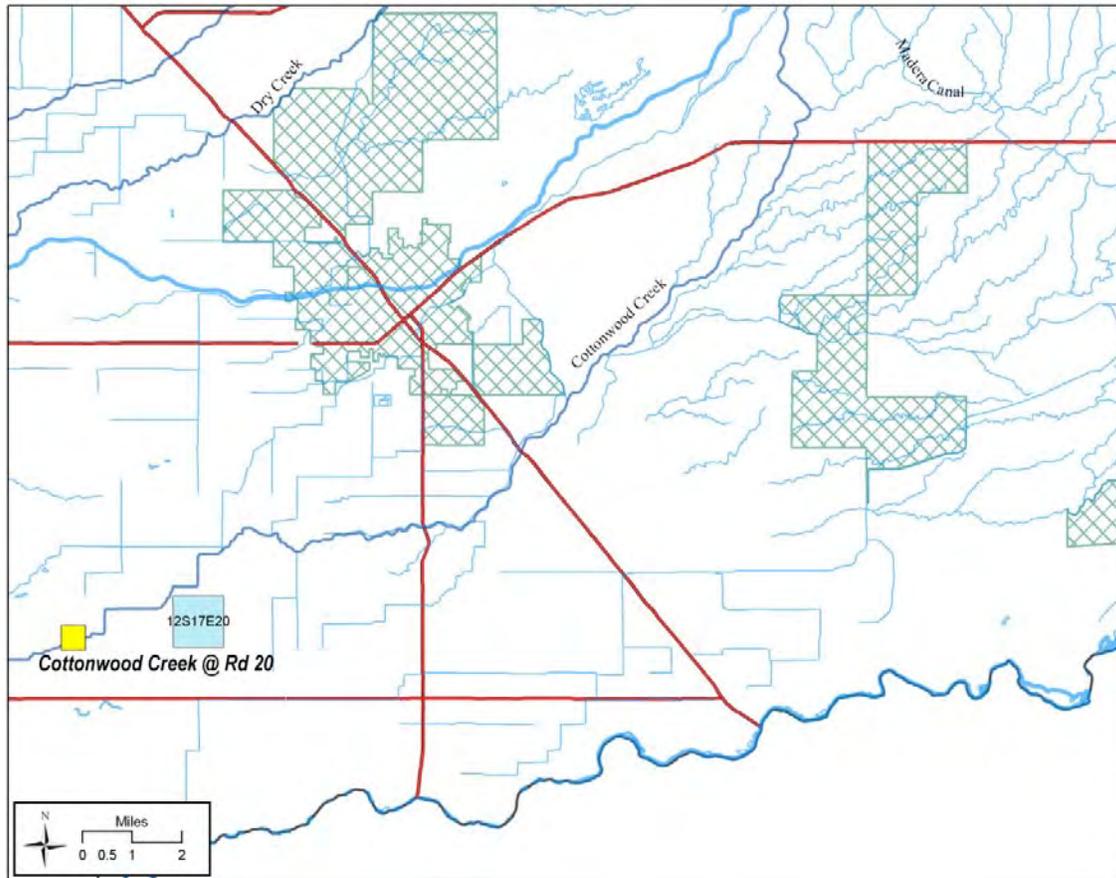

Cyanazine was detected at exceedance levels for the first time at the Cottonwood Creek @ Rd 20 sample site during this monitoring event. Cyanazine is a triazine herbicide that is not currently registered for use. Due to the long hydrolysis half-life of cyanazine (3,680 days according to the Pesticide Action Network Database), it is possible that the detection was a result of applications in the past. Cyanazine was classified as a

Restricted Use Pesticide between 1995 and 2002 and during that time the production of cyanazine was phased out. The sale and use of stocks of cyanazine was prohibited after September 30, 2002. Pesticide Use Reports (PURs) show that use did occur within the Cottonwood Creek site subwatershed in July of 1995. However, it is unlikely that these two applications could be the source of the exceedance detected.

**Table 2.** Cyanazine applications within the Cottonwood Creek @ Rd 20 site subwatershed between 1995 and 2002.

Date	TRS	Commodity	Product Name	Chemical Name	Pounds Product Applied	Pounds Chemical Applied	Acres Treated	Application Method
7/18/1995	12S17E20	Corn (forage - fodder)	Du Pont Bladex 4l Herbicide	Cyanazine	74.97	32.2371	40	G
7/19/1995	12S17E20	Corn (forage - fodder)	Du Pont Bladex 4l Herbicide	Cyanazine	74.97	32.2371	40	G

**Figure 1.** Map of TRS with cyanazine applications in the Cottonwood Creek @ Rd 20 site subwatershed between 1995 and 2002. The TRS where applications occurred is highlighted blue. The sample site is shown in yellow.

Cyanazine is known to be toxic to *Selenastrum capricornutum* (LC<sub>50</sub> of 145 µg/L), however no toxicity was detected in the samples from this site. If additional

exceedances of cyanazine are detected at this site, then the exceedances will be addressed in the Coalition Management Plan.

### 3. Complete analytical results

Analytical results for these exceedances are attached to the transmittal message. These results include all triazine data reports for this monitoring event provided to the Coalition by the analytical laboratory. QC and calibration data are included in the data reports.

### 4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.

**Table 3.** Time Schedule

Action	Anticipated Completion Date
Obtain PURs	Done
Contact Growers in Watersheds	December 31, 2008
Perform Management Practices Survey	Complete (update to occur 12/31/08)
Outreach/BMP Education	March 2009
Management Plan	Not yet scheduled

Justification for dates:

**Obtain PURs** – Cyanazine is not currently registered for use, however PURs for applications that occurred in the past in the site subwatershed are provided above.

**Contact growers in the watersheds** – A proactive outreach strategy is being implemented by the Coalition, and current outreach is occurring based on exceedances from the 2007 irrigation season. Mailings were sent to Coalition members within the site subwatersheds where pesticide exceedances occurred during the previous season. In addition, outreach meetings have occurred on a site subwatershed basis where exceedances occurred during the previous year’s monitoring. These outreach activities are structured to remind growers just prior to the application period to use management practices this season that will help to reduce their discharge. Information on the 2008 irrigation season exceedances and management practices to address these exceedances will be provided to growers at the beginning of the 2009 irrigation season.

**Perform management practices survey** – Best Management Practices (BMP) surveys have been provided to growers through mailings and at grower meetings. Results from these surveys were compiled and provided with the December 31, 2007 Semi-Annual Monitoring Report. For growers that do not currently have a survey on record, a survey will be provided to them with the Coalition Annual Report by December, 2008.

**Outreach/ BMP Education** – Current outreach activities are occurring to address exceedances detected during the 2007 irrigation season. Management practices that can be implemented to reduce the chance of discharge this season are discussed at

grower meetings or provided in mailings. A grower meeting was held in Merced County on July 21, 2008 to discuss exceedances from the past and management practices to address the exceedances. Though the exceedance in this report is likely a result of legacy use, the Coalition meeting to address irrigation season exceedances is planned to occur in the late winter/early spring of 2009, just prior to the time when herbicides would be applied for terrestrial and aquatic weed control.

**Management Plan** – An updated Management Plan will be submitted for all subwatersheds that have experienced two or more exceedances in one constituent through September, 2007. This Management Plan will be submitted September 30, 2008.

Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style with a large initial "M".

Michael L. Johnson, Technical Program Manager

## East San Joaquin Water Quality Coalition

1201 L Street  
Modesto, CA 95354  
www.esjcoalition.org

September 30, 2008

Dania Huggins  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting the formal Communication Report for physical parameters and metals exceedances reported on July 28, 2008 (see Table 1). Only exceedances that occurred for the first time at a sample site are included in this report. Sampling occurred at these sites on June 17 and 24, 2008 for the third irrigation season monitoring event.

**Table 1.** TDS and metals exceedances detected for the first time at a sample site during the second irrigation monitoring event on May 27, 2008.

Site Name	Sample Date	Arsenic	Cadmium	Copper	Lead	Nitrate
		10 µg/L	0.04 µg/L*	Variable (based on hardness)	Variable (based on hardness)	10 µg/L
Livingston Drain @ Robin Ave	6/17/2008					11
Livingston Drain @ Robin Ave (FD)	6/17/2008					11
Silva Drain @ Meadow Dr	6/17/2008		0.1	68 (27)		
Bear Creek @ Kibby Rd	6/24/2008	17				
South Slough @ Quinley Rd	6/24/2008			4 (3.7)	0.85 (0.81)	

FD – Field duplicate sample

\*Current water quality trigger limit for cadmium is 5 µg/L, however the original exceedance report was written using the old trigger limit; 0.04 µg/L.

### 1. Follow-up monitoring and analyses conducted.

No immediate follow-up sampling was performed. Results were not received from the laboratories until after the next event of sampling on July 22 and 29, 2008. Normal monitoring occurred again at these sites for the analysis of metals and nutrients and results from those samples were reported on August 28 and September 5, 2008. Of the exceedances included in this report, cadmium was detected again at the Silva Drain @ Meadow Dr site (0.08 µg/L) during the following sampling event. The water quality

trigger limit (WQTL) value for cadmium has increased from 0.04 µg/L to 5 µg/L since these samples were reported, and neither detection at Silva Drain (from sampling event from August or September) would be considered an exceedance with the current limits. If additional exceedances do occur during future monitoring events then they will be addressed through a subwatershed Management Plan.

## **2. Actions taken to identify the source of the exceedance.**

### **Arsenic**

An exceedance of arsenic was detected at the Bear Creek @ Kibby Rd sample site during the June 24, 2008 sampling event. There were no other metals detected at exceedance levels at this site. Arsenic is found in sodium cacodylate which is applied by agriculture for broadleaf weed control and as a cotton defoliant. The registrations on many products with this active ingredient have been cancelled. However, there are four products currently registered for use on citrus, for weed control around ditches, for use on ornamental plants, for nonagricultural weed control, and for weed control around buildings, driveways, sidewalks, rights-of-way, and fencerows. Several products are available for use by homeowners and nonagricultural users (e.g. county road maintenance)

([http://www.pesticideinfo.org/List\\_Products.jsp?Rec\\_Id=PC34358&Chem\\_Name=Sodium%20cacodylate&PC\\_Code=012502](http://www.pesticideinfo.org/List_Products.jsp?Rec_Id=PC34358&Chem_Name=Sodium%20cacodylate&PC_Code=012502)) and the product may have been purchased for use by local homeowners for use on their property. California Department of Pesticide Regulation records indicate no use of sodium cacodylate across the Coalition region between 1998 and 2006 for agricultural use.

At this point the source of arsenic is unclear although native soils can contain elevated concentrations of arsenic. The Coalition will work with the Regional Board to determine if it is feasible to obtain the necessary data to establish background levels when arsenic becomes a priority.

### **Cadmium**

Cadmium was detected at the Silva Drain @ Meadow Dr site above the WQTL of 0.04 µg/L. Since the time of this exceedance, the WQTL for cadmium has increased to 5 µg/L and the exceedance listed in this report is therefore no longer considered an exceedance. As a result, there will be no follow-up actions to deal with this exceedance at this time.

### **Copper**

Copper was detected at exceedance levels at the Silva Drain @ Meadow Dr and South Slough @ Quinley Rd sample sites. Copper is commonly applied throughout the Coalition region and is considered an organic herbicide, fungicide, and algicide. Copper is known to contribute to the toxicity of *Selenastrum* reducing growth of the algae. Copper active ingredients (AIs) include copper, copper hydroxide, copper sulfate and copper sulfate pentahydrate. Copper can also become available to water bodies through

the weathering of rocks and soils that naturally contain metals. Copper is found in automobile components and wearing of brakes can add substantial amounts of copper to surface waters that pass through or near urban areas. Since copper does not degrade, it is possible that applications can cause exceedances several months after application. Tables and maps of relevant pesticide applications in the site subwatersheds are provided below.

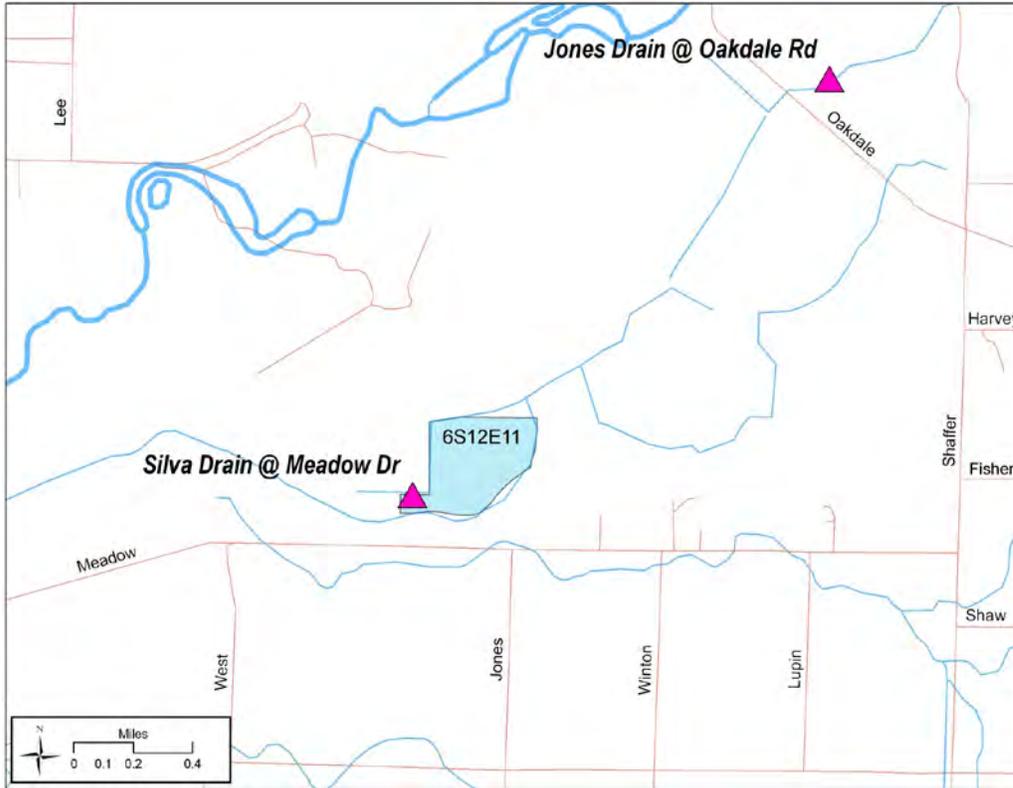

**Table 2.** Copper applications that occurred in the Silva Drain @ Meadow Dr site subwatershed within three months of the date of sampling.

Commodity	Application Date	EPA Number	EPA name	Active Ingredient	Pounds Active Ingredient Used	Application Method	Treated acres	TRS
ALMOND	1/4/2008	352-656-AA	DUPONT KOCIDE 2000 FUNGICIDE/BACTERICIDE	COPPER HYDROXIDE	204	Ground	34	6S12E11
ALMOND	1/4/2008	352-656-AA	DUPONT KOCIDE 2000 FUNGICIDE/BACTERICIDE	COPPER HYDROXIDE	210	Ground	35	6S12E11
ALMOND	1/11/2008	352-656-AA	DUPONT KOCIDE 2000 FUNGICIDE/BACTERICIDE	COPPER HYDROXIDE	170	Ground	34	6S12E11

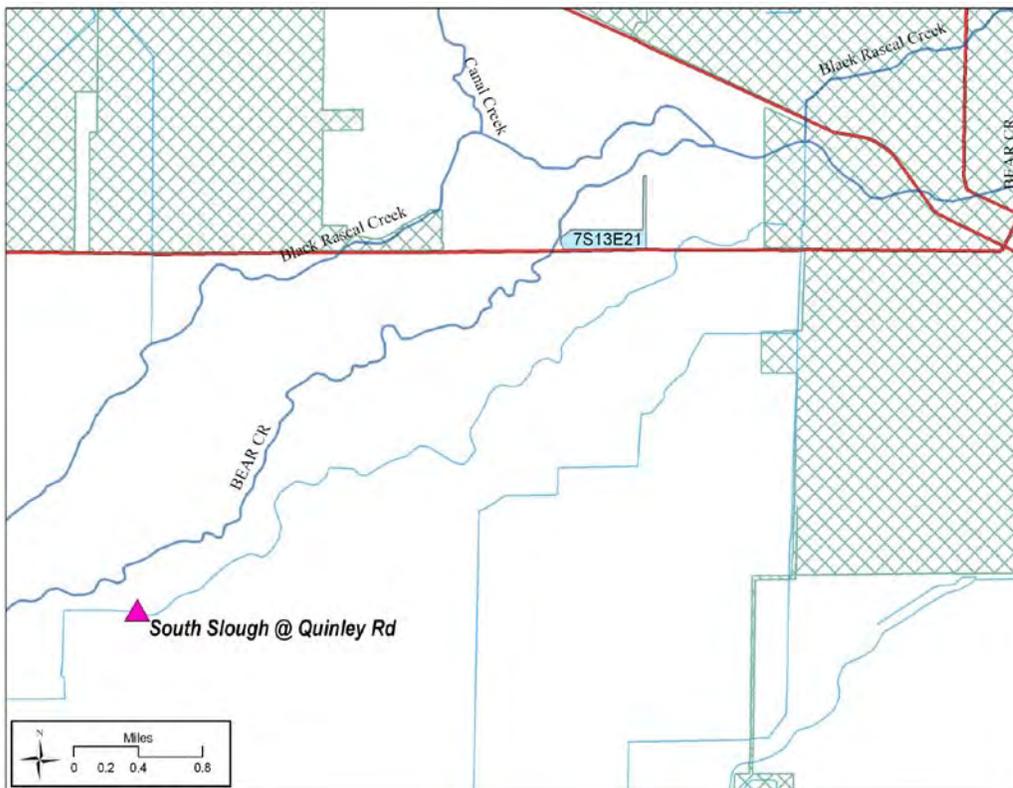

**Table 3.** Copper applications that occurred in the South Slough @ Quinley Rd site subwatershed within three months of the date of sampling.

Commodity	Application Date	EPA Number	EPA Name	Active Ingredient	Pounds Applied	Application Method	Treated Acres	TRS
ALMOND	2/29/2008	352-656-AA	DUPONT KOCIDE 2000 FUNGICIDE/BACTERICIDE	COPPER HYDROXIDE	140	Ground	35	7S13E21

**Figure 1.** Map of copper applications that occurred in the Silva Drain @ Meadow Dr site subwatershed within three months of the date of sampling.

**Figure 2.** Map of copper applications that occurred in the South Slough @ Quinley Rd site subwatershed within three months of the date of sampling.

## **Lead**

An exceedance of lead was detected at the South Slough @ Quinley Rd site subwatershed. Lead is a legacy of any of a number of potential sources including deposition from leaded gasoline, disposal of lead-containing products such as paints, electronic components, and batteries, and old applications of lead arsenate pesticides. Currently, there are no pesticides applied that have lead as a material, although lead arsenate was used in the past. Lead arsenate was used generally only until the 1960s and has been banned on all food crops since 1991. Currently, the most probable source is contaminated soils that originated from old pesticide applications, disposal of products containing lead, or the deposition of automobile exhaust along roadways. Lead is predominantly particulate-bound and is not bioavailable in that form. Major roads and highways within subwatersheds may contribute to the leaching of lead into the waterways. In addition, disposal of lead paint in the vicinity, burial of old buildings with lead paint, or leaching lead from lead arsenate deposition could all be contributors to lead detections. The source of lead in the South Slough site subwatershed is unknown, however, regardless of the source, the constituent is not likely to be manageable by implementing Management Practices (MPs).

## **Nitrate**

The WQTL for nitrate was exceeded at the Livingston Drain @ Robin Ave sample site. Nitrate was detected at 11 µg/L in both the grab and duplicate samples collected from this site. Potential sources of nitrates in surface waters include runoff of fertilizers or organic matter from irrigated pasture, leaking septic systems, waste-treatment facility effluent, and inputs from dairies. These sources can move to surface waters through above ground runoff or shallow subsurface flows.

Animal waste that enters surface waters can be converted to nitrate by nitrifying bacteria. Possible sources of animal waste in a drain include dairies, chicken lots, pasture and/or wildlife. The Livingston Drain site drains only a small portion of land (approximately 69 irrigated acres), however, a pasture is located just adjacent to the sample site. Runoff from the pasture could be the source of nitrate in the drain either through direct runoff or through movement in shallow ground water. If additional exceedances occur at this site, actions may be taken to address the issue through the subwatershed Management Plan.

### **3. Complete analytical results**

Analytical results are appended electronically to the transmittal message. These results include all data reports provided to the Coalition by the analytical laboratory. QC data are included in the data reports.

**4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

**Table 4.** Time Schedule.

<b>Action</b>	<b>Anticipated Completion Date</b>
Obtain PURs	Done
Contact Growers in Watersheds	December 31, 2008
Perform Management Practices Survey	Complete (update to occur 12/31/08)
Outreach/BMP Education	March 2009
Management Plan	September 30, 2008

Justification for dates:

**Obtain PURs** – PUR data for pesticide applications relevant to the copper exceedances in the Silva Drain and South Slough subwatersheds are provided in this report. The remainder of the exceedances do not include active ingredients of pesticides, and PUR data are not relevant to this report.

**Contact growers in the watersheds** – A proactive outreach strategy is being implemented by the Coalition, and current outreach is occurring based on exceedances from the 2007 irrigation season. Mailings were sent to Coalition members within the site subwatersheds where exceedances occurred during the previous season. In addition, outreach meetings have occurred on a site subwatershed basis where exceedances occurred during the previous year’s monitoring. These outreach activities are structured to remind growers just prior to the application period to use management practices to reduce their discharge. Information on the 2008 irrigation season exceedances and management practices to address these exceedances will be provided to growers at the beginning of the 2009 irrigation season.

**Perform management practices survey** – BMP surveys have been provided to growers through mailings and at grower meetings. Results from these surveys were compiled and provided with the December 31, 2007 Semi-Annual Monitoring Report. For growers that do not currently have a survey on record, a survey was provided with the call for membership renewal in the spring of 2008, and if that is unsuccessful will be provided to them with the Coalition Annual Report by December 2008.

**Outreach/ BMP Education** – Current outreach activities are occurring to address exceedances detected during the 2007 irrigation season. Management practices that can be implemented to reduce the chance of discharge this season are discussed at grower meetings or provided in mailings. The Coalition meeting to address the exceedances in this report is planned to occur in the late winter/early spring of 2009, just prior to the time when any products with metals would be applied.

**Management Plan** – An updated Management Plan will be submitted on September 30, 2008 for all subwatersheds that have experienced two or more exceedances in one constituent up to September 2007.

Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style with a vertical line extending downwards from the end of the signature.

Michael L. Johnson, Technical Program Manager

Dear Dania,

Attached is a Communication Report for the pesticide exceedance that occurred for the first time in samples collected on July 29, 2008. The final laboratory report relevant to this exceedance has been posted to the MLJ-LLC Sharepoint website. To access these files, go to <http://sharepoint.mlj-llc.com/mlj-db/database/forms/allitems.aspx> (user name: ftpuser, password: Aqua2007!). Let us know if you have any questions on this report.

Sincerely,

Krista

## East San Joaquin Water Quality Coalition

1201 L Street  
Modesto, CA 95354  
[www.esjcoalition.org](http://www.esjcoalition.org)

November 20, 2008

Dania Huggins  
Irrigated Lands Conditional Waiver Program  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive, #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting a formal Communication Report for the pesticide exceedance reported on September 16, 2008 that has not been addressed in a Management Plan or previous Communication Report (see Table 1 below). Sampling occurred at this site on July 29, 2008 during the fourth irrigation event of 2008.

**Table 1.** ESJWQC pesticide exceedance in samples collected during the fourth irrigation monitoring event on July 29, 2008. The water quality trigger limit is listed below the constituent header.

Site Name	Sample Type	Sample Date	Chlorpyrifos
			0.015 µg/L
South Slough @ Quinley Rd	NM	7/29/2008	0.029 µg/L

NM – Normal Monitoring

### 1. Follow-up monitoring and analyses conducted.

No follow-up sampling was conducted as a result of the pesticide exceedance. The fifth irrigation season sampling event occurred on August 26, 2008 and results from that monitoring event indicated that the exceedance was not persistent at the site. Further discussion on the exceedance is provided below.

### 2. Actions taken to identify the source of the exceedance.

Chlorpyrifos was detected at exceedance levels for the first time at the South Slough @ Quinley Rd sample site during this monitoring event. Chlorpyrifos is an organophosphate pesticide, commonly applied for pest control on alfalfa, corn, and orchard crops, among others. Chlorpyrifos is highly toxic to *Ceriodaphnia dubia*, however there was no toxicity detected in these samples. Pesticide Use Report (PUR)

data for the South Slough @ Quinley Rd site subwatershed are not yet available for the month of July. Once data are received from the Merced County Agricultural Commissioner's Office, these data will be compiled and provided in the form of a table and map in the Coalition Annual Monitoring Report (AMR) on March 1, 2009. If additional exceedances of chlorpyrifos are detected at this site, then the exceedances will be addressed in the Coalition Management Plan.

**3. Complete analytical results**

Analytical results for this exceedance are attached to the transmittal message. These results include all organophosphate data reports for this monitoring event provided to the Coalition by the analytical laboratory. QC and calibration data are included in the data reports.

**4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

**Table 2.** Time Schedule

Action	Anticipated Completion Date
Obtain PURs	March 1, 2009
Contact Growers in Watersheds	December 2008
Perform Management Practices Survey	Complete (update to occur by 1/31/09)
Outreach/BMP Education	December 2008
Management Plan	April 1, 2009

Justification for dates:

**Obtain PURs** – PURs for chlorpyrifos applications that occurred prior to the exceedance in the site subwatershed will be provided with the Coalition AMR on March 1, 2009.

**Contact growers in the watersheds** – A summary of exceedances for each of the site subwatersheds will be provided to growers through the ESJWQC Annual Report. The Annual Report will go out to growers either by mail or at the Coalition Annual Meetings. Annual Meetings are scheduled for the month of December in Merced, Madera and Stanislaus Counties.

**Perform management practices survey** – Best Management Practices (BMP) surveys have been provided to growers through mailings and at grower meetings. Results from these surveys were compiled and provided with the ESJWQC Semi-Annual Monitoring Report. As described in the ESJWQC Management Plan submitted on September 30, 2008, an updated Survey Summary Report will be submitted by January 31, 2009.

**Outreach/ BMP Education** – Coalition Annual Meetings are scheduled to occur in the counties of Merced, Madera and Stanislaus during the month of December, 2008. Coalition monitoring exceedances and management practices that are effective in reducing or eliminating exceedances will be discussed.

**Management Plan** – An updated Management Plan will be submitted for all subwatersheds that have experienced two or more exceedances in one constituent. This Management Plan will be submitted by April 1, 2009. Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style with a large, looped initial "M".

## East San Joaquin Water Quality Coalition

1201 L Street  
Modesto, CA 95354  
www.esjcoalition.org

December 2, 2008

Dania Huggins  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting the formal Communication Report for one lead exceedance experienced for the first time at the Silva Drain @ Meadow Drive sample site (Table 1). This exceedance occurred in samples collected on August 19, 2008 and was reported on September 24, 2008.

**Table 1.** First-time exceedance in samples collected from the Silva Drain sample site during the fifth irrigation monitoring event on August 19, 2008.

Site Name	Sample Date	Lead*
Silva Drain @ Meadow Dr	8/19/2008	3 (2.02)

\*The water quality trigger limit for lead is calculated based on water hardness and is shown in parenthesis.

### 1. Follow-up monitoring and analyses conducted.

No immediate follow-up sampling was performed. Results were not received from the laboratories until after the next event of sampling occurred. Samples were collected again as part of normal monitoring for the analysis of metals on September 23, 2008, and results from those samples were reported on October 29, 2008. There were no exceedance level detections of lead at the Silva Drain site during that event. If additional exceedances of lead occur at this site, then those exceedances will be addressed through a subwatershed Management Plan.

### 2. Actions taken to identify the source of the exceedance.

#### Lead

Lead is a legacy of any of a number of potential sources including deposition from leaded gasoline, disposal of lead-containing products such as paints, electronic

components, and batteries, and old applications of lead arsenate pesticides. Currently, there are no pesticides applied that contain lead, although lead arsenate was used in the past. Lead arsenate was used generally only until the 1960s and has been banned on all food crops since 1991. It is unknown if lead arsenate pesticides were applied in the subwatershed. Currently, the most probable source is contaminated soils that originated from old pesticide applications, disposal of products containing lead, or the deposition of automobile exhaust. Contaminated soils may have caused contaminated sediment and that sediment may be moved into the water body during storm events. Lead is predominantly particulate bound and not bioavailable in that form. Major roads and highways within subwatersheds may contribute to the leaching of lead into the waterways. In addition, disposal of lead paint in the vicinity, burial of old building materials with lead paint, or leaching lead from lead arsenate deposition could all be contributors to lead detections. The source(s) of lead in the Silva Drain is not certain, but is not likely a result of agricultural management practices.

### **3. Complete analytical results**

Analytical results are provided on the MLJ-LLC Sharepoint website (<http://sharepoint.mlj-llc.com/mlj-db/database/forms/allitems.aspx>). These results include all data reports provided to the Coalition by the analytical laboratory. QC data are included in the data reports.

### **4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

Because this exceedance was detected for the first time at this site and is not a result of agricultural applications, no follow-up actions will be taken to address this exceedance at this time. This exceedance will be addressed in a Management Plan for the site if lead is detected again at exceedance levels in the site subwatershed.

Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style and is positioned to the left of a vertical line.

December 4, 2008

Dania Huggins  
 Irrigated Lands Conditional Waiver Program  
 Central Valley Regional Water Quality Control Board  
 11020 Sun Center Drive, #200  
 Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting the formal Communication Report for sediment toxicity exceedances reported on September 26, 2008. Sediment samples were collected for the 2008 irrigation season on August 28, 2008 (see Table 1 below) and sites that experienced sediment toxicity were re-sampled on October 2, 2008. Only the toxicity exceedances that occurred for the first time at a sample site are included in this report.

**Table 1.** ESJWQC toxicity in sediment samples collected during the 2008 irrigation sampling event conducted on August 28, 2008.

Site Name	Sample Date	Season	<i>Hyaella azteca</i> (percent survival)
Bear Creek @ Kibby Rd	8/28/2008	Sediment	90
Black Rascal Creek @ Yosemite Rd	8/28/2008	Sediment	62
Deadman Creek @ Hwy 59	8/28/2008	Sediment	89
Duck Slough @ Hwy 99	8/28/2008	Sediment	84
Westport Drain @ Vivian Rd	8/28/2008	Sediment	91

**1. Follow-up monitoring and analyses conducted**

Sediment re-sampling for *Hyaella* toxicity at the sites listed in Table 1 occurred on October 2, 2008 and results indicated that the toxicity at two of the seven sites was persistent (Table 2).

**Table 2.** ESJWQC results from sediment re-sampling (RS) on October 2, 2008 as follow-up to toxicity.

Site Name	Sample Date	Season	<i>Hyaella azteca</i> (percent survival)
Bear Creek @ Kibby Rd	10/2/2008	Sediment - RS	88
Duck Slough @ Hwy 99	10/2/2008	Sediment - RS	87

## 2. Actions taken to identify the source of the exceedances

Although considered toxic statistically, the percentage difference between the samples at four of the five sites indicates that the death of one or two organisms in the treatment could be the reason for the statistical significance. The percentage differences compared to the controls in all samples except the Black Rascal Creek sample are minor and would not be considered biologically significant.

Exceedance level detections of metals were apparent in water samples collected from three of the seven sites listed above, two days prior to sediment sampling. Water sampling detections may be helpful in determining possible sources of sediment toxicity, but cannot be directly correlated to sediment toxicity, both because the timing of water and sediment sampling is different and the respective natures of the test matrices (and the types of constituents that they retain) are different as well. Metals found in the water column of a stream may not also reside in the sediment nor will all metals in the substrate necessarily be detected in the water column. As a result, constituents found in the water column can be used only as indications of what may be causing toxicity in the sediment, but cannot be directly attributed as a source of toxicity.

Copper was detected at exceedance levels (7.1 µg/L) at the Bear Creek @ Kibby Rd site in water samples collected on August 26, 2008. Copper is known to cause *Hyalella* toxicity at high concentrations in the sediment, however these water samples were analyzed for total metals which includes both particulate bound and dissolved compounds. Consequently it is unclear how much of the copper detected in the water column would be deposited in the sediment. Pesticide Use Reports (PUR) are not yet available for the month of August at the Bear Creek site, however it is unknown if pesticides applied in August would be responsible for sediment toxicity. Once data become available tables and maps of copper and other pesticide applications relevant to the sediment toxicity exceedances in this report will be provided with the ESJWQC Annual Monitoring Report (AMR) on March 1, 2009.

Arsenic was detected at exceedance levels (11 µg/L) at the Deadman Creek @ Hwy 59 sample site, and lead was detected at exceedance levels (0.72 µg/L) at the Duck Slough @ Hwy 99 site during the August 26, 2008 water sampling event. These exceedances may be relevant to the toxicity experienced in the sediment, however as mentioned previously, the analysis of total metals leaves some uncertainty as to what fraction of the measured concentrations would be deposited in the sediment.

There were no pesticide exceedances in water samples collected on August 20, 2008, however one detection of chlorpyrifos was measured at 0.015 µg/L (not above the water quality trigger limit). The physical characteristics of chlorpyrifos allow the pesticide to both partition to sediments and stay dissolved in the water column. As a result, this detection in the water column may be an indication of chlorpyrifos in the sediment, and a source of toxicity to *Hyalella*. PUR data are not yet available for the Deadman Creek site subwatershed. Once data become available, tables and maps of

chlorpyrifos and other pesticide applications relevant to the sediment toxicity in this report will be provided with the ESJWQC AMR on March 1, 2009.

Besides the exceedances and detections listed above, numerous metals (i.e. arsenic, boron, copper, nickel, lead, selenium and zinc) are commonly detected at low levels in water samples from all monitoring sites. If these metals also reside in the sediment, and especially if sediment-bound metals are at a higher concentration than in the surrounding water column, then they may also be contributing to the *Hyalella* toxicity at these sites. However most of these metals are not a result of current agricultural applications and may not be manageable by the Coalition.

For sites in which pesticides or metals were not detected in the water samples, PUR data should provide useful information as to any recent pesticide applications that may be relevant to the toxicity exceedances. As mentioned previously, PUR data relevant to each of these toxicities will be provided with the Coalition AMR on March 1, 2009.

### 3. Complete analytical results

The final report from the laboratory is too large to attach to this transmittal message and is posted to the MLJ-LLC Sharepoint website (<http://sharepoint.mlj-llc.com/mlj-db/database/forms/allitems.aspx>). This report includes all data for sediment toxicity provided to the Coalition by the analytical laboratory.

### 4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.

**Table 3.** Time Schedule

Action	Anticipated Completion Date
Obtain PURs	March 1, 2009
Contact Growers in Watersheds	December 2008
Perform Management Practices Survey	Complete (update to occur by 1/31/09)
Outreach/BMP Education	December 2008
Management Plan	April 1, 2009

Justification for dates:

**Obtain PURs** – PURs for all pesticide applications relevant to the sediment toxicity exceedances in this report will be provided with the Coalition AMR on March 1, 2009.

**Contact growers in the watersheds** – A summary of exceedances for each of the site subwatersheds will be provided to growers through the ESJWQC Annual Report. The Annual Report will go out to growers either by mail or at the Coalition Annual Meetings. Annual Meetings are scheduled for the month of December in Merced, Madera and Stanislaus Counties.

**Perform management practices survey** – Best Management Practices (BMP) surveys have been provided to growers through mailings and at grower meetings. Results from these surveys were compiled and provided with the ESJWQC Semi-Annual Monitoring Report. As described in the ESJWQC Management Plan submitted on September 30, 2008, an updated Survey Summary Report will be submitted by January 31, 2009.

**Outreach/ BMP Education** – Coalition Annual Meetings are scheduled to occur in Merced, Madera and Stanislaus counties during the month of December, 2008. Coalition monitoring exceedances and management practices that are effective in reducing or eliminating exceedances (and toxicity) will be discussed.

**Management Plan** – An updated Management Plan will be submitted for all subwatersheds that have experienced two or more exceedances in one constituent (or toxicity more than once). This Management Plan will be submitted by April 1, 2009. Let us know if further explanation or documentation is necessary.

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style with a large, looped initial "M".

Michael L. Johnson, Technical Program Manager

**Subject:** Pesticide Communication Report - Irrigation5 2008

**Attachments:** ESJWQC\_08\_CR\_Pesticide\_Irrigation5\_121008\_final.doc

Dear Dania,

Attached is a Communication Report for pesticide exceedances during the fifth irrigation monitoring event on August 19, 2008. Please let us know if you have any questions on this report.

Sincerley,

Krista

Dania Huggins  
Irrigated Lands Conditional Waiver Program  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive, #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting a formal Communication Report for the pesticide exceedances reported on October 2, 2008 that have not yet been addressed in a Management Plan or previous Communication Report (see Table 1 below). Sampling occurred at these sites on August 19, 2008 during the fifth irrigation event of 2008. Only exceedances that occurred for the first time at a site are included in this report.

**Table 1.** ESJWQC pesticide exceedance in samples collected during the fifth irrigation monitoring event on August 19, 2008. The water quality trigger limit is listed below the constituent header.

Site Name	Sample Date	Sample Type	DDE	DDT	Malathion	Methyl parathion
			0.00059 µg/L	0.00059 µg/L	0 µg/L*	0 µg/L*
Highline Canal @ Lombardy Rd	8/19/2008	NM	0.0089J	0.018	0.14	0.18
Hilmar Drain @ Central Ave	8/19/2008	NM	0.0056J			
Prairie Flower Drain @ Crows Landing Rd	8/19/2008	NM			0.012	

\*Malathion and methyl parathion are prohibited discharge pesticides and any detection in the water column is considered an exceedance.

NM – Normal Monitoring

J – Between the minimum detection limit (MDL) and the reporting limit (RL) and therefore considered an estimate.

### 1. Follow-up monitoring and analyses conducted.

No follow-up sampling was conducted as a result of these pesticide exceedances. The sixth irrigation season sampling occurred at these sites on September 23, 2008 and

there were no pesticide exceedances in any samples collected during that monitoring event. Further discussion on the exceedances in this report is provided below.

## **2. Actions taken to identify the source of the exceedance.**

First-time exceedances of DDT and DDE were detected at two sites during this sampling event. Both DDE and DDT were detected at the Highline Canal @ Lombardy Rd site and DDE (only) was detected at the Hilmar Drain @ Central Ave site. DDE is a breakdown product of its parent compound, DDT; an organochlorine pesticide that was used abundantly in the past, but is not currently registered for agricultural use. This was the first DDE or DDT exceedance at the Highline Canal @ Lombardy Rd site; however exceedances of DDD have occurred in the past at the Hilmar Drain @ Central Ave site. Due to the long half-life of the constituent, DDT and its breakdown products are still found in Coalition water bodies. Current agricultural pesticide applications are not the source of these exceedances and Pesticide Use Report (PUR) data will not be evaluated to follow-up on this exceedance. If additional exceedances of DDT or its breakdown products occur at either of these sites, then the exceedances will be addressed through actions stated in the Coalition Management Plan.

During this sampling event, the organophosphate pesticides, malathion and methyl parathion, were detected for the first time at the Highline Canal @ Lombardy Rd sample site. Malathion was also detected for the first time at the Prairie Flower Drain @ Crows Landing Rd site. Both malathion and methyl parathion are prohibited discharge pesticides and therefore any detection in a water sample is considered an exceedance. Malathion is predominantly used on alfalfa, field crops, walnut orchards, and for structural pest control (in California). Methyl parathion is also an organophosphate insecticide and is used in California on walnuts, corn, onions and wine grapes. Both of these pesticides are known to be toxic to *Ceriodaphnia dubia*; however there was no toxicity detected in these samples. PUR data for the months of July and August are not yet available from the Merced County Agricultural Commissioner's Office. Once the data become available, pesticide use relevant to these exceedances will be summarized in the Coalition Annual Monitoring Report (AMR) on March 1, 2009. If an additional exceedance of malathion or methyl parathion are detected at either of these sites, then actions will be taken to address the exceedances in the Coalition Management Plan.

## **3. Complete analytical results**

Analytical results for this exceedance are available on the MLJ-LLC Sharepoint website (<http://sharepoint.mlj-llc.com/mlj-bd/database/forms/allitems.aspx>). These results include all organochlorine and organophosphate data reports for this monitoring event provided to the Coalition by the analytical laboratory. QC and calibration data are included in the data reports.

**4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

**Table 2.** Time Schedule

<b>Action</b>	<b>Anticipated Completion Date</b>
Obtain PURs	March 1, 2009
Contact Growers in Watersheds	December 2008
Perform Management Practices Survey	Complete (update to occur by 1/31/09)
Outreach/BMP Education	December 2008
Management Plan	April 1, 2009

Justification for dates:

**Obtain PURs** – PURs for malathion and methyl parathion applications that occurred prior to the exceedance in the site subwatershed will be provided with the Coalition AMR on March 1, 2009.

**Contact growers in the watersheds** – A summary of exceedances for each of the site subwatersheds will be provided to growers through the ESJWQC Annual Report. The Annual Report will go out to growers either by mail or at the Coalition Annual Meetings. Annual Meetings are scheduled for the month of December in Merced, Madera and Stanislaus Counties.

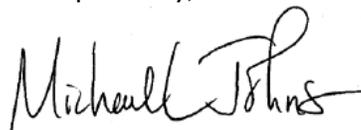

**Perform management practices survey** – Best Management Practices (BMP) surveys have been provided to growers through mailings and at grower meetings. Results from these surveys were compiled and provided with the ESJWQC Semi-Annual Monitoring Report. As described in the ESJWQC Management Plan submitted on September 30, 2008, an updated Survey Summary Report will be submitted by January 31, 2009.

**Outreach/ BMP Education** – Coalition Annual Meetings are scheduled to occur in the counties of Merced, Madera and Stanislaus during the month of December, 2008. Coalition monitoring exceedances and management practices that are effective in reducing or eliminating exceedances will be discussed.

**Management Plan** – An updated Management Plan will be submitted for all subwatersheds that have experienced two or more exceedances in one constituent. This Management Plan will be submitted by April 1, 2009.

Let us know if further explanation or documentation is necessary.

Respectfully,

Michael L. Johnson, Technical Program Manager

## East San Joaquin Water Quality Coalition

1201 L Street  
Modesto, CA 95354

[www.esjcoalition.org](http://www.esjcoalition.org)

December 11, 2008

Dania Huggins  
Irrigated Lands Conditional Waiver Program  
Central Valley Regional Water Quality Control Board  
11020 Sun Center Drive, #200  
Rancho Cordova, CA 95670-6114

Dear Dania,

We are submitting the formal Communication Report for one field parameter exceedance that occurred during sediment resampling (RS) on October 2, 2008 (see Table 1 below). Only the exceedance that was experienced for the first time at the sample site is included in this report.

**Table 1.** Field exceedance detected in receiving waters on October 2, 2008 during sediment resampling.

Sample Site	Sample Date	Sample Type	pH (pH units)
Silva Drain @ Meadow Drive	10/2/08	Sediment RS	8.51

### 1. Follow-up monitoring and analyses conducted.

Follow-up sampling for field parameter exceedances did not occur at this site. However, field parameters have been measured again at this site during the October and November normal monitoring events and there were no additional pH exceedances detected at this site. The lack of persistence of the exceedance at Silva Drain indicates that the basic pH detected was due to temporary conditions in the water body. If this exceedance is experienced a second time, it will then be addressed in the management plan for that site.

### 2. Actions taken to identify the source of the exceedance.

#### pH

pH dynamics in surface waters are not well understood and can vary diurnally with photosynthetic rates and changes in the concentration of CO<sub>2</sub> and O<sub>2</sub> in the water. Control of pH in surface waters is a function of the balance between the buffering

capacity of the water, inputs of organic acids from soil leaching, and the relative amount of photosynthesis. The pH of 8.51 is .01 pH units above the water quality trigger limit and the level of accuracy of the pH meter the Coalition uses for its measurements is  $\pm$  0.2 pH units.

### **3. Complete analytical results**

Complete analytical results in the form of field sheets in pdf format are too large to send by email with this report, but can be provided upon request.

### **4. Time schedule to identify and implement the Management Practice Effectiveness evaluation.**

Because this exceedance was detected for the first time at this site and may be due to natural fluctuations in the creek, no follow-up actions will be taken to address this exceedance at this time. If a second exceedance of pH is detected at the Silva Drain sample site, then the exceedance will be addressed in a Management Plan for the site subwatershed.

Let us know if further explanation or documentation is necessary.

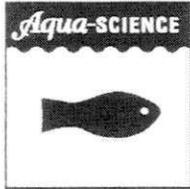

Respectfully,

A handwritten signature in black ink that reads "Michael L. Johnson". The signature is written in a cursive style with a vertical line to its right.

# Identification of Causes of Toxicity to *Ceriodaphnia dubia* and Green Algae (*Selenastrum capricornutum*) in Agriculture-Dominated Discharge Samples from the East San Joaquin Water Quality Coalition - Irrigation 2008

## 1.0 EXECUTIVE SUMMARY

A total of 149 samples of agriculturally-dominated discharge, collected from within the boundaries of the East San Joaquin Water Quality Coalition during six irrigation test events from April through September 2008. Water samples were screened for toxicity to green algae (*Selenastrum capricornutum*), the invertebrate *Ceriodaphnia dubia*, and/or larval fathead minnows (*Pimephales promelas*). Toxicity was detected in 22 of 133 algae tests (17%), 2 of 140 *C. dubia* tests (1.4%), and 1 of 130 fathead minnow tests (0.8%). Samples that produced  $\geq 50\%$  effect on the test species were subjected to Phase I Toxicity Identification Evaluations (TIEs) to identify chemical class of the toxicant(s) responsible for the toxicity with the exception of two samples. In April, Deadman's Creek @ Hwy 59 and Duck Slough @ Hwy 99 both had a  $>50\%$  toxic effect in algae cell growth in the resamples collected due to toxicity in the original sample. Phase I algae TIEs were scheduled for the resamples, but due to lab technician error the samples were discarded prior to the TIE initiation. Thus, Phase I TIEs were conducted on 10 samples that caused algal chronic toxicity and 1 sample that caused acute *C. dubia* toxicity. The algae Phase I TIEs identified non-polar organic chemicals (NPOs) plus cationic metals toxicity in 5 samples (Prairie Flower Drain @ Crows Landing Rd, Cottonwood Creek @ Road 20, Miles Creek @ Reilly Rd, South Slough @ Quinley Rd, and Hatch Drain @ Tuolumne Rd), while toxicity was not detected in the TIEs with the remaining 5 samples. Algae Phase III TIEs on these samples indicated that concentrations of the cationic metals nickel, copper, and particularly zinc were sufficient to contribute to the algal toxicity exhibited by each of the five samples evaluated. The herbicides diuron and paraquat were detected at toxic concentrations in the Cottonwood Creek and Miles Creek samples, respectively. No analytical chemistry information was available for the Hatch Drain sample since it was collected as a resample due to toxicity at Hatch Drain on April 22, 2008. The *C. dubia* Phase I TIE indicated that metabolically-activated organophosphate insecticides (OPs) were the cause of toxicity in the Silva Drain @ Meadow Rd sample. The *C. dubia* Phase III TIE on this sample confirmed that the OP insecticide, chlorpyrifos, was responsible for the toxicity (5.2 TUa) detected in the sample. Overall, the Phase III TIE analyses were consistent with the Phase I TIE results for both algae and *C. dubia*.

## 2.0 INTRODUCTION

AQUA-Science (A-S) was retained by MLJ-LLC (Davis, CA) to conduct aquatic toxicity tests and toxicity identification evaluations (TIEs) on samples collected from the East San Joaquin Water Quality Coalition (ESJWQC) in response to monitoring requirements of the Conditional Waiver of Waste Discharge for Irrigated Lands (Ag Waiver). A total of 149 samples collected

during six irrigation test events (April through September 2008) were tested using three-species toxicity tests with the cladoceran (*Ceriodaphnia dubia*), green algae (*Selenastrum capricornutum*), and larval fathead minnows (*Pimephales promelas*). TIEs were conducted on 10 samples with algae and 1 sample with *C. dubia* which demonstrated a  $\geq 50\%$  effect on the test species endpoint. Results of these analyses are reported herein.

### 3.0 MATERIALS AND METHODS

#### 3.1 Test Events

Samples were collected during the 2008 irrigation season (April through September 2008) including Management Plan Monitoring (MPM). The number of samples collected in each event is shown below:

<i>Sample Date</i>	<i>Test Event</i>	<i>No. Samples/Species</i>
4/22/08	ESJ 08-03A	22 <i>Ceriodaphnia</i>
4/29/08	ESJ 08-03B	22 fathead minnow 22 algae
5/7/08	ESJ 08-04MPM	24 <i>Ceriodaphnia</i>
5/20/08	ESJ 08-04A	22 fathead minnow
5/27/08	ESJ 08-04B	21 algae
6/3/08	ESJ 08-05MPM	23 <i>Ceriodaphnia</i>
6/17/08	ESJ 08-05A	23 fathead minnow
6/24/08	ESJ 08-05B	22 algae
7/8/08	ESJ 08-06MPM	25 <i>Ceriodaphnia</i>
7/22/08	ESJ 08-06A	23 fathead minnow
7/29/08	ESJ 08-06B	26 algae
8/5/08	ESJ 08-07MPM	23 <i>Ceriodaphnia</i>
8/19/08	ESJ 08-07A	21 fathead minnow
8/26/08	ESJ 08-07B	22 algae
9/9/08	ESJ 08-08MPM	23 <i>Ceriodaphnia</i>
9/23/08	ESJ 08-08A	19 fathead minnow
9/30/08	ESJ 08-08B	20 algae
	<b>Total</b>	<b>140 <i>Ceriodaphnia</i></b> <b>130 fathead minnow</b> <b>133 algae</b>

### 3.2 Test Samples

Test samples (4 gallon/site) were subsurface grabs obtained by MLJ-LLC sampling personnel under the direction of Dr. Mike Johnson. Sample name and GPS coordinates of the sample sites are shown in Table 1. Field measurements included temperature, dissolved oxygen (DO), pH, conductivity, and flow. Samples were placed in ice chests with sufficient wet ice to maintain sample temperature at  $\leq 6$  °C. Upon arrival at A-S, temperature, DO, conductivity, hardness, alkalinity, and pH were measured. Samples were stored in the dark at 4 °C until tested, within 24 hours of collection.

a Samples from the indicated sites were never collected since the site was dry during the entire collection period

### 3.3 Toxicity Test Protocols

The 96-hour acute *C. dubia* and 96-hour acute fathead minnow toxicity tests were conducted in accordance with the U.S. Environmental Protection Agency (USEPA) 5<sup>th</sup> edition protocol (USEPA 2002a). The 96-hour chronic algal toxicity tests were conducted in accordance with the USEPA 4<sup>th</sup> Edition protocol (USEPA 2002b). Control water for the toxicity tests and TIEs was reverse osmosis and granular carbon-treated well water amended with dry salts to attain USEPA moderately hard specifications (EPAMH).

### 3.4 Algae Toxicity Tests

Algal toxicity tests were conducted in 4 replicates of 125-mL flasks containing 50-mL of test sample filtrate (0.45 µm). A fifth replicate was used as a surrogate for daily water quality measurements. The flasks, containing algal assay media without EDTA, were inoculated with  $1 \times 10^4$  cells/mL of a 2-4 day-old culture of *S. capricornutum* (University of Texas Algae Type Collection, Austin, TX) in log phase growth. A sixth replicate was tested without algae inoculate to confirm that absence of indigenous algae. This replicate was also used as a sample blank and for water quality measurements. Flasks were placed on a shaker table (100 rpm) in an environmental chamber at  $25 \text{ }^\circ\text{C} \pm 2 \text{ }^\circ\text{C}$  with continuous lighting ( $400 \pm 40 \text{ fc}$ ) and were randomized twice daily. After the 96-hour test period, the absorbance was measured with a spectrophotometer at 750 nm (Model DR2800, Hach Co., Loveland, CO). The absorbance units were corrected to cell number using a calibration curve as follows:

$$\text{cell number} = (\text{absorbance units @ 750 nm} \times 13.026) - 0.0328 \quad (R^2 = 0.9995)$$

Using this conversion, the test was acceptable if the mean algal density in the control flasks was greater than or equal to  $2 \times 10^5$  cells/mL and the coefficient of variation in the control replicates was  $\leq 20\%$ .

### 3.5 *Ceriodaphnia dubia* Toxicity Tests

*C. dubia* 96-hour acute toxicity tests were initiated with < 24 hour old neonates collected from in-house cultures. Each sample was tested using four replicates of 5 neonates each in a 20-mL glass scintillation vials containing 18-mL of test solutions. Test duration was 96 hours, and test solutions were renewed daily. *C. dubia* were fed a mixture of green algae (*S. capricornutum*) and YTC (a mixture of yeast, organic alfalfa and trout chow) 4 hours prior to 24-hour test solution renewal. Tests were conducted at  $25 \pm 2$  °C with a 16 hour light:8 hour dark photoperiod. Mortality was noted daily. The test was acceptable if control survival was  $\geq 90\%$ .

### 3.6 Fathead Minnow Toxicity Tests

Fathead minnows were obtained from Aquatox, Inc. (Hot Springs, AK), and were maintained in EPA moderately hard (EPAMH) water until tested at 6-10 days old. Each test sample was tested using 4 replicates of 10 fish each in 400 mL glass beakers containing 250 mL of test solutions. Test duration was 96 hours and test solutions were renewed daily. Fish were fed *Artemia* nauplii 4 hours prior to daily sample renewal. Tests were conducted at  $25 \pm 2$  °C with a 16 hour light:8 hour dark photoperiod. Mortality was noted daily. The test was acceptable if control survival was  $\geq 90\%$ .

### 3.7 Statistical Analysis

Each test sample was subjected to statistical analysis using ToxCalc v. 5.23 (Tidepool Scientific, McKinleyville, CA, USA) according to USEPA procedures (USEPA 2002a,b) to determine if the observed effect was statistically different ( $p < 0.05$ ) from the control. In the TIEs, mortality data from the dilution series tests were used to estimate EC<sub>50</sub> values, e.g., the calculated concentration of the test sample that results a 50% effect on the test endpoint, respectively. Toxic units (TUs) were calculated from the EC<sub>50</sub> values ( $100/EC_{50}$ ). *Note that throughout this document, the term "EC" represents EC, IC or LC, as appropriate.*

### 3.8 Chemical Analysis

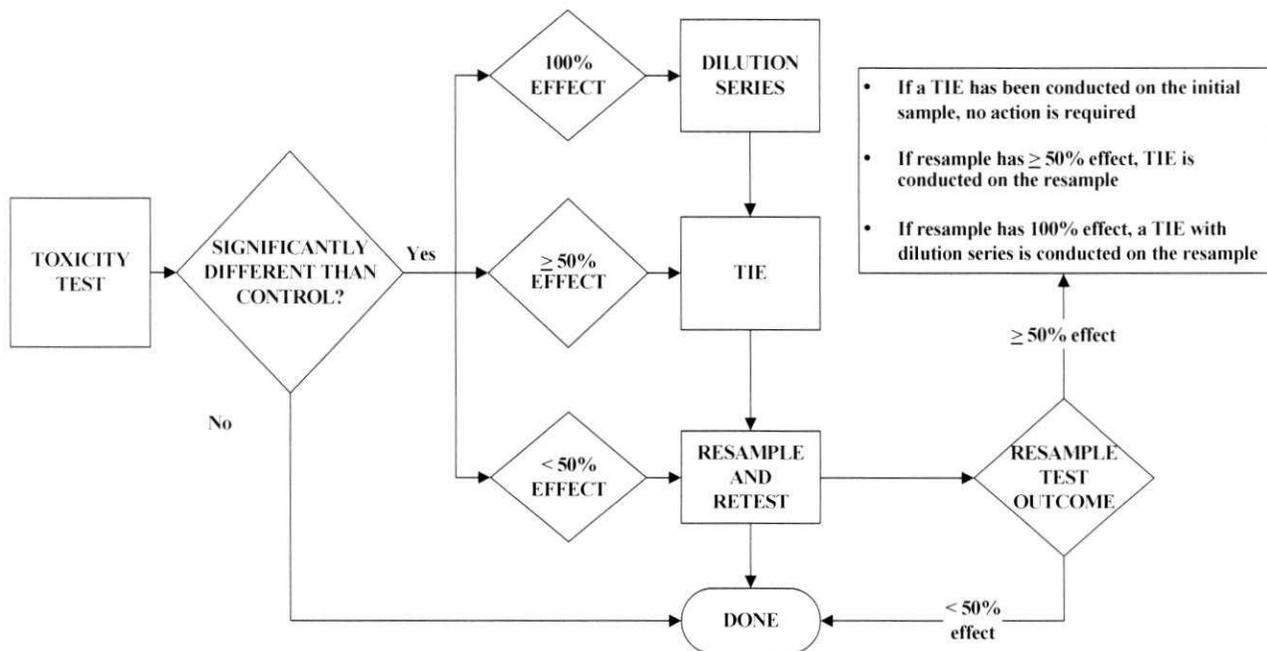

During irrigation monitoring events (not retesting/resampling events) water samples were collected for chemical analysis of five major groups of pesticides (pyrethroids, organochlorines, organophosphates, triazines, and carbamates) plus glyphosate and paraquat dichloride. The ESJWQC Quality Assurance Program Plan (QAPP) includes a list of all 39 pesticides that are analyzed, associated analytical methods, collection containers, reporting limits and hold times. In addition, total metals were analyzed (arsenic, boron, cadmium, copper, lead, nickel, selenium and zinc) using inductively coupled argon plasma-mass spectrometry analysis (EPA 200.8). All samples were collected as outlined in the ESJWQC QAPP meeting all quality assurance requirements. Retesting or resampling was conducted if toxicity occurred to test for persistence as required by the Ag Waiver. Since these samples were collected for the testing of persistence,

no additional water was collected for chemistry analysis. In addition, Management Plan Monitoring was conducted at some sites for toxicity as outlined in the ESJWQC Management Plan. Depending on the Management Plan schedule, this may or may not have corresponded with specific chemistry analysis.

### 3.9 Retesting and Toxicity Identification Evaluation (TIE) Requirements

Figure 1 depicts the retesting and TIE requirements. Briefly, if the sample shows no significant effect, no further action is required. If the sample is significantly different from the control but <50% effect, then the site must be resampled and retested. If there is a  $\geq 50\%$  effect, a TIE is initiated on the toxic sample, and the site must be resampled and retested. If there is a 100% effect, the TIE must incorporate a dilution series toxicity test. If a retest sample exhibits <50% effect, no further action is required. If there is a  $\geq 50\%$  effect in a retest, and a TIE was not conducted on the original sample, then a TIE must be initiated on the retest sample. If the retest sample has 100% effect, the TIE must also incorporate a dilution series. Two resamples, Deadman’s Creek @ Hwy 59 and Duck Slough @ Hwy 99, collected on April 29, 2008 exhibited <50% effect (the original sample did not) and a TIE was not run due to laboratory miscommunication.

Figure 1. Retesting and Toxicity Identification Evaluation (TIE) Requirements.

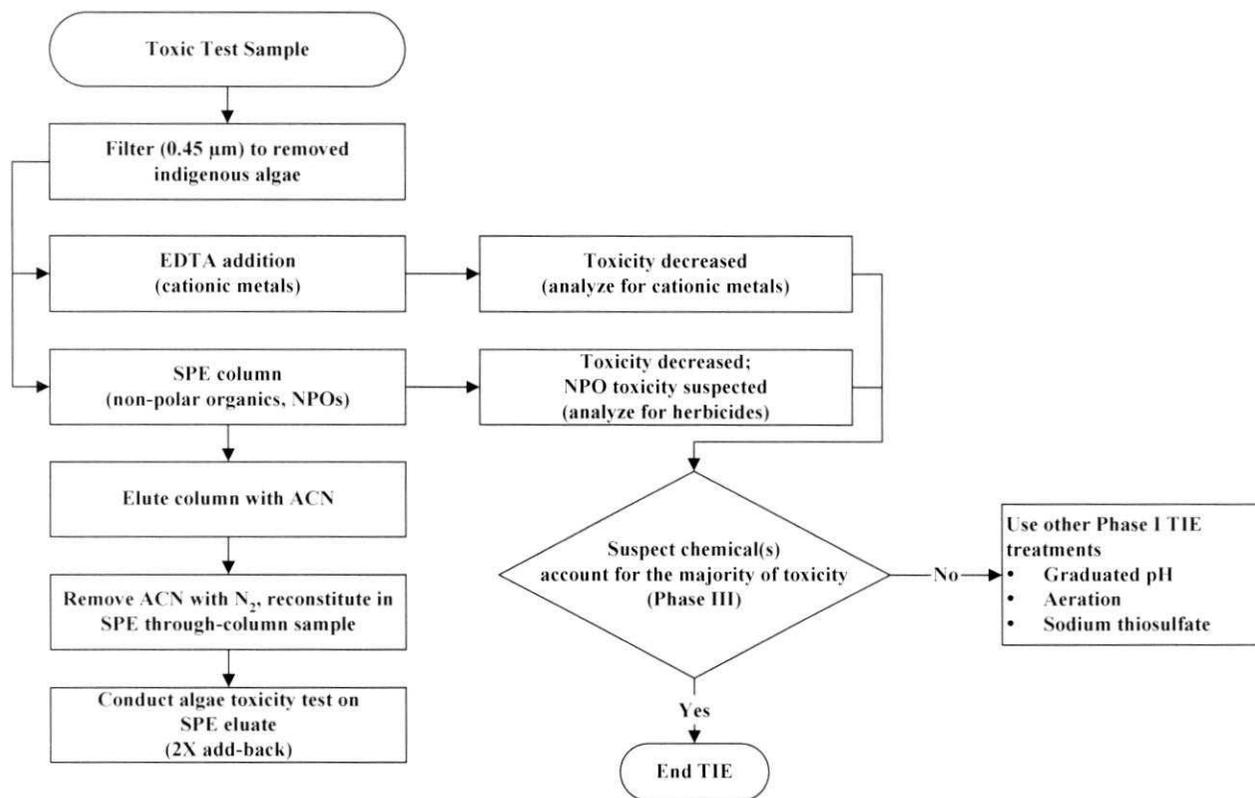

### 3.10 Toxicity Identification Evaluations (TIEs)

The purpose of the Phase I TIE is to identify the chemical class of the toxicant(s) in the test sample (USEPA 1991). The purpose of the Phase II TIE is to gain the identity of the material(s) responsible for the sample toxicity (USEPA 1993a). The purpose of the Phase III TIE is to determine if there is a robust relationship between the concentrations of the suspected toxicant(s) identified, and the amount of toxicity measured in the test sample (USEPA 1993b).

#### 3.10.1 Algae Phase I TIEs

Algae Phase I TIEs included a baseline toxicity test, solid phase extraction (SPE) column treatment to identify non-polar organic chemicals (NPOs), ethylenediamine tetrachloroacetic acid (EDTA) addition to identify cationic metal toxicity, and EDTA addition to SPE-treated sample to determine the interaction between cationic chemicals and NPOs. The SPE column was eluted three times with 1-mL of acetonitrile (ACN), which was blown to dryness using a gentle stream of nitrogen. The ACN was removed from the eluate because algae are affected by even low concentrations of organic solvent (Miller et al, 2005). The eluate residue was reconstituted in the SPE through-column sample and added back to the sample at 2X. The algae Phase I TIE flow chart is shown in Figure 2 (Miller et al, 2005).

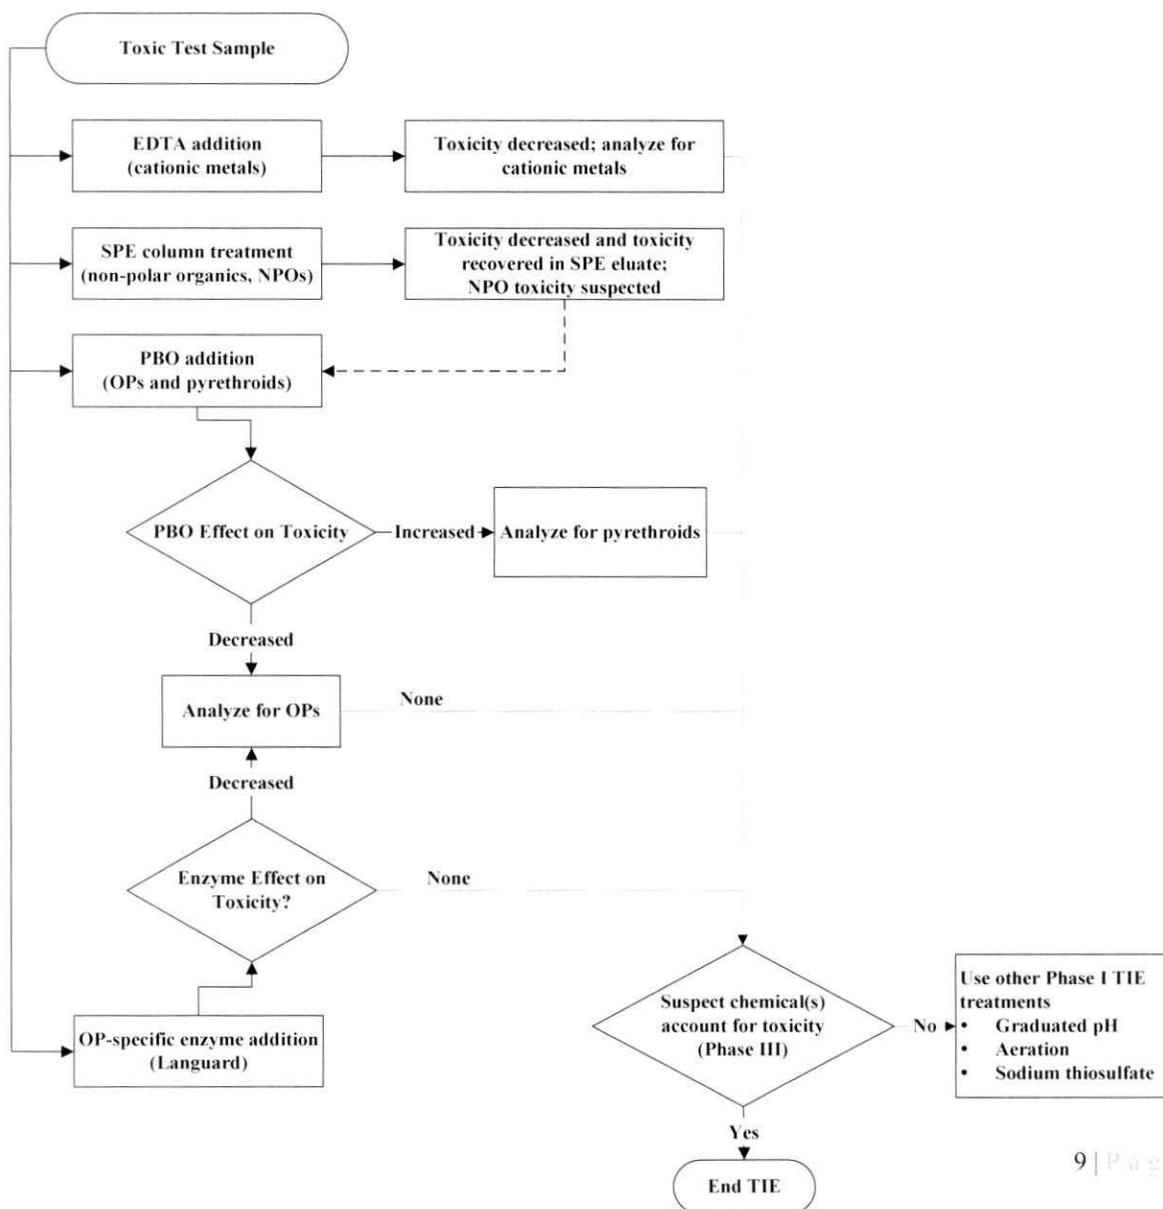

Figure 2. Phase I TIE Flowchart Modified for Algae.

### 3.10.2 *C. dubia* Phase I TIEs

The Phase I *C. dubia* TIEs incorporated the same series of treatments as the algae, with the addition of a piperonyl butoxide (PBO) treatment. PBO binds *in vivo* with mixed-function oxidase enzymes that metabolize non-polar organic chemicals such as organophosphorous (OP) and pyrethroid insecticides. With OPs, PBO prevents the metabolism to their toxic oxone form, decreasing/preventing toxicity (Ankley et al, 1991). With pyrethroids, PBO prevents metabolism to less toxic forms, increasing/prolonging toxicity (Wheelock et al, 2004). In some cases, an OP-specific enzyme (Landguard™, Orica Watercare, Watkins, CO) was added to the test sample. Removal or decreased toxicity after addition of this enzyme was further evidence that the toxicity was caused by OP insecticide(s). The *C. dubia* Phase I TIE flow chart is shown in Figure 3.

**Figure 3. Phase I TIE Flowchart for *C. dubia*.**

### 3.10.3 Phase III TIEs

In the Phase III TIE, the sample toxic units (TUs;  $100/EC_{50}$ ) measured in the dilution series toxicity test is compared with the TU calculated from the detected concentration of the suspect toxicants (predicted TUs = measured conc ( $\mu\text{g/L}$ )/suspect chemical  $EC_{50}$ ) (USPEA 1993b). If more than one suspect toxicant was present, the TUs were summed if there was evidence that they act jointly, e.g., diazinon and chlorpyrifos (Bailey et al, 1997). Although the USEPA TIE guidance has not established a minimum level of agreement between measured TU and predicted TU in a sample, these values should correlate, or the sample should be subjected to further Phase II TIE evaluation to identify additional toxicant(s).

## 4.0 RESULTS

### 4.1 Phase I TIEs Results

Phase I TIEs were conducted on samples that demonstrated  $\geq 50\%$  effect on the endpoint. TIE results for algae and *C. dubia* are summarized in Table 2 and Table 3, respectively.

TIEs on the Hilmar Drain @ Central Ave. and Bear Creek @ Kibby Rd. Irrigation 1 samples did not detect toxicity in the baseline tests. Therefore, the cause(s) of the algae toxicity exhibited in the initial algae bioassays could not be determined. In the TIEs on the remaining samples in the Irrigation 1 event, toxicity was eliminated with EDTA addition, a characteristic of cationic chemical toxicity, particularly with divalent metals. In addition, the toxicity in each of the samples was either reduced or eliminated completely with SPE column treatment, a characteristic of NPO toxicity. However, no toxicity was detected in the SPE column eluates from the samples. EDTA addition to the SPE-treated samples also reduced or eliminated the toxicity, indicating that both cationic metals and NPOs contributed to the toxicity of each of the samples.

The chronic algae TIEs did not detect toxicity in the Hatch Drain @ Tuolomne Rd. and Hilmar Drain @ Mitchell Rd. Irrigation 4 baseline samples, or in the Hatch Drain @ Tuolomne Rd. Irrigation 5 baseline sample. Therefore, the cause(s) of the algae toxicity exhibited in the initial algae bioassays could not be determined.

In the acute *C. dubia* TIE on the Silva Drain @ Meadow Rd. Irrigation 4 sample, toxicity was eliminated by SPE column treatment, a characteristic of NPO toxicity. Toxicity was unaffected by EDTA addition, indicating that cationic metals were not a cause of toxicity. Furthermore, the toxicity in the sample was eliminated by PBO treatment and the OP insecticide-specific enzyme (Landguard™). The TIE results strongly implicate OP insecticide(s) as the cause of the toxicity.

## 4.2 Phase III TIEs

The purpose of the Phase III TIE is to determine if the suspect toxicant(s) account for the majority of toxicity detected in the sample. Information required to conduct the Phase III TIE process include: (a) TUA detected in the Phase I TIE baseline, if applicable, (b) concentration(s) of the suspect toxicant(s) detected in the sample, and (c) EC<sub>50</sub> values for the suspect toxicant(s). In addition, the chemicals detected in the samples must be consistent with the Phase I TIE results. If any of this information is missing, the Phase III TIE analysis cannot be conducted. Results of the algae and *C. dubia* Phase III TIEs are summarized in Table 4A and 4B, respectively.

**Table 4A. Summary of Algae Phase III TIE Analyses.**

## 5.0 DISCUSSION

The Phase I TIEs conducted in this study employed treatments that are designed to identify toxicity caused by non-polar organics (NPOs) and cationic chemicals (including divalent metals). Two additional treatments (PBO addition and OP-specific enzyme addition) were included for *C. dubia* to identify toxicity caused by metabolically-activated organophosphate insecticide(s) (OPs). We believe this suite of treatments is optimal for identification of the chemical class of

successful in identifying the chemical class of the toxicant(s), a Phase III TIE analysis was conducted on the sample to confirm if the concentration(s) of the suspect toxicant(s) could, based on their EC<sub>50</sub> values, account for the level of toxicity detected in the sample. We relied primarily on the USEPA ECOTOX Data Base (<http://cfpub.epa.gov/ecotox/>) and other published sources for the EC<sub>50</sub> information. Since the EXOTOX database contains a range of values for each constituent of interest, we used the most conservative (lowest) value that appeared to be reasonably supported by the other available information (Attachment 1). Unfortunately, no toxicity information was available for some constituents, precluding the assessment of their role in the sample toxicity. This lack of toxicity information for chemicals of interest in ambient TIEs is problematic and we recommend that studies be conducted, under conditions used in these types of toxicity tests, to generate this information.

A total of 10 samples were subjected to Phase I TIEs with algae. The TIEs identified non-polar organic (NPO) in combination with cationic metal toxicity in 5 samples while toxicity was not detected in the TIE baseline test with the other 5 samples. Phase III TIEs on these samples confirmed concentrations of cationic metals copper, nickel, and particularly zinc, were present at potentially toxic concentrations. Concentrations of the herbicides paraquat and diuron were sufficiently high to contribute to the algae toxicity detected in two of the samples. Unfortunately, there is no published information on the combined toxicity of the herbicides and soluble metals detected in the samples. Also, uncertainties exist in the ECOTOX database algae EC<sub>50</sub> values for both metals and herbicides detected in the samples. Development of this information should be considered a research priority.

One Phase I TIE was conducted with *C. dubia*. The TIE indicated that OPs were the cause of the toxicity in the sample. The *C. dubia* Phase III TIE confirmed that the chlorpyrifos concentration measured in the sample could fully account for the level of toxicity (5.2 TUa) detected in the sample.

Overall, the Phase III TIE analyses were consistent with the Phase I TIE results for both algae and *C. dubia*.

## ALGAL BIOASSAY DATA SHEETS

## 6.0 Lab Notes

5/10/08

**ESJ 08-03A TIE**  
96 Hr. Static Growth  
*Selenastrum capricornutum*

**Ambient Samples (042208)**

Hilmar Drain @ Central Ave. (535XHDACA)  
Prairie Flower Drain @ Crows Landing Rd (535XPFDCCL)

**1.0 Stock Preparation**

0.1 liters of Ambient Sample filtered through 0.22 µm Metrigard filter.  
0.2 liters R/O EPAMH filtered through 0.22 µm Metrigard filter

**2.0 Water Quality Measurement**

Water quality of dilution and effluent measured after addition of EPA Algal Assay Media (AAM). Section 3.0, page 1

**EPA Algal Assay Media Addition (Without EDTA)**

Algal Assay Media prepared as per EPA 821-R-02-013; Section 14-Tables 1 and 2  
Added 0.12 mL each of #1-5 EPA AAM to 0.12 L **Ambient Sample**  
Added 0.22 mL each of #1-5 EPA AAM to 0.22 L R/O EPAMH; **Control Water**

Added 0.12 mL each of #1-5 EPA AAM to 0.12 L **C8 SPE Column Blank**  
Added 0.12 mL each of #1-5 EPA AAM to 0.12 L **C8 SPE Through Column**  
Added 0.12 mL each of #1-5 EPA AAM to 0.12 L **C8 SPE Through Column + 1 mg/L EDTA**  
Added 0.12 mL each of #1-5 EPA AAM to 0.12 L **C8 SPE 2X Addback**

Added 0.12 mL each of #1-5 EPA AAM to 0.12 L **EDTA Column Blank**  
Added 0.22 mL each of #1-5 EPA AAM to 0.22 L **Ambient Sample + 1 mg/L EDTA**

Stirred samples on magnetic stir plates for approx. 15 minutes.

**4.0 Background Counts**

Particle background counts measured with electronic particle counter - Coulter Counter, model ZBI.  
Counts recorded on section 2.0, page 2.

**5.0 Exposure Series Preparation and Algal Inoculation**

All concentrations prepared as described in section 4.0, page 1, and held in 125 mL solution beakers .  
All solutions were inoculated with pure culture algal stock in log phase growth to achieve a concentration of 10,000 cells/mL, calculations in section 6.0 page 2. All solutions thoroughly stirred. Divided the 150 mL solution beaker into 3-50 mL aliquots and distributed into flasks A, B and C. Placed all flasks randomly on a shaker table with 100 rpm continuous rotation in environmental chamber (continuous light at 25 °C ± 1 °C)  
All flasks randomly rotated twice daily.

Bear Creek @ Kibby Rd  
Hatch Drain @ Tuolomne Rd**

**Summary of Chronic Phase I Algae TIE  
on ESJ Cottonwood Creek 4/29/08 Sample  
(545XCCART)**

<i>Treatment</i>	<i>Conc. (%)</i>	<i>Absorbance @ 750 nm</i>	<i>Cells/mL (x 10<sup>6</sup>)<sup>a</sup></i>	<i>Comment</i>
<b>Baseline</b>	Lab Control 100	0.2570 0.0110*	3.3149 0.1105	Test sample had 3% of algal control growth
<b>Baseline + 1 mg/L EDTA</b>	EDTA Control 100	0.3105 0.6115	4.0118 7.9326	EDTA eliminated toxicity – cationic chemical toxicity suspected
<b>C-8 SPE Through-Column</b>	Column Blank 100	0.3555 0.3055	4.5979 3.9466	SPE column treatment eliminated toxicity – NPO toxicity suspected; toxicity not recovered from the 2X add-back
	Treatment Blank 2X add-back	0.3520 0.3405	4.5524 4.4026	
<b>C-8 SPE + EDTA</b>	100	0.5435	7.0468	The combined SPE/EDTA treatment eliminated toxicity – cationic chemicals + NPO toxicity suspected.

Sample Date: 4/29/08

Test Date: 5/13/08

a Cell number x 10<sup>6</sup> = 13.026 x absorbance @ 750 nm - 0.0328

\* significantly different from control (p<0.05)

**Conclusion:**

Sample toxicity caused by cationic chemical(s) and NPO(s).

**Summary of Chronic Phase I Algae TIE  
on ESJ Miles Creek 4/29/08 Sample  
(535XMCARR)**

<i>Treatment</i>	<i>Conc. (%)</i>	<i>Absorbance @ 750 nm</i>	<i>Cells/mL (x 10<sup>6</sup>)<sup>a</sup></i>	<i>Comment</i>
<b>Baseline</b>	Lab Control 100	0.2570 0.1400*	3.3149 1.7908	Test sample had 54% of algal control growth
<b>Baseline + 1 mg/L EDTA</b>	EDTA Control 100	0.3105 0.6910	4.0118 8.9682	EDTA eliminated toxicity – cationic chemical toxicity suspected
<b>C-8 SPE Through-Column</b>	Column Blank 100 Treatment Blank 2X add-back	0.3810 0.4545 0.3520 0.3040	4.9301 5.8875 4.5524 3.9271	SPE column treatment eliminated toxicity – NPO toxicity suspected; toxicity not recovered from the 2X add-back
<b>C-8 SPE + EDTA</b>	100	0.6260	8.1215	The combined SPE/EDTA treatment eliminated toxicity – cationic chemicals + NPO toxicity suspected.

Sample Date: 4/29/08

Test Date: 5/13/08

a Cell number x 10<sup>6</sup> = 13.026 x absorbance @ 750 nm - 0.0328

\* significantly different from control (p<0.05)

**Conclusion:**

Toxicity was eliminated by EDTA addition, SPE column treatment and SPE + EDTA treatment, suggesting that toxicity was caused by both cationic chemicals and NPOs.

**Summary of Chronic Phase I Algae TIE  
on ESJ South Slough 4/29/08 Sample  
(535XSSAQR)**

<i>Treatment</i>	<i>Conc. (%)</i>	<i>Absorbance @ 750 nm</i>	<i>Cells/mL (x 10<sup>6</sup>)<sup>a</sup></i>	<i>Comment</i>
<b>Baseline</b>	Lab Control 100	0.2570 0.0115*	3.3149 0.1170	Test sample had 3% of algal control growth
<b>Baseline + 1 mg/L EDTA</b>	EDTA Control 100	0.3105 0.5315	4.0118 6.8905	EDTA eliminated toxicity – cationic chemical toxicity suspected
<b>C-8 SPE Through-Column</b>	Column Blank 100 Treatment Blank 2X add-back	0.3100 0.0455 0.3520 0.3780	4.0053 0.5599 4.5524 4.8910	SPE column treatment slightly reduced toxicity when compared to the untreated ambient sample – NPO toxicity suspected; toxicity not recovered from the 2X add-back
<b>C-8 SPE + EDTA</b>	100	0.5825	7.5548	The combined SPE/EDTA treatment eliminated all toxicity – cationic chemicals + NPO toxicity suspected.

Sample Date: 4/29/08

Test Date: 5/13/08

a Cell number x 10<sup>6</sup> = 13.026 x absorbance @ 750 nm - 0.0328

\* significantly different from control (p<0.05)

**Conclusion:**

The majority of the sample toxicity was due to cationic chemical, while NPOs were responsible for a small component of the toxicity.

**Summary of Chronic Phase I Algae TIE  
on ESJ Bear Creek 4/29/08 Sample  
(535XBCAKR)**

<i>Treatment</i>	<i>Conc. (%)</i>	<i>Absorbance @ 750 nm</i>	<i>Cells/mL (x 10<sup>6</sup>)<sup>a</sup></i>	<i>Comment</i>
<b>Baseline</b>	Lab Control	0.2570	3.3149	No toxicity detected in the sample
	100	0.4560	5.9071	
<b>Baseline + 1 mg/L EDTA</b>	EDTA Control	0.4560	5.9071	
	100	0.3105	4.0118	
<b>C-8 SPE Through-Column</b>	Column Blank	0.3460	4.4742	
	100	0.4120	5.3339	
	Treatment Blank	0.3520	4.5524	
<b>C-8 SPE + EDTA</b>	2X add-back	0.3530	4.5654	
	100	0.3950	5.1125	

Sample Date: 4/29/08

Test Date: 5/13/08

a Cell number x 10<sup>6</sup> = 13.026 x absorbance @ 750 nm - 0.0328

\* significantly different from control (p<0.05)

**Conclusion:**

Sample toxicity was lost prior to or during the TIE, therefore none of the treatments provided any useful information regarding the cause(s) of toxicity detected in the initial toxicity test.

on ESJ Hatch Drain 4/29/08 Sample  
(535XHDATA-RS)**

<i>Treatment</i>	<i>Conc. (%)</i>	<i>Absorbance @ 750 nm</i>	<i>Cells/mL (x 10<sup>6</sup>)<sup>a</sup></i>	<i>Comment</i>
<b>Baseline</b>	Lab Control 100	0.2570 0.0415*	3.3149 0.5078	Test sample had 15% of algal control growth
<b>Baseline + 1 mg/L EDTA</b>	EDTA Control 100	0.3105 0.3825	4.0118 4.9496	EDTA eliminated toxicity – cationic chemical toxicity suspected
<b>C-8 SPE Through-Column</b>	Column Blank 100	0.3555 0.2655	4.5979 3.4256	SPE column treatment eliminated toxicity – NPOs responsible for a portion of toxicity; toxicity partially recovered from the 2X add-back
	Treatment Blank 2X add-back	0.2520 0.1915	4.5524 2.4617	
<b>C-8 SPE + EDTA</b>	100	0.3965	5.1320	The combined SPE/EDTA treatment eliminated toxicity – cationic chemicals + NPO toxicity suspected.

Sample Date: 4/29/08

Test Date: 5/13/08

a Cell number x 10<sup>6</sup> = 13.026 x absorbance @ 750 nm - 0.0328

\* significantly different from control (p<0.05)

**Conclusion:**

Sample toxicity due to cationic chemicals with NPOs responsible for a portion of the toxicity.

Hatch Drain @ Tuolumine Road 535XHDATR-RS

**1.0 Stock Preparation**

0.5 liters of Ambient Sample filtered through 0.22 µm Metrigard filter.  
0.5 liters R/O EPAMH filtered through 0.22 µm Metrigard filter

**2.0 Water Quality Measurement**

Water quality of dilution and effluent measured after addition of EPA Algal Assay Media (AAM). Section 3.0, page 1

**EPA Algal Assay Media Addition (Without EDTA)**

Algal Assay Media prepared as per EPA 821-R-02-013; Section 14-Tables 1 and 2

Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **Ambient Sample**

Added 0.5 mL each of #1-5 EPA AAM to 0.5 L R/O EPAMH; **Control Water**

Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **C8 SPE Column Blank**

Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **C8 SPE Through Column**

Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **C8 SPE Through Column + 1 mg/L EDTA**

Added 0.10 mL each of #1-5 EPA AAM to 0.10 L **C8 SPE 2X Addback**

Added 0.20 mL each of #1-5 EPA AAM to 0.20 L **Ambient Sample + 1 mg/L EDTA**

Stirred samples on magnetic stir plates for approx. 10 minutes.

**4.0 Background Counts**

Particle background counts measured with electronic particle counter - Coulter Counter, model ZBI.

Counts recorded on section 2.0, page 2.

**5.0 Exposure Series Preparation and Algal Inoculation**

All concentrations prepared as described in section 4.0, page 1, and held in 125 mL solution beakers .

All solutions were inoculated with pure culture algal stock in log phase growth to achieve a concentration of 10,000 cells/mL, calculations in section 6.0 page 2. All solutions thoroughly stirred. Divided the 150 mL solution beaker into 3-50 mL aliquots and distributed into flasks A, B and C. Placed all flasks randomly on a shaker table with 100 rpm continuous rotation in environmental chamber (continuous light at 25 °C ± 1 °C)

All flasks randomly rotated twice daily.

## Environmental Toxicology Specialists ALGAL BIOASSAY DATA SHEETS

### 5.0 TEST INITIATION

WITHOUT EDTA		Sample	Counts		
Coulter Counter	Isoton	18	21	23	
Background Check	Control	106	97	107	
	Hatch Drain	70	89	72	

### 6.0 ALGAE COUNT

Replicate	Dilution Factor				Cell Counts			Mean
	Dil 1	Dil 2	Count	Factor	1	2	3	
1	0.25mL	0.5 to 2mL	0.5mL	160:1	29809	29874	29898	29866
2	sample							

Calculations:

Target: 10,000 cells/mL test solution

Time of Inoculation: 1451

Algal Stock Concentration:

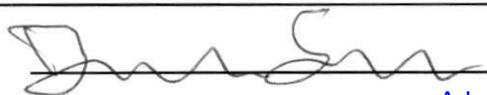

$$\frac{29866 \times 160}{\text{Average cell count} \times \text{Dilution Factor}} = \frac{4.7776 \times 10^6}{\text{cells/mL algal stock}}$$

Inoculation:

$$\frac{10,000 \text{ cells/mL solution} \times 150 \text{ mL test solution/concentration}}{4.7776 \times 10^6 \text{ cells/mL algal stock}} = 0.314 \text{ mL algal stock/conc.} = 314 \text{ } \mu\text{L algal stock/conc.}$$

Final Algal Density Check:

LABORATORY NOTES

7/29/08	EDTA Standard
① 221.3mg of EDTA plus 20ml of ultra pure to give a 1° standard of:	
$\frac{221.3 \text{ mg}}{20 \text{ ml}} \approx \frac{10 \text{ mg}}{\text{ml}}$	
② making 2° standard: 1:10 dilution; 1ml of 1° EDTA Standard to 9ml of ultra pure.	
③ math: $\left(\frac{1 \text{ mg}}{1000 \text{ ml}}\right) (200 \text{ ml}) = \left(\frac{10 \text{ mg}}{\text{ml}}\right) (x)$	
$x = 0.02 \text{ ml}$ $= 20 \text{ ml}$	
dilution factor 10	
so, $20 \text{ ml} \times 10 = 200 \text{ ml}$	
$= 250 \text{ ml}$	
$= 300 \text{ ml}$

## ALGAL BIOASSAY DATA SHEETS

### 5.0 TEST INITIATION

WITHOUT EDTA		Sample	Counts		
Coulter Counter	Isoton	30	38	34	
Background Check	Control	78	65	69	
	Hilmar Drain	336	327	330	

### 6.0 ALGAE COUNT

Replicate	Dilution Factor				Cell Counts			Mean
	Dil 1	Dil 2	Count	Factor	1	2	3	
1	0.25ml	0.5ml	0.5ml	160:1	64767	65038	65378	65058
2	Sample							

Calculations:

Target: 10,000 cells/mL test solution

Time of Inoculation: 1522

Algal Stock Concentration:

$$\frac{65058 \times 160}{\text{Average cell count} \times \text{Dilution Factor}} = \frac{10.4093 \times 10^6}{\text{cells/mL algal stock}}$$

Inoculation:

$$\frac{10,000 \text{ cells/mL solution} \times 150 \text{ mL test solution/concentration}}{10.4093 \times 10^6 \text{ cells/mL algal stock}} = 0.144 \text{ mL algal stock/conc.} = 144 \text{ } \mu\text{L algal stock/conc.}$$

Final Algal Density Check:

	ID	Count 1	Count 2	Count 3	Dilution	Adj. Avg.
Time: 1601	Flask #1	341	349	333	40:1	10800
	Flask #2				40:1	9320
	Flask #3					
	Flask #4					
	Flask #5

**ESJ 08-06A RS TIE**  
96 Hr. Static Growth  
*Selenastrum capricornutum*

**Ambient Samples (072208)**

Hilmar Drain @ Mitchell Rd (535XHDAMR-RS)

**1.0 Stock Preparation**

0.5 liters of Ambient Sample filtered through 0.22 µm Metrigard filter.  
0.5 liters R/O EPAMH filtered through 0.22 µm Metrigard filter

**2.0 Water Quality Measurement**

Water quality of dilution and effluent measured after addition of EPA Algal Assay Media (AAM). Section 3.0, page 1

**EPA Algal Assay Media Addition (Without EDTA)**

Algal Assay Media prepared as per EPA 821-R-02-013; Section 14-Tables 1 and 2

Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **Ambient Sample**

Added 0.5 mL each of #1-5 EPA AAM to 0.5 L R/O EPAMH; **Control Water**

Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **C8 SPE Column Blank**

Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **C8 SPE Through Column**

Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **C8 SPE Through Column + 1 mg/L EDTA**

Added 0.10 mL each of #1-5 EPA AAM to 0.10 L **C8 SPE 2X Addback**

Added 0.20 mL each of #1-5 EPA AAM to 0.20 L **Ambient Sample + 1 mg/L EDTA**

Stirred samples on magnetic stir plates for apprx. 10 minutes.

**4.0 Background Counts**

Particle background counts measured with electronic particle counter - Coulter Counter, model ZBI.

Counts recorded on section 2.0, page 2.

**5.0 Exposure Series Preparation and Algal Inoculation**

All concentrations prepared as described in section 4.0, page 1, and held in 125 mL solution beakers .

All solutions were inoculated with pure culture algal stock in log phase growth to achieve a concentration of 10,000 cells/mL, calculations in section 6.0 page 2. All solutions thoroughly stirred. Divided the 150 mL solution beaker into 3-50 mL aliquots and distributed into flasks A, B and C. Placed all flasks randomly on a shaker table with 100 rpm continuous rotation in environmental chamber (continuous light at 25 °C ± 1 °C)

All flasks randomly rotated twice daily.

Sample Date: 8/19/08

Test Date: 8/26/08

a Cell number x 10<sup>6</sup> = 13.026 x absorbance @ 750 nm – 0.0328

\* Significantly different from control (p<0.05)

**Conclusion:**

Sample toxicity was lost prior to or during the TIE, therefore none of the treatments provided any useful information regarding the cause(s) of toxicity detected in the initial toxicity test.

0.5 liters R/O EPAMH filtered through 0.22 µm Metrigard filter

**2.0 Water Quality Measurement**

Water quality of dilution and effluent measured after addition of EPA Algal Assay Media (AAM). Section 3.0, page 1

**EPA Algal Assay Media Addition (Without EDTA)**

Algal Assay Media prepared as per EPA 821-R-02-013; Section 14-Tables 1 and 2  
Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **Ambient Sample**  
Added 0.5 mL each of #1-5 EPA AAM to 0.5 L R/O EPAMH; **Control Water**

Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **C8 SPE Column Blank**  
Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **C8 SPE Through Column**  
Added 0.2 mL each of #1-5 EPA AAM to 0.2 L **C8 SPE Through Column + 1 mg/L EDTA**  
Added 0.10 mL each of #1-5 EPA AAM to 0.10 L **C8 SPE 2X Addback**

Added 0.20 mL each of #1-5 EPA AAM to 0.20 L **Ambient Sample + 1 mg/L EDTA**

Stirred samples on magnetic stir plates for approx. 10 minutes.

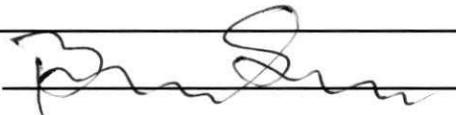

**4.0 Background Counts**

Particle background counts measured with electronic particle counter - Coulter Counter, model ZBI.  
Counts recorded on section 2.0, page 2.

**5.0 Exposure Series Preparation and Algal Inoculation**

All concentrations prepared as described in section 4.0, page 1, and held in 125 mL solution beakers .  
All solutions were inoculated with pure culture algal stock in log phase growth to achieve a concentration of 10,000 cells/mL, calculations in section 6.0 page 2. All solutions thoroughly stirred. Divided the 150 mL solution beaker into 3-50 mL aliquots and distributed into flasks A, B and C. Placed all flasks randomly on a shaker table with 100 rpm continuous rotation in environmental chamber (continuous light at 25 °C ± 1 °C)  
All flasks randomly rotated twice daily.

**Summary of Acute Phase I *Ceriodaphnia dubia* TIE  
on ESJ Silva Drain 7/22/08 Sample  
(535XSDAMD)**

<i>Treatment</i>	<i>Conc. (%)</i>	<i>96-hr Survival (%)</i>	<i>Toxic Units (TUa)<sup>a</sup></i>	<i>Comment</i>
<b>Baseline</b>	Lab Control	100	NOEC = 12.5%	Based on the EC <sub>50</sub> , the sample contained 5.2 TUa
	6.25	100	<b>(8 TUa)</b>	
	12.5	100		
	25	10*	EC <sub>50</sub> = 19.4%	
	50	0*	<b>(5.2 TUa)</b>	
	100	0*		
<b>Baseline + 100 ppb PBO</b>	PBO Control	100	NOEC = 100%	PBO prevented the majority of the toxicity.
	6.25	100	<b>(1 TUa)</b>	
	12.5	100		
	25	100	EC <sub>50</sub> > 100%	
	50	95	<b>(&lt; 1 TUa)</b>	
	100	90		
<b>C-8 SPE Through- Column</b>	Column Blank	100	--	Toxicity removed by SPE extraction. Non-polar organic (NPO) toxicity indicated; consistent with OP toxicity
	100	100		
<b>C-8 SPE Column 2X Add-Back</b>	MeOH Ctrl	100	--	Toxicity not recovered in methanol eluate
	2X add-back	100		
<b>Baseline + EDTA</b>	EDTA Control	100	--	EDTA treatment ineffective; toxicity not caused by cationic chemicals
	100	0*		
<b>OP-Specific Enzyme</b>			--	Toxicity removed at 10 mg/L and reduced at 50 mg/L. OP insecticide toxicity suspected.
	<b>10 mg/L</b>	Control	100	
		100	95	
	<b>50 mg/L</b>	Control	95	
100		60*		

Sample Date: 7/22/08

Test Date: 7/24/08

a TUa = 100/NOEC; TUa = 100/EC<sub>50</sub>

\* significantly different from control (p<0.05)

**Conclusion:**

Toxicity was prevented by PBO, removed by SPE and eliminated by the OP-specific enzyme (Landguard™). The TIE results are consistent with OP insecticide-caused toxicity.

Dear Mr. Jones;

Over the past four years, the ESJWQC has performed water quality monitoring in the waterways listed above. Results from numerous sampling events indicate these waterways do not meet standards set by the Central Valley Regional Water Quality Control Board for several parameters (pesticides, E. coli, metals).

Despite numerous mailings to landowners along these waterways, we continue to find exceedances of water quality standards. Since the ESJWQC and its members are committed to solving water quality problems, the coalition contracted with the County Agricultural Commissioner's office to "walk the creeks" and identify and record locations where pipes, conduits or drainage enters these waterways. **You have been identified as a property owner where such a potential discharge point is located -- see enclosed map for discharge site locations.**

Landowners within the Central Valley who have irrigation water and/or stormwater leaving their irrigated lands **must** obtain regulatory coverage. These discharges of irrigation or storm water may potentially contribute "waste" (as defined in the California Water Code) to surface waters (rivers, creeks, sloughs, lakes). Pesticide residues, nutrients and sediment are examples of waste that are typically discharged. The Water Board allows landowners and/or operators of irrigated lands to obtain regulatory coverage required by the California Water Code by:

- Joining a Water Board-approved Coalition Group that forms on behalf of individual growers; or
- Obtaining individual coverage under the Individual Discharger Conditional Waiver.

**Some of you receiving this letter are already members of ESJWQC, while others are not. In order to more fully explain your responsibilities as a discharger, the Coalition has**

scheduled a workshop at the location below. Please plan to attend (or send someone representing you).

**Wednesday, June 18, 2008, 10 am – 12 pm**

## July 1, 2008: Letter to Almond and Alfalfa growers in all counties

### Cover Letter

---

Tuesday, July 1, 2008

**ID # 0000**

Farmer Name & Company  
101 America Street  
Anytown, CA 99999

Dear Member,

Nine waterways sampled by the ESJWQC in July 2007 were found to have exceedances of chlorpyrifos insecticide (Lorsban, Lock-On, Govern). After numerous conversations with growers and crop advisors, it appears the exceedances were likely caused by two factors: **spray drift and irrigation runoff after an application**. The most frequent chlorpyrifos uses in July are applications for Navel Orange Worm (NOW) in almonds and for alfalfa weevil in alfalfa.

While multiple exceedances occurred (see enclosed chart), all but one were just slightly over water quality standards for chlorpyrifos. These low numbers are one reason for suspecting spray drift into the waterways as a primary cause. The other is that the highest July exceedance in Black Rascal Creek – more than 100 times higher than the others – was traced to an almond grower who had irrigation drainage into the creek not long after making a chlorpyrifos hull split application. Drift was also believed to be a contributor.

Although the exceedances prompted development of Management Plans for those nine waterways and future scrutiny by regulators, we believe these exceedances are a problem that can be solved. **Preventing spray drift is a “doable” management practice** and can eliminate future movement of the insecticide into waterways. In particular, following the chlorpyrifos label-required buffer between waterways (25 feet for boom sprayers, 50 feet for orchard sprayers) and not spraying when the wind is blowing toward the waterway. Irrigation drainage after a chlorpyrifos application should be delayed 48 hours or is discouraged altogether unless the water can be held on the farm. Keep in mind that if you switch to pyrethroid insecticides, they too can be transported off site through drift or in irrigation drainage and detected in coalition sediment monitoring.

When a problem is identified in a watershed where you farm, simply being a Coalition member does not satisfy Regional Water Board regulations. You must also do the following:

- 1. Read and follow the enclosed Best Management Practice (BMP) information.** If you farm near a waterway, work to adopt practices that minimize movement of chlorpyrifos from your fields. You can find more information on BMPs for irrigated crops at [www.curesworks.org](http://www.curesworks.org).
- 2. Complete the enclosed Management Practice survey.** Completing the enclosed survey is the first step for the ESJWQC and landowners to understand how certain management practices may help improve water quality. All Coalition members in watersheds with Management Plans must submit a

Over

management practice survey as it is a significant measurement of success to the Water Board. Information from the survey can help guide recommendations and adoption of management practices to protect surface water and solve water quality problems. ***(If your survey is already on file with us, this envelope will not contain a blank survey.)***

**3. Attend Coalition workshops.** These meetings will be scheduled this fall in your area to review 2008 water sampling results and provide information on management practices.

**Why should I bother?** Grower participation in workshops, completing surveys and more importantly, adopting BMPs on lands contributing to runoff or spray drift problems are key success measures for you and the ESJWQC to remain in compliance with the Irrigated Lands Regulatory Program. Failure to solve water quality problems through watershed-wide efforts could lead to regulations requiring individual permitting of each farm by the Regional Water Board.

**Please return the survey in the enclosed envelope before August 30.** The information is very valuable to the Coalition.

Contact us at the numbers below if you have questions.

Sincerely,

Parry Klassen

#### Management Practices Survey for Dry Creek at Wellsford Road Subwatershed

- What kind of drainage system is used to handle runoff from storms or irrigation water?
 

Storm	Irrigation		Storm	Irrigation	
<input type="checkbox"/>	<input type="checkbox"/>	Discharge to local drainage system	<input type="checkbox"/>	<input type="checkbox"/>	Sediment settling ditch
<input type="checkbox"/>	<input type="checkbox"/>	Recirculation system	<input type="checkbox"/>	<input type="checkbox"/>	None
<input type="checkbox"/>	<input type="checkbox"/>	Holding basin	<input type="checkbox"/>	<input type="checkbox"/>	No runoff occurs
			<input type="checkbox"/>	<input type="checkbox"/>	Other _____
- Who is most responsible for making decisions about application of pesticides or manure for your operation?
 

Owner                       Employee                       Other: \_\_\_\_\_
- Who actually applies the pesticides or manure for your operation?
 

Owner                       Employee                       Contractor                       Other: \_\_\_\_\_
- What most influences your decision to select a pesticide or other pest management strategy in your field(s)?
 

Monitor pest situation; use appropriate treatment  
 Spray based on past history of pest problems  
 Spray according to calendar date
- Have you applied chlorpyrifos (Lorsban, Lock-On, Govern) to your crop in the last 12 months? Yes / No (circle answer)  
 If yes, what is the distance between your crop and waterway such as a drainage ditch?
 

50 feet                       100 feet                       150 feet or more
- If you HAVE applied chlorpyrifos to your crop, how long between the application and irrigation?
 

12 hrs                       24 hrs                       36 hrs                       48 hrs or more
- Which of the following herbicides have you applied to cropland in the last 12 months? (check all that apply).
 

Trifluralin (Treflan)     Eptam                       Prowl                       Simazine  
 Metolachlor             Metribuzin               Cyanazine               Prometryn
- Have you applied copper fungicides to your cropland in the last 12 months? Yes / No (circle answer)  
 If yes, what is the distance between your treated crop and waterway such as a drainage ditch?
 

50 feet                       100 feet                       150 feet or more
- Do you normally spot treat insect-infested areas or treat an entire field to prevent further infestation?
 

Spot treat only             Treat whole field always     Decision based on many variables
- What is the minimum distance between any pesticide or fertilizer mixing/loading area and any ditches, canals or streams that feed into nearby rivers?
 

Less than 20 feet         Between 20 and 100 feet     More than 100 feet

11. Is vegetation allowed to grow in and along field drainage ditches to trap sediment?  
 Yes                       No                       Some growth in winter

12. What practices have you used to lessen storm or irrigation runoff from fields into ditches, canals or streams? Indicate time frame when practices were installed, in the past 12 months or prior to 2007.

|                          |                          |  |                          | Other: _____                              |
|                          |                          |  |                          | (or equivalent) fertilizer recommendation |

14. If you **are not** already implementing the "BMPs" listed in question 12 & 13 that are applicable to your operation, why not?

- Lack of knowledge (for example, engineering)
- I don't believe it is applicable for my operation
- I'm not convinced it will work
- Lack of available equipment
- Cost of implementation
- Other: \_\_\_\_\_

15. Please check all the manure types that your agricultural operation has applied in the past 5 years, currently apply, and intend to apply in the next 5 years. (Check all that apply)

	Dairy	Chicken	Other: (Please specify: _____)
Used in the past 5 years	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Currently use	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Intend to use in the next 5 years	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

16. Approximately how many total tons of manure do you apply annually (and rate per acre)?

Dairy: \_\_\_\_\_ Rate/ac: \_\_\_\_\_  
 Chicken: \_\_\_\_\_ Rate/ac: \_\_\_\_\_  
 Other: \_\_\_\_\_ (Please specify) Rate/ac: \_\_\_\_\_

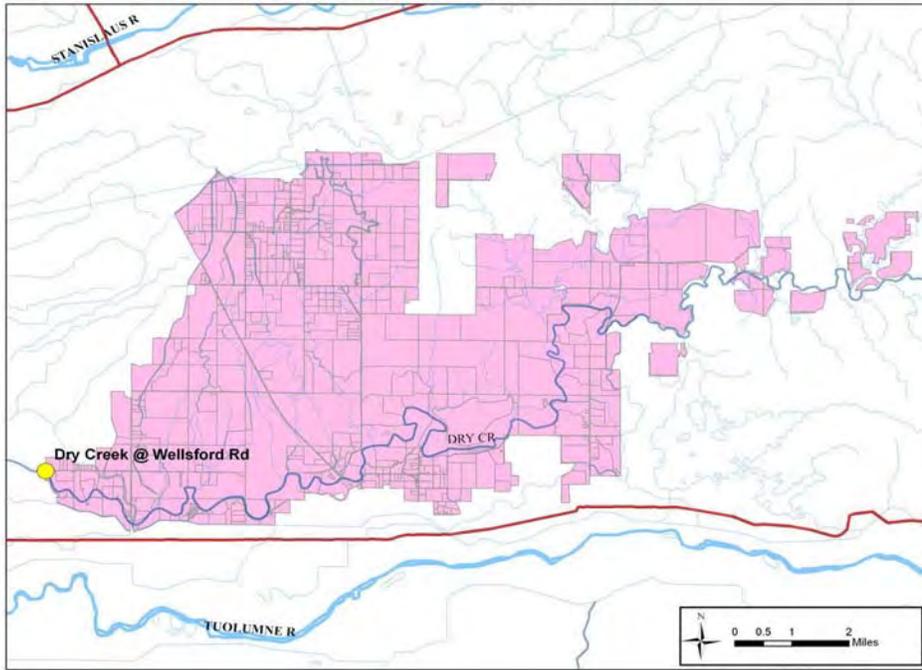

17. How close are surface water ways (creeks, drains, irrigation ditches or canals, etc) to the fields you apply manure?

- Adjacent                       Very Close (within 100 ft)                       Close (Within 300 ft)                       Distant (>300 ft)

## Membership Policy

January 2009

As a member of the Coalition in good standing, irrigated acres that you own or manage are now legally covered under the requirements described for watershed coalitions in the Irrigated Lands Regulatory Program (Central Valley Regional Water Quality Control Board Resolution No. R5-2003-0105).

### **Member Responsibilities**

---

As a member of the East San Joaquin Water Quality Coalition (Coalition), you agree to:

1. Respond to requests for information by ESJWQC that enable the Coalition to remain in compliance with requirements of the ILRP.
2. Cooperate with the ESJWQC to take corrective action should water quality problems be tracked back to your farming operation.
3. Implement management practices that minimize or eliminate fertilizer, pesticide and sediment runoff.

### **ESJWQC Responsibilities**

---

1. Perform activities that enable Coalition members to be in compliance with the Irrigated Lands Regulatory Program.
2. File required reports with the Central Valley Regional Water Quality Control Board (Regional Board) to maintain ILRP coverage for Coalition members.
3. Implement an economical and scientifically valid water monitoring program for waterways within the Coalition boundaries.
4. Spread costs equitably among Coalition members.
5. Communicate to Coalition members where water monitoring indicates water quality problems are related to farming practices and facilitate efforts to solve those problems.

**Agenda**  
**East San Joaquin Water Quality Coalition**  
**Annual Member Meeting**

December 16, 2008  
Stanislaus County Department of Agriculture, Modesto  
10:00 am to 12:00 pm; lunch following

10:00 pm	Welcome and introductions	Wayne Zipser Stanislaus Co. Farm Bureau
	Overview of Irrigated Lands Regulatory Program; Coalition Status New Regulations	Parry Klassen Board Chairman, ESJWQC
	Gary Caseri	Ag Commissioner, Stanislaus County
	Update on East San Joaquin Water Quality Coalition Activities	Wayne Zipser Stanislaus Co. Farm Bureau
	Coalition Water Monitoring Results	Michael Johnson
	Break	Door prize drawings
	Priority Management Plans – Pesticides Drive Water Quality Challenges BMP Surveys	Parry Klassen
12:00		Lunch: Sponsored by ESJWQC

*2 hours of CE credits, laws and regulations*

*Sponsored by*  
East San Joaquin Water Quality Coalition  
Stanislaus County Agricultural Commissioner  
Stanislaus County Farm Bureau
