Ms. Elizabeth Jennings
Senior Staff Counsel
Office of Chief Counsel
State Water Resources Control Board
P. O. Box 100
Sacramento, CA 995812-0100

Dear Ms. Jennings:

EVIDENCE AND EXHIBITS SUPPLEMENT TO THE ADMINISTRATIVE RECORD – IN RE: THE CITIES OF BELLFLOWER, ET AL., CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION (REVIEW OF JANUARY 26, 2000, ACTION OF THE REGIONAL BOARD AND IT EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054, PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001]). [SWRCB/OCC FILES A-1280, A-1280(a) AND A-1280 (b)]

Please find enclosed our "Evidence and Exhibits Supplement to the Administrative Record" for the hearing scheduled in the above matter.

The submittal includes, (i) selected papers on storm water pollution and new development designs for water quality, (ii) a summary paper on the impact of storm water runoff on Santa Monica Bay, (iii) a storm water informative videotape, (iv) a memorandum on the "Definition of Maximum Extent Practicable" issued by the Office of Chief Counsel, (v) a letter from the plaintiffs attorneys, (vi) policy statements from the State of Washington and the State of Maryland, (vii) a letter of support from U.S.EPA Region 9. We are awaiting policy statements on controls on new development from USEPA Headquarters – Engineering Analysis Division, the State of Florida, and the State of Virginia. These may have been mailed directly to you. We reserve the right to supplement the record for the hearing with the above documents and other related materials not made a part of the package at this time.

If you have any questions or need more information, please call me at (213) 576 – 6605 or Dr. Xavier Swamikannu at (213) 576 – 6754, or Regional Board Counsel, Jorge Leon at (916) 657-2428.

Sincerely,

Dennis A. Dickerson
Executive Officer

Re: Support for the 3/4 inch standard to reduce runoff from new and redevelopment

Dear Mr. Dickerson:

I recently have had the chance to review the standard urban stormwater mitigation plan for Los Angeles County and Cities in Los Angeles County. Treatment of the stormwater quality is an essential element for protecting local watersheds, and is widely used by many municipalities around the country. I strongly support the three-quarter inch runoff treatment standard based on past scientific research on the performance of stormwater best management practices. I have also enclosed a recent article on stormwater strategies for arid and semi-arid watersheds that may be helpful in adapting effective stormwater practices for your region.

Thank you for the opportunity to comment on the proposed stormwater mitigation plan. Adoption of the three quarter inch standard will help to protect the creeks and coastlines of Los Angeles from the impacts of stormwater pollutants, and represents a fair, equitable and achievable threshold for stormwater treatment.

Sincerely,

Thomas R. Schueler
Executive Director

cc Mark Gold

II. Stormwater Strategies for Arid and Semi-Arid Watersheds

Water supply and flood control have traditionally dominated watershed planning in arid and semi-arid climates. Until recent years, stormwater quality has simply not been much of a priority for water resource managers in the west. This situation is changing rapidly, as fast growing communities are responding to both emerging water quality problems and new federal regulations. In particular, larger cities in the west have gradually been dealing with stormwater quality to meet the requirements of the first phase of EPA's municipal stormwater NPDES program. Soon, thousands more smaller communities will need to develop stormwater quality programs when the second phase of this national stormwater regulatory program is rolled out later this year.

At first glance, it seems ludicrous to consider managing the quality of stormwater in arid regions where storms are such a rare and generally welcome event— sort of like selling combs at a bald convention. The urban water resources of the southwest, however, are strongly influenced by stormwater runoff and by the watershed development that increases it. Indeed, the flow of many urban streams in the southwest is generated almost entirely by human activity: by urban storm flow, irrigation return flow and wastewater effluent. Thus, the quality of both surface water and groundwater in urbanizing areas of arid and semi-arid regions of the southwest is strongly shaped by urbanization.

For purposes of this article, arid watersheds are defined as those that receive less than 15 inches of rain each year. Semi-arid watersheds get between 15 and 35 inches of rainfall, and have a distinct dry season where evaporation greatly exceeds rainfall. In contrast, humid watersheds are defined as those that get at least 35 inches of rain each year, and often much more. There are many arid and semi-arid watersheds, most of which are located in fast growing regions of the western United States (Figure 1). Low annual rainfall, extensive droughts, high intensity storms and high evaporation rates are characteristic of these watersheds, and present many challenges to the stormwater manager. [Note: in some arid and semi-arid watersheds, most precipitation falls as snow and evaporation rates are much lower. These watersheds are found in portions of Alaska and at higher elevations of the Rocky Mountains and Sierra Nevada. Guidance on stormwater strategies for these dry but cold watersheds can be found in Caraco (1997)].

Soon, thousands more smaller communities will need to develop stormwater quality programs.

This article reviews strategies for managing stormwater in regions of scarce water based on an extensive survey of 30 stormwater managers from arid and semi-arid regions. Next, the article explores how source control, better site design and stormwater practices can be adapted to meet the demanding conditions posed by arid and semi-arid climates. It begins by examining the environmental factors that make stormwater management in arid and semi-arid watersheds so unique and challenging. As a consequence, stormwater strategies for the west are often fundamentally different from those originally developed for more humid regions. Some of the fundamental differences are outlined in Table 1 and are described in detail in the following text.

Figure 1. Regions of the Continental United States With Less Than 15" of Precipitation Annually

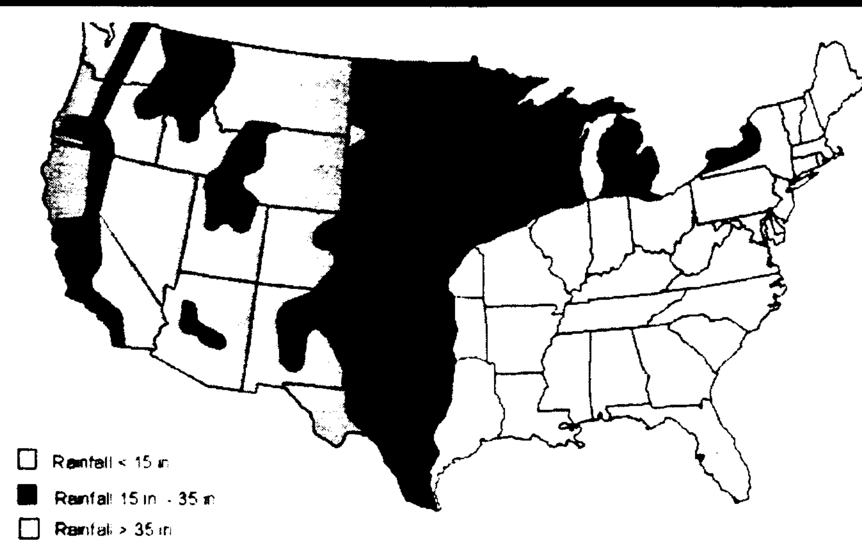

Table 1. The West Is Different: Key Considerations in Arid and Semi-Arid Watersheds
Aquatic resources and management objectives are fundamentally different
Rainfall depths are much lower
Evaporation rates are much higher
Pollutant concentrations in stormwater are much greater
Vegetative cover is sparse in the watershed
Sediment movement is great
Dry weather flow is rare, unless return flows are present

Aquatic resources and management objectives are fundamentally different

The rivers of arid regions are dramatically different from their humid counterparts. Some idea of these differences can be seen by comparing the dynamics of an arid river to a humid one (see Box 1). The differences are even more profound for the smaller urban streams in arid watersheds. In fact, it is probably appropriate to refer to them as gullies or arroyos rather than streams, since they rarely have a perennial flow of water. Many of the physical, chemical and biological indicators used to define stream quality in humid watersheds simply do not apply to the ephemeral washes and arroyos that comprise the bulk of the drainage network of arid watersheds. Without such indicators, it is difficult to define the qualities that merit protection in ephemeral streams. Clearly, the goals and purposes of stream protection need to be reinterpreted for ephemeral stream channels, and cannot be imported from humid regions.

In humid watersheds, the first objective of stormwater management is the protection of perennial streams, with goals such as maintaining pre-development flow rates, habitat conditions, water quality and biological diversity. In contrast, the objectives for stormwater management in most arid watersheds are ultimately driven either by flood control or the quality of a distant receiving water, such as a reservoir, estuary, ocean, or an underground aquifer. Witness some of the recent water quality problems in arid and semi-arid watersheds for which stormwater is suspected to be primarily responsible: beach closures along the Southern California coast, trash and floatables washed into marinas in Santa Monica, nutrient enrichment in recreational reservoirs like Cherry Creek Reservoir in Denver and Town Lake in Austin, trace metals violations in the estuarine waters of San Francisco Bay, or concerns about the quality and quantity of groundwater recharge in aquifers of San Antonio and Austin. Usually, the only local concern is preventing the loss of capacity of irrigation channels or storage reservoirs caused by sedimentation.

Groundwater is a particularly valued water resource in arid and semi-arid watersheds. Many fast-growing western communities are highly reliant on

Box 1 **An Arid River Runs Through It**

Consider, for a moment, the characteristics of the South Platte River as it runs through Denver, Colorado, as chronicled by Harris et al (1996). Flow in the South Platte river is extremely variable with a few thunderstorms and the spring snow melt causing a half dozen dramatic peaks in discharge. Normally, however, river flows quite low, falling below the average daily flow level some 354 days a year. Much of the flow in the South Platte has been spoken for: it has been estimated that river water is used and returned back to the river from three to seven times before it leaves the state (primarily due to upstream water appropriations for irrigation). Most of the time, the river's flow is sustained by municipal wastewater effluent flows, which contribute about 90% of the river's daily flow during most of the year. Indeed, without wastewater and irrigation flows, the river would frequently run dry (as it had prior to settlement). The river continues to strongly interact with groundwater, and much of the flow moves underground. The South Platte is very warm, with summer surface water temperatures exceeding 30 degrees Celsius (and fluctuating by as much as 15 degrees each day).

From a water quality standpoint, the South Platte frequently suffers from oxygen depletion, and has high concentrations of dissolved salts and nitrogen. Prior to settlement, the South Platte River was not believed to have riparian forest corridors, but in recent years, introduced species have become well established along many parts of the river. The quality of river habitat is generally regarded as poor, due to low flows, sandy, shifting substrates, and a lack of channel structure and woody debris. The river's channel continually changes in response to extreme variations in both flow and sediment supply. These extremely variable conditions are not conducive to a diverse aquatic habitat for aquatic insects or fish. For example, fewer than a dozen fish species inhabit the South Platte River, as compared to 30 or more that might be found in a humid region.

11- 301

Table 2. Rainfall Statistics for Eight U.S. Cities (all units in inches) Sources: NOAA, 1997; US DOC, 1975; CWP 1999

City	Rainfall Statistics					
	Annual Rainfall	Days of Rain per Year	90% Rainfall Event	Annual Evaporation Rate	Two Year, 24 Hour Storm	Ten Year, 24 Hour Storm
Washington, DC	38	67	1.2	48	3.2	5.2
Dallas, TX	35	32	1.1	66	4.0	6.5
Austin, TX	33	49	1.4	80	4.1	7.5
Denver, CO	15	37	0.7	60	1.2	2.5
Los Angeles, CA	12	22	1.3	60	2.5	4.0
Boise, ID	11	48	0.5	53	1.2	1.8
Phoenix, AZ	7.7	29	0.8	82	1.4	2.4
Las Vegas, NV	4	10	0.7	120	1.0	2.0

groundwater resources, and it is becoming a limiting factor for some. On a national basis, groundwater provides 39% of the public water supply. In the arid and semi-arid southwest, however, groundwater sources comprise 55% of the water supply (Maddock and Hines, 1995). Consequently, these communities have a strong interest in both the recharge and protection of groundwater on which they depend.

Rainfall Depths Are Much Smaller

Table 2 compares a series of rainfall statistics for eight arid, semi-arid and humid cities and documents that it rarely rains in arid watersheds. For example, in the fast growing Las Vegas, Nevada region, rainfalls greater than a tenth of an inch occur, on average, less than ten days a year. Not only does rain seldom fall, not much falls when it does. For example, 90% of all rainfall events in a given year are usually less than 0.50 to 0.80 inches in arid watersheds, compared to 1.0 to 1.5 inches in humid watersheds. If a "90% rule" was used in many arid regions, the water quality storm would be roughly half that of most semi-arid and humid watersheds, which would greatly reduce the size, land consumption and cost of structural practices that need to be built. In many cases, the entire water quality storm could be disposed of on-site through better site design, without the need for structural practices. It should be noted that there are some significant exceptions to this rule. Los Angeles, for example, experiences higher rainfall depths due to intense coastal storms in the winter, especially in el Nino years.

While intense storms cause the flash flooding that is so characteristic of the west, it is also important to keep in mind that the depth of rainfall in these storms is smaller than that of semi-arid and humid watersheds (Table 2). For example, the rainfall depth associated with the two-year 24-hour storm in most arid watersheds ranges from 1.0 to 1.4 inches, which is roughly equal to the typical water quality storm for a humid watershed. Similarly, the rainfall depth for the ten-year 24-hour storm in most arid watersheds ranges from two to three inches, which is roughly equivalent to the depth of a two-year storm in a semi-arid or humid watershed. Consequently, stormwater managers in arid regions can fully treat the quality and quantity of stormwater with about a third to a half of the storage needed in humid or semi-arid watersheds, with all other factors being equal.

Even though the rainfall depths in arid watersheds are lower, watershed development can greatly increase peak discharge rates during rare flood events. For example, Guay (1996) examined how development had changed the frequency of floods in arid watersheds around Riverside, California. Over two decades, impervious cover increased from 9% to 22% in these fast-growing watersheds. As a direct result, Guay determined that peak flow rate at gauged stations for the two-year storm event had climbed by more than 100%, and that the average annual stormwater runoff volume had climbed by 115% to 130% over the same time span.

Watershed development can greatly increase peak discharge rates during rare flood events.

Evaporation Rates are Greater

High evaporation rates are a great challenge in arid and semi-arid watersheds. Low rainfall combined

11-302

with high evaporation usually means that stored water will be lost water. In Las Vegas, for example, annual rainfall is a scant four inches, while pan evaporation exceeds ten feet (See Table 2). Consequently, it is virtually impossible to maintain a pond or wetland in an arid watershed without a supplemental source of water (see Saunders and Gilroy, 1997; *Technical Note* 111). Evaporation also greatly exceeds rainfall for many months of the year in semi-arid watersheds, and requires special pond design techniques.

As streams urbanize, dry weather flow can actually increase.

Pollutant Concentrations in Stormwater Are Often Higher

The pollutant concentration of stormwater runoff from arid watersheds tends to be higher than that of humid watersheds. This is evident in Table 3, which compares event mean concentrations (EMCs) from five arid or semi-arid cities to the national average for several common stormwater pollutants. As can be seen, the concentration of suspended sediment, phosphorus, nitrogen, carbon and trace metals in stormwater runoff from arid and semi-arid watersheds consistently exceeds the national average, which is heavily biased toward humid watersheds. In addition, bacteria levels are often an order of magnitude higher in arid regions (Chang, 1999).

The higher pollutant concentrations in arid watersheds can be explained by several factors. First, since rain events are so rare, pollutants have more time to build up on impervious surfaces compared to humid regions. Second, pervious areas produce high sediment and organic carbon concentrations because the sparse vegetative cover does little to prevent soil erosion in uplands and along channels when it does rain. The strong effect of upland and channel erosion can be detected when stormwater samples are taken from channels, but are less pronounced in stormwater outfall pipes.

Vegetative Cover is Sparse in the Watershed

Native vegetative cover is relatively sparse in arid and semi-arid watersheds, and offers little protection against soil erosion. Irrigation is required to establish dense and vigorous cover, which may not be sensible or economical given scarce water resources. In addition, high flows released from storm drains frequently accelerate downstream erosion since channels are also sparsely vegetated. Finally, many stormwater practices require dense vegetative cover to perform properly (e.g., grass swales are often not practical in arid watersheds, given the difficulty to establish and maintain turf).

Sediment Movement Is Greater

Stream channels in arid and semi-arid watersheds move a lot of sediment when they flow. For example, Trimble (1997) found that stream channel erosion supplied more than two thirds of the annual sediment yield of an urban San Diego Creek. He concluded that the higher flows due to watershed urbanization had greatly accelerated the erosion of arroyos, over and above the increases caused by grazing, climate and riparian management. Channel erosion can be particularly severe along road ditches that experience higher stormwater flows, which not only increases sediment erosion but also creates chronic ditch maintenance problems.

Dry Weather Flows Are Rare, Unless Supplemented by Return Water

Most small streams in arid watersheds are gullies or arroyos that only flow during and shortly after infrequent storm events. As streams urbanize, however, dry weather flow can actually increase. Human sources of dry weather flow include return flows from lawn and landscape watering, car washing, and surface discharges of treated wastewater. For example,

Figure 2: Arial Photograph from Boise, Idaho

11-303

Mizell and French (1995) found that excess water from residential and commercial landscape irrigation and construction site dewatering greatly increased rate and duration of dry weather flow in a Las Vegas Creek, and was sufficiently reliable to be the primary irrigation source for a downstream golf course.

Stormwater Strategies for Arid and Semi-Arid Watersheds

Watershed managers need to carefully choose stormwater practices that can meet the demanding climatic conditions and water resource objectives of arid and semi-arid watersheds. Communities can employ three broad strategies: aggressive source control, better site design, and application of "western" stormwater practices. Some of the key trends in each of these areas are described below.

Aggressive Source Control

The term "source control" encompasses a series of practices to prevent pollutants from getting into the storm drain system in the first place. The practices include pollution prevention, street sweeping, and more frequent clean outs of storm drain inlets. Each practice acts to reduce the accumulation of pollutants on impervious surfaces or within the storm drain system during dry weather, thereby reducing the supply of pollutants available for wash off when it rains.

Pollution prevention. Pollution prevention seeks to change behaviors at residential, commercial and industrial sites to reduce exposure of pollutants to rainfall. Almost all arid stormwater managers considered pollution prevention measures to be an integral element of their stormwater management program, on par with the use of structural stormwater practices (Caraco, 1997). Indeed, many western communities have pioneered innovative pollution prevention programs (see *On Watershed Education*, this issue). These programs focus on educating homeowners and businesses on how they can reduce or prevent pollutants from entering the storm drain system when it's not raining.

In recent years, western communities have been targeting their educational message to more specific groups and populations (see *On Watershed Education*, this issue). For example, Los Angeles County has identified seven priority categories for intensive employee training in industrial pollution prevention — auto scrap yards, auto repair, metal fabrication, motor freight, chemical manufacturing, car dealers, and gas stations— on the basis of their hotspot potential and their numerical dominance (Swammikannu, 1998). In the Santa Clara Valley of California, the three key priorities for intensive commercial pollution prevention training are car repair, construction, and landscaping services. Targeting is also used to reach homeowners with specific water conservation, car washing, fertilization and pesticide messages (see *On Watershed Education*).

Street sweeping. Street sweeping seeks to remove the buildup of pollutants that have been deposited along the street or curb, using vacuum assisted sweeper trucks. The pollutant removal performance of a new generation of street sweeper was recently reviewed in *Technical Note* 103. While researchers continue to debate whether street sweepers can achieve optimal performance under real-world street conditions, most concede that street sweeping should be more effective in areas that have distinct wet and dry seasons (CDM, 1993), which is a defining characteristic of arid and semi-arid watersheds.

> Better site design presents a great opportunity to minimize impervious cover and stormwater impacts in the west.

Storm drain inlet clean outs. One of the last lines of defense to prevent pollutants from entering the storm drain system is to catch them in the storm drain inlet. Mineart and Singh (1994) reported that monthly or even quarterly clean outs of sediment in storm drain inlets could reduce stormwater pollutant loads to the San Francisco Bay by 5% to 10%. Currently, few communities clean out their storm drain inlets more than once a year, but a more aggressive effort by public works to clean out storm drains prior to the onset of the wet season could be a viable strategy in some communities.

Better Site Design

Better site design clearly presents great opportunities to reduce impervious cover and stormwater impacts in the west, but has not been widely implemented to date. Indeed, the "California" development style, with its wide streets, massive driveways, and huge cul-de-sacs has been copied in many western communities and arguably produces more impervious cover per home or business than any other part of the country (Figure 2). While the popularity of the California development style reflects the importance of the car in shaping communities, it is also a strong reaction against the arid and semi-arid landscape. The brown landscape is not green or pastoral, and many residents consider concrete and turf to be a more pleasing and functional land cover than the dirt and shrubs they replace.

While the techniques and benefits of better site design have been extensively profiled in the last issue of *Techniques* (3:2), it is worth discussing how these techniques can be adapted for western developments.

11-304

A key adaptation is to incorporate the concept of "stormwater harvesting" into residential and commercial development design (COT, 1996). Water harvesting is an ancient concept that involves capturing runoff from rooftops and other impervious surfaces and using it for drinking water or to irrigate plants (e.g., the cistern). In a more modern version, rooftop runoff is spread over landscaping areas or the yard, with the goal for complete disposal of runoff on the property for storm events up to the two-year storm (which ranges from one to two inches in most arid and semi-arid climates. For example, the City of Tucson recommends 55 gallons of storage per 300 to 600 square feet of rooftop for residential bioretention areas (COT, 1996). In higher density settings, it may be more practical to store water in a rain barrel or cistern for irrigation use during dry periods.

When water harvesting is aggressively pursued, stormwater runoff is produced only from the impervious surfaces that are directly connected to the roadway system. Denver has utilized a similar strategy program to disconnect impervious areas and reduce the amount of stormwater pollution (DUDFC, 1992). A useful guide on these techniques has also been produced for the San Francisco Bay area (BASMAA, 1997). Water harvesting may also prove to be a useful stormwater retrofitting strategy, particularly in regions where water conservation is also a high priority.

Better site design principles also need to be adapted for fire safety in Western communities adjacent to chaparral vegetation that are prone to periodic wildfires. In some case, vegetation setbacks must be increased in these habitats to protect developments from dangerous wildfires (CWP, 1998).

Developing Western Stormwater Practices

Given the many challenges and constraints that arid and semi-arid watersheds impose, managers need to adapt and modify stormwater practices that were originally developed in humid watersheds. In our stormwater managers survey, four recurring principles emerged on how to design "western" stormwater practices that are suited to the challenging climate and water resource problems of arid and semi-arid watersheds:

1. Carefully select and adapt stormwater practices for arid watersheds
2. Minimize irrigation needs for stormwater practices
3. Protect groundwater resources and encourage recharge

Table 3. Stormwater Pollutant Event Mean Concentrations in Arid and Semi-Arid Regions (Units: mg/l, except for metals which are in ug/l)

Pollutant	National	Phoenix, AZ	Boise, Idaho	Denver, Colorado	San Jose, California	Dallas, Texas

R0073047

4. Reduce downstream channel erosion and protect from upland sediment

1. Carefully select and adapt stormwater practices for arid watersheds

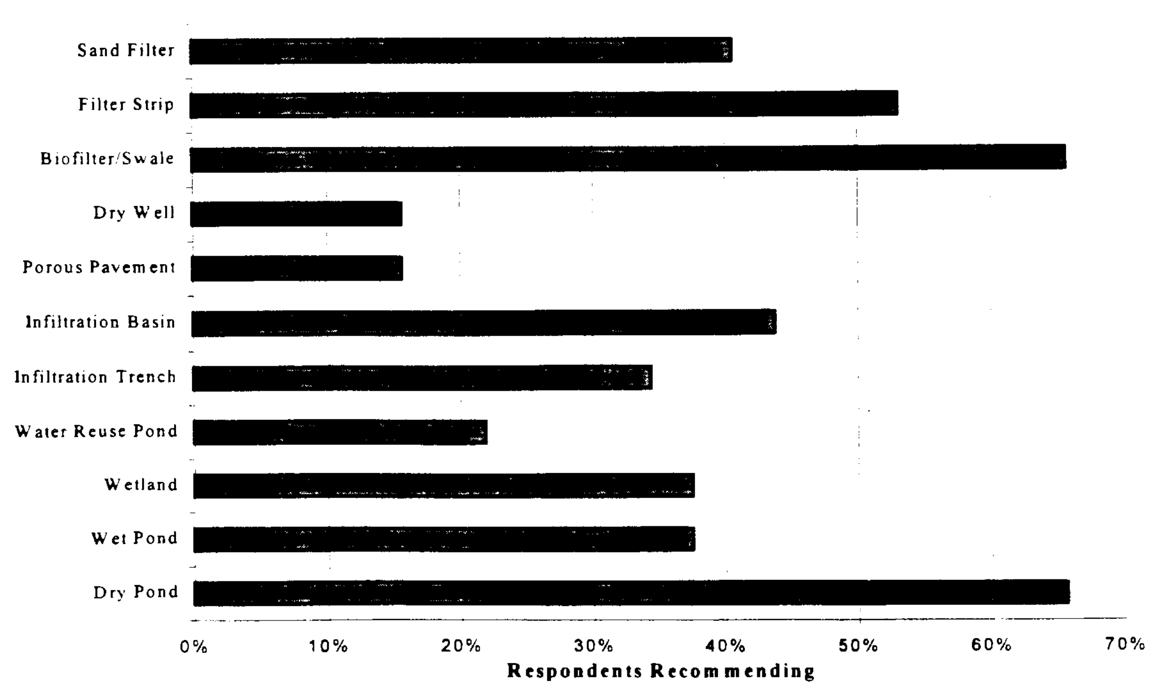
Some stormwater practices developed in humid watersheds are simply not applicable to arid watersheds, and most others require major modifications to be effective (Table 4). Even in semi-arid watersheds, design criteria for most stormwater practices need to be revised to meet performance and maintenance objectives. The following section highlights some of the major design and performance differences to consider for major stormwater practices.

Extended Detention (ED) Dry Ponds. The most widely utilized stormwater practices in arid and semi-arid watersheds were dry ponds, according to the Center's survey (Figure 3). Most were designed exclusively for flood control, but can be easily modified to provide greater treatment of stormwater quality. While dry ED ponds are not noted for their ability to remove soluble pollutants, they are reasonably effective in removing sediment and other pollutants associated with particulate matter (see *Technical Note* 95). In addition, ED ponds can play a key role in downstream channel protection, if the appropriate design storm is selected, and adequate upstream pretreatment is incorporated. Dry extended detention is the most feasible pond practice in arid watersheds, since they do not require a permanent pool of water.

Wet Ponds. Wet ponds are often impractical in arid watersheds since it is not possible to maintain a permanent pool without supplemental water, and the ponds become stagnant between storms. Wet ponds are feasible in some semi-arid watersheds, on the other hand, when carefully designed. Performance monitoring studies have demonstrated that wet ponds exhibit greater pollutant removal than other stormwater practices in Austin, Texas, at a lower cost per volume treated (COA, 1998, and *Technical Note* XX). In arid and semi-arid climates, wet ponds can require supplemental water to maintain a stable pool elevation. Saunders and Gilroy (1997) reported that 2.6 acre-feet per year of supplemental water were needed to maintain a permanent pool of only 0.29 acre-feet. Generally speaking, stormwater designers working in semi-arid watersheds should design for a variable pool level that can have as much as a three-foot draw down during the dry season. The use of wetland plants along the pond's shoreline margin can help conceal the drop in water level, but managers will need to reconcile themselves to chronic algal blooms, high densities of aquatic plants and occasional odor problems. The City of Austin has prepared useful wet pond design criteria to address these issues (COA, 1997).

Stormwater Wetlands. Few communities recommend the use of stormwater wetlands in either arid or semi-arid watersheds. Once again, the draw down rates caused by evaporation make it difficult to impossible to maintain standing water that can sustain emergent wetland plants, unless copious subsidies of supplemental water

Figure 3: BMP Preferences in Arid Climates



II-306

are supplied. One interesting exception was a gravel-based wetland that treated parking lot runoff in Phoenix, Arizona (Wass and Fox, 1995). While the wetland did require some supplemental water, evaporation was reduced by the overlying gravel bed, and the wetland achieved relatively high removal rates of oil and grease.

Sand Filters. Sand filters continue to be one of the most common practices used to treat the quality of stormwater in both arid and semi-arid watersheds. Sand filters require no supplemental water and can be used with almost any soil type. Still, the basic sand filter design continues to evolve to counter the tough design conditions found in these regions. For example, Urbonas (1997) evaluated sand filter performance in Denver, Colorado, and concluded that designs need to be modified to account for the greater sediment buildup in arid regions (*Technical Note* 100). Urbonas found that the

Table 4. Design Modifications for Stormwater Practices in Arid and Semi-Arid Watersheds

Stormwater Practice	Arid Watersheds	Semi-Arid Watersheds
ED Dry Ponds	PREFERRED multiple storm ED stable pilot channels "dry" forebay	ACCEPTABLE dry or wet forebay needed
Wet Ponds	NOT RECOMMENDED evaporation rates are too high to maintain a normal pool without extensive use of scarce water	LIMITED USE liners to prevent water loss require water balance analysis design for a variable rather than permanent normal pool use water sources such as AC condensate for pool aeration unit to prevent stagnation
Stormwater Wetlands	NOT RECOMMENDED evaporation rates too great to maintain wetland plants	LIMITED USE require supplemental water submerged gravel wetlands can help reduce water loss
Sand Filters	PREFERRED requires greater pretreatment exclude pervious areas	PREFERRED refer to COA, 1997 for design criteria
Bioretention	MAJOR MODIFICATION no irrigation better pretreatment treat no pervious area xeriscape plants or no plants replace mulch with gravel	MAJOR MODIFICATION use runoff to supplement irrigation use xeriscaping plants avoid trees replace mulch with gravel
Rooftop Infiltration	PREFERRED dry well design for recharge of residential rooftops	PREFERRED recharge rooftop runoff on-site unless the land use is a hotspot
Infiltration	MAJOR MODIFICATION no recharge for hotspot land uses treat no pervious area multiple pretreatment soil limitations	MAJOR MODIFICATION no recharge for hotspot land uses treat no pervious area multiple pretreatment
Swales	NOT RECOMMENDED not recommended for pollutant removal, but rock berms and grade control needed for open channels to prevent channel erosion	LIMITED USE limited use unless irrigated rock berms and grade control essential to prevent erosion in open channels

11-307

R0073049

test sand filter quickly became clogged with sediment after just a few storms, and recommended that sand filters include a more frequent sediment clean out regime, an increase in the filter bed size, and upstream detention to provide greater sediment pretreatment. Some additional research on the performance and longevity of sand filters in the semi-arid climate of Austin, Texas can be found in *Technical Notes* 111 and 112 (this issue).

Bioretention. The use of bioretention as a stormwater treatment practice is not very common in many western communities at the present time. Clearly, this practice will require extensive modification to work in arid watersheds. This might entail xeriscape plantings, use of gravel instead of mulch as ground cover, and better pretreatment. Sprinkler irrigation of bioretention areas should be avoided.

Infiltration Practices. While a number of communities allowed the use of infiltration in arid and semi-arid watersheds, few encouraged its use. Two concerns were frequently cited as the reason for lack of enthusiasm for structural infiltration. The first concern was that infiltration practices are too susceptible to rapid clogging, given the high erosion rates that are customary in arid and semi-arid watersheds. The second concern was that untreated stormwater could potentially contaminate the aquifers that are used for groundwater recharge.

Swales. The use of grass swales for stormwater treatment was rarely reported for arid watersheds, but was much more common in semi-arid conditions. Grass swales are widely used as a stormwater practice in residential developments in Boise, Idaho, but the dense turf can only be maintained in these arid conditions through the use of sprinkler irrigation systems. The pollutant removal performance of swales in arid and semi-arid watersheds appears to be mixed (Table 5). Poor to negative pollutant removal performance was reported in a Denver swale that was not irrigated (Urbonas, 1999 -personal communication). In the semi-arid climate of Austin, Texas, Barret et al (1998) reported excellent pollutant removal in two highway swales that were vegetated but not irrigated. Similar performance was also noted in a non-irrigated swale monitored by the City of Austin (COA, 1997).

2. Minimize irrigation needs for stormwater practices

In arid climates, all sources of water, including stormwater runoff, need to be viewed as a resource. It seems senseless, therefore, to irrigate a practice with 50 inches of scarce water a year so that it can be ready to treat the stormwater runoff produced from 10 inches of rain a year. Still, irrigation of stormwater practices the 183 and Walnut Creek sites. In our survey of stormwater managers, 65% reported that irrigation was commonly used to establish and maintain vegetated cover for most stormwater practices.

Irrigation should be limited to practices that meet some other landscaping or recreational need in a community and would be irrigated anyway, such as landscaping islands in commercial areas and road rights of way. Irrigation may also be a useful strategy for dry ED ponds that are designed for dual use, i.e., facilities that serve as a ballfield or community park during the dry season. Even when irrigation is used, practices should be designed to "harvest" stormwater, and therefore reduce irrigation needs. Landscapers should also consider planting native drought resistant plant material to

11-308

reduce water consumption.

3. Protect groundwater resources and encourage recharge

In many arid communities, protection of groundwater resources is the primary driving force behind stormwater treatment. Ironically, early efforts to use stormwater to recharge groundwater have resulted in some groundwater quality concerns. In Arizona, for example, stormwater was traditionally injected into 10 to 40 foot deep dry wells to provide for groundwater recharge. Concerns were raised that deep injection could increase the risk of localized groundwater contamination, since untreated stormwater can be a source of pollutants, particularly if the proposed land use is classified as a stormwater hotspot.

Wilson et al (1990) evaluated the risk of dry well stormwater contamination in Pima County, Arizona, and determined that dry wells had elevated pollutant concentrations in local groundwater. The build up of pollutant levels that had occurred over several decades tended to be localized, and did not exceed drinking water standards. Still, it is important to keep in mind that dry wells and other injection recharge methods should only be used to infiltrate relatively "clean" runoff, such as residential roofs. Other surface infiltration practices, such as trenches and basins, can also potentially contaminate groundwater unless they are carefully designed for runoff pretreatment, provide a significant soil separation distance to the aquifer, and are not used on "hot spot" runoff sites.

In many arid communities, protection of groundwater ,sources is the primary driving force behind stormwater treatment.

4. Design to reduce channel erosion

Above all, the western stormwater practice must be designed to reduce *downstream* erosion in ephemeral channels, while at the same time protecting itself from sediment deposition from *upstream* sources. This is a daunting challenge for any engineer, but the following ideas can help.

With respect to *downstream channel erosion*, designers will need to clamp down on the storm events that produce active erosion in channels. This might entail the design of ponds or basins that can provide 12 hours of extended detention for the one-year return interval storm event (which is usually no more than an inch or two in most arid and semi-arid watersheds). Local geomorphic assessment will probably be needed to set channel protection criteria, and these hydraulic studies are probably the most critical research priority in both arid and semi-arid watersheds today. Without ED channel protection, designers must rely on clumsy and localized engineering techniques to protect ditches and channels from eroding, such as grade control, rock berms, rip-rap, or even concrete lined channels. Bioengineering options to stabilize downstream channels in arid watersheds are limited, and often require erosion control blankets to retain moisture and seeds, as well as extensive irrigation.

Upstream erosion quickly reduces the capacity of any stormwater practice in an arid or semi-arid watershed, due to sparse vegetation cover and erosion from upstream gullies, ditches, or channels. Designers have several options to deal with this problem. The most effective option is to locate the practice so that it can only accept runoff from impervious areas, particularly for infiltration, sand filters and bioretention. Even then, the practice will still be subject to sediment transported by the wind.

All stormwater practices in arid and semi-arid watersheds require greater pretreatment *than in humid watersheds.* Seventy percent of the arid stormwater managers surveys reported that sediment clogging and deposition problems were a major design and maintenance problem for nearly all of their stormwater practices.

Even though not all upstream erosion can be prevented, designers can compensate for sediment buildup within the stormwater practice itself. Pretreatment and over-sizing can prevent the loss of storage or clogging associated with sediment deposition. As noted in *Technical Note* 112, rock berms or vertical gravel filters are ideally suited as a pretreatment device.

Most stormwater managers surveyed indicated that sediment cleanout regimes for stormwater practices need to be more frequent in arid and semi-arid watersheds, with removal after major storms and at a minimum, once a year. Lastly, stormwater managers consistently emphasized the need for better upland erosion control during construction. A full 65% of the managers reported that upstream erosion and sediment control was a major emphasis during their stormwater plan review.

Summary

It is clear that stormwater managers in arid and semi-arid climates cannot simply import the stormwater programs and practices that were originally developed for humid watersheds. Instead, they will need to develop stormwater solutions that combine aggressive source control, better site design and stormwater practices in a distinctly western context. Regulators, in turn, need to recognize that western climates, terrain and water resource objectives are different, and be flexible and willing to experiment with new approaches in municipal stormwater programs. Lastly, stormwater managers from arid and semi-arid watersheds must work more closely together to share experiences about the stormwater solutions that work and fail. It is only through this dialogue that western communities can gradually engineer stormwater practices that are rugged enough to withstand the demanding challenges of the arid and semi-arid west.

Better Site Design

I. An Introduction to Better Site Design

Few watershed management practices simultaneously reduce pollutant loads, conserve natural areas, save money, and increase property values. Indeed, if such "wonder practices" were ever developed, they would certainly spread quickly across the nation. As it turns out, these practices have existed for years. Collectively called "better site design," the techniques employ a variety of methods to reduce total paved area, distribute and diffuse stormwater, and conserve natural habitats. Despite their proven benefits and successful local application, better site design techniques often fail to earn the endorsement of local communities. In fact, many communities simply prohibit their use.

"Better site design" is a fundamentally different approach to residential and commercial development. It seeks to accomplish three goals at every development site: to reduce the amount of impervious cover, to increase natural lands set aside for conservation, and to use pervious areas for more effective stormwater treatment. To meet these goals, designers must scrutinize every aspect of a site plan—its streets, parking spaces, setbacks, lot sizes, driveways, and sidewalks— to see if any of these elements can be reduced in scale. At the same time, creative grading and drainage techniques reduce stormwater runoff and encourage more infiltration.

Why is it so difficult to implement better site design in so many communities? The primary reason is the outdated development rules that collectively govern the development process: a bewildering mix of subdivision codes, zoning regulations, parking and street standards, and drainage regulations that often work at cross-purposes with better site design. Few developers are willing to take risks to bend these rules with site plans that may take years to approve or that may never be approved at all.

In 1997, a national site planning roundtable was convened to address ways to encourage better site design techniques in more communities. The participants represented the diverse mix of organizations that affect the development process (listed in Table 1) and provided the technical and real world experience to make better site design happen. After two years of discussion, the roundtable endorsed 22 better site design techniques that offer specific guidance that can help achieve one of the basic better site design goals. These techniques are organized into three areas:

1. Residential Streets and Parking Lots
2. Lot Development
3. Conservation of Natural Areas

These techniques are not intended to be strict guidelines, and their actual application should be based on local conditions. The remainder of this article introduces each of the better site design techniques, describes some of the barriers to their wider use, and suggests ways to overcome these impediments.

Residential Streets and Parking Lots

As much as 65% of the total impervious cover in the landscape can be classified as "habitat for cars," which includes streets, parking lots, driveways, and other surfaces designed for the car. Consequently, 10 better site design techniques address ways to reduce car habitat in new developments.

Figure 1: A Neotraditional Community in Gaithersburg, MD
Better site design techniques have been successfully applied in a growing number of communities like the Kentlands

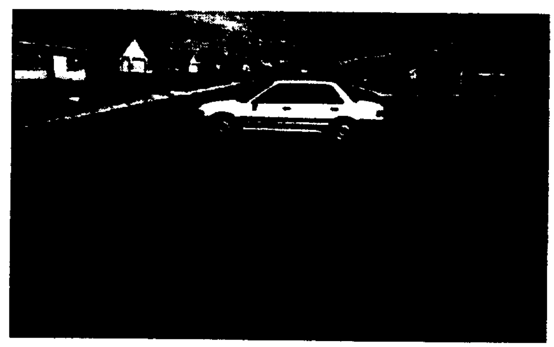
Design residential streets for the minimum required pavement width needed to support travel lanes, on-street parking, and emergency, maintenance, and service vehicle access. Street widths should be based on traffic volume.

In some communities, residential streets can be 32, 36, and even 40 feet wide, despite the fact that they only serve a few dozen homes. These wide streets are the greatest source of impervious cover in most subdivisions. Wide residential streets are created by blanket applications of high volume and high speed design criteria, the perception that on-street parking is needed on both sides of the street, and the perception that they provide unobstructed access for emergency vehicles.

Communities have a significant opportunity to reduce impervious cover by revising their street standards to widths of smaller residential access streets. Residential streets widths should be designed to handle expected traffic volumes, provide adequate parking, and ensure access for service, maintenance, and emergency vehicles. Two strategies can help to narrow streets: using queuing streets (see Figure 2) and critically evaluating the need for on-street parking on both sides of the street. Several national engineering organizations have recommended residential streets as narrow as 22 feet in width (ASSHTO, 1994 and ASCE, 1990).

Conventional Street



Queuing Street

(photos by Randall Arendt)

Figure 2: Queuing Streets as a Technique for Minimizing Street Width
While traditional streets are composed of two travel lanes and parking on either side of the road, queuing streets have one designated travel lane and two queuing lanes that can be used for travel or parking.

R0073054

Reduce the total length of residential streets by examining alternative street layouts to determine the best option for increasing the number of homes per unit length.

It stands to reason that a longer street network produces more impervious cover and greater development costs than a shorter one, yet most communities do not even consider whether a shorter street network can serve individual lots on residential streets. It is generally assumed that the cost of constructing roads is sufficient incentive to assure short street networks. Streets are designed to accommodate rapid, smooth traffic flow, and consequently, total street length is rarely the most important design consideration.

There is no one street layout guaranteed to minimize total street length in residential developments. Instead, site designers are encouraged to analyze different layouts to see if they can reduce street length.

Wherever possible, residential street right-of-way widths should reflect the minimum required to accommodate the travel-way, the sidewalk, and vegetated open channels. Utilities and storm drains should be located within the pavement section of the right-of-way wherever feasible.

In many communities, a single right-of-way width of 50 feet or more is applied to all residential street categories. While a wide right-of-way does not necessarily create more impervious cover, it requires more clearing and consumes land that could be used for achieving a more compact site design. By redesigning each of the main components of the right-of-way (ROW), the total width of the ROW can be sharply reduced. Techniques include reducing street width, narrowing sidewalks or restricting them to one side, narrowing the distance between street and sidewalk, and installing utilities beneath street pavement. Combined, these techniques narrow the ROW by 10 to 25 feet.

Minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered.

Many communities require the end of cul-de-sacs to be 50 to 60 feet in radius, creating large circles of needless impervious cover. There are several different options to reduce the impervious cover created by traditional cul-de-sacs. One option is to reduce the radius of the turnaround bulb. Several communities have implemented this successfully and the smaller radii can range from 33 to 45 feet. Since vehicles only use the outside of a cul-de-sac when turning, a second option is to create a pervious island in the middle of the cul-de-sac, creating a donut-like effect. A third option is to replace cul-de-sacs with loop roads and hammerheads (see Figure 3).

Where density, topography, soils, and slope permit, vegetated open channels should be used in the street right-of-way to convey and treat stormwater runoff.

Communities often require that curbs and gutters be installed along residential streets, which quickly convey stormwater runoff and associated pollutant loads directly into the stream. In contrast, open channels can remove pollutants by infiltration and filtering, and are also often less expensive than curb and gutter systems.

New engineering techniques have greatly improved the performance of conventional roadside ditches, which have traditionally suffered from erosion, standing water and increased pavement maintenance. One alternative is dry swales, which are designed both to convey the 10 year storm and treat a water quality stream through a sandy loam filter along the roadway (see Figure 4).

Engineering techniques have improved the performance of conventional roadside ditches.

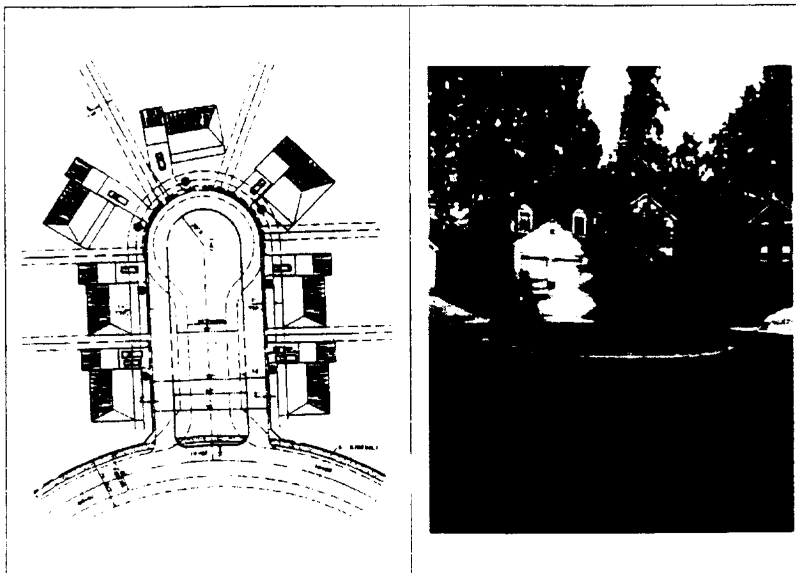


Figure 3: Two Alternatives to the Traditional Cul-de-Sac
A loop road or a pervious island in the middle are two alternatives that can significantly reduce impervious cover.

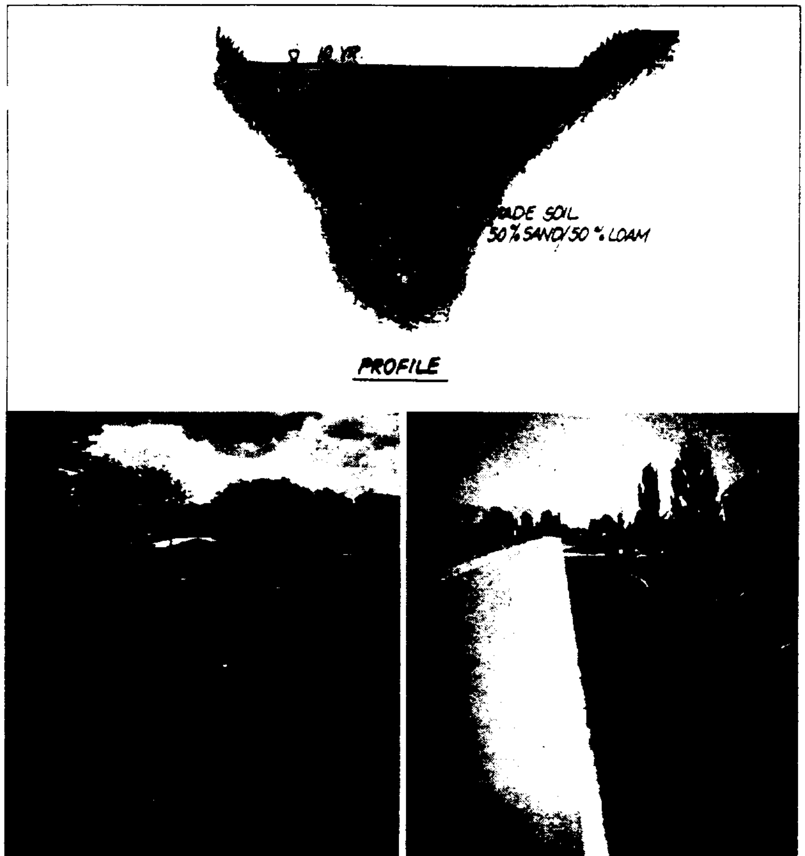

Figure 4: Profile and Two Examples of Open Vegetated Channels
Open vegetated channels allow for infiltration and treatment of stormwater on-site. A dry swale is typically designed to convey the 10 year storm, while treating smaller events with a subsurface composed of a sand and loam filler that treats the runoff before it enters a stream.

The required parking ratio governing a particular land use or activity should be enforced as both a maximum and a minimum in order to curb excess parking space construction. Existing parking ratios should be reviewed for conformance, taking into account local and national experience to see if lower ratios are warranted and feasible.

Many communities routinely build more parking spaces than are needed to meet actual parking demands. This is a result of using outdated or overly generous local parking codes to determine minimum parking ratios.

Communities should check their local codes to ensure that both a minimum and a maximum number of parking spaces are set for each building project (see Table 2 for recommended maximum parking spaces). By referring to national, regional and/or local studies, communities can evaluate their parking needs more accurately, thereby reducing the creation of unnecessary parking spaces. Even small reductions in parking can reduce construction and stormwater management costs. As it turns out, shrinking parking lots is critical in reducing the impact of commercial development (see next Feature Article).

Parking codes should be revised to lower parking requirements where mass transit is available or enforceable shared parking arrangements are made.

Despite the fact that parking lot size can shrink dramatically if credits for shared parking or mass transit are provided, only a handful of communities require or encourage developers to use these tools. Shared parking allows adjacent land uses to share parking lots if peak parking demands occur during different times of the week. Mass transit can reduce the number of vehicle trips, which translates directly into smaller parking lots.

Despite challenges, several communities have successfully provided parking credits for shared parking for reducing the total number of parking spaces created. One such example is Oakland, California, where a thorough study of short and long term parking demand was conducted. By taking an inventory of existing land uses, parking, and occupancy; and by considering vacancy factors, mass transit access, low auto ownership, and operations of special use facilities, the study concluded that parking rate for office space could be reduced from three spaces to 1.44 spaces per 1,000 gross square feet (ITE, 1995).

Reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in the spillover parking areas where possible.

Reducing the size of parking stall dimensions represents another opportunity to reduce impervious cover. The length and often the width of a typical parking stall can often be reduced by a foot or more.

Table 2: Recommended Parking Demand Ratios for Selected Land Uses
(Source CWP 1998b)

Land Use	Better Site Design Parking Ratios
Single Family Homes	2 spaces or less per dwelling unit*
Professional Offices	3.0 spaces or less per 1000 ft^2
Retail	4.0 to 4.5 spaces or less per 1000 ft^2

* can be accommodated in driveway

R0073056

Parking codes can also be amended to require a fixed percentage of smaller stalls for compact cars. Lastly, while permeable parking surfaces can be more expensive to install and maintain, the use of these materials in the 10-20% of the lot that will be used for spillover parking can reduce stormwater treatment costs.

Provide meaningful incentives to encourage structured and shared parking to make it more economically viable.

The type of parking facility in a development site is usually determined by the cost of land balanced against the cost of constructing parking. In suburban and rural areas, the low cost of land makes surface parking more cost-effective than building a garage. In highly urban areas, garages may be a more economical option, since land costs are at a premium.

Vertical parking structures can significantly reduce impervious cover by reducing acreage converted to parking. However, given the economics of surface parking versus garages, it is unlikely that garages will become the norm without incentives. Incentives for defraying some of the costs of parking garages could include tax credits, stormwater waivers or bonuses for density, floor area or building height. A simple way to save on the cost of garages is to incorporate them below or on the first floor of buildings, thereby reducing the structural cost for parking.

Wherever possible, provide stormwater treatment for parking lot runoff using bioretention areas, filter strips, and/or other practices that can be integrated into required landscaping areas and traffic islands.

Although parking lots are a significant source of stormwater pollution, many communities do not require developers to provide stormwater quality control. In other communities, opportunities to minimize and treat stormwater runoff at the parking lot are often overlooked. Parking lots can be made more attractive at the same time they treat stormwater. Bioretention areas, dry swales, perimeter sand filters, and filter strips are all effective at treating stormwater within the parking lot. Figure 5 provides a schematic diagram and example of a bioretention facility.

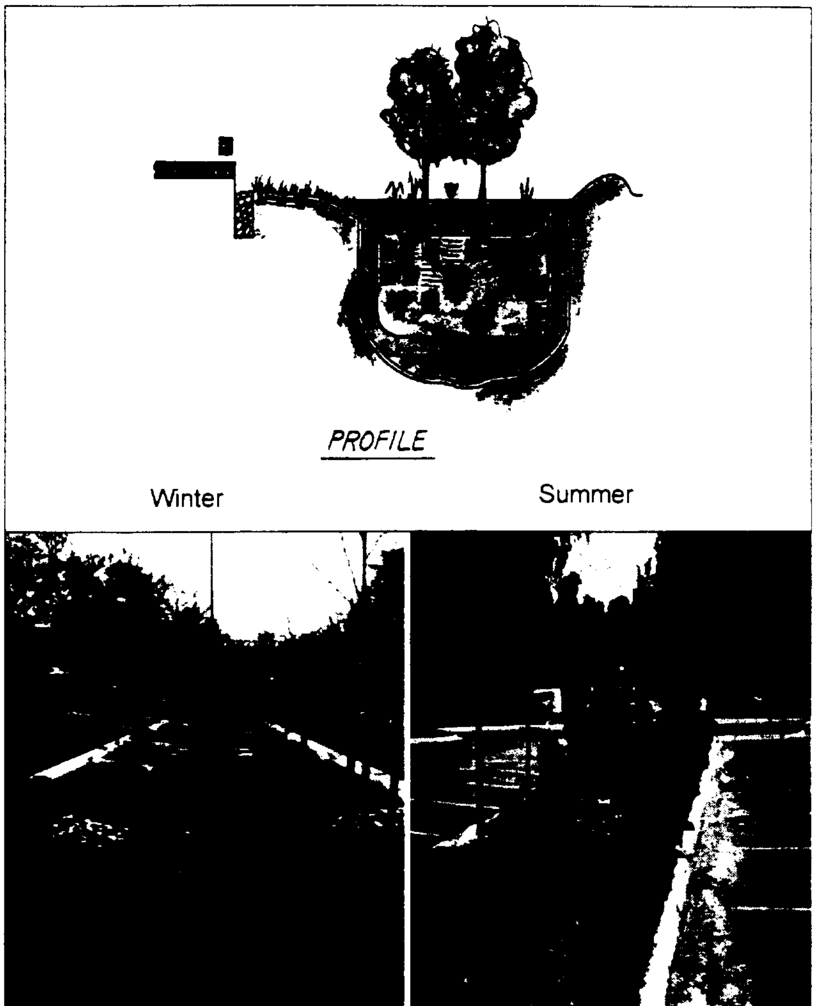

Figure 5: Profile of Parking Lot Bioretention Facilities
Bioretention areas can be designed for parking lots or on-site residential stormwater treatment, and can be an attractive landscaping feature in all seasons.

Lot Development

Many opportunities exist to reduce impervious cover in residential developments by modifying the shape, size, and layout of residential lots. Perhaps the greatest opportunity is to shift from conventional subdivisions to open space or cluster subdivisions.

Advocate open space design subdivisions incorporating smaller lot sizes to minimize total impervious area, reduce total construction costs, conserve natural areas, provide community recreational space, and promote watershed protection.

Open space subdivisions cluster houses into a smaller portion of the development site, leaving more of the site as natural open space. Figure 6 illustrates the differences between a conventional and an open space subdivision. Open space subdivisions have been documented to reduce impervious cover, stormwater runoff, and construction costs (see the second feature article in this issue for more details). While open space subdivisions are not always feasible in dense residential zones (more than six dwelling units per acre), communities that can utilize this technique should consider making open space subdivisions a by-right development option.

Conventional Subdivision | Open Space Subdivision

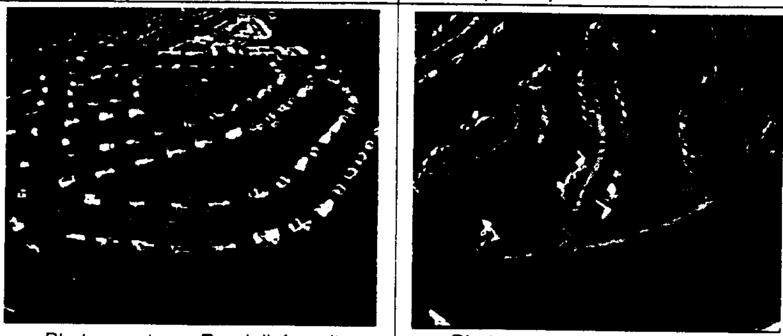

Photo courtesy: Randall Arendt | Photo courtesy: Randall Arendt

Figure 6: Examples of Conventional and Open Space Site Designs
Many conventional developments are designed using a cookie-cutter approach. Open space site designs preserve more of the existing vegetation and reduce the amount of land that is cleared and graded for individual lots.

Long Front Setback | Reduced Front Setback

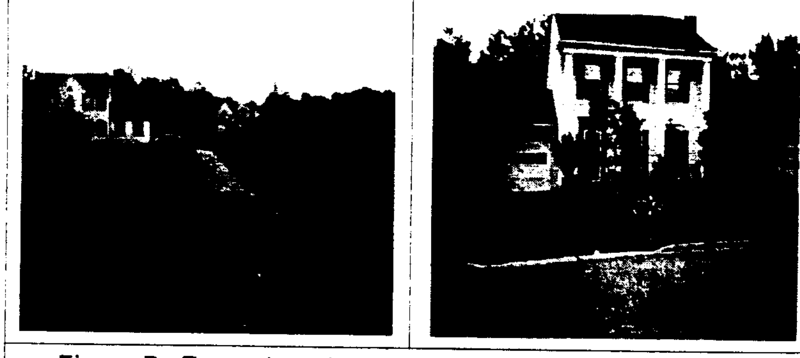

Figure 7: Examples of Long and Reduced Front Setbacks
Smaller front setbacks can reduce site impervious cover, but many current subdivision codes have strict requirements that govern setbacks.

Although open space subdivisions (also known as cluster design) have been advocated by planners for many years, they are often prohibited or severely restricted by local zoning regulations. In 95% of communities surveyed by Heraty (1992), clustering is a voluntary, rather than a mandatory, development option. In addition, open space subdivisions often require a special exception or zoning variance (i.e. they are not a by-right form of development) which requires more review time. Consequently, open space designs are not always widely exercised by developers.

Relax side yard setbacks and allow narrower frontages to reduce total road length in the community and overall site imperviousness. Relax front setback requirements to minimize driveway lengths and reduce overall lot imperviousness.

Many current subdivision codes have very strict requirements that govern lot geometry, including setbacks and lot shape. These criteria constrain site planners from designing open space or cluster developments that can reduce impervious cover. Smaller front and side setbacks, often essential for open space designs, are typically not allowed or require a zoning variance that may be difficult to obtain.

Relaxing setback requirements allows developers to create attractive, compact lots that are marketable and livable (see Figure 7). For example, side yard setbacks can be as close as five feet from detached housing without specific fire protection measures. Often, fears about fire safety, noise, parking capacity and sight distance impairment are cited as impediments to shorter setbacks, but the reality is that these concerns can be overcome with careful design.

Promote more flexible design standards for residential subdivision sidewalks. Where practical, consider locating sidewalks on only one side of the street and providing common walkways linking pedestrian areas.

Most subdivision codes require sidewalks on both sides of residential streets, constructed of impervious concrete or asphalt, 4-6 feet wide, and 2-10 feet from the street. While these codes are intended to promote pedestrian safety, sidewalks should not be designed so rigidly. Instead, the general goal should be to improve pedestrian movement by diverting it away from street traffic. Often, a sidewalk on one side of the street is sufficient. In fact, in a study of pedestrian accidents associated with sidewalks, there was a negligible difference in accident rates when sidewalks were reported on just one side of the street versus sidewalks on both sides of the street (NHI, 1996).

Communities should also consider reducing the sidewalk width of sidewalks to 3-4 feet and placing them further from the street. Sidewalk design should emphasize the connections between neighborhoods, schools, and shops, instead of merely following the road layout (Figure 8). In addition, sidewalks should be graded to drain to front yards rather than the street. These alternatives reduce impervious cover and provide practical, safe, and attractive travel paths.

Reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together.

Most local subdivision codes are not very explicit as to how driveways should be designed. Most simply require a standard apron to connect the street to the driveway but do not specify width or surface material for driveways. Typical residential driveways are 12 feet wide for one car driveways and 20 feet wide for two. Shared driveways are discouraged or prohibited by many communities.

Shared driveways can reduce impervious cover, and can work when maintenance agreements and easements can be enforced. By specifying narrower driveways, promoting permeable paving materials, and allowing two-track driveways or gravel and grass surfaces, communities can sharply reduce the typical 400 to 800 square feet of impervious cover created by each driveway (see Figure 9).

Clearly specify how community open space will be managed and designate a sustainable legal entity responsible for managing both natural and recreational open space.

Open space subdivisions encourage the preservation of common areas that must be effectively managed. Surveys of local open space regulations, however, revealed that open space was poorly defined in most communities (Heraty, 1992). Less than a third required that open space be consolidated. Only 10% required that a portion of open space be maintained as natural cover, and few specified which uses were allowed or excluded in the open space areas. Some communities are wary of open space because they feel that community associations may lack financial, legal, or technical resources to effectively maintain their common areas.

In reality, open space maintained in a natural condition costs up to five times less to maintain than lawns. Communities should explore more reliable methods to assure that responsibility is taken for open space management. Effective methods include creating a community association, or shifting responsibility to a land trust or park through a conservation easement.

Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas and avoid routing rooftop runoff to the roadway and the stormwater conveyance system.

Often, local codes discourage the storage and treatment of rooftop runoff on individual lots, thus bypassing opportunities to promote filtering or infiltration in the front or back yard. Most subdivision codes require that yards have a minimum slope to ensure drainage away from homes. The slope helps move runoff away from the home to prevent nuisance ponding, basement flooding, or ice formation on driveways or sidewalks. However, these concerns are only significant within 10 or 15 feet from the home foundation.

Sending rooftop runoff over a pervious surface before it reaches an impervious one can decrease the annual runoff volume from residential development sites by as much as 50%. Techniques to treat rooftop runoff in the yard include directing flow into small bioretention areas that encourage sheet flow across vegetated areas (see Figure 10) or infiltrate runoff in trenches, dry wells, or french drains.

Conservation of Natural Areas

Conservation of natural areas is integral to better site design, and the last six techniques deal with conserving and managing natural areas at the development site. These techniques include stream buffers, clearing and grading, tree conservation and stormwater treatment. To fully utilize these techniques, communities may need to offer developers both flexibility and incentives.

Create a variable width, naturally vegetated buffer system along all perennial streams that also encompasses critical environmental features such as the 100-year floodplain, steep slopes and freshwater wetlands.

This technique establishes a three-zone buffer system to protect streams, shorelines and wetlands at the development site (Figure 11). These three zones

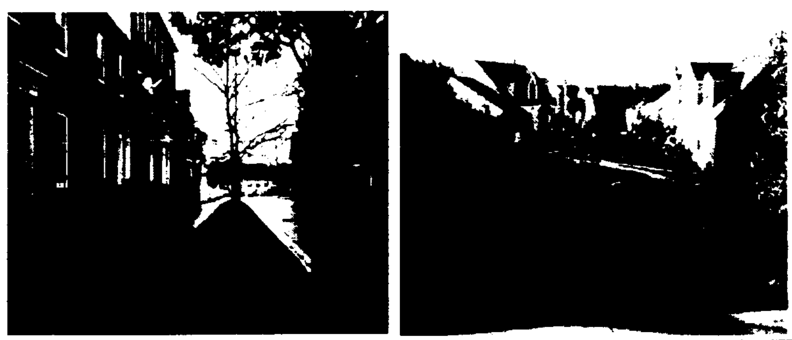

Figure 8: Using Flexible Design Standards for Sidewalks
Creating sensible pathways can produce safe, pedestrian friendly communities.

Figure 9: Examples of Different Types of Shared Driveways
Shared driveways can help reduce the amount of impervious cover created for parking.

R0073059

Figure 10: Alternative Runoff Management
Two alternatives for managing rooftop runoff are bioretention areas and rain barrels.

Shoreline Buffer	A Forested Buffer

Figure 11: Development vs. Buffer
A buffer is more than a setback from the stream or shoreline. Native vegetation cover should be retained within part of the buffer to protect the water quality, treat stormwater, and enhance natural beauty.

are distinguished by the types of allowable uses unique to each zone. In addition, the buffer should incorporate the 100-year floodplain, steep slopes, and freshwater wetlands to fully protect the water quality of streams, help treat stormwater, and enhance the quality of life for residents (Schueler, 1995).

Buffers are noted for their economic benefits as well, including include increased property values, reduced flood damages, and sediment removal costs savings. A model stream buffer ordinance and regional samples can be downloaded from our website at www.cwp.org.

The riparian stream buffer should be preserved or restored with native vegetation. The buffer system should be maintained through the plan review delineation, construction, and post-development stages.

While establishing a buffer is paramount to better site design, assuring that the forest buffer is safeguarded from clear cutting is just as essential. Many communities have stream buffer ordinances, but a line drawn on a map is virtually invisible to contractors and landowners. Few communities require that buffer lines be marked. A strong buffer ordinance should outline the legal rights and responsibilities for management and maintenance during construction and for the long term. An effective buffer program should also indicate who is responsible for these issues and address measures to reestablish buffers using native vegetation. Figure 12 illustrates two techniques for preserving and maintaining natural areas and buffers.

Clearing and grading of forests and native vegetation at a site should be limited to the minimum amount needed to build lots, allow access, and provide fire protection. A fixed portion of any community open space should be managed as protected green space in a consolidated manner.

Most communities allow the entire development site to be cleared and graded, with a few exceptions in specially regulated areas such as jurisdictional wetlands, steep slopes, and floodplains. Since areas that are conserved in their natural state retain their natural hydrology and are not exposed to erosion during construction, it is desirable to conserve as much original soil at the site as possible. Clearing should be limited to the minimum area required for building footprints, construction access, and safety setbacks. Existing tools that could be adapted to limit clearing include erosion and sediment control ordinances, grading ordinances, forest conservation or tree protection ordinances, and open space development. One study has shown that providing grassed lots can add $750 to the value of a lot as compared to bare lots (Harbor and Herzog, 1999). For more information on clearing and grading, see Technical Notes 80, 81, 107 and 108.

Conserve trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and conserving native vegetation. Wherever practical, incorporate trees into community open space, street rights-of-way, parking lot islands, and other landscaped areas.

Few communities require that a percentage of trees and native vegetation be conserved during the development process. In fact, many communities promote the use of lawns instead of native vegetation. However, native trees, shrubs, and grasses contribute to the quality of the environment, create a sense of place, and increase property values. Tools that can be used for tree conservation include adopting forest conservation ordinances, encouraging open space design, planting street trees in the rights-of-way,

R0073060

adopting clearing and grading restrictions to preserve trees and native vegetation, and adding landscaping requirements for parking lots.

Incentives and flexibility should be encouraged to promote conservation of stream buffers, forests, meadows, and other areas of environmental value. In addition, off-site mitigation should be encouraged where it is consistent with locally adopted watershed plans.

A small number of communities require conservation of non-regulated areas such as stream buffers, forests, and meadows. Even fewer provide meaningful incentives for developers to conserve more natural areas than they are required to. To combat this problem, communities may want to offer increased flexibility and incentives to reward developers for conserving natural areas.

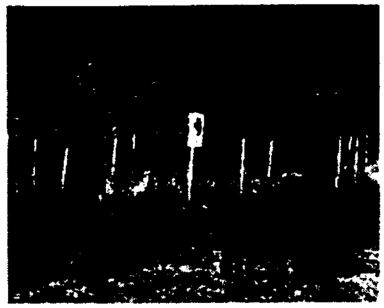
Methods to encourage conservation include by-right open space development, buffer flexibility, property tax credits, density bonuses, transferrable development rights, and providing credits for reduced stormwater management requirements. Stormwater credits exist for natural area conservation, disconnecting rooftop runoff, and routing sheetflow to buffers (MDE, 2000).

New stormwater outfalls should not discharge unmanaged stormwater into jurisdictional wetlands, sole-source aquifers, or sensitive areas.

Stormwater runoff generated from impervious cover can represent a significant threat to the quality of wetlands, surface water and groundwater. While many communities are beginning to require stormwater quality practices, they are often poorly matched to site conditions and watershed objectives.

Stormwater practices can be designed to be effective, attractive and relatively easy to maintain. A well-designed stormwater practice should add value to a community while meeting stormwater management objectives. For new criteria on the design of stormwater practices, refer to the Maryland Stormwater Manual available online: http://www.mde.state.md.us/ environment/wma/

Buffer Reforestation



Tree Conservation Area

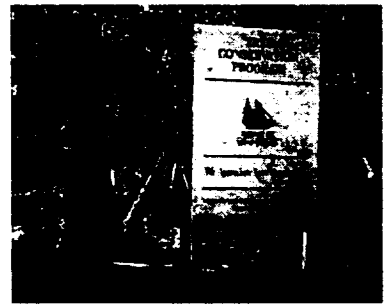


Figure 12: Two Techniques for Natural Areas and Buffers
Buffer reforestation and tree conservation are two important techniques for maintaining natural areas, including buffers. Buffer lines should be clearly marked to protect from clearing and grading both during and after construction.

Summary

For many communities, implementing better site design may require that development rules be changed, and this process is not an easy one. Advocates of better site design are likely to have to answer some difficult questions from fire chiefs, lawyers, traffic engineers, developers, and many others in the community. Will a proposed change make it more difficult to park? Lengthen response times for emergency vehicles? Increase risks to community residents and children? Progress toward better site design will require more local governments to examine their current practices in the context of a broad range of concerns, such as how the changes will affect development costs, local liability, property values, public safety, and a host of other factors.

Subsequent articles in this special issue of *Techniques* supply more background on the benefits of better site design and how it can be implemented in your community. In the next article, *The Benefits of Better Site Design in Residential Subdivisions*, we document how open space subdivisions can reduce runoff, pollutant export and development costs when compared to conventional subdivisions. The third article, *The Benefits of Better Site Design at Commercial Developments*, examines strategies to shrink the parking lots that comprise more than half of the area of new commercial developments and help mitigate the harmful impact parking lots have on the environment. The last article, *Changing Development Rules in Your Community*, describes a process for making better site design happen in your community. Finally, our *Resources* section profiles more than a dozen useful better site design references.

Better site design has considerable potential to reduce the environmental impacts of new development sites, and when adapted properly, of redevelopment sites as well. Better site design is a particularly useful strategy in watersheds where future development is projected to approach or slightly exceed impervious cover thresholds. It should be kept in mind, however, that better site design alone cannot adequately protect most watersheds. It must be combined and integrated with other watershed protection tools, such as watershed planning, land conservation, erosion and sediment control and the rest. These caveats notwithstanding, better site design is the one of the few watershed protection tools that simultaneously provides dividends for watershed advocates, developers and the community as a whole. Consequently, communities are encouraged to invest in the local site planning roundtable process that can make it happen. *–HYK*

Better site design alone cannot adequately protect most watersheds.

Editor's Note: We are currently working on techniques for infill and redevelopment. Beginning later this year, we will begin a national roundtable consensus process focusing on topics, challenges, and concerns. Refer to our website (www.cwp.org) for updates on this project.

Better Site Design

II. The Benefits of Better Site Design in Residential Subdivisions

Though they may not realize it, site planners have an excellent opportunity to reduce storm water runoff and pollutant export simply by changing the way they lay out new residential subdivisions. Planners that employ open space design techniques can collectively reduce the amount of impervious cover, increase the amount of natural land conserved, and improve the performance of stormwater treatment practices at new residential developments.

Simply put, open space designs concentrate density on one portion of a site in order to conserve open space elsewhere by relaxing lot sizes, frontages, road sections, and other subdivision geometry. While site designs that employ these techniques go by many different names, such as clustering or conservation design, they all incorporate some or all of the following better site design techniques:

- Using narrower, shorter streets and rights-of-way
- Applying smaller lots and setbacks and narrow frontages to preserve significant open space
- Reducing the amount of site area devoted to residential lawns
- Spreading stormwater runoff over pervious surfaces
- Using open channels rather than curb and gutter
- Protecting stream buffers
- Enhancing the performance of septic systems, when applicable

In this article, we examine some of the benefits of employing better site design techniques as they apply to residential subdivisions. The analysis utilizes a simple spreadsheet computer model to compare actual residential sites constructed in the 1990s using conventional design techniques with the same sites "redesigned" utilizing better site design techniques. For each development scenario, site characteristics such as total impervious and vegetative cover, infrastructure quantities, and type of stormwater management practice are estimated.

The Simplified Urban Nutrient Output Model (SUNOM) was used to perform a comparative analysis for two subdivisions that span a wide range of residential density (see box on page 645). The first is a large-lot subdivision known as Duck Crossing, and the second is a medium-density subdivision known as Stonehill Estates. In each case, the model was used to simulate five different development scenarios:

- Pre-developed conditions
- Conventional design without stormwater practices
- Conventional design with stormwater practices
- Open space design without stormwater practices
- Open space design with stormwater practices

Open space design concentrates density on one portion of a site in order to conserve open space elsewhere.

This article compares the hydrology, nutrient export, and development cost for these sites under both conventional and open space design, and with and without stormwater treatment. The article also summarizes other research on the benefits of open space design and discusses the implications it can have for the watershed manager.

R0073063

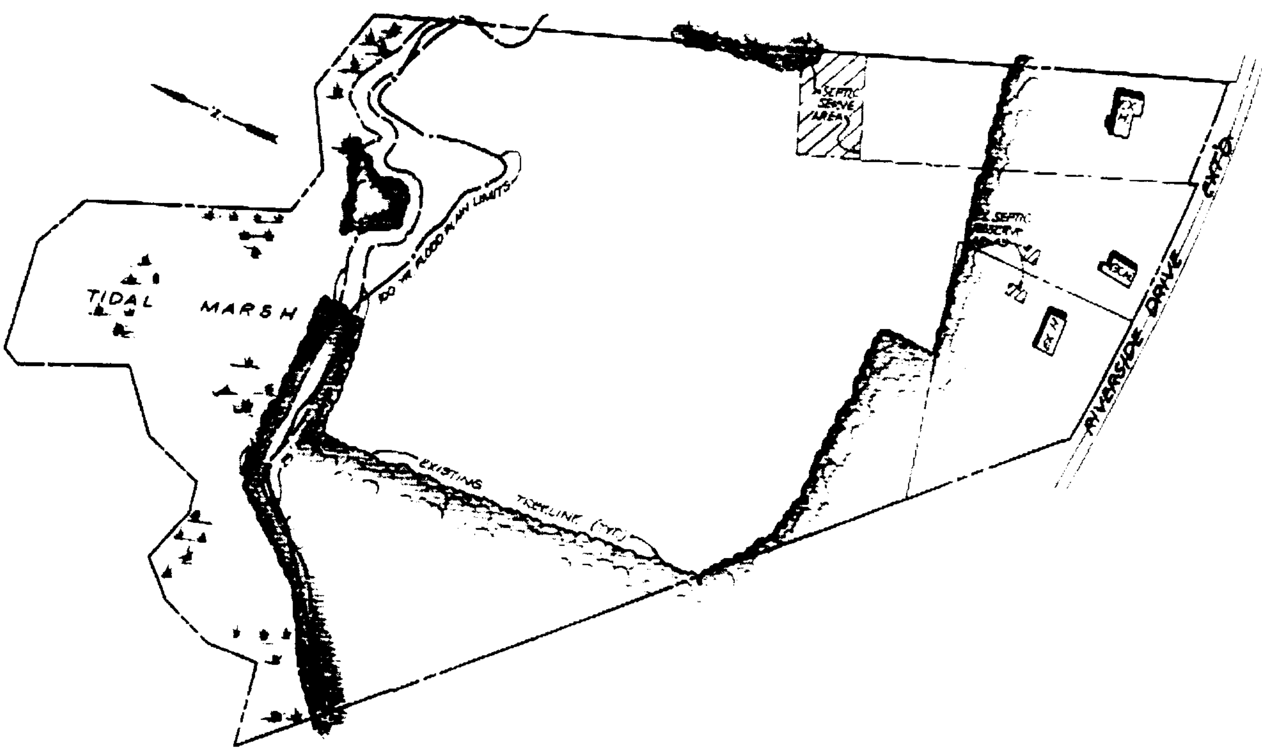

Figure 1: Predevelopment Conditions at the Duck Crossing Site

Duck Crossing - A Low-Density Residential Subdivision

Duck Crossing is a large-lot residential development located in Wicomico County on Maryland's Eastern Shore. Prior to development, the low gradient coastal plain site contained a mix of tidal and non-tidal wetlands, natural forest, and meadow (Figure 1). Its sandy soils were highly permeable (hydrologic soil group A). Three existing homes were located on the parcel, which relied on septic systems for on-site sewage disposal. The existing septic systems discharged a considerable nutrient load to shallow groundwater.

A conventional large-lot subdivision of eight single family homes was constructed on the 24-acre site in the early 1990s. The subdivision is reasonably typical of rural residential development along the Chesapeake Bay waterfront during this era (Figure 2). Each new lot ranged from three to five acres in size, and was set back several hundred feet from an access road. The access road was 30 feet wide and terminated in a large diameter cul-de-sac. Sidewalks were located on both sides of the street. Each lot was served by a conventional septic system with a primary and reserve field of about 10,000 square feet. Stormwater management consisted of curb and gutters that conveyed runoff into a storm drain system that, in turn, discharged to a small dry pond (designed for the water quality volume, only).

The entire site was privately owned, with the exception of the tidal marsh, which was protected under state and federal wetland laws and represented the only common open space on the site. As a result of construction, the existing meadow was entirely converted to lawn, and the impervious cover for the site increased to slightly over 8%.

Open Space Design for Duck Crossing

The critical ingredient of the open space redesign was a reduction in lot size from several acres to about 30,000 square feet. This enabled about 74% of the site to be protected and managed as common open space, which included most of the existing forest, wetlands and meadow (Figure 3). Consequently, only 19% of the site was managed as turf, nearly all of which was located on the private lots.

The open space redesign at Duck Crossing also incorporated a narrower access road (20 feet wide) along with shorter, shared driveways that served six of the eight lots. The road turnaround was designed as a loop rather than a cul-de-sac bulb. Also, a wood chip trail system was provided through the open space

R0073064

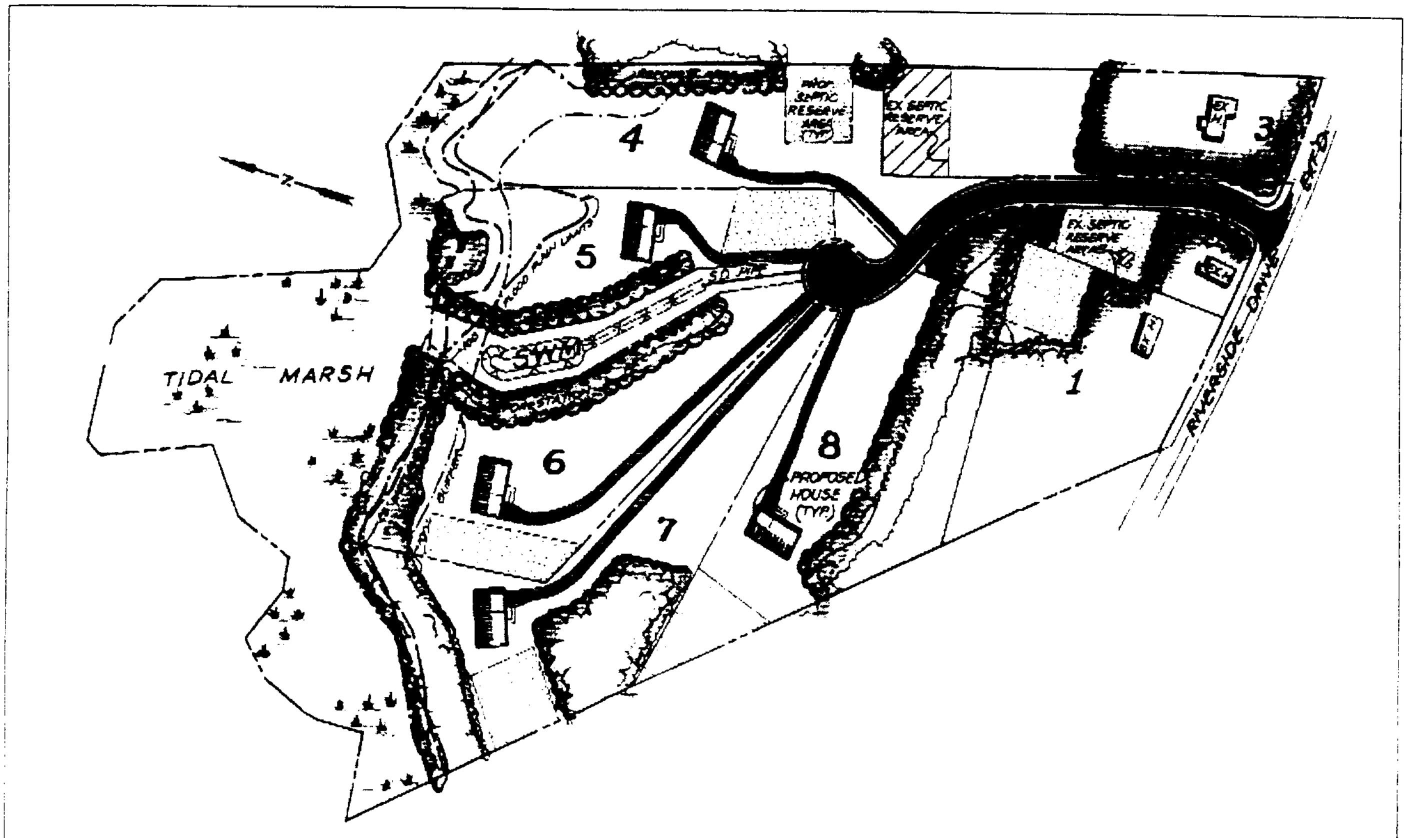

Figure 2: The Low-Density Conventional Subdivision Built at Duck Crossing (eight lots)

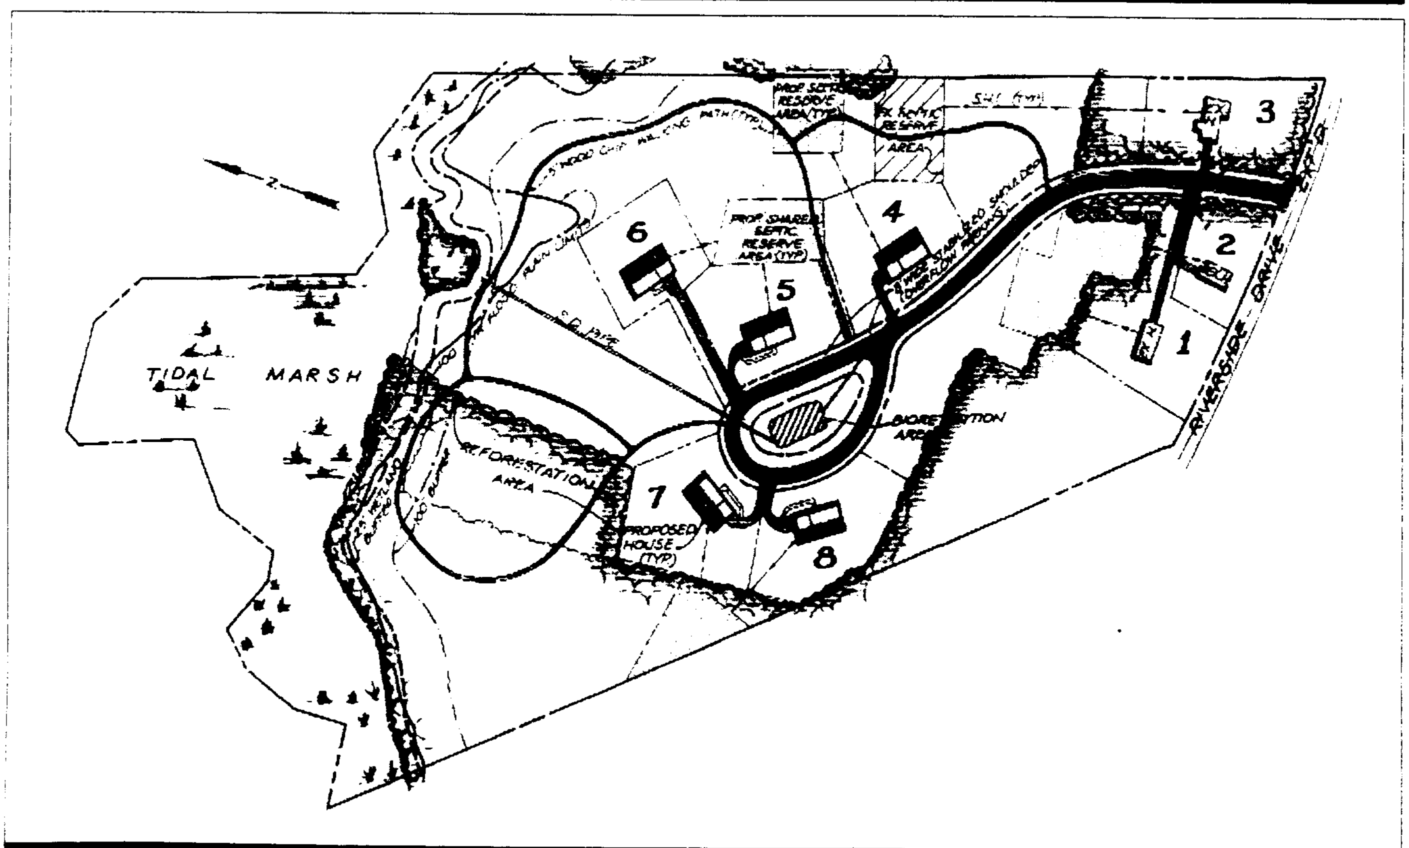

Figure 3: The Open Space Subdivision That Could Have Been Built at Duck Crossing (eight lots)

R0073065

instead of sidewalks along the road. Each home site was carefully located away from sensitive natural areas and the 100-year flood plain. Taken together, these better site design techniques reduced impervious cover for the site by about a third compared to the conventional design (from 8% to 5%).

The redesigned stormwater conveyance system utilized dry swales rather than a curb and gutter system, and featured the use of bioretention areas in the roadway loop to treat stormwater quality. This combination of stormwater practices provided greater pollutant removal through filtration and infiltration.

One of the most important objectives in the redesign strategy was to improve the location and performance of the septic systems that dispose of wastewater at the site. Home sites were oriented to be near soils that were most suitable for septic system treatment. In addition, six homes shared three common septic fields located within open space rather than on individual private lots. Lastly, given the permeability of the soils, advanced re-circulating sand filters were installed to provide better nutrient removal than could be achieved by conventional septic systems.

Comparative Hydrology for Duck Crossing

Given its low impervious cover and permeable soils, the water balance at Duck Crossing was dominated by infiltration, even after development. The comparative hydrology under the five development scenarios is presented in Table 1. As might be expected, the conventional design yielded the greatest volume of surface runoff and the least amount of infiltration. The open space design produced about 25% less annual surface runoff and 12% more infiltration than the conventional design, but did not come close to replicating pre-development conditions. The use of stormwater practices did not materially change the water balance under either the conventional or open space design at Duck Crossing (see Table 1).

The open space design sharply reduced nutrient export.

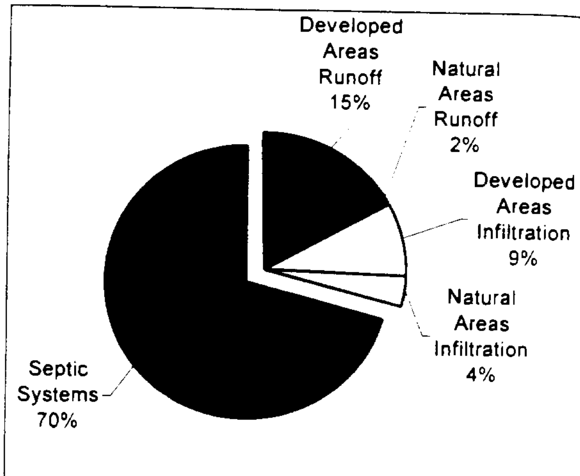

Figure 4: Nitrogen Load Distribution From the Conventional Design of Duck Crossing, Without Stormwater Practices

Comparative Nutrient Output at Duck Crossing

Nutrient export at Duck Crossing was dominated more by subsurface water movement than by surface runoff. Indeed, stormwater runoff seldom comprised more than 15% of the annual nitrogen or phosphorus load from this lightly developed site. The SUNOM model indicated that the major source of nutrients was subsurface discharges from septic systems, which typically accounted for 60 to 80% of the total load in every development scenario (see Figure 4).

The open space design sharply reduced nutrient export, primarily because re-circulating sand filters were used in the shared septic systems and helped to reduce (but not eliminate) subsurface nutrient discharge. The other elements of the open space design (reduced impervious cover, reduced lawn cover, and multiple stormwater practices) also helped to reduce nutrient export, but by a much smaller amount. The comparative nutrient export from each Duck Crossing development scenario is detailed in Figure 5.

R0073066

Table 1: Annual Water Budget of Duck Crossing

		Pre-Developed	Conventional Design	Open Space Design
Runoff (inches/year)	no practice	2.3	4.8	3.9
	practices	--	4.8	3.7
Infiltration (inches/year)	no practice	18.2	15.3	17.0
	practices	--	15.3	17.2

Comparative Cost of Development

The cost to build infrastructure for the open space design was estimated to be 25% less than the conventional design at Duck Crossing, due primarily to the necessity for less road paving, sidewalks, and curbs and gutters. Even when higher costs were factored in for the more sophisticated stormwater and on-site wastewater treatment used in the open space design, the total cost was still 12% lower than the conventional design. In addition, the open space design had seven fewer acres that needed to be cleared and graded, or served by erosion and sediment controls, compared to the conventional design (these costs are not currently evaluated by the SUNOM model). Overall, the SUNOM model estimated that the conventional design at Duck Crossing had a total infrastructure cost of $143,600, compared to $126,400 for the open space design.

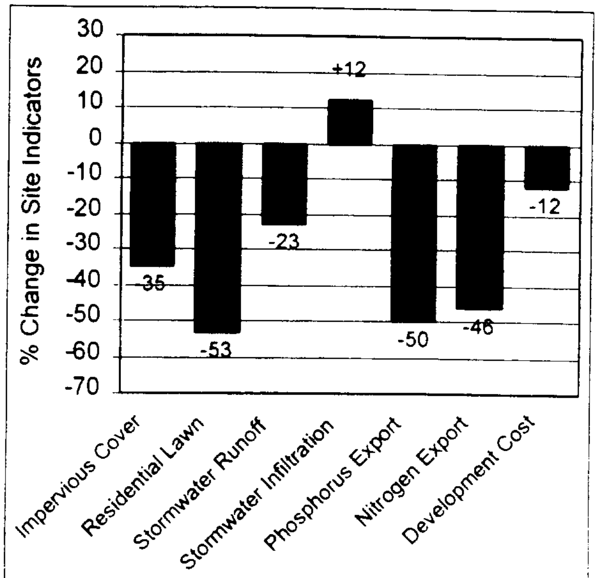

Figure 6: Percentage Change in Key Site Conditions From a Conventional Design to an Open Space Design, Both With Stormwater Practices

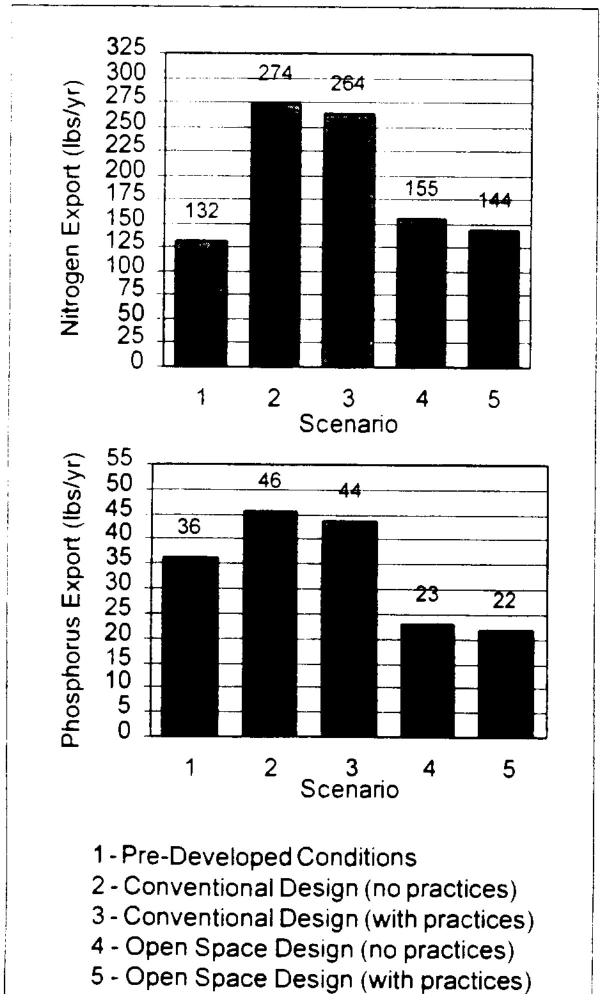

Figure 5: Annual Nitrogen and Phosphorus Loads for Each Development Scenario at Duck Crossing

Summary

The comparative results for the Duck Crossing redesign analysis are summarized in Figure 6. The open space design increased natural area conservation and reduced impervious cover, stormwater runoff, nutrient export, and development costs compared to the conventional subdivision design.

R0073067

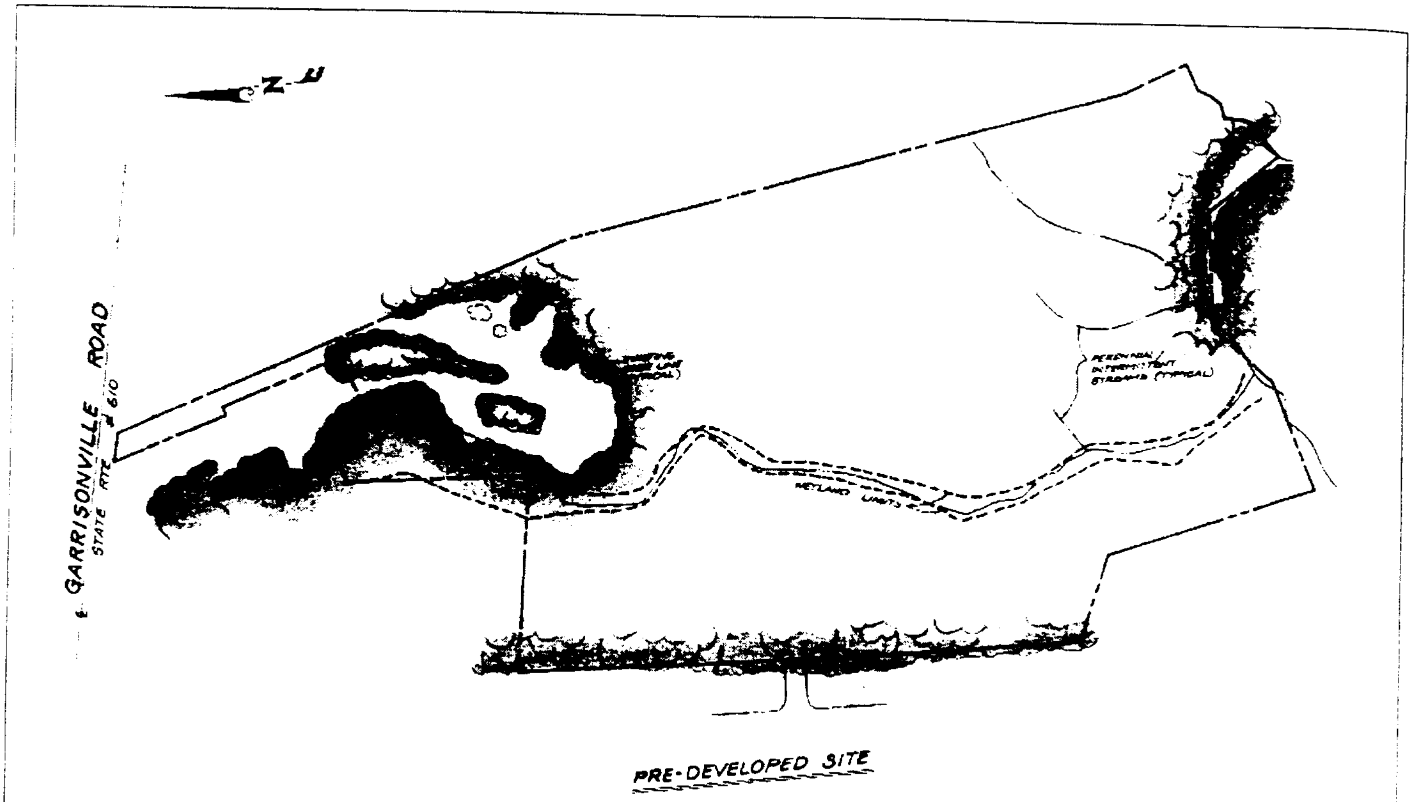

Figure 7: Predevelopment Conditions at the Stonehill Estates Site

Stonehill Estates - A Medium-Density Residential Subdivision

Stonehill Estates, located near Fredericksburg, Virginia, is situated in the rolling terrain of the Piedmont. The undeveloped parcel was 45 acres in size, nearly all of which was mature hardwood forest (Figure 7). An intermittent stream bisected the site, discharging into a perennial stream near the southern edge of the parcel. Roughly 3.6 acres of forested wetlands were found along the stream corridors, and an extensive floodplain was located along the perennial stream. Soils at the site were primarily silt loams and were moderately permeable (hydrologic soil groups C and D).

The site was highly attractive for development, given the excellent access provided by two existing roads, both of which had public water and sewer lines that could be easily tapped to serve the new subdivision. The conventional design was zoned for three dwelling units per acre. After unbuildable lands were excluded, the parcel yielded a total of 108 house lots, each of which was about 9,000 square feet in size (Figure 8). The subdivision design typifies medium-density residential subdivisions developed in the last two decades in the Mid-Atlantic region, where lots sizes were uniform in size and shape and homes were set back a generous and fixed distance from the street. The design utilized a mix of wide and moderate street sections (34 feet and 26 feet), and included six large diameter cul-de-sacs for turn-arounds. Sidewalks were generally installed on both sides of the street.

The stormwater management system for the conventional design represents the typical "pipe and pond" approach utilized in many medium-density residential subdivisions. Street runoff was conveyed by curbs and gutters into a storm drain system that discharged into the intermittent stream channel, and then traveled downstream to a dry extended detention pond. The pond was primarily designed to control flooding, but also provided some limited removal of stormwater pollutants.

Interestingly, about 25% of the site was reserved as open space in the conventional design at Stonehill Estates. Nearly all of these lands were unbuildable because of environmental and site constraints (e.g., floodplains, steep slopes, wetlands, and stormwater facilities), and the resulting open space was highly fragmented. Even so, about a fourth of the forested wetlands were impacted by two roads crossing over the intermittent stream. Almost 90% of the original forest cover was cleared as a result of the conventional design, and was replaced by lawns and impervious cover. Overall, about 60% of the site was converted to lawns, and another 27% was converted to impervious cover.

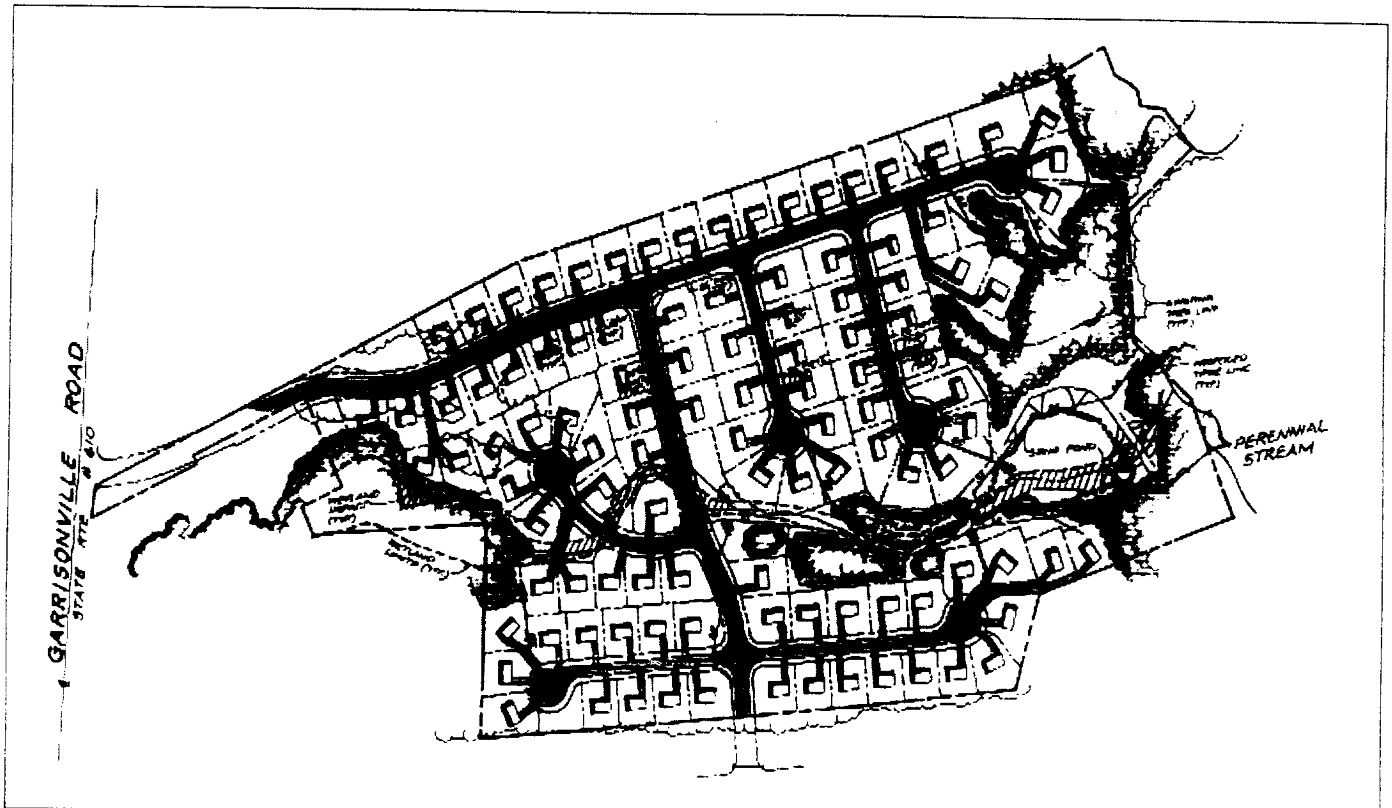

Figure 8: The Conventional Subdivision Design That Was Built at Stonehill Estates (108 lots)

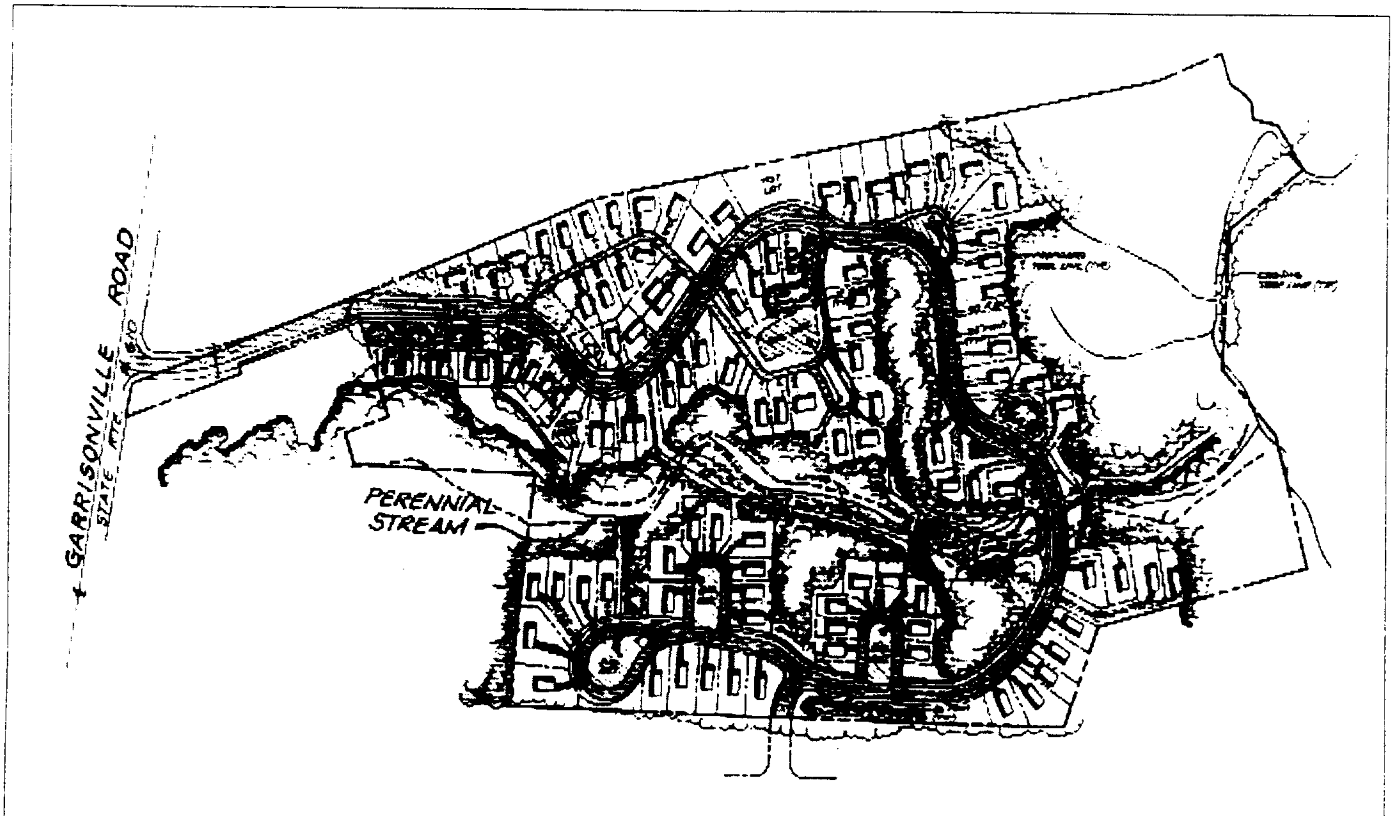

Figure 9: The Open Space Subdivision That Could Have Been Built at Stonehill Estates (108 lots)

Open Space Design for Stonehill Estates

In the redesign analysis, Stonehill Estates was designed to incorporate many of the open space design techniques advocated by Arendt (1994). The resulting design retained the same number of lots as the conventional design, but had a much different layout (Figure 9). The average lot size declined from about 9,000 square feet in the conventional design to 6,300 square feet in the open space design. This reduced lot size allowed about 44% of the site to be protected as open space, most of which was managed as a single unit that included an extensive natural buffer along the perennial and intermittent stream corridor.

The basic open space layout was augmented by several other better site design practices, including narrower streets, shorter driveways, and fewer sidewalks. Loop roads were used as an alternative to cul-de-sacs. In some portions of the site, irregularly shaped lots and shared driveways were used to reduce overall road length. Each individual lot was located adjacent to open space, so that the more compact open space lots would not feel as crowded. As a result of these techniques, the open space design for Stonehill Estates reduced impervious cover from 27% to 20%. In addition, lawn cover declined from 60% to 30% of the total site area.

The innovative stormwater collection system utilized dry swales rather than storm drains in gently sloping portions of the site. The dry swales and several bioretention areas located in loop turnarounds were used to initially treat stormwater quality. Each of these practices then discharged to a small micro-pool detention pond, whose embankment was created by the single road crossing over the intermittent stream.

Comparative Hydrology

Prior to its development, the highly wooded site produced very little surface runoff, but because of relatively tight soils, generated only a modest amount of infiltration. However, after the site was converted into the conventional subdivision, surface runoff increased by a factor of five, and infiltration was reduced by about 40% (Table 2). In contrast, the open space design worked to reduce stormwater runoff and increase stormwater infiltration compared to the conventional design, although it did not come close to replicating the original hydrology of the forested site (Table 2).

Comparative Nutrient Output

As might be expected, the conversion of the forest into a conventional subdivision greatly increased nutrient export from the site; the model indicated that annual phosphorus and nitrogen export would increase by a factor of seven and nine, respectively, after development (see Figure 10). Unlike Duck Crossing, nutrient export at Stonehill Estates was dominated by stormwater runoff after development. The SUNOM model indicated that stormwater runoff contributed about 94% of the annual nutrient export from the site,

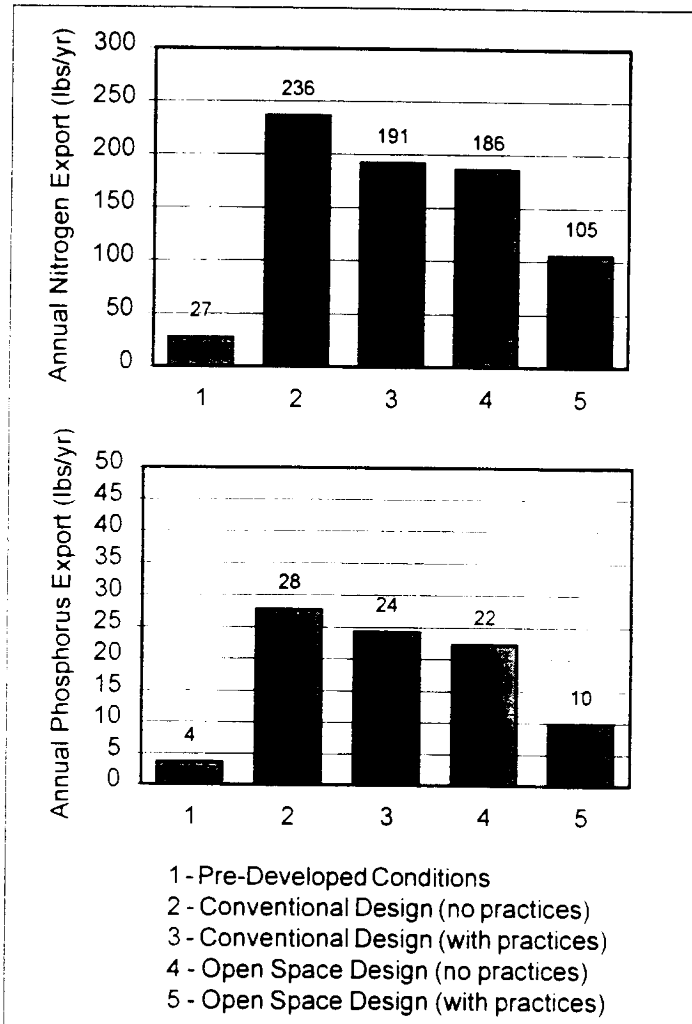

Figure 10: Annual Nitrogen and Phosphorus Loads for Each Stonehill Estates Development Scenario

Table 2: Comparative Hydrology of Stonehill Estates

		Pre-Developed	Conventional Design	Open Space Design
Runoff (inches/year)	no practice	2.1	10.6	8.8
	practices	n/a	10.6	8.0
Infiltration (inches/year)	no practice	4.9	3.1	4.0
	practices	n/a	3.1	4.8

Table 3: Redesign Analyses Comparing Impervious Cover and Stormwater Runoff from Conventional and Open Space Subdivisions					
Residential Subdivision	Original Zoning for Subdivision	Impervious Cover at the Site			Reduction in Stormwater Runoff (%)
		Conventional Design	Open Space Design	Net Change	
Remlik Hall [1]	5 acre lots	5.4 %	3.7%	- 31%	20%
Tharpe Knoll [2]	1 acre lots	13%	7%	- 46%	44%
Chapel Run [2]	½ acre lots	29%	17%	- 41%	31%
Pleasant Hill [2]	½ acre lots	26%	11%	- 58%	54%
Prairie Crossing [3]	½ to 1/3 acre lots	20%	18%	- 20%	66%
Buckingham Greene [2]	1/8 acre lots	23%	21%	- 7%	8%
Belle-Hall [4]	High Density	35%	20%	- 43%	31%

Sources: [1] Maurer, 1996; [2] DE DNREC, 1997; [3] Dreher, 1994; and [4] SCCCL, 1995.

with subsurface water movement adding only 6% to the total export. Nutrient loads were not greatly reduced by the dry extended detention pond installed at the conventional subdivision; the model indicated that nutrient export from the conventional design would still be six to seven times greater than the predevelopment condition even with this stormwater treatment practice.

In contrast, the open space design resulted in greater nutrient reduction (Figure 10). For example, the open space design scenario *without* stormwater practices produced a lower nutrient load than the conventional design scenario *with* stormwater practices. This was primarily due to lower impervious cover associated with the open space design. When the open space design was combined with more sophisticated stormwater practices (i.e., bioretention, dry swales and wet ponds), nutrient export was half that of the conventional design. It is interesting to note, however, that even when the most innovative site design and stormwater techniques were applied to the site, nutrient export was still three to four times greater than that produced by the forest prior to development.

Infrastructure Costs

The total cost to build infrastructure at Stonehill Estates was about 20% less for the open space design than for the conventional design. Considerable savings were realized in the form of less road paving and shorter lengths of sidewalks, water and sewer lines and curbs and gutters. The cost difference between the open space and conventional designs would have been greater were it not for the fact that higher costs were incurred for the more sophisticated stormwater practices used in the open space design. It was estimated that the infrastructure cost for the conventional design was $1.54 million, compared to $1.24 million for the open space design.

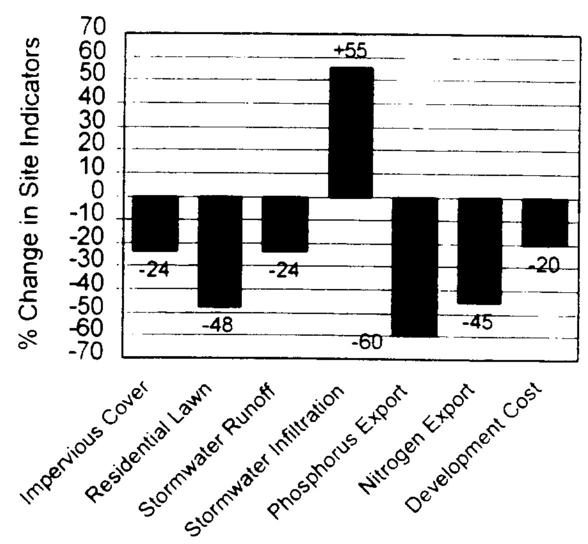

Figure 11: Change in Site From a Conventional Design to an Open Space Design, Both With Stormwater Practices

Table 4: Projected Construction Cost Savings for Open Space Designs from Redesign Analyses		
Residential Development	Construction Savings	Notes
Remlik Hall[1]	52%	Includes costs for engineering, road construction, and obtaining water and sewer permits
Tharpe Knoll [2]	56%	Includes roads and stormwater management
Chapel Run [2]	64%	Includes roads, stormwater management and reforestation
Pleasant Hill [2]	43%	Includes roads, stormwater management, and reforestation
Buckingham Greene [2]	63%	Includes roads and stormwater management

Summary

The comparative results for the Stonehill Estates redesign analysis are summarized in Figure 11. The open space design reduced impervious cover, natural area conversion, stormwater runoff, nutrient export and development costs compared to the conventional subdivision design.

Other Redesign Research

Several other researchers have employed redesign comparisons to demonstrate the benefits of open space subdivisions, over a wide range of base lot sizes. The results are shown in Table 3. It should be recognized that each study used slightly different models and assumptions, and as such, strict comparisons should be avoided. The redesign comparisons clearly show that open space designs can sharply reduce impervious cover and storm water runoff while accommodating the same number of dwelling units, at least to base lot sizes of an eighth of an acre. The reductions in impervious cover and runoff range from 7 to 65%. The ability of open space design to reduce impervious cover starts to diminish for residential zones that exceed densities of four dwelling units per acre.

Other studies reinforce the conclusion that open space designs are less expensive to build than conventional subdivisions.

These studies reinforce the conclusion that open space designs are usually less expensive to build than conventional subdivisions. The projected construction cost savings associated with open space designs ranged from 40 to 66% (Table 4). Most of the cost savings were due to reduced need for road building and stormwater conveyance. In another study, Liptan and Brown (1996) reported that open space design produced infrastructure construction costs savings of $800 per home in a California subdivision.

Numerous economic studies have shown that well-designed and marketed open space designs are very desirable to home buyers and very profitable for developers. Strong evidence indicates that open space subdivisions sell faster, produce better cashflow, yield a higher return on investment and appreciate faster than their traditional counterparts (Arendt *et al.*, 1994, Ewing, 1996, NAHB, 1997, ULI, 1988. CWP, 1998a, and Porter, 1988). While open space designs are often perceived as applying only to upscale and affluent consumers, several successful open space subdivisions have been built for moderate to lower income buyers. Both ULI (1988) and Ewing (1996) report that open space designs can be an effective tool to promote affordable housing within local communities.

The relatively high demand for open space designs reflects two important economic trends. The first trend is that the tastes and preferences of many new home buyers are gradually changing. Recent market surveys indicate that home buyers increasingly desire natural areas, smaller lawns, better pedestrian access, wildlife habitat and open space in the communities they choose to live in. The second trend is that open space developments that can provide these amenities seldom comprise more than 5% of the new housing offered in most communities. Consequently, there appears to be a large and relatively untapped potential demand for more open space developments. Other compelling benefits of open space design are detailed in CWP (1998a) and Schueler (1995).

R0073072

Table 5: Sample Evaluation Criteria for the Quantity and Quality of Open Space Development (Adapted from Conservation Fund, 1999)

Points Achieved by the Development	Percent of Open Space Achieved for Different Residential Zones				
	More than 4 units per acre	From 2 to 4 units per acre	From 1 to 2 units per acre	From 0.5 to 1 unit per acre	less than ½ unit per acre
-2	0 to 9%	less than 15%	15 to 24%	25 to 34%	less than 40%
-1	10 to 14%	15 to 24%	25 to 34%	35 to 49%	less than 50%
0	15 to 24%	25 to 34%	35 to 49%	50 to 59%	less than 60%
+1	25 to 30%	35 to 40%	50 to 55%	60 to 70%	less than 70%
+2	more than 30%	more than 40%	more than 55%	more than 70%	more than 80%

The total open space achieved by the site is computed using the following formula:

$$\frac{A(0.2) + B(0.2) + C(0.5) + D}{E} \times 100$$

A = open space acres in managed landscape
B = open space acres in annual crops
C = open space acres in perennial crops
D = open space acres in native vegetation
E = total undeveloped acres in open space

Evaluating the Quality of Individual Open Space Developments

In the real world, site designers must satisfy a wide range of economic objectives, and water quality or resource protection is usually not on the top of the list. It is certainly possible to design a lousy open space design, and communities should expect a wide range in the quality of open space designs they review. How can a community objectively evaluate the quality of individual open space design proposals, and differentiate poor or mediocre projects from the good and outstanding ones?

Nerenberg and Freil (1999) have recently developed a simple rating system to evaluate the quality of individual open space design proposals. The rating system, known as the Conservation Development Evaluation System (CeDES), was developed in consultation with a host of planning agencies and organizations. The CeDES employs 10 core criteria to test how well a proposed open space design reduces impervious cover, minimizes grading, prevents soil loss, reduces and treats stormwater, manages open space, protects sensitive areas, and conserves trees or native vegetation. Each of the 10 core criteria has a quantitative benchmark for comparison. An example of one benchmark that rates the quantity and quality of open space is provided in Table 5. A full description of the CeDES rating can be found in Conservation Fund (1999).

Based on the total score achieved under the 10 core criteria, an open space design project can earn anywhere from zero "oak leaves" up to four "oak leaves." The more oak leaves earned, the better the quality of the proposed project. Based on initial testing, the CeDES seems to do a good job of sorting the poor projects from the outstanding ones. While the CeDES is intended for use as a tool for local development review, it can also be used as a marketing tool to let home buyers know how green their new subdivision actually is.

Implications for the Watershed Manager

The redesign comparisons have several implications for the watershed manager. First, they offer compelling quantitative evidence that open space design can sharply reduce stormwater and nutrient export from new development, and as such, can serve as an effective tool for watershed protection. It is interesting to note that open space design, by itself, produced nutrient reductions roughly equivalent to those achieved by structural stormwater practices. In other words, nutrient export from open space designs *without* stormwater treatment was comparable to the conventional designs *with* stormwater treatment. When open space design were combined with effective stormwater treatment, nutrient loads were sharply reduced, but were still greater than pre-development conditions.

> Despite its economic and environmental benefits, open space design is not a development option in many communities.

A second, more troubling implication is that it may well be impossible to achieve a strict goal of no increase in nutrient load for new development, even when the best site design and most sophisticated stormwater practices are applied. A handful of communities have adopted stormwater criteria that mandate that no

R0073073

net increase in phosphorus load occur as a result of development, but as the redesign comparisons in this article show, such criteria are not likely to be actually achieved. Thus, if nutrient loads are capped in a watershed, managers may need to remove pollutants at existing developments with stormwater retrofits in order to offset increases in nutrient loads produced by new development.

The redesign research also has some implications for watershed-based zoning. Quite simply, a shift from conventional to open space design can reduce the impervious cover of many residential zoning categories by as much as 30 to 40%. In some watersheds, an aggressive shift to open space design in new residential zones is an essential strategy to meet an impervious cover cap for protecting sensitive or impacted streams.

Another notable finding is that large lot subdivisions have the potential to generate the same unit area nutrient export as higher density subdivisions. The high nutrient loading from large lot developments in un-sewered areas is attributed to subsurface discharges from septic systems. From a nutrient management standpoint, it may be more cost effective to regulate septic system performance than stormwater performance in very low density residential subdivisions located on permeable soils.

Lastly, watershed managers have only a few tools at their disposal that offer developers a real chance to save money. The economic evidence clearly suggests that open space design is such a tool, and has potential to either reduce the cost of development, or at least offset the cost of other watershed protection measures. However, despite its economic and environmental benefits, open space design is not a development option in many communities, nor is it widely used by most developers even when available. Many communities will need to fundamentally change their local development rules in order to make open space design an attractive development option.

Site planning roundtables that involve the local players that shape new residential development, described later in this issue, are an effective way to bring this change about. The ultimate goal is to make open space design a "by-right" form of development, so that its design, review and approval are just as easy and certain as a conventional subdivision. Who knows, the day may come when a special exception or permit is needed to build a conventional subdivision. *- JAZ*

Editor's Note: Some useful model ordinances for open space design can be found at www.cwp.org. Also, check the Resources section in this issue for some great references on how to make open space design work in your community.

Description of the Simplified Urban Nutrient Output Model

The basic tool used in the redesign analysis was a spreadsheet model known as the Simplified Urban Nutrient Output Model (SUNOM). The SUNOM model computes the annual hydrologic budget, nutrient export and infrastructure cost for individual development sites, using simple input variables that can be easily derived or measured from any site engineering plan.

The first step in applying the SUNOM model is to measure the fraction of the site in each of six categories of surface cover: impervious surfaces, lawns, forests/wetlands, meadow, open water, and stormwater treatment areas. In the next step, the user measures key infrastructure variables from the site plan including the length of roads, sidewalks, water and sewer utilities, curb and gutter, and storm drain pipes (in some cases, widths or diameters are needed as well). Basic soil type data is then collected, in order to classify soils according to the hydrologic soil group(s) present on the pervious surfaces of the site. Lastly, basic data is assembled on the size and type of stormwater practices and septic systems, when present. Depending on the size and complexity of the plan, it typically takes about a day to derive all the necessary inputs to operate the model.

Estimating Hydrology for the Site

SUNOM operates based on a simplified water balance. Rainfall can take several different pathways once it reaches the ground surface. A fraction of the rainfall leaves the site directly as stormwater runoff, while the remainder infiltrates into the subsurface soils (storage in surface depressions or interception by the tree canopy interception is ignored in the model, since they are a small and often temporary component of the annual water balance). Once water infiltrates into the soil, much of it returns to the atmosphere through evapotranspiration. The remainder moves to shallow ground water, is transported as interflow, or recharges deeper groundwater. The SUNOM model does not differentiate between these three final destinations, but simply computes the total volume of subsurface infiltration. The water budget can be adjusted further if lawn irrigation or septic system effluent is expected to contribute "outside" water to the development site.

Surface runoff from all surfaces is calculated using a volumetric runoff coefficient that is closely related to impervious cover. Resulting runoff quantities are normalized to runoff inches over the entire site (Schueler, 1987). Surface runoff from natural cover and turf are computed assuming that these areas are one percent impervious (NVPDC, 1980), but these values can be changed to reflect the prevailing soil type or soil compaction (see Technical Note 107).

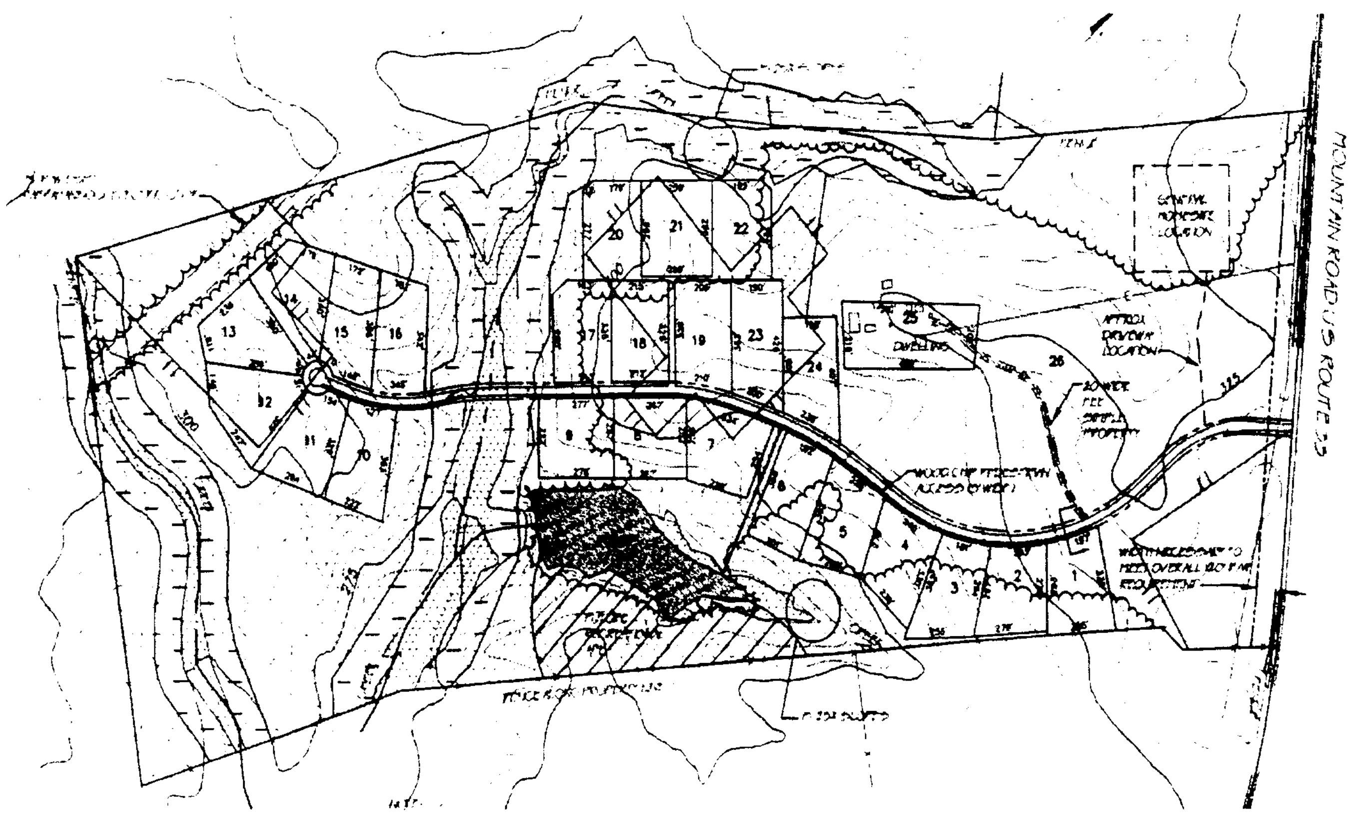

Figure 1: The SUNOM Model Operates Using Basic Site Variables That Can Be Easily Derived From Most Site Plan Submittals

Estimating infiltration is a somewhat trickier affair. For the purposes of the model, total infiltration is defined as the sum of subsurface infiltration plus septic infiltration. Subsurface infiltration is estimated based on annual infiltration volume for the prevailing hydrologic soil group of the pervious area, which can be adjusted for soil compaction. The annual volume of subsurface infiltration is calculated without estimating its final destination (i.e., quick interflow, deep recharge, shallow groundwater). Once annual stormwater runoff and subsurface infiltration volumes are calculated, they can be checked against an annual evapotranspiration volume to ensure that the overall water balance is reasonable.

Annual septic system infiltration is calculated under the assumption that entire wastewater flow into a septic system infiltrates to the subsurface. The volume of this wastewater flow, in site-inches, is derived as a function of the number of individuals using each septic system multiplied by their per capita annual water use. Some stormwater practices can take surface runoff and convert it into subsurface infiltration. The model accounts for this by deducting the fraction of treated runoff volume that is infiltrated back into the soil from the annual stormwater runoff volume and adding it to the infiltration volume.

Calculation of Nutrient Loads

This module computes nutrient loads for each of the types of surface cover present at a site by multiplying its computed stormwater runoff and subsurface infiltration volume by a median nutrient concentration. For stormwater flows, the mean concentrations are derived based on national stormwater monitoring data or single land use or source area marketing data. Subsurface nutrient concentrations for natural areas are estimated based on measured baseflow concentrations from adjacent undeveloped receiving waters. Median nutrient concentrations from published sources were used to characterize the subsurface concentrations from turf areas. In the case of septic systems, typical per capita septic loads, along with septic efficiencies, were used to characterize this nutrient loading source.

The total annual nutrient load for a development site is then computed as the sum of the stormwater runoff load, and the subsurface infiltration load from natural areas, turf, and septic systems. Surface stormwater loads are adjusted to reflect pollutant reduction by stormwater practices if they are present. The spreadsheet contains typical nutrient removal rates for many common stormwater practices (see Technical Note 95). Subsurface infiltration loads can also be adjusted to reflect the use of innovative septic system technology with higher nutrient removal capability. Default data are provided in the SUNOM model for all nutrient concentration and removal parameters, but the user can also supply their own estimates if better local or regional data are available.

Development Cost

The SUNOM modules computes the cost of building the infrastructure to serve a new development. The module calculates these costs based on the dimensions of the infrastructure that are specified in the development plan, and supplied as model input (e.g., length and area of roads, length and diameter of pipe). These units of infrastructure are then multiplied by unit costs that were derived for the mid-Atlantic region. The SUNOM model can estimate the following component costs: paving for roads or parking lots, curb and gutter, sidewalks, stormwater conveyance, utilities, landscaping, reforestation, septic systems and other necessary elements for site construction. Stormwater treatment costs are calculated as a function of the volume of stormwater runoff treated by the practice using predictive equations developed by the Center (see Technical Note 90). At this time, the SUNOM model does not estimate engineering or permitting costs, nor does it itemize costs related to clearing, grading and erosion and sediment control, but these enhancements can be added by the user.

Appropriate Use of the SUNOM Model

The SUNOM model is basically a simple accounting tool to track the annual runoff, nutrient loads, and total infrastructure costs from four kinds of surface cover in a development plan. The model is most appropriately used as a tool to compare how these factors change in response to different development scenarios. These "redesign" scenarios help demonstrate the costs and benefits of better site design. As with any empirical model, it is very important to make sure that parameter values are sensible and regionally appropriate. The user should always check whether default infiltration rates, nutrient concentrations, removal rates and unit costs make sense given local conditions. The SUNOM model is intended to serve as a planning model rather than an engineering model. More detailed simulation models or monitoring may be required to give the precise and accurate predictions needed for actual engineering design at a given development site. More extensive documentation on the model is contained in Appendix A of CWP, 1998. We are continually improving the SUNOM model, and the most recent version, which utilizes a Microsoft Excel spreadsheet, is available through the Center at a nominal charge.

Better Site Design

III. The Benefits of Better Site Design in Commercial Development

Modern commercial development is dominated by the parking lot. Indeed, as much as half of the entire surface area of a typical office park or shopping center is devoted to parking. No one has ever stepped up to claim that they invented the parking lot, and their reluctance is understandable: the parking lot is a prime habitat for the car and not much else.

From an environmental standpoint, parking lots rank among the most harmful land uses in any watershed. Parking lots not only collect pollutants that are deposited from the atmosphere, but also accumulate pollutants that leak, drip or wear off cars. Researchers have found that parking lot runoff can have extremely high concentrations of nutrients, trace metals and hydrocarbons (see Technical Notes 15 and 105). Parking lots also influence the local air and stream temperatures. In the summer months, pavement temperatures can exceed 120 degrees Fahrenheit, which in turn increases local air temperatures five to 10 degrees compared to a shaded forest. Parking lots can also exacerbate smog problems, as parked cars emit greater levels of smog precursors under extreme heat island conditions (Scott *et al.*, 1999).

Perhaps the greatest environmental impact of parking lots is hydrological in nature. Simply put, there is no other kind of surface in a watershed that produces more runoff and delivers it faster than a parking lot. When this runoff is discharged into a headwater stream, its great erosive power steadily degrades the quality of downstream habitats, unless exceptionally sophisticated stormwater practices are installed.

Is it possible to design a better parking lot? At first glance, there seems to be little opportunity to incorporate better site design into parking lots. However, the better site design techniques described earlier in this issue suggest a key design strategy: *work to incrementally shrink the surface area of the parking lots and then use the space saved to integrate functional landscaping and better stormwater treatment within the parking lot.* Through a series of relatively minor design adjustments, it is possible to reduce the surface area of parking lots by 5-20%. These design adjustments include curbing excess parking, incrementally reducing parking demand ratios, providing credits for mass transit, shrinking stall sizes, narrowing drive aisles, and using grid pavers for spillover parking areas.

In this article, we examine some of the benefits of employing better site design as they apply to commercial development. As with the residential redesign, this analysis also uses the Simplified Urban Nutrient Output Model (SUNOM) to compare actual commercial development sites constructed in the 1990s with the same sites redesigned utilizing better site design techniques. The two commercial developments analyzed include a retail shopping center and a commercial office park.

Our fairly conservative approach to parking lot redesign is intended to reflect realistic opportunities in a suburban setting. For example, we did not utilize shared parking, porous pavement, or structured parking in any of the redesigns, although each of these techniques is very effective. Nor did we reduce the basic footprint or size of the buildings in either scenario, although smaller "boxes" may well have been more appropriate for the zoning. Instead, our basic approach was to make a series of relatively modest changes in parking lot design to shrink parking lot area, and then implement better landscaping and stormwater treatment measures within the saved space.

> From an environmental standpoint, parking lots rank among the most harmful land uses in any watershed.

This article reports on the potential benefits of parking lot redesign in terms of reduced runoff, pollutant export and development costs. It also reviews the initial experience of communities that are experimenting with new and innovative parking lot designs, and concludes with some implications for both the engineer and watershed manager.

R0073077

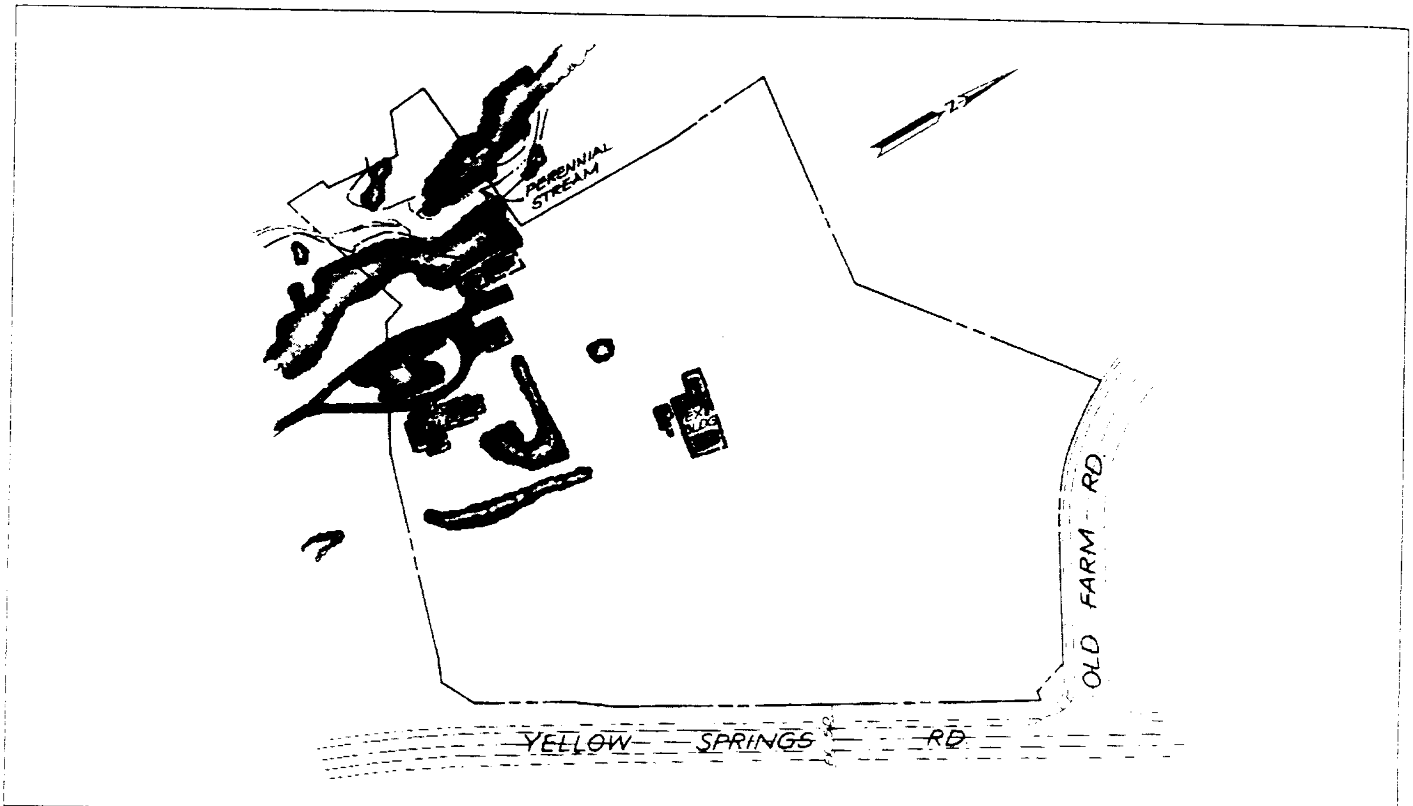

Figure 1: Predevelopment Conditions at the Old Farm Shopping Center Site

Redesign of the Old Farm Shopping Center

The undeveloped Old Farm shopping center, located in the City of Frederick, Maryland, was primarily meadow, with some shrubby forest and a few farm buildings. Bordered by two major arterial roads and served by existing public water and sewer, the site was a prime candidate for commercial development.

Construction of the shopping center site parcel commenced in 1992. The 9.3 acre site is a typical suburban "strip" shopping center with two large retail stores, other retail space, a gas station and a drive-in bank (Figure 2). In terms of surface cover, the shopping center devoted 50% of its total area for parking, as compared to 16% for the actual footprint of the retail buildings. Another 24% of the surface area was devoted to landscaping or stormwater treatment. Less than 10% natural cover was retained on the site, and part of the project encroached on the 100-year floodplain and the stream buffer. The entire site was mass graded during construction. The basic layout was designed to accommodate the car, with generous parking located in front of the stores. The parking lot design provided 5.2 full-size stalls per 1,000 square feet (sf) of retail space, which exceeded the already generous local parking requirement of five spaces per 1,000 sf. According to the most recent national parking research, only 4.0 to 4.5 spaces are needed to serve shopping centers (ULI, 1999).

The stormwater treatment system at Old Farm consisted of an infiltration basin located near the rear of the shopping center that captured runoff from about a third of the site, and three oil grit separators that provide some treatment for the remaining two-thirds of the site. After discharging from the oil/grit separators, runoff traveled through a series of storm drains that extended along the road and eventually discharged to the stream (albeit without detention of any kind). It should be noted that recent performance monitoring has shown that oil grit separators have little or no pollutant removal capability (see Technical Notes 101 and 104).

The Redesigned Old Farm Shopping Center

The Old Farm shopping center was redesigned using a "U-shaped" layout that maintained the same amount of gross floor area, but sharply reduced the site area devoted to parking (Figure 3). The new design reduced walking distances, encouraged pedestrian use, and created a more intimate shopping experience. Parking dropped from 50% of the total site area to 38%, primarily because the parking demand ratio was reduced from 5.2 spaces to 4.4 spaces per 1,000 sf of retail area.

R0073078

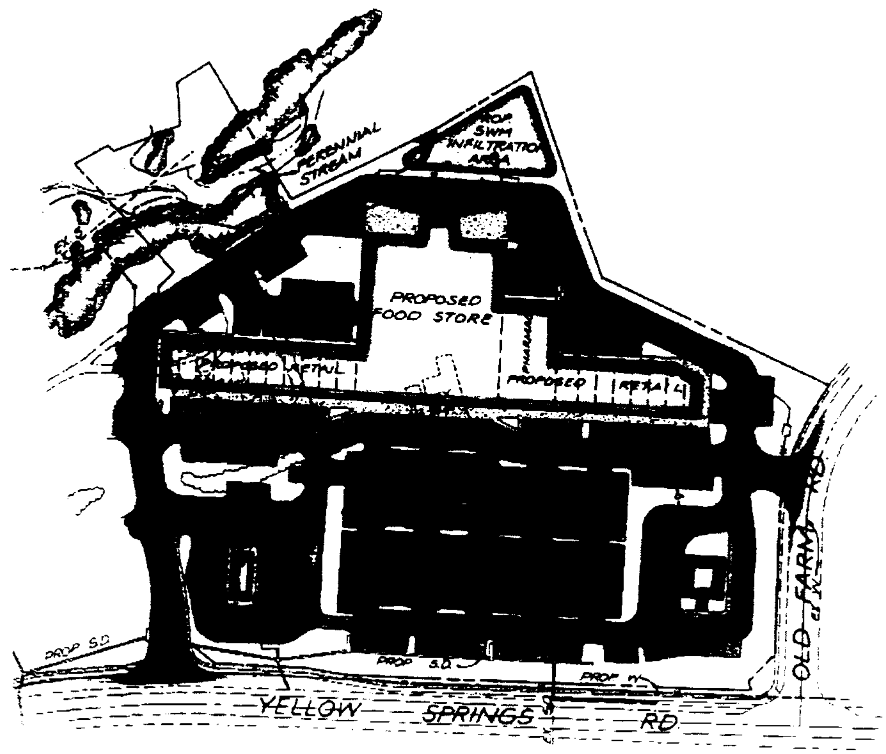

Figure 2: The Conventional Design of the Old Farm Shopping Center

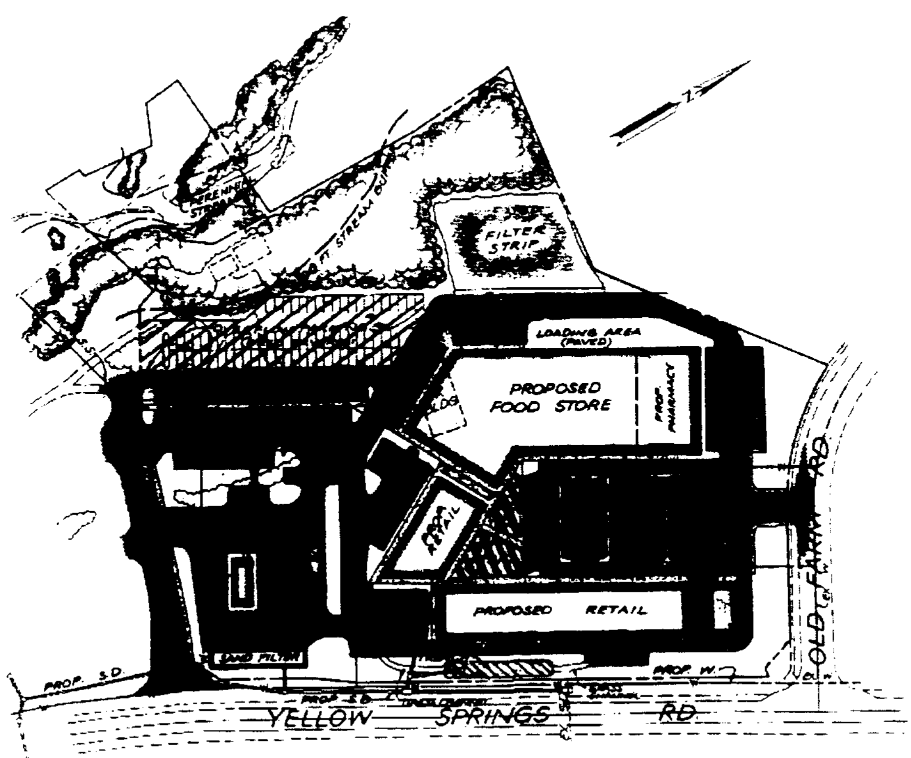

Figure 3: The Innovative Design of the Old Farm Shopping Center

R0073079

Table 1: Hydrology of the Old Farm Shopping Center Case Study				
		Pre-Developed	Conventional Parking Lot	Innovative Parking Lot
Runoff (inches/yr)	no practice	2.6	24.5	20.6
	practices		18.1	15.1
Infiltration (inches/yr)	no practice	11.8	2.7	3.4
	Practices		9.1	8.9

The rationale for the lower parking demand was justified in two ways. First, no extra parking spaces were allowed beyond those required by the locality. Second, the existing parking demand ratio was reduced by about 15% to reflect actual parking demand more accurately. As a result, the total number of parking spaces dropped from 343 to 291. In addition, 17% of the parking stalls were designed for compact cars, which require slightly smaller stalls than standard full-sized spaces. Taken together, these changes eliminated slightly more than one acre of parking area, which provided enough space to design a more effective landscaping and stormwater treatment system.

Several parking lot islands were increased in size and converted into bioretention areas to treat stormwater. Other elements of the stormwater treatment system included a sand filter, an infiltration trench, and a filter strip. Furthermore, 25% of the entire parking area was designated for "spillover parking," and grid pavers were used rather than normal paving materials. The grid pavers helped store the first few tenths of an inch of rainfall that would have otherwise run off the parking lot (ICPI, 2000). Lastly, the redesign enabled reforestation and greater protection of the buffer along the stream that runs along the edge of the property. As a result, the proportion of natural cover at the site climbed from 7% to 19% as a result of the parking lot redesign.

Comparative Hydrology at the Old Farm Shopping Center

As expected, the construction of the original shopping center dramatically changed the hydrology of the site (Table 1). The increase in impervious cover from 1% to more than 70% increased annual runoff volume by a factor of nine. The infiltration basin used in the original design helped put some runoff back into the ground, but even so, annual runoff was seven times greater than the pre-development condition. The redesigned parking lot, by virtue of its lower impervious cover and improved stormwater practices, produced about 20% less runoff than the original design. Nevertheless, the stormwater practices at the redesigned parking lot were not able to match the pre-development hydrology.

Comparative Nutrient Output from the Old Farm Shopping Center

The conversion of the meadow into a shopping center greatly increased nutrient export from the site; the SUNOM model indicated that annual phosphorus and nitrogen export would increase tenfold as a result of the development (see Figure 4). Nutrient export from the shopping center was dominated by stormwater runoff, as the model indicated that stormwater runoff contributed about 95% of the annual nutrient export from the site. Nutrient loads were not greatly reduced by the infiltration basin or oil/grit separators that were installed at the conventional parking lot. Nutrient export was still projected to be eight to ten times higher than pre-development conditions, even after these stormwater treatment practices were installed.

In contrast, the redesigned parking lot sharply reduced nutrient export (Figure 4). In fact, the redesigned parking lot *without* stormwater practices produced about the same nutrient load as the conventional parking lot *with* stormwater practices. This reduction was a direct result of the lower impervious cover associated with the redesigned parking lot. When the redesigned parking lot was combined with more sophisticated stormwater practices (i.e., bioretention, sand filter, infiltration trench and filter strip), the total nutrient export was half that of the conventional parking lot with stormwater practices. It is interesting to note, however, that this load was still about five times higher than that produced by the meadow prior to development.

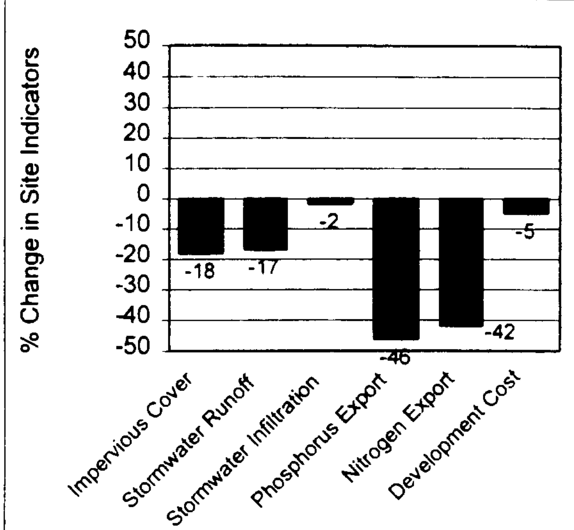

Figure 5: Percentage Change in Key Site Indicators From a Conventional Design of the Old Farm Shopping Center to an Innovative Design, Both With Stormwater Practices

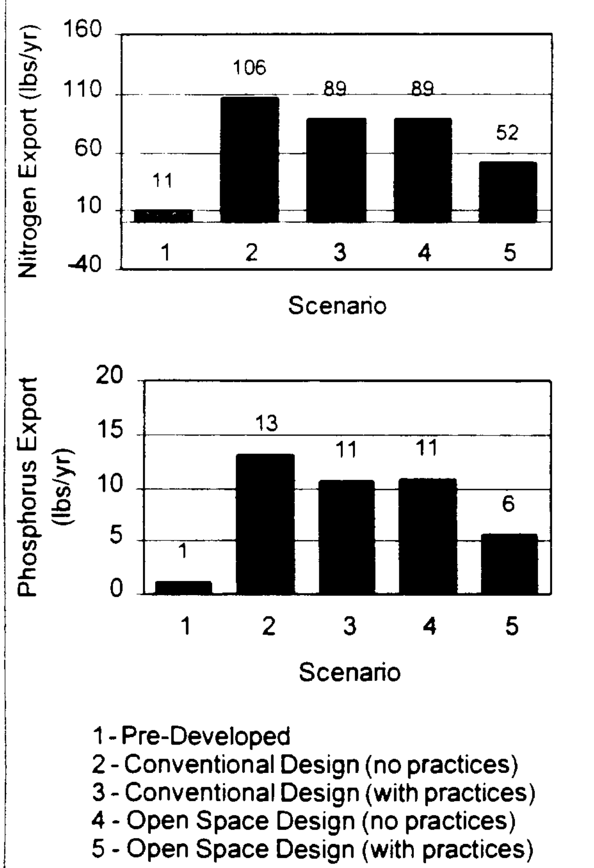

Figure 4: Annual Nitrogen and Phosphorus Export in Each Old Farm Shopping Center Development Scenario

Comparative Cost to Develop the Old Farm Shopping Center

The cost to develop the redesigned parking lot was marginally lower than the cost for the conventional parking lot — about 5%. Considerable cost savings were realized due to less paving, shorter sidewalks, and fewer curbs and gutters, but these savings were largely offset by added costs for improved stormwater practices, landscaping and grid pavers. Overall, the estimated cost to build the conventional parking lot was $782,500, compared to $746,270 for the redesigned parking lot. The extent of potential cost savings depends heavily on the level of sophistication of the original stormwater treatment system. In this case, the unsophisticated stormwater practices used in the conventional parking design were fairly inexpensive, but were also not effective in removing nutrients.

Summary

Figure 5 summarizes the redesign analysis of the Old Farm Shopping Center. The redesigned parking lot resulted in less impervious cover, stormwater runoff, and nutrient export for a slightly lower development cost than the conventional design.

R0073081

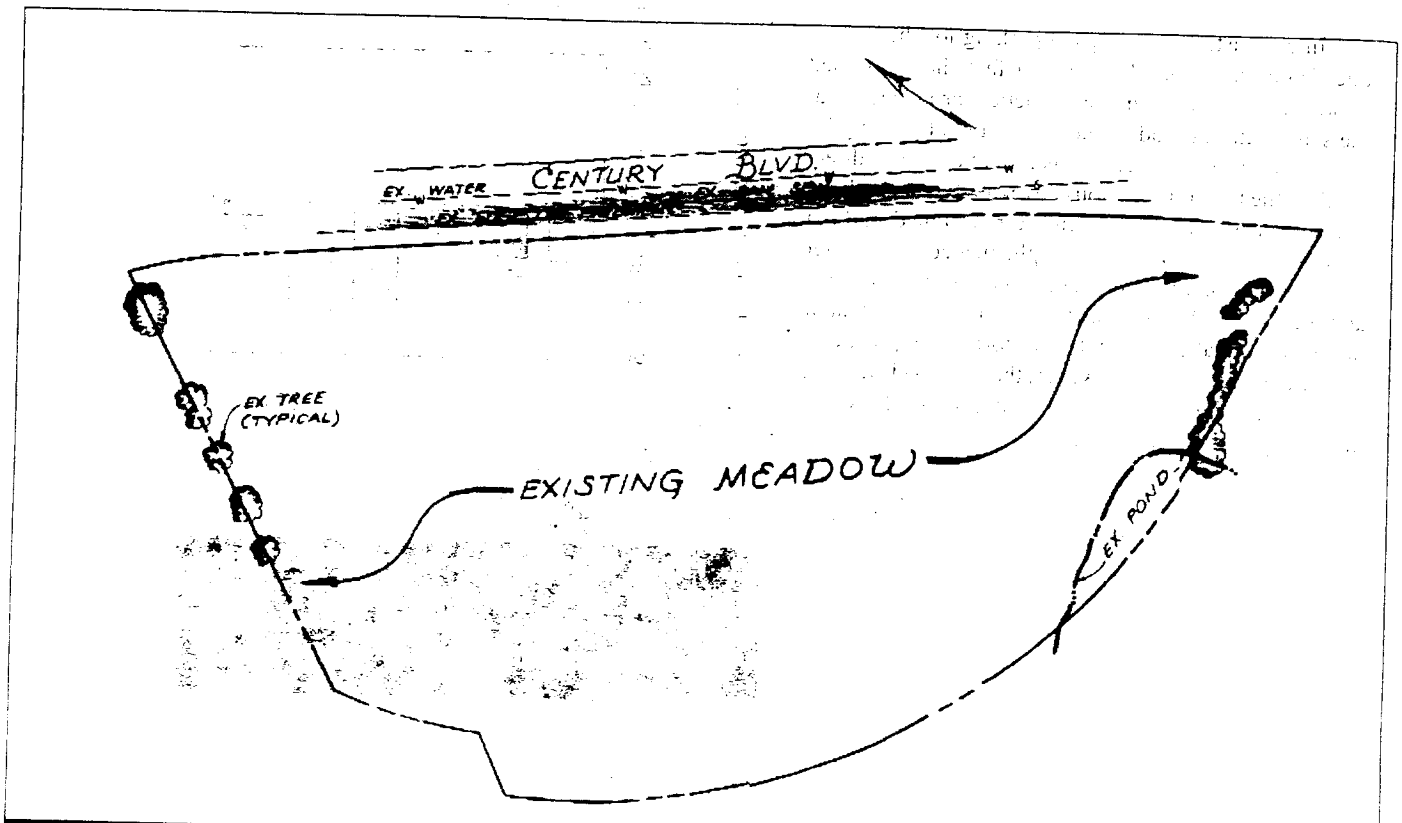

Figure 6: Predevelopment Conditions at the 270 Corporate Office Park Site

Redesigning the 270 Corporate Office Park

The second case study involved the redesign of a typical suburban office park. The 12.8 acre parcel is located in Germantown, Maryland in the mildly sloping terrain of the Piedmont (Figure 6). The existing cover at the site was almost entirely meadow, except for a few trees and an old farm pond that bisected the property boundary. No wetlands or other sensitive natural features were evident on the site. The site was zoned for office development, and existing infrastructure made it an attractive candidate for development. An existing network of public water and sewer, electric, gas, and other utilities ran along the frontage of a large arterial road.

The layout of the conventional suburban office park design is depicted in Figure 7. The project included a pair of five-story office buildings, surrounded by a sea of parking. Over half (52%) of the surface cover at the office park was devoted to parking, as compared to only 11% for actual footprint of the office building. Most of the remainder of the site was utilized for landscaping, stormwater treatment or turf. Only 2% of the natural cover was retained on the site, and nearly all of the parcel was mass graded during construction.

As with many suburban office parks, the location of the building and parking were primarily oriented toward the car. The parking lot was sized using a parking demand ratio of 3.1 spaces per 1,000 sf of building, which slightly exceeded the minimum parking requirements of the locality. As a result, the parking lot created room for 745 standard stalls, along with 33 larger stalls for vans and disabled access. The parking bays also featured roomy aisles between the stalls (24 feet wide). The design was intended to provide some amenities for the office workers, including a short path system between buildings, an ornamental stormwater pond, and some landscaping in required setbacks and parking islands.

The conventional design featured the classic "pipe and pond" approach to stormwater management. Parking lot runoff was initially collected by a curb and gutter system that sent runoff into underground storm drain pipes that, in turn, discharged into two very small wet ponds. Each pond served roughly half of the site and was expected to have a reasonably good capability to remove nutrients (see Technical Note 95).

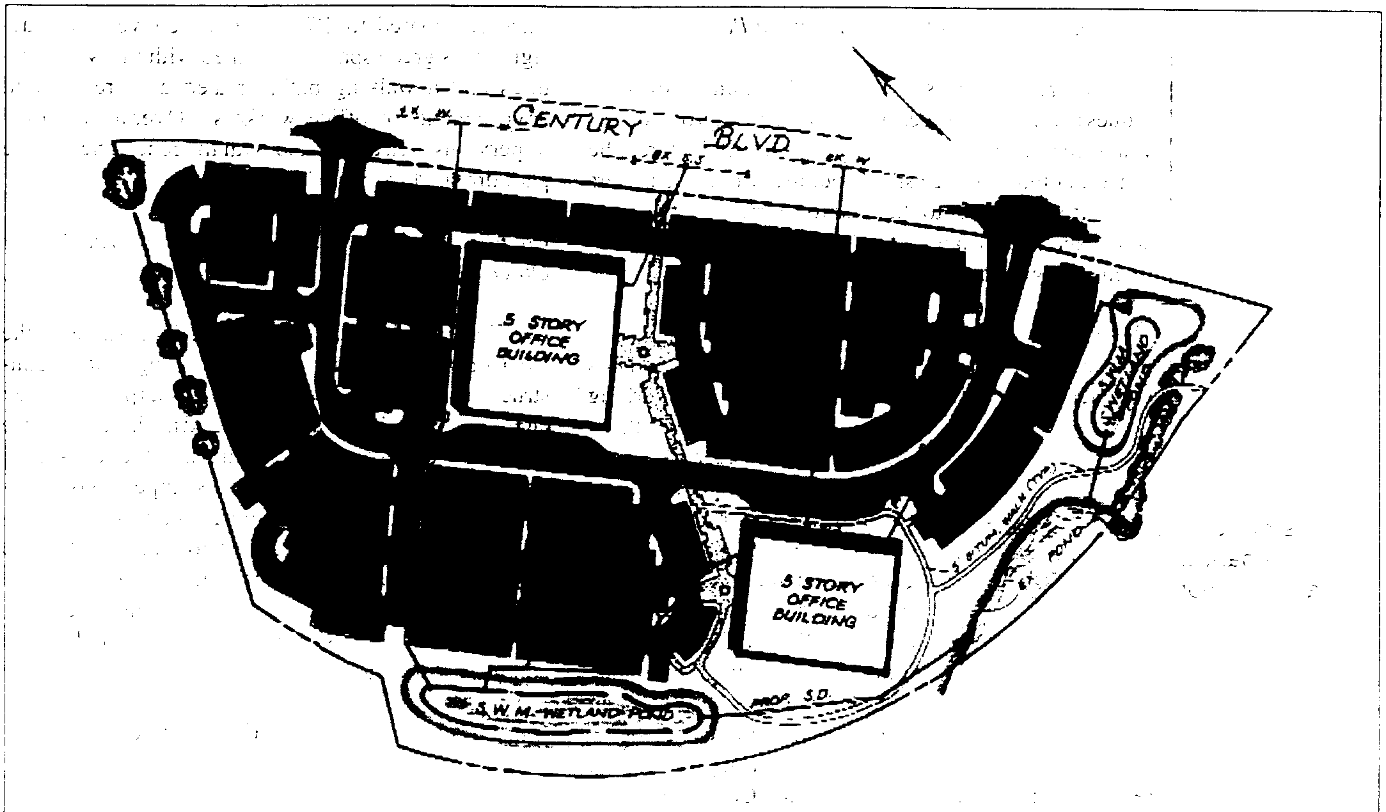

Figure 7: The Conventional Design of the 270 Corporate Office Park

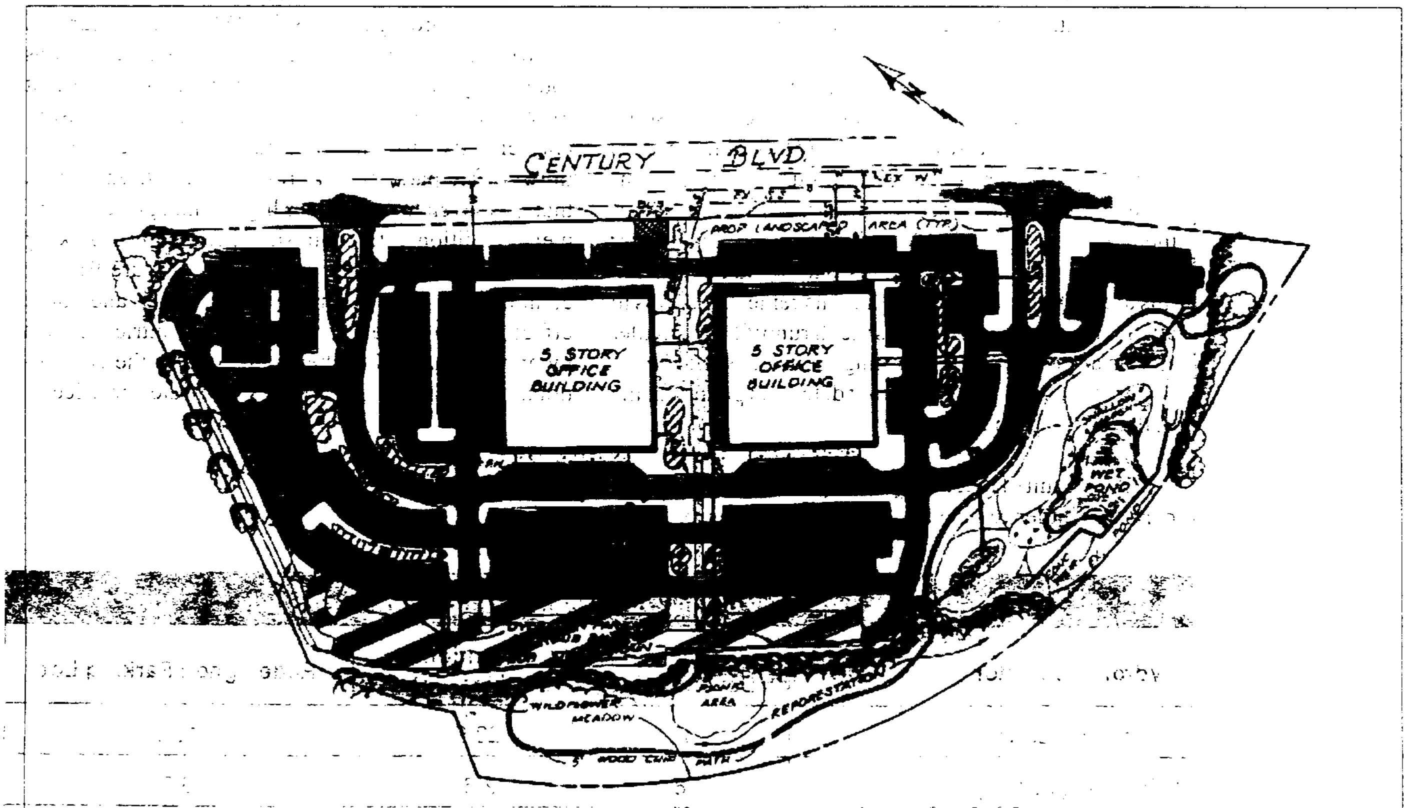

Figure 8: The Innovative Design of the 270 Corporate Office Park

R0073083

The Redesigned 270 Corporate Office Park

The redesigned site employed a number of techniques to minimize impervious cover and improve stormwater treatment (Figure 8). The office park featured the same amount of office space, but the two office towers were situated closer to the road to shorten utility extensions, and pedestrian access to a bus stop was provided to encourage the use of public transportation.

The key strategy employed in the redesign was to incrementally reduce the size of the parking lot, and this was achieved in five ways. First, no excess parking spaces were allowed over those required by the local parking demand ratio. Second, the local parking demand ratio was reduced by 8% to reflect actual parking demand. Third, the parking demand ratio was reduced by another 10% to reflect the proximity to the bus stop. Fourth, the size of approximately 20% of all parking stalls was downsized to accommodate compact cars. Lastly, drive aisles in many parking bays were reduced from 24 feet in width to 20 feet. Combined, these measures reduced the total parking lot area by nearly 30%, or about two acres. Once again, the savings in paving gave the designer more room to integrate landscaping with more effective stormwater treatment.

Construction of the conventional office park sharply increased annual runoff and decreased infiltration.

For example, larger landscaping islands were installed in the parking lot to plant shade trees, and some of these areas were also converted into bioretention areas to treat stormwater. A dry swale was used to treat stormwater within a landscaped setback area in another part of the site. About 15% of the lot was designated for spillover parking, and grid pavers were used to attenuate runoff in this area. The basic stormwater management goal was to attenuate, treat, or recharge as much runoff from smaller storms as possible in the parking lot itself. Runoff from larger storms was treated in a wet detention pond near the outlet of the property.

As a result of the redesign, roughly 14% of the office park was either retained in natural land cover or reforested (compared to 2% under the conventional design). This green space, combined with the water features and a walking path, created a more tranquil environment for office workers. Overall, the total impervious area associated with the redesigned office park dropped from 68% to 53%.

Comparative Hydrology for the 270 Corporate Center Office Park

The hydrological story was much the same for the 270 Corporate Center as for the shopping center. Construction of the conventional design sharply increased annual runoff volumes and decreased infiltration (Table 2). Runoff did not increase as much in the redesigned parking lot, primarily because its impervious cover was much lower. Annual runoff volumes were 21% lower in the redesigned parking lot compared to the conventional design, and infiltration volumes were 42% higher. Despite these improvements, the redesigned parking lot was unable to mimic the hydrologic conditions prior to development.

Nutrient Output at the 270 Corporate Center Office Park

As expected, the conversion of the meadow into an office park greatly increased nutrient export. Annual phosphorus and nitrogen export increased roughly ten-fold, according to the SUNOM model (Figure 9). As with the shopping center, stormwater runoff was found to generate about 95% of the annual nutrient export from the site. The two wet ponds were reasonably effective in removing nutrients at the conventional office park, but still resulted in nutrient export that was seven to eight times higher than pre-development conditions. In contrast, the redesigned parking lot sharply reduced nutrient export (Figure 9). The combination of lower impervious cover and more effective stormwater practices reduced nutrient export by about 40 to 50%, when compared to the conventional parking lot design *with* stormwater practices.

Table 2: Hydrology of the 270 Corporate Office Park Case Study

Hydrologic Factor	Pre-Developed	Conventional Parking Lot	Redesigned Parking Lot
Runoff (inches/yr)	2.7	23.9	18.9
Infiltration (inches/yr)	11.8	2.6	3.7

Note: no change in the annual volume of runoff or infiltration was calculated as a result of the stormwater practices installed at either the conventional or redesigned parking lots.

R0073084

Comparative Cost to Develop the 270 Corporate Office Park

The cost to develop the redesigned office park was approximately the same as the cost to develop the conventional office park, although the component costs were somewhat different. Less was spent on paving, sidewalks and utility pipes, but these savings were largely offset by higher costs for improved stormwater treatment practices, landscaping, grid pavers and curiously, curbs and gutters (the higher cost for this last item was due to the wider parking islands used for bioretention areas). Overall, the estimated cost to build the conventional parking lot was $948,900, compared to $921,200 for the redesigned parking lot.

Summary

The redesigned parking lot at the 270 Corporate Office Park resulted in less impervious cover, stormwater runoff, and nutrient export for about the same development cost as the conventional design. The results are summarized in Figure 10.

The Limits and Potential of Parking Lot Redesign

To our knowledge, no one has yet tried to quantify the potential economic and environmental benefits of better parking lot design at new commercial developments. This initial analysis provides compelling evidence that better site design is an important, if not indispensable, tool for managing the quantity and quality of stormwater runoff from parking lots.

In each of the case studies, the redesigned parking lot resulted in less impervious cover, stormwater runoff, and nutrient export for about the same or even slightly lower cost than the conventional design. Taken together, better site design techniques reduced impervious cover by at least 15% in each case. While this is an impressive reduction, about half of each site remained impervious after the redesign. Perhaps the most critical benefit of each redesign was that it created more room to locate more effective stormwater treatment practices. When smaller parking lots were combined with better stormwater practices, the resulting nutrient export was almost half that of a conventional parking lot.

In each case study, the critical ingredient was an incremental reduction in the local parking demand ratio. Without this capability to shrink the surface area devoted to parking, designers have little ability to devise the more sophisticated stormwater treatment and landscaping systems that can

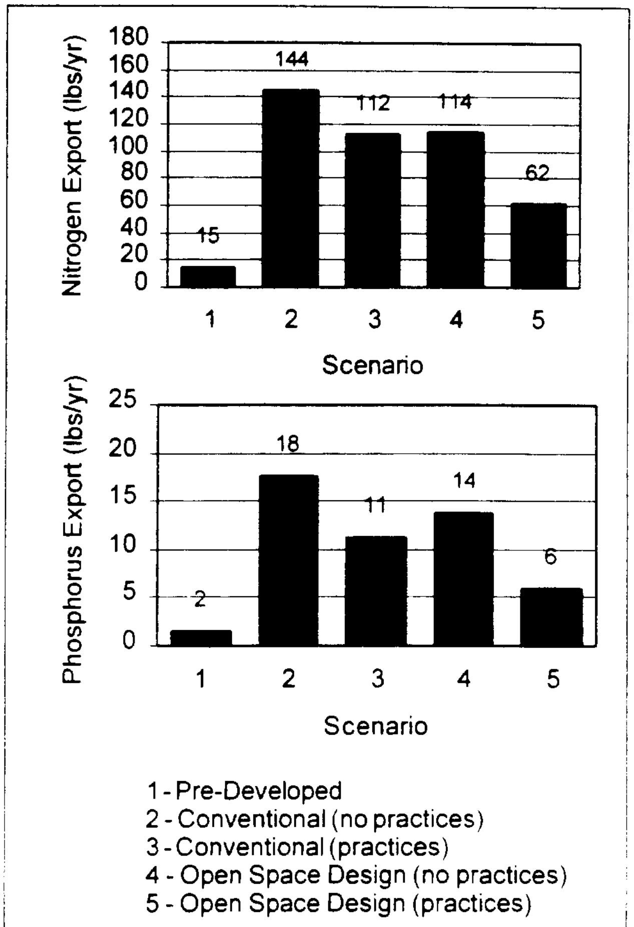

Figure 9: Annual Nitrogen and Phosphorus Load in Each 270 Corporate Office Park Development Scenario

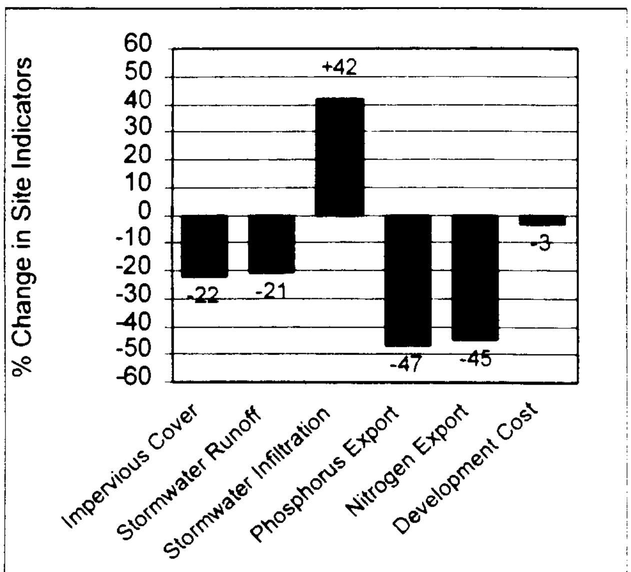

Figure 10: Percentage Change in Key Site Conditions from a Conventional Design to a Redesigned Parking lot at the 270 Corporate Office Park, Both With Stormwater Practices

R0073085

help mitigate the impact of the parking lot. Therefore, the first and most important step in implementing better site design for commercial developments *is to reduce local parking demand ratios, even if only by five or ten percent.* For many communities, however, this modest step may seem like a terrifying leap, possibly off a cliff.

Developers, bankers, retailers and drivers all have a shared interest in abundant and convenient parking, and it is hard to convince them that any attempt to downsize parking lots, however modest, will not work against this goal. This kind of thinking is quite understandable. Most people can easily recall the rare situation where parking was hard to find, but the more common situation where parking is plentiful generally escapes our everyday notice.

Small wonder, then, that so many communities are prone to inertia when it comes to changing parking codes. Perhaps the only way watershed advocates can overcome this inertia is to document the existence of excess parking capacity in each community. Indeed, it is a rather simple step for volunteers to count cars and photograph empty stalls during peak times at similar commercial land uses to demonstrate how generous local parking requirements actually are.

The most important step to implement better site design for commercial developments is to reduce local parking demand ratios.

A small but growing list of communities are now experimenting with their parking standards and parking lot designs, including cities like Scarborough, Ontario; Oakland, CA; Olympia, WA; Sacramento, CA; Bellevue, WA; Davis, CA and Prince George's County, MD. Each community has worked in different ways to redesign their parking lots, and many of their successful experiences are recounted in *Better Site Design: A Handbook for Changing Development Rules in Your Community* (CWP 1998a).

Given the prevalence of parking lots in our urban landscape and the environmental harm they cause, we need to fundamentally change the way that parking lots are sized and designed. The modest ideas presented in this article are merely an initial step in this direction. A wide range of professions collectively influence the form and function of parking lots, including engineers, hydrologists, landscape architects, urban foresters, soil scientists, developers, leasing agents, plan reviewers, transportation researchers and many, many others. Working together, these groups can move us closer toward the goal of a truly sustainable parking lot, i.e., one that not only provides car habitat, but also prevents damage to other habitats as well. **- *JAZ***

Editor's Note: Some useful benchmarks for testing how good your local parking codes can be found in the Codes and Ordinances Worksheet (see accompanying article).

Task 6

1.0 INTRODUCTION

Storm water Best Management Practices (BMPs) are a primary tool to improve the quality of urban streams and meet the requirements of NPDES permits. They include both structural options, such as construction of storm water ponds, and non-structural ones, such as implementing a storm drain stenciling program. Using BMPs can represent a significant cost to communities, but these costs should be weighed against the benefits they provide. This report will review available data on the costs and potential benefits of both structural and non-structural BMPs designed to improve the quality of urban and urbanizing streams, and the larger water bodies to which they drain.

2.0 STRUCTURAL BMP COSTS

The term structural BMPs, often referred to as "Treatment BMPs," refers to physical structures designed to remove pollutants from storm water runoff, reduce downstream erosion, provide flood control and promote groundwater recharge. They can also have ancillary benefits and costs such as increasing or decreasing property values. In contrast with non-structural BMPs, structural measures include some engineering design and construction.

Structural BMPs include:

- Ponds and Created Wetlands
- Infiltration Practices
- Filters
- Bioretention
- Vegetative BMPs
- Other structures (not included in this analysis).

Ponds and wetlands include several designs that treat storm water through the use of some combination of a permanent pool and detention storage. Wetlands also incorporate the use of aquatic plants to aid in treatment by slowing runoff velocities and providing some pollutant uptake. Some typical pond and wetland designs are described in Table 1.

Table 1. Storm Water Pond and Wetland Designs

Design	Description
Dry Extended Detention Pond	A pond with no permanent pool of water. Detention (usually 24 or 48-hour) is the only mechanism to improve water quality.
Wet pond	A pond with a permanent pool of water but no extended detention storage. Retention and biological activity in the permanent pool are the primary mechanisms of pollutant removal.
Wet Extended Detention Pond	Wet extended detention ponds incorporate the features of wet ponds and extended ponds, with a permanent pool of water and extended detention storage above the pool.
Shallow Marsh	A shallow marsh system is a wetland with a very shallow depth, which treats runoff primarily through settling and pollutant uptake in the permanent pool.
Extended Detention Wetland	A shallow marsh system with extended detention storage above the permanent pool.
Pond/Wetland System	Use of a wetland following a wet pond. This design can achieve high pollutant removal, while consuming less space than a shallow marsh.

Infiltration BMPs have no "formal" outlet for small storms, and thus these storms are treated by filtration as they percolate through the soil into the groundwater. The two infiltration systems focused on in this report are infiltration trenches and infiltration basins (Table 2).

Table 2. Infiltration BMPs

Design	Description
Infiltration Trench	A rock-filled trench with no outlet. Storm water directed to the trench is infiltrated into the ground, and pollutant removal is achieved through filtering by the soil matrix.
Infiltration Basin	A shallow impoundment with no low flow outlet. Therefore, storm water runoff entering the basin must infiltrate through the bottom soils to exit the basin. Pollutant removal is accomplished as storm water is filtered through the soil.

Filtering systems remove pollutants by passing storm water though a filtering medium such as a sand or organic medium. Runoff is typically returned to a drainage or stream system after being treated by filters. The three filtering systems discussed in this segment, as well as bioretention, are described in Table 3. Although bioretention can serve as a filtering system or infiltration practice, it is discussed separately for the remainder of the document because it has separate cost data and design criteria.

Table 3. Filtering Practice Designs

Design	Description
Surface Sand Filter	A BMP where runoff enters a sedimentation chamber that provides pretreatment, and then flows to a sand filter, where the runoff flows through a bed of sand, receiving additional treatment. Treated runoff is collected in and underdrain system and returned to the storm drain network or stream channel.
Underground Sand Filter	Use the same pollutant removal mechanisms as surface sand, but the filter and the pretreatment storage are located in a vault underground.
Perimeter Sand Filter	Also uses the same pollutant removal mechanisms as surface sand filters. In the perimeter sand filter design, the filter typically lies parallel to the curb at the edge of a parking lot. The inlet to the system is a grated system at the edge of the lot.
Bioretention	A shallow landscaped depression that temporarily ponds 6 to 12 inches of storm water before it filters through a soil matrix. Nutrient uptake into woody plants is an additional removal mechanism.

Vegetative BMPs, sometimes called open channel BMPs, treat storm water runoff as it flows over a sloping vegetated surface. Treatment is through settling and through filtering as storm water infiltrates into the soil matrix below the vegetated surface. Some typical vegetated BMPs are described in Table 4. In this report, wet swales are assumed to have the same cost as biofilters, because there is little cost data available on this practice.

Table 4. Vegetative BMP Designs

Design	Description
Grass Channel/ Biofilter	A modified drainage channel designed with a cross-section and slope that keeps the storm water velocity low enough to allow filtering and some infiltration during small to moderate storm events.
Wet Swale	An open channel that retains the water quality volume in a series of linear cells along a channel. The channel bottom usually intersects the seasonally high groundwater table, and pollutant removal is achieved due to settling and pollutant uptake by plants in the swale.
Dry Swale	Constructed open channels designed to capture and treat a defined volume of storm water runoff by filtering it through a surface cover and a prepared soil mix.

Other BMPs include experimental and proprietary products, as well as some conventional structures such as water quality inlets. They are not included in this analysis because sufficient data are not available to support either the performance or the cost of these devices, or they have poor pollutant removal or life-long performance.

2.1 Screening Criteria

Site suitability for selecting a particular BMP strategy is key to successful performance. Most BMPs have limitations for applicability. Considerations include drainage area, soils, and long-term maintenance requirements. Tables 5 through 8 set forth common screening criteria in devising a BMP strategy to serve a site or watershed. These criteria were developed for the State of Maryland (CWP et al., 1997), and are most applicable to moderate, humid climates such as the mid-Atlantic and Pacific Northwest. In cold climates, design modifications may be needed to adjust for phenomena such as freezing and spring snowmelt (Caraco and Claytor, 1997). In arid climates, some BMPs may not be appropriate due to water requirements of the BMPs. Table 9 lists BMPs that require supplemental water, and outlines their value in arid and semi-arid climates.

Table 5. BMP Selection Matrix No. 1
PHYSICAL FEASIBILITY

CODE	BMP LIST	SOILS	WATER TABLE	DRAINAGE AREA (acres)	SITE SLOPE	HEAD (ft)	ULTRA URBAN
P-1	Micropool ED	"A" soils may require pond liner "B" soils may require testing	2 feet if hotspot or aquifer	10 min*	No more than 15%	6 to 8 ft	Not practical

Table 9. BMP Use in Arid and Semi-Arid Climates

BMP		Supplemental Water Required?	Use in Arid and Semi-Arid Climates
Ponds	Detention Pond	◗	• Consider alternatives to a vegetated bottom, such as sand or stones. • Always use drought tolerant vegetation • If water is required, use a non-potable water source.
	Dry ED Pond	◗	
	Wet Pond	●	• Rarely applicable in arid or semi-arid climates.
	Wet ED Pond	●	• Rarely applicable in arid climates • In semi-arid climates, may be used if the permanent pool is allowed to vary seasonally, rather than be maintained at a fixed level.
Wetlands	Shallow Marsh	●	• Rarely applicable in arid or semi-arid climates.
	ED Wetland	●	• Rarely applicable in arid climates • In semi-arid climates, may be used if the permanent pool is allowed to vary seasonally, rather than be maintained at a fixed level.
	Pond/Wetland	●	• Rarely applicable in arid or semi-arid climates.
Infiltration	Infiltration Trench	○	• Applicable in arid and semi-arid climates.
	Infiltration Basin	◗	• Consider alternatives to a vegetated bottom, such as sand or stones. • Always use drought tolerant vegetation • If water is required, use a non-potable water source
Filters	Sand or Organic Filters	○	• Applicable in arid and semi-arid climates.
Bioretention	Bioretention	◗	• Always use drought tolerant vegetation • If water is required, use a non-potable water source
Vegetative BMPs	Channels	◗	• Consider alternatives to a vegetated bottom, such as sand or stones. • Always use drought tolerant vegetation • If water is required, use a non-potable water source
	Designed Swales	◗	
	Filter Strips	◗	

ED = Extended Detention, Arid = <15" of rain per year, Semi-Arid = <30" of rain per year

● = Yes, significant amounts of water required

◗ = Yes, but only for maintenance (e.g., vegetated BMPs)

○ = No supplemental water required.

2.2 Base Capital Costs

The base capital costs refer primarily to the cost of actually constructing and building the BMP. This may include the cost of erosion and sediment control during construction. The costs of design, geotechnical testing, legal fees, and other unexpected or additional costs are not included in this estimate. The cost of constructing any BMP is variable and depends largely on site conditions and drainage area. For example, if a BMP is constructed in very rocky soils, the increased excavation costs may substantially increase the cost of construction. In addition, designs vary slightly among BMP types. A pond may be designed with or without various levels of landscaping, for example. The data in Table 10 represent typical unit costs ($/cubic foot) from various studies, and should be considered planning level. In the case of ponds, a range is used to reflect the economies of scale involved in designing this BMP.

In some ways there is no such value as the "average" construction cost for some BMPs, because many BMPs can be designed for widely varying drainage areas. However, there is some value in assessing the cost of a typical application of each BMP. The data in Table 11 reflect base capital costs for typical applications of each category of BMP. It is important to note that, since many BMPs have economies of scale, it is not practical to extrapolate these values to larger or smaller drainage areas in many cases.

Table 10. Typical Unit Base Costs for BMPs

BMP	Typical Cost ($/cf)	Notes	Source
Pond	0.50-1.00	Cost range reflects economies of scale in designing this BMP. The lowest unit cost represents approximately 150,000 cubic feet of storage, while the highest is approximately 15,000 cubic feet. Typically, dry ponds are the least expensive design options among ponds.	Adapted from Brown and Schueler (1997)
Wetland	0.60-1.25	Although little data are available to assess the cost of wetlands, it is assumed that they are approximately 25% more expensive (because of plant selection and sediment forebay requirements) than ponds.	Adapted from Brown and Schueler (1997)
Infiltration Trench	4.00	Represents typical costs for a 100-foot long trench.	Adapted from SWRPC (1991)
Infiltration Basin	1.30	Represents typical costs for a 0.25-acre infiltration basin.	Adapted from SWRPC (1991)
Sand Filter	3.00-6.00	The range in costs for sand filter construction is largely due to the different sand filter designs. Of the three most common options available, surface sand filters are the most expensive, perimeter sand filters are moderate and underground sand filters are the most expensive.	Adapted from Brown and Schueler (1997)
Bioretention	5.30	Bioretention is relatively constant in cost, because it is usually designed as a constant fraction of the total drainage area.	Adapted from Brown and Schueler (1997)
Dry Swale	4.25	Very few dry swales have been constructed, but the design is similar to a bioretention facility, with less landscaping. Thus, it is assumed that dry swales cost approximately 80% as much as bioretention.	Adapted from Brown and Schueler (1997)
Grass Channel/ Biofilters	0.50	Based on cost per square foot, and assuming 6" of storage in the filter.	Adapted from SWRPC (1991)
Filter Strip	0.00-1.30	Based on cost per square foot, and assuming 6" of storage in the filter strip. The lowest cost assumes that the buffer uses existing vegetation, and the highest cost assumes sod was used to establish the filter strip.	Adapted from SWRPC (1991)

Table 11. Base Costs of Typical Applications of Stormwater BMPs[1]

BMP	Typical Cost ($/BMP)	Application	Source
Pond	$100,000	50- Acre Residential Site (Impervious Cover = 35%)	Adapted from Brown and Schueler (1997)
Wetland	$125,000	50- Acre Residential Site (Impervious Cover = 35%)	Adapted from Brown and Schueler (1997)
Infiltration Trench	$45,000	5-Acre Commercial Site (Impervious Cover = 65%)	Adapted from SWRPC (1991)
Infiltration Basin	$15,000	5-Acre Commercial Site (Impervious Cover = 65%)	Adapted from SWRPC (1991)
Sand Filter	$35,000-$70,000[2]	5-Acre Commercial Site (Impervious Cover = 65%)	Adapted from Brown and Schueler (1997)
Bioretention	$60,000	5-Acre Commercial Site (Impervious Cover = 65%)	Adapted from Brown and Schueler (1997)
Dry Swale	$30,000	5- Acre Residential Site (Impervious Cover = 35%)	Adapted from Brown and Schueler (1997)
Grass Channel/ Biofilters	$3,500	5- Acre Residential Site (Impervious Cover = 35%)	Adapted from SWRPC (1991)
Filter Strip	$0-$9,000	5- Acre Residential Site (Impervious Cover = 35%)	Adapted from SWRPC (1991)

1: Total captial costs can typically be determined by increasing these costs by approximately 30%.
2: A range is given to account for design variations.

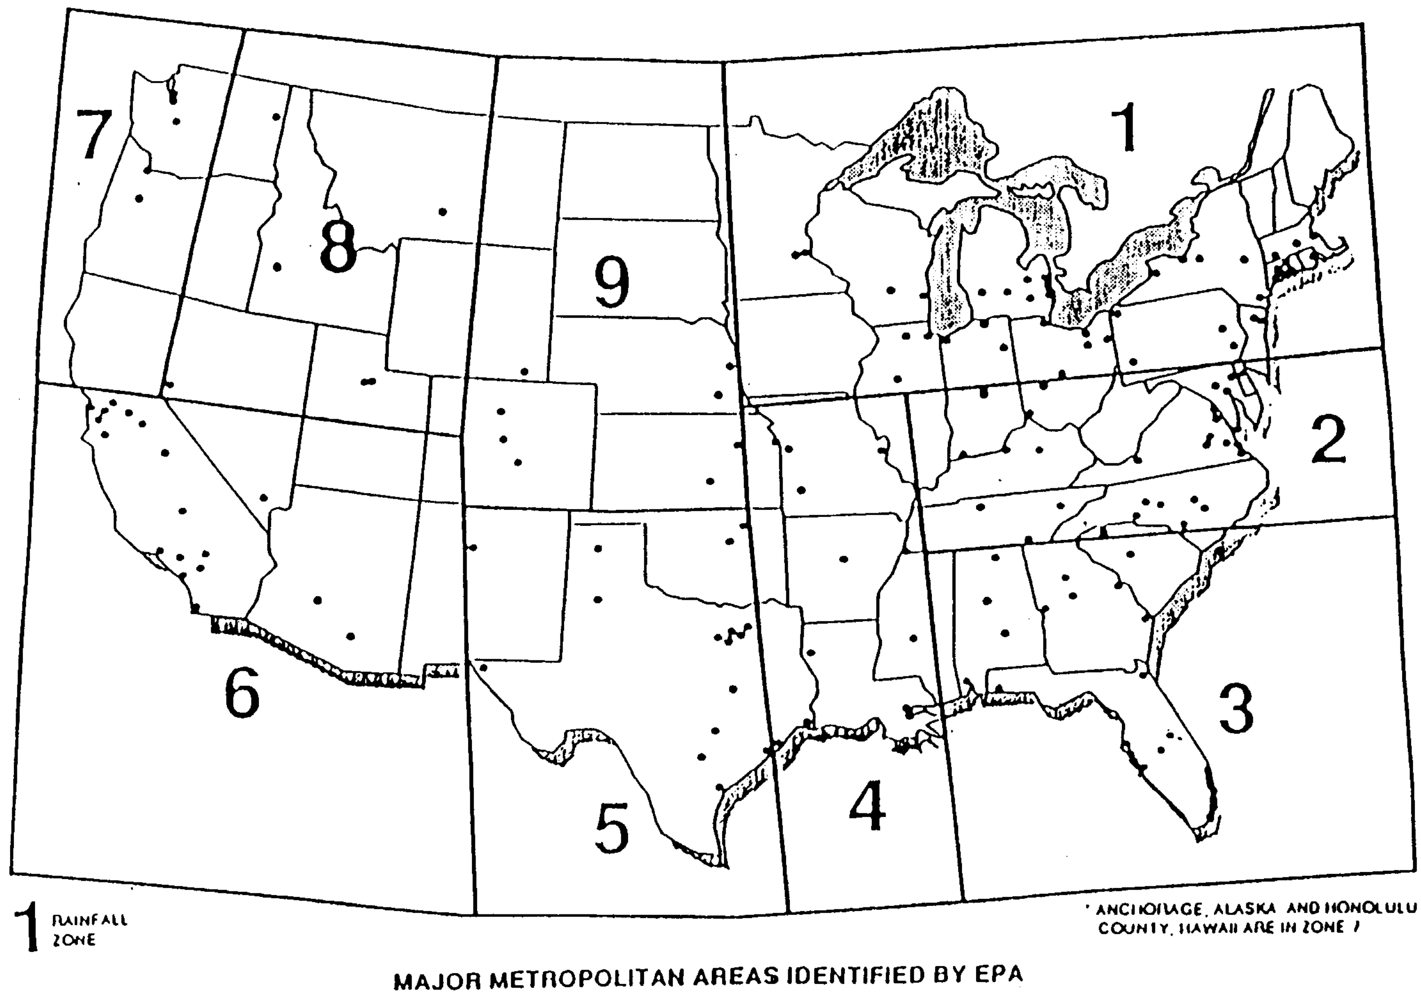
Although various manuals report construction cost estimates for storm water ponds, only three studies, to our knowledge, have systematically evaluated the construction costs associated with structural BMPs since 1985. The three studies used slightly different estimation procedures. Two of these studies were conducted in the Washington, DC region and used a similar methodology (Wiegand et al., 1986; Brown and Schueler, 1997). In both studies, the costs were determined based on engineering estimates of construction costs from actual BMPs throughout the region. In the third study, conducted in Southeastern Wisconsin, costs were determined using standardized cost data for different elements of the BMP, and assumptions of BMP design (SWRPC, 1991).

Any costs reported in the literature need to be adjusted for inflation and regionally. All costs reported in this report assume a 3% annual inflation rate. In addition, studies are adjusted to the "twenty cities average" construction cost index, to adjust for regional biases, based on a methodology followed by the American Public Works Association (APWA, 1992). Using the EPA's rainfall regions (See Figure 1), a cost adjustment factor is assigned to each region (Table 12). For example, rainfall region 1 has a factor of 1.12. Thus, all studies in the Northeastern United States are divided by 1.12 in order to adjust for this bias.

Table 12. Cost Adjustment Factors
Source: Modified from APWA, 1992

Rainfall Region	1	2	3	4	5	6	7	8	9
Adjustment Factor	1.12	0.90	0.67	0.92	0.67	1.24	1.04	1.04	0.76

Figure 1. US EPA Rainfall Zones
Source: APWA, 1992



2.1.1 Ponds and Wetlands

Total pond volume is generally a strong predictor of cost (Table 11). There are some economies of scale associated with constructing ponds, as evidenced by the slope of the volume equations derived. This is largely because of the costs of inlet and outlet design, and mobilization of heavy equipment that are relatively similar regardless of pond size.

Erosion and sediment control represents only about 5% of the construction cost of ponds and wetlands (Brown and Schueler, 1997). Thus, the construction cost estimates presented in Table 13 are comparable. The cost of building storm water ponds has increased since 1986 (Figure 2), even after adjusting for inflation. Part of the reason for this increase is thought to be attributable to the improved design of storm water ponds to enhance water quality and to the more complex regulatory and review environment (Brown, 1997). The cost estimations made by SWRPC (1991) were generally a mid-range between the earlier and more recent studies.

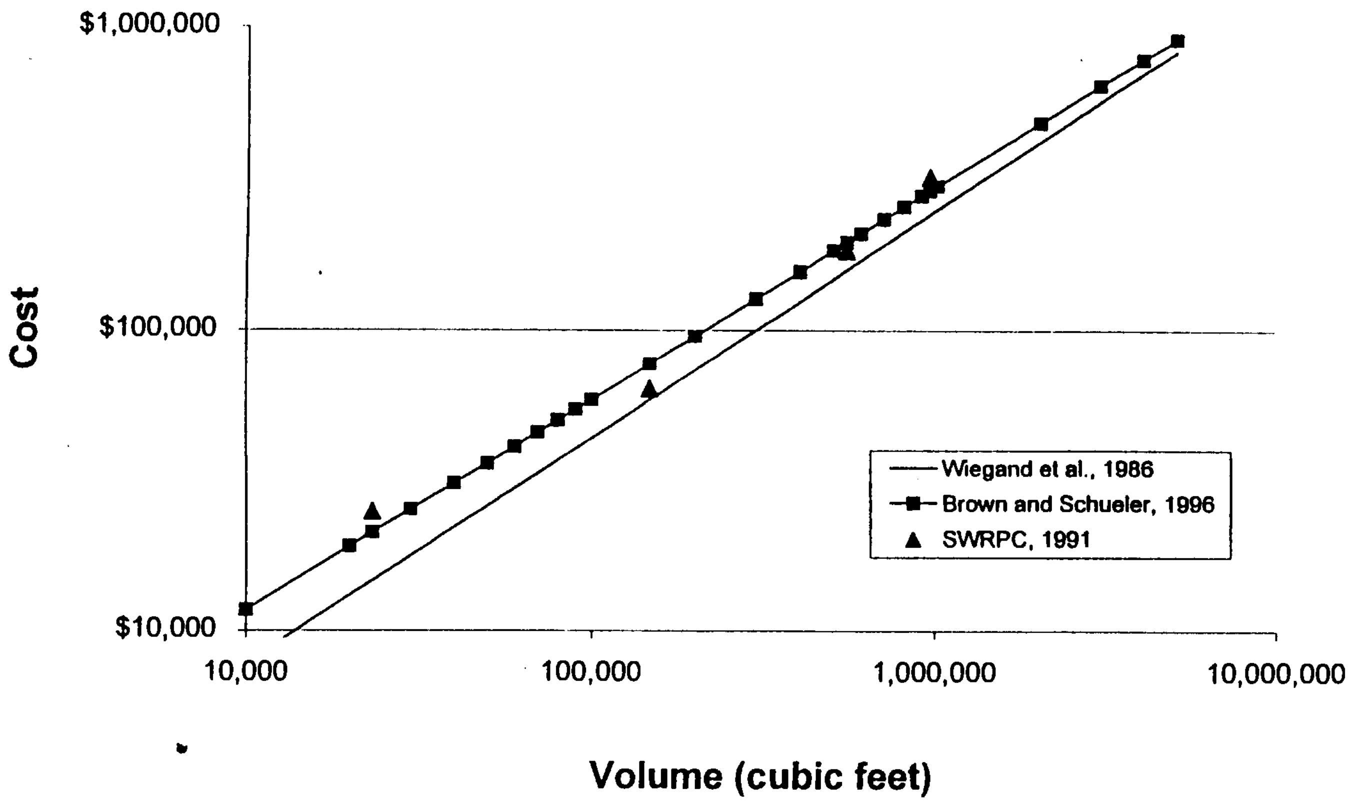
Table 13. Base Capital Costs for Storm Water Ponds and Wetlands

BMP	Cost Equation or Estimate[1,2]	Costs Included: Construction	Costs Included: E&S Control	Source
All Ponds and Wetlands	$7.75V^{0.75}$	✔	✔	Wiegand et al.. 1986
All Ponds and Wetlands	$18.5V^{0.70}$	✔		Brown and Schueler, 1997
Dry Ponds	$7.47V^{0.78}$	✔	✔	Brown and Schueler, 1997
Wet Ponds	1.06V: 0.25 acre wet detention basin (23,300 cubic feet)	✔		SWRPC, 1991
	0.43V: 1.0 acre wet detention basin (148,000 cubic feet)			
	0.33V: 3.0 acre wet detention basin (547,000 cubic feet)			
	0.31V: 5.0 acre wet detention basin (952,000 cubic feet)			

1: V refers to the total pond volume in cubic feet
2: Costs presented from SWRPC (1991) are "moderate" costs reported in that study.

R0073103

Figure 2. Pond Construction Cost



2.1.2 Infiltration Practices

Costs for infiltration BMPs are highly variable from site to site, depending on soils and other geotechnical information. Perhaps because of this variability, cost estimates for infiltration trenches have been widely different (Table 14; Figure 3). Brown and Schueler (1997) concluded that the Wiegand (1986) equation underestimated cost, partially because of the lack of pretreatment in earlier designs, although they were unable to develop a consistent equation due to a small sample size.

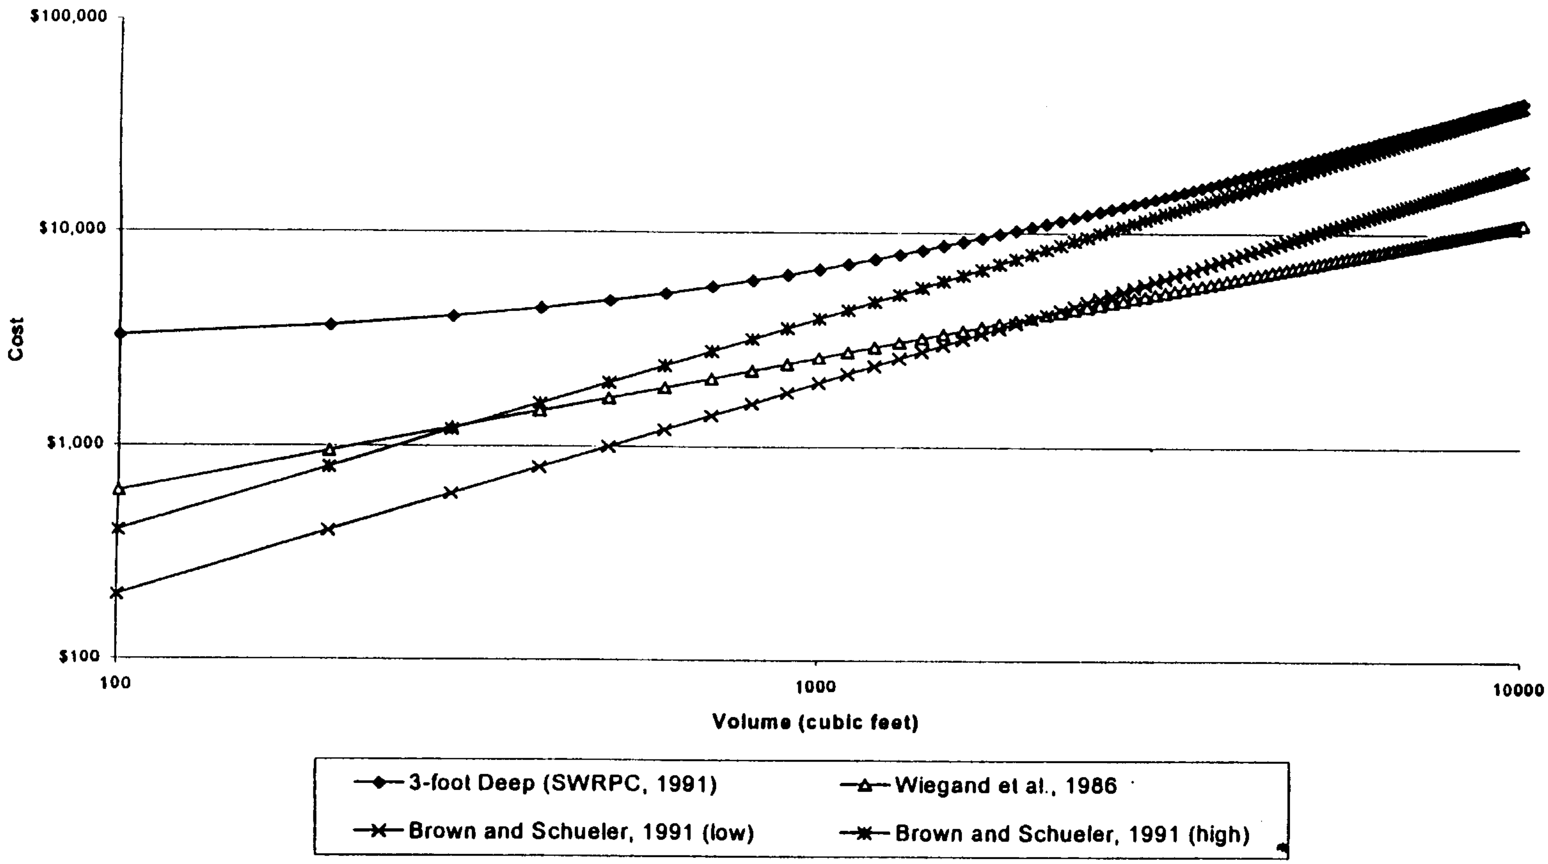
It is difficult to estimate the cost of infiltration basins, particularly since there have been very few constructed within the last several years. The costs estimates for SWRPC are dramatically higher than those estimated by Schueler, 1987 (Figure 4). This is largely because the SWRPC document assumes that 50% additional volume is excavated for the spillway, while Schueler, 1987 uses a wet pond cost equation.

Table 14. Base Capital Costs for Infiltration Practices

BMP	Cost Equation or Estimate[4]	Costs Included: Construction	Costs Included: E&S Control	Source
Infiltration[1] Trenches	$33.7V^{0.63}$	✔		Wiegand et al., 1986
	2V to 4V; average of 2.5V	✔		Brown and Schueler, 1997
	\$4,400: 3-foot deep, 4-foot wide, 100-foot long trench	✔		SWRPC, 1991
	\$10,400: 6-foot deep, 10-foot wide, 100-foot long trench			
	3.9V+2,900: 3-foot deep, 100-foot long trench	✔		Modified from SWRPC, 1991
Infiltration Basins[2]	$13.2V^{0.69}$	✔	✔	Schueler, 1987; Modified from Wiegand et al., 1986
	1.3V: 0.25-acre infiltration basin (15,000 cubic feet)	✔		SWRPC, 1991
	0.8V: 1.0-acre infiltration basin (76,300 cubic feet)			
Porous Pavement[3]	50,000A	✔		SWRPC, 1991
	80,000A	✔		Schueler, 1987

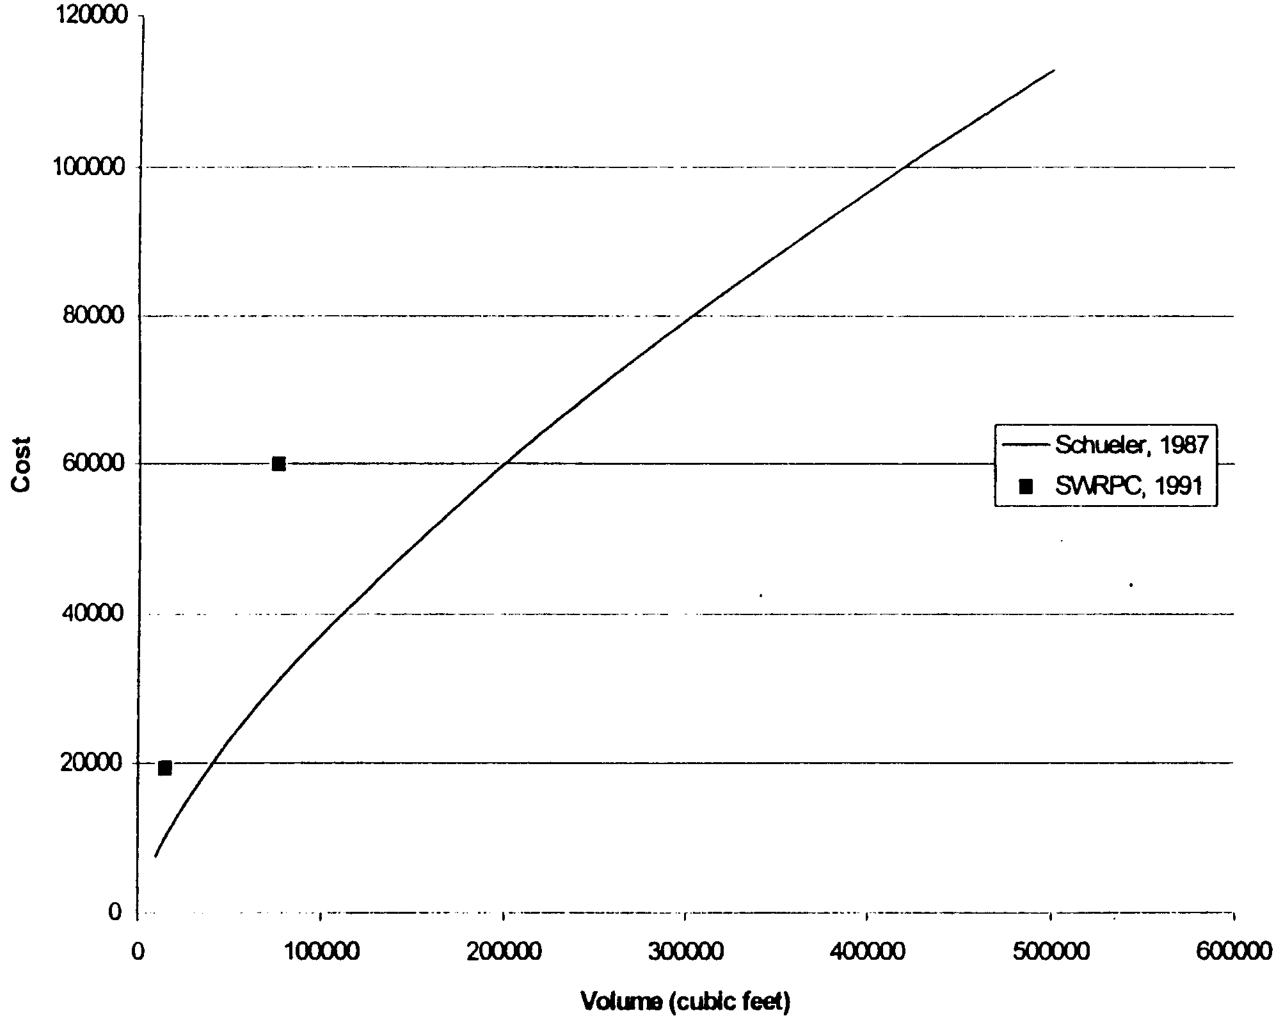
1: V for infiltration trenches refers to the treatment volume within the trench, assuming a porosity of 32%
2: V for infiltration basins refers to the total basin volume
3: A is the surface area in acres of porous pavement
4: Costs presented from SWRPC (1991) are "moderate" costs reported in that study.

Figure 3. Infiltration Trench Costs



R0073105

Figure 4. Infiltration Basin Construction Cost



R0073106

2.1.3 Sand Filters

Since sand filters are a relatively recent technology, less information is available on their cost than on most BMPs. In addition, the costs of sand filters vary significantly due to the wide range of design criteria for sand filters (Table 15). Brown and Schueler (1997) were unable to derive a valid relationship between sand filter cost and water quality volume, with costs ranging between $2 and $6 per cubic foot of water quality volume, with a mean cost of $2.50 per cubic foot. The water quality volume includes the pore space in the sand filter, plus additional storage in the pretreatment basin.

Because sand filters are a relatively new technology, no equation referencing the economies of scale has been developed. However, it appears that economies of scale do exist. For example, data from Austin indicates that the cost per acre decreased by over 80% for a design of a 20-acre drainage area, when compared with a 1-acre drainage area. (Schueler, 1994).

Table 15. Construction Costs for Various Sand Filters
Source: Schueler, 1994

Region (Design)	Cost/Impervious Acre
Delaware	$10,000
Alexandria, VA (Delaware)	$23,500
Austin, TX (<2 acres)	$16,000
Austin, TX (>5 acres)	$3,400
Washington, DC (underground)	$14,000
Denver, CO	$30,000-$50,000

2.1.4 Bioretention

Little information is available on the costs of bioretention because it is also a new practice. Brown and Schueler (1997) found consistent construction costs of approximately $5.30 per cubic foot of water quality volume for the construction cost. The water quality volume includes 9" above the surface area of the bioretention structure.

2.1.5 Vegetative BMPs

Vegetative BMPs include such practices as grassed swales and filter strips. The three major types of vegetative BMPs include filter strips, grassed channels (also called biofilters) and designed swales, which include a "made" soil bed and an underdrain system (Claytor and Schueler, 1997). The costs for these BMPs vary, and largely depend on the method used to establish vegetation (Table 16).

Table 16. Base Capital Costs of Vegetative BMPs

BMP	Cost Equation or Estimate[2]	Costs Included		Source
		Construction	E&S Control	
Filter Strips	Existing Vegetation: 0 Seed: $13,800/acre Sod: $29,000/acre	✔		SWRPC, 1991
Grassed Channels	25¢ per square foot	✔		SWRPC, 1991
Designed Swales[1]	$4.25 per cubic foot	✔		Modified from Brown and Schueler, 1997

1: Assumes that the cost of a designed swale is 80% of the cost of bioretention.
2: Costs presented from SWRPC (1991) are "moderate" costs reported in that study.

2.2 Design, Contingency and Permitting Costs

Most BMP cost studies assess only part of the cost of constructing a BMP, usually excluding permitting fees, engineering design and contingency or unexpected costs. In general, these costs are expressed as a fraction of the construction cost (Table 17). These costs are generally only estimates, based on the experience of designers.

Table 17. Design, Contingency and Permitting Costs

Additional Costs Estimate (Fraction of base construction costs)	Source	Comments
25%	Wiegand et al., 1986	Includes design, contingencies and permitting fees
32%	Brown and Schueler, 1997	Includes design, contingencies, permitting process and erosion and sediment control

2.3 Land Costs

The cost of land is extremely variable both regionally and by surrounding land use. For example, many suburban jurisdictions require open space, reducing the effective cost of land for BMPs to zero (Schueler, 1987). On the other hand, the cost of land may far outweigh construction and design costs in ultra-urban settings. For this reason, some underground BMPs that are relatively expensive to construct may be attractive in this "ultra-urban" setting (Lundgren, 1996) if sub-surface conditions are suitable. The land consumed per treatment volume depends largely on how much of the BMP's treatment is underground, and varies considerably (Table 18).

Table 18. Relative Land Consumption of Storm Water BMPs
Source: Claytor and Schueler, 1997

BMP	Land consumption (% of Impervious Area)
Wet Pond	2-3%
Marsh or Wetland	3-5%
Infiltration Trench	2-3%
Infiltration Basin	2-3%
Porous Pavement	0%
Sand Filters	0%-3%
Bioretention	5%
Swales	10%-20%
Filter Strips	100%

Note: Represents the amount of land needed as a percent of the impervious area that drains to the practice to achieve effective treatment.

2.4 Operation and Maintenance Costs

In most studies, operation and maintenance costs have been estimated as a percentage of base construction costs (Table 19). While some BMPs require infrequent, costly maintenance, others need more frequent but less costly maintenance. Accordingly, selection of appropriate structural BMPs must factor in maintenance cost (and a responsible party to carry out maintenance) to ensure the necessary long-term performance. Typical maintenance activities are included in Table 20

Table 19. Annual Maintenance Costs

BMP	Annual Maintenance Cost (% of Construction Cost)[1]	Cost for a "Typical" Application (See Table 10)	Source(s)
Ponds and Wetlands	3%-6%	$3,000 to $6,000	Wiegand et al., 1986 Schueler et al., 1987 SWRPC, 1991
Dry Ponds	-1%	$1,200	Livingston et al., 1997; Brown and Schueler, 1997
Wetlands	-2%	$3,800	Livingston et al., 1997; Brown and Schueler, 1997
Infiltration Trench	5%-20%	$2,300 to $9,000	Schueler, 1987 SWRPC, 1991
Infiltration Basin	1%-3%	$150 to $450[2]	Livingston et al., 1997; SWRPC, 1991
	5%-10%	$750-$1,500	Wiegand et al., 1986; Schueler et al., 1987; SWRPC, 1991
Sand Filters	11%-13%	$2,200	Livingston et al., 1997; Brown and Schueler, 1997
Swales, grassed channels	5%-7%	$200 to $2,000	SWRPC, 1991
Bioretention	5%-7%	$3,000 to $4,000	(Assumes the same as swales)
Filter strips	$320/acre (maintained)	$1,000	SWRPC, 1991

1: Livingston et al. (1997) reported maintenance costs from the maintenance budgets of several cities, and percentages were derived from costs in other studies

2: This value was extrapolated from the costs for much larger basins.

R0073110

Table 20. Maintenance Schedules for BMPs

BMP	Activity	Schedule
Pond/ Wetland[1]	• Cleaning and removal debris after major storm events; (>2" rainfall). • Harvest vegetation when a 50% reduction in the original open water surface area occurs. • Repair of embankment and side slopes. • Repair of control structure.	Annual or As Needed
	• Removal of accumulated sediment from forebays or sediment storage areas when 60% of the original volume has been reduced.	5-year cycle
	• Removal of accumulated sediment from main cells of pond once 50% of the original volume has been reduced.	20-year cycle
Infiltration Trench[1]	• Cleaning and removal of debris after major storm events; (>2" rainfall). • Mowing and maintenance of upland vegetated areas. • Sediment cleanout. • Repair or replacing of stone aggregate. • Maintenance of inlets and outlets.	Annual or as needed
	• Removal of accumulated sediment from forebays or sediment storage areas when 50% of the original volume has been reduced.	4-year cycle
Infiltration Basin[2]	• Cleaning and removal of debris after major storm events; (>2" rainfall). • Mowing and maintenance of upland vegetated areas. • Sediment cleanout.	Annual or as needed
	• Removal of accumulated sediment from forebays or sediment storage areas when 50% of the original volume has been reduced.	3- to 5-year cycle
Sand Filters[3]	• Removal of trash and debris from control openings. • Repair of leaks from the sedimentation chamber or deterioration of structural components. • Removal of the top few inches of sand, and cultivation of the surface, when filter bed is clogged.	Annual or as needed
	• Clean out of accumulated sediment from filter bed chamber once depth exceeds approximately one-half (½) inch, or when the filter layer will no longer drawdown within 24 hours. • Clean out of accumulated sediment from sedimentation chamber once depth exceeds 12 inches.	3- to 5-year cycle
Bioretention[4]	• Repair of erosion areas • Mulching of void areas • Removal and replacement of all dead and diseased vegetation • Watering of plant material	Bi-Annual or as needed
	• Removal of mulch and application of a new layer	Annual

Table 20. Maintenance Schedules for BMPs

BMP	Activity	Schedule
Dry Swale/ Grass Channel/ Biofilters[1]	• Mowing and litter and debris removal • Stabilization of eroded side slopes and bottom • Nutrient and pesticide use management • Dethatching swale bottom and removal of thatching • Discing or aeration of swale bottom	Annual or as needed
	• Scraping swale bottom, and removal of sediment to restore original cross section and infiltration rate • Seeding or sodding to restore ground cover (use proper erosion and sediment control)	5-year cycle
Filter Strip[5]	• Mowing and litter debris removal • Nutrient and pesticide use management • Aeration of soil on the filter strip • Repair of eroded or sparse grass areas	Annual or as needed

1: Modified from Livingston, et al. (1997)
2: Modified from Livingston et al. (1997), based on infiltration trench requirements
3: Modified from Claytor and Schueler (1997)
4: Modified from ETA and Biohabitats (1993)
5: Modified from Livingston et al. (1997) based on grass swale recommendations.

2.5 Lifelong BMP Cost: Two Scenarios

In order to compare various BMP options, costs were calculated for a 5-acre commercial site and a 38-acre residential site. Construction costs were evaluated using the following steps:

1) Calculate the water quality volume (WQ_v).
   using Schueler's Simple Method. The water quality volume used was for the 1" storm. Thus, the volume is equal to:

$$WQ_v = (.05+.9I)\ A/12$$

Where:

WQ_v = Water Quality Volume (Acre-Feet)
I = Impervious Fraction in the Watershed
A = Watershed Area (Acres)

2) Calculate the detention storage volume.
   Total detention storage was determined using standard peak flow methods (NRCS, 1986). Detention storage was calculated for a 5" storm.

3) Calculate total volume.
   Many BMPs do not require any detention storage, but for BMPs that do provide flood storage, such as ponds, the total volume is the sum of the water quality and detention volumes calculated in steps 1) and 2).

4) Determine the construction cost.
   The construction cost for each BMP is determined based on equations described in section 3.0.

2.5.1 5-Acre Commercial Development

The following data were used as the basis for the 5-acre commercial development.

Table 21. Data for the Commercial Site

Area (A)	5 acres
Impervious Cover (I)	65%
Water Quality Volume: P·Rv·A/12 P=1" of rainfall Rv = 0.5+0.9(I) A = Drainage Area	0.26 ac-ft
Total Detention Storage (TR-55)	0.74 ac-ft
Total Storage	1.00 ac-ft

These data were then used to compare various BMP options (Table 22). Grassed channels and filter strips were not included in this analysis because, although they do improve water quality, their pollutant removal is significantly lower than for other storm water BMPs (Brown and Schueler, 1997a). Again, it is important to note that the cost of land is not included in this calculation. Although ponds are the least expensive option on an annual basis, the cost of land may drive designs to less space-consumptive BMPs, such as sand filters or bioretention systems.

Table 19. BMP Costs for a Five-acre Commercial Development

BMP	Construction Cost Equation	Construction Cost	Typical Design, Contingency and Other Capital Costs (30% of Construction Costs)	Annual Maintenance Costs (% of Construction, $)	Life[4] (Years)	Notes	Sources
Pond	$18.5V_t^{0.70}$	$32,700	$9,810	5%; $1,640	50	Much of the cost associated with this BMP is the extra storage to provide flood control and channel protection. Ponds are very reliable.	Brown and Schueler, 1997; Wiegand et al., 1986; Schueler et al., 1987; SWRPC, 1991 US EPA, 1993
Infiltration Trench	$3.9V_{wq}+2{,}900$	$47,100	$14,100	12%; 5,650	10	Although infiltration trenches are designed to last a long time, they need to be inspected and rebuilt if they become clogged.	SWRPC, 1991; Schueler, 1987; US EPA, 1993
Infiltration Basin	$1.3V_{wq}$	$4,716	$1,410	8%; $377	25	Infiltration basins are not very reliable, and tend to become clogged.	SWRPC, 1991; Wiegand et al., 1986; Schueler et al., 1987; SWRPC, 1991; US EPA, 1993
Sand Filter	$4V_{wq}$	$44,500	$13,400	12%; $5,340	25	Sand filters require frequent maintenance in order to function long-term.	Brown and Schueler, 1997; Livingston et al., 1997; US EPA, 1993
Dry Swale	$4.25V_{wq}$	$48,100	$14,400	6%; $2,890	25	Dry swales are a relatively new BMP. Little is known about their long-term performance.	Brown and Schueler, 1997; SWRPC, 1991; US EPA, 1993
Bioretention	$5.30V_{wq}$	$60,000	$18,000	6%; $3,600	25	Bioretention is a relatively new BMP. Little is known about its long-term performance.	Brown and Schueler, 1997; SWRPC, 1991

1: V_{wq} = Water Quality Volume 2: V_t=Total Volume
3: Sand filter volume was estimated at 4V, which is slightly high, to account for the relatively small drainage area.
4: Life: Length of time without major modifications or reconstruction

2.5.2 38-Acre Residential Development

The following data were used as the basis for the 38-acre residential development.

Table 23. Data for the residential 38-acre site

Area (A)	38 acres
Impervious Cover (I)	36%
Water Quality Volume:	1.1 ac-ft
Total Detention Storage (TR-55)	2.8 ac-ft
Total Storage	3.9 ac-ft

The same analysis conducted for the commercial site was repeated for the larger site (Table 24). Swales, bioretention and infiltration systems were not included in this analysis, because these BMPs are best applied on small sites.

2.5.3 Adjusting Costs Regionally

The cost data in these examples can be adjusted to specific regions of the country using the conversion factors in Table 10. For example, if costs for rainfall region 1 were needed, the data in Tables 19 or 21 would be multiplied by 1.12.

In addition, design variations in different regions of the country may cause prices to be changed. For example, wetland and wet ponds may be restricted in arid regions of the country. Furthermore, while ponds with a wet pool are used in semi-arid regions, they usually incorporate design variations to improve their performance (Saunders and Gilroy, 1997). In cold regions, BMPs may need to be adapted to account for snowmelt treatment, deep freezes and road salt application (Oberts, 1994, Caraco and Claytor, 1997).

Table 24. BMP costs for a thirty-eight acre residential development

BMP	Construction Cost Equation	Construction Cost	Design, Contingency and other Capital Costs (30% of Construction)	Annual Maintenance Costs (% of Construction; $)	Life[4] (Years)	Notes	Sources
Pond	$18.5V_t^{0.70}$	$84,800	$25,400	5%; $4,240	50	Pond systems are relatively easy to apply to large sites.	Brown and Schueler, 1997; Wiegand et al., 1986; Schueler, 1987; SWRPC, 1991; US EPA, 1993
Sand Filter	$2V_{wq}$	$95,800	$28,700	12%; $11,500	25	Although the sand filter is used in this example, some evidence suggests that sand filters may be subject to clogging if used on a site that drains a relatively pervious drainage area such as this one.	Brown and Schueler, 1997; Livingston et al., 1997; US EPA, 1993

1: V_{wq} = Water Quality Volume 2: V_t=Total Volume
3: Sand filter volume was estimated at 2V, which is slightly low, to account for the relatively large drainage area.
4: Life: Length of time without major modifications or reconstruction

3.0 NON-STRUCTURAL BMP COSTS

Non-structural BMPs, or "source controls", prevent degradation of water resources by preventing pollution at the source, rather than treating polluted runoff. Non-structural practices include a variety of practices, including: street sweeping, illicit connection identification, public education, land use modifications, waste collection and proper materials storage. While non-structural practices play an invaluable role in protecting surface waters, their costs and benefits are not as easily quantified as for structural BMPs. This is primarily because there are no "design standards" for these practices. For example, a public education program may vary from one part-time individual to several full-time staff. It is possible to identify costs associated with specific components of these programs based on past experience. The extent of benefits may only be speculative, partly because the contribution of human behavior to urban storm water pollution is unknown.

3.1.1 Street Sweeping

The costs of street sweeping include the capital costs of purchasing the equipment, plus the maintenance and operational costs to operate the sweepers. Both equipment and operating costs vary depending on the type of sweeper selected. There are several different options for sweepers, but the two basic choices are mechanical sweepers versus vacuum-assisted sweepers.

Mechanical sweepers use brushes to remove particles from streets. Vacuum-assisted dry sweepers, on the other hand, use a specialized brush and vacuum system in order to remove finer particles. While the equipment costs of mechanical sweepers are significantly higher, the total operation and maintenance costs of vacuum sweepers are lower (Table 25).

Table 25. Sweeper Cost Data

Sweeper Type	Life (Years)	Purchase Price ($)	Operation and Maintenance Costs ($/curb mile)	Sources
Mechanical	5	75,000	30	Finley, 1996; SWRPC, 1991
Vacuum-assisted	8	150,000	15	Satterfield, 1996; SWRPC, 1991

Using these data, the cost of operating street sweepers per curb mile were developed, assuming various sweeping frequencies (Table 26). The following assumptions were made to conduct this analysis:

- One sweeper serves 8,160 curb miles during a year (SWRPC, 1991).
- The annual interest rate is 8%.

Table 26. Annualized Sweeper costs ($/curb mile/year)

Sweeper Type	Sweeping Frequency					
	weekly	biweekly	monthly	four times per year	twice per year	annual
Mechanical	1680	840	388	129	65	32
Vacuum-Assisted	946	473	218	73	36	18

Modified from Finley, 1996; SWRPC, 1991; and Satterfield, 1996

3.1.2 Illicit Connection Identification

One source of pollutants is connections to the storm drain system that carry material other than storm water, such as industrial wastes. These pollutants are then discharged through the storm drain system directly to streams without receiving treatment. These illicit connections can be identified using visual inspection during dry weather or through the use of smoke or dye tests. Using visual inspection techniques, illicit connections can be identified for between $1,250 and $1,750 per square mile (Claytor and Brown, 1996).

3.1.3 Public Education

Public education programs encompass many other more specific programs, such as fertilizer management, public involvement in stream restoration and monitoring projects, storm drain stenciling, and overall awareness of aquatic resources. All public education programs seek to reduce pollutant loads by changing people's behavior. They also make the public aware of and gain support for programs in place to protect water resources. Most municipalities have at least some educational component as a part of their program. A recent survey found that 93% of municipal storm water programs incorporate an education program (Livingston et al., 1997).

The City of Seattle, with a population of approximately 535,000, has a relatively aggressive education program, including classroom and field involvement programs. The 1997 budget for some aspects of the program is included in Table 27. Although this does not necessarily reflect typical effort or expenditures, it does provide a guideline for some educational expenditures. These data represent only a portion of the entire annual budget.

Table 27. Public Education Costs in Seattle, Washington
Source: Washington DOE, 1997

Item	Description	1997 Budget
Supplies for Volunteers	Covers supplies for the Stewardship Through Environmental Partnership Program.	$17,500
Communications	Communications strategy highlighting a newly formed program within the city.	$18,000
Environmental Education	Transportation costs from schools to field visits (105 schools with four trips each).	$46,500
Education Services/ Field Trips	Fees for student visits to various sites.	$55,000
Teacher Training	Covers the cost of training classroom teachers for the environmental education program.	$3,400
Equipment	Equipment for classroom education, including displays, handouts, etc.	$38,800
Water Interpretive Specialist-Staff	Staff to provide public information at two creeks.	$79,300
Water Interpretive Specialist - Equipment	Materials and equipment to support interpretive specialist program.	$12,100
Youth Conservation Corps	Supports clean-up activities in creeks.	$210,900

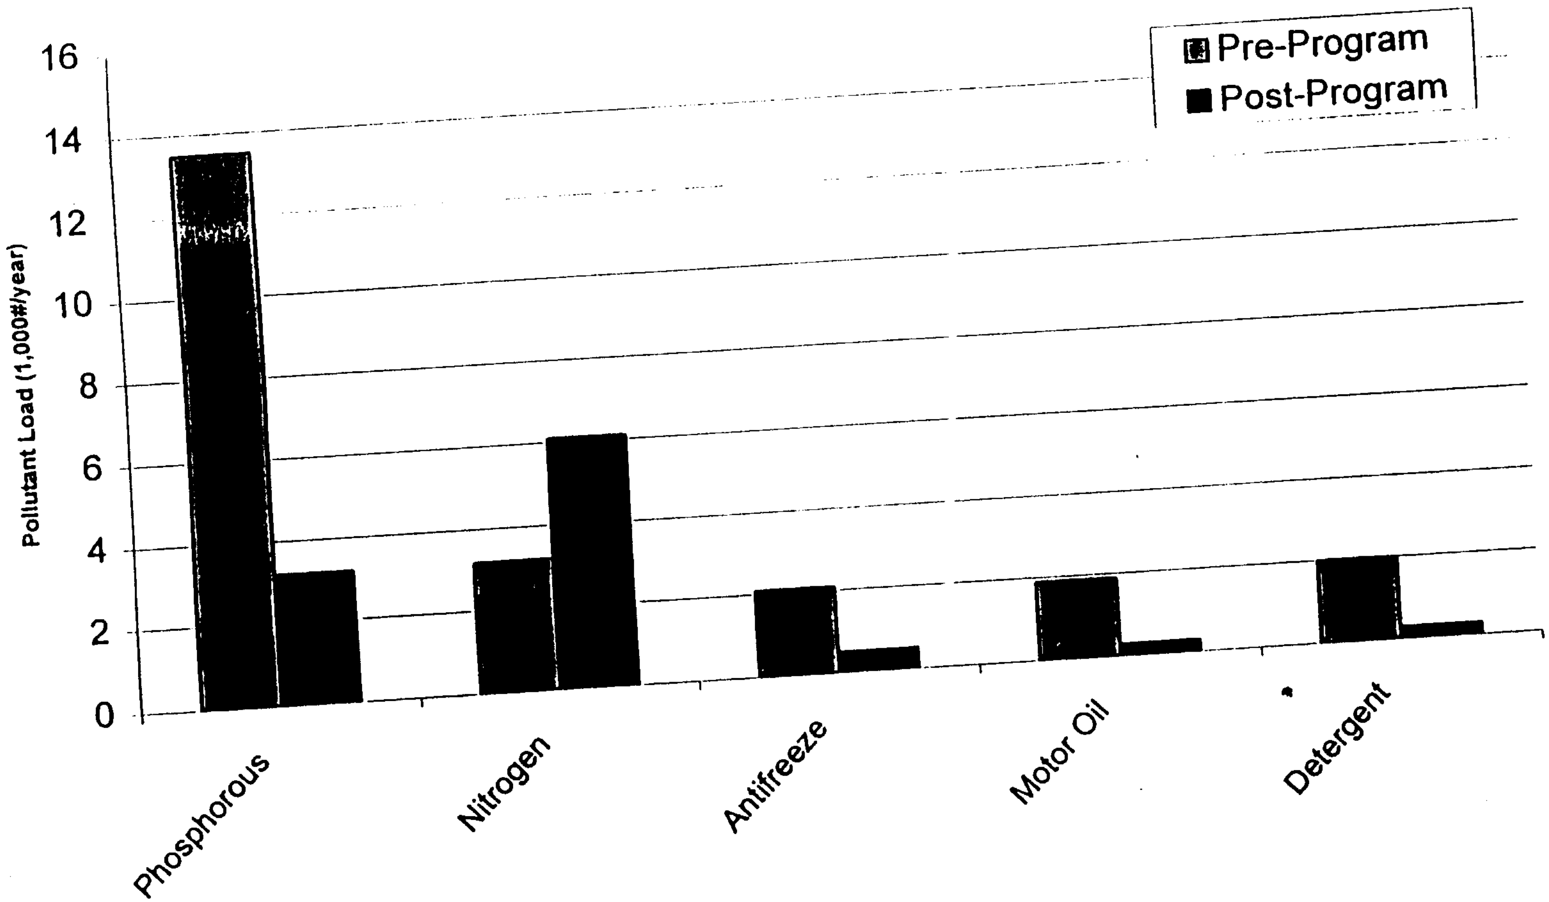
Some unit costs for educational program components are included in Table 28.

Table 28. Unit Program Costs for Public Education Programs

Item	Cost	Source
Public Attitude Survey	$1,250-$1,750 per 1,000 households	Claytor and Brown, 1996
Flyers	10-25¢/ flyer	Ferguson et al., 1997
Soil Test Kit*	$10	Ferguson et al., 1997
Paint	25-30¢/SD Stencil	Ferguson et al., 1997
Safety Vests for Volunteers	$2	Ferguson et al., 1997
* Includes cost of testing, but not sampling.		

Although public education has the obvious benefit of raising public awareness, and therefore promoting support of environmental programs, it is difficult to quantify actual pollutant reductions associated with education efforts. Public attitudes can be used as a gauge of how these programs perform, however. In one study, a public survey was used in combination with modeling to estimate pollutant load reductions associated with public education (Smith et al., 1993; Claytor, 1996; Figure 5). An initial study was conducted to estimate field application of fertilizers, use of detergents and pollution due to oil and antifreeze. Pollutant reductions were then completed assuming that 70% of the population complied with recommendations of the public education program. A follow-up survey was used to assess the effectiveness of the program. Although insufficient data were able to support a second model run, the follow-up survey indicated that educational programs influenced many citizen behaviors, such as recycling. They were unsuccessful, however, at changing the rate at which citizens apply lawn fertilizers.

Figure 5. Changes in Pollutant Load Based on a Public Survey
Source: Claytor, 1996



3.1.4 Land Use Modifications

One of the most effective tools to reduce the impacts of urbanization on water resources is to modify the way growth and development occurs across the landscape. At the jurisdictional or regional level, growth can be managed to minimize the outward extension of development. Jurisdictions can direct growth away from environmentally sensitive areas using such techniques as rezoning or the transfer of development rights. At the site level, the nature of development can be modified to reduce the impacts of impervious cover at individual development projects through techniques such as reduced street widths, clustered housing, smaller parking lots, and incorporation of vegetative BMPs into site design. While there are legal fees associated with changing both local and regional zoning codes, data suggests that concentrating development and minimizing impervious cover at the site level can actually reduce construction costs to both developers and local governments.

By concentrating development near urban areas, the capital costs of development can be lowered substantially due to existing infrastructure and other public services. With conventional development patterns, the cost of servicing residential developments exceeds the tax revenues from these developments by approximately 15% (Pelley, 1997). By encouraging growth to occur in a compact region, rather than over a large area, these capital costs can be reduced substantially (Table 29).

Table 29. Comparison of Capital Costs of Services for a Single Dwelling Unit
SOURCE: Frank, 1989; Quoted in Pelley, 1997

Development Pattern	Capital Costs (1987 Dollars)
Compact Growth	$18,000
Low-Density Growth	$35,000
Low-Density Growth, 10 Miles from Existing Development	$48,000

Savings can also be realized at the site level by reducing the costs of clearing and grading, paving and drainage infrastructure. A recent study compared conventional development plans with alternative options designed to reduce the impacts of development on the quality of water resources. The cost savings realized through these alternative options are summarized in Table 30. In all site designs, the road width was reduced from 28' to 20', reduced lot sizes or reconfigured lots to consume less open space, and provided on-site stormwater treatment.

Table 30. Impervious Cover Reduction and Cost Savings of Conservation Development SOURCE: DE DNREC, 1997

Location	**Techniques Used**	**Impervious Cover Reduction (%)**	**Cost Savings (%)**
Sussex County, DE	• Reduced street widths (from 28' to 20') • Smaller lots (from ½ acre to 1/8 acre) • Cluster development • Preserve woodland areas • Use vegetated BMPs that promote infiltration on site	38%	52%
New Castle County, DE	• Houses clustered into attached units around courtyards • Reduced road widths (28' to 20') • Preserve woodland areas • Use vegetated BMPs that promote infiltration on site	6%	63%
Kent County, DE	• Reduced road widths (28' to 20') • Minimum disturbance boundary • Smaller lots (1 acre to ½ acre) • Preserve woodland areas • Use vegetated BMPs that promote infiltration on site	24%	39%

3.1.5 Oil and Hazardous Waste Collection

Providing a central location for the disposal of oil or hazardous wastes protects water quality by offering citizens an alternative to disposing of these materials in the storm drain. Disposal costs vary considerably depending on the size of the program, and what types of wastes are collected. One study estimated the capital costs at approximately $30,000, with about $12,000 maintenance for a used oil collection recycling program in a typical MS4 (Apogee, 1998a). This estimate was based on data from the Galveston Bay National Estuary Program. Data from the City of Livonia, Michigan indicates that the cost of hazardous waste disposal averages about $12 per gallon (Ferguson et al., 1997).

3.1.6 Proper Storage of Materials

Proper storage of materials can prevent accidental spills or runoff into the storm drain. The design of storage structures varies depending on the needs of the facility. There are also training costs associated with the proper storage of materials. Typical cost estimates, based on standard construction data, are $6 to $11 per square foot for pre-engineered buildings and $3.40 to $5 per square foot for a 6" thick concrete slab (Ferguson et al., 1997).

4.0 BENEFITS OF STORM WATER BMPS

Although it is possible to quantify the economic benefits of water quality improvement (USEPA, 1983), it is difficult to create a "balance sheet" of economic costs and benefits for individual BMPs. Instead, the benefits can be outlined in terms of: 1) effectiveness at reducing pollutant loads 2) other direct water quality impacts and 3) additional economic benefits or costs.

4.1 Storm Water Pollutant Reduction - Structural

A primary function of storm water BMPs is to prevent pollutants from reaching streams and rivers. While all BMPs achieve this function to some extent, there is considerable variability between different types of BMPs. For example, while swales are on par with ponds for removing suspended solids, they are not nearly as efficient at removing phosphorous. Some of this variability is because the pollutant removal mechanisms utilized by each BMP influence the types of pollutants (e.g., soluble versus suspended) that can be removed.

4.1.1 Solids

There are two sources of total suspended solids (TSS) in urban waterways: sediment carried in urban runoff, and streambank erosion caused by the increased runoff from urbanized watersheds. Most BMPs are relatively effective at removing suspended solids from storm water (Table 31), and some others also have the ability to control storm water flows, thus reducing streambank erosion (See Section 4.3). The primary mechanism for removing solids from urban runoff is settling, but another mechanism is filtering through a vegetative or soil medium.

While turbidity and dissolved solids (TDS) are also significant problems in urban streams, little data are available to determine the effectiveness of various BMPs at removing the fine solids that contribute to elevated turbidity. Available data suggest that BMPs are less effective at removing TDS than TSS. While these fine sediments are also removed through settling, they settle at a much slower rate than larger particles, and thus require long retention times.

Table 31. Effectiveness of Storm Water BMPs at Removing Solids
Source: Schueler, 1997

BMP		Median Solids Removal (%)		
		TSS	TDS	Turbidity
Ponds	Detention Pond	7	ND	ND
	Dry ED Pond	61		
	Wet Pond	77	5[3]	
	Wet ED Pond	60		
Wetlands	Shallow Marsh	84	-24[3]	69[3]
	ED Wetland	63		
	Pond/Wetland	72		
Infiltration	All Infiltration	99[1]	ND	ND
Filters	Sand or Organic Filters	87	16	-32[3]
Bioretention	Bioretention	81[2]	ND	60[2]
Vegetative BMPs	Channels	0	ND	ND
	Designed Swales	81	ND	60[3]
	Filter Strips	69[3]	ND	ND

ED = Extended Detention
1: Not based on actual monitoring data. Source: Schueler, 1987
2: Assumes the same removal efficiency as designed swales.
3: Based on fewer than 5 data points.
ND = No or insufficient data, ED = Extended detention

4.1.2 Oxygen Demanding Substances and Dissolved Oxygen

Oxygen demanding substances, usually organic materials, can be removed by settling or filtering in BMPs. Another mechanism for BOD removal is degradation by microbes in a BMP. This mechanism is most active in BMPs with a permanent pool, such as ponds and wetlands. Three different measures are commonly used to assess the oxygen demanding substances in storm water: Total Organic Carbon (TOC), Biochemical Oxygen Demand (BOD) and Chemical Oxygen Demand (COD). All three of these parameters have been monitored in storm water, but too few studies are available to make a statement about the removal efficiency of BMPs for each individual measure. The data in Table 32 represent the average removal for all three measures of oxygen demand.

Table 32. Effectiveness of Storm Water BMPs at Removing Oxygen Demanding Substances
Source: Schueler, 1997

BMP		Median Removal (%)
Ponds	Detention Pond	(-1)[3]
	Dry ED Pond	25
	Wet Pond	45
	Wet ED Pond	27[3]
Wetlands	Shallow Marsh	21
	ED Wetland	ND
	Pond/Wetland	4
Infiltration	All Infiltration	90[1]
Filters	Sand or Organic Filters	66
Bioretention	Bioretention	67[2]
Vegetative BMPs	Channels	18
	Designed Swales	67[3]
	Filter Strips	ND

1: Not based on actual monitoring data. Source: Schueler, 1987
2: Assumes the same removal efficiency as designed swales.
3: Based on fewer than 5 data points.
ND = No or insufficient data, ED = Extended detention

4.1.3 Nitrogen and Phosphorous

Nitrogen and phosphorous are often key pollutants, particularly if eutrophication of a downstream resource such as a lake or estuary are important. Nutrients exist in urban runoff in both organic and mineral phases. While organic nutrients generally remain in a solid phase, mineral forms go into solution as various ionic forms. For the most part, BMPs are more effective at removing the organic forms of nutrients than dissolved forms (Table 33). Ponds and wetlands can remove some portion of dissolved pollutants through biological activity in the permanent pool, and through seasonal uptake in plant materials. Designed swales also show some ability to remove dissolved pollutants, largely due to infiltration or biological activity in a wet soil matrix.

Table 33. Effectiveness of Storm Water BMPs at Removing Nitrogen and Phosphorous Source: Schueler, 1997

BMP		Median Solids Removal (%)			
		Total N	Nitrate	Total P	Soluble P
Ponds	Detention Pond	5[3]	3[3]	10[3]	2[3]
	Dry ED Pond	31[3]	9[3]	19	-9[3]
	Wet Pond	30	24	47	51
	Wet ED Pond	35[3]	42[3]	58	58[3]
Wetlands	Shallow Marsh	24	78	38	37[3]
	ED Wetland	36[3]	29[3]	24[3]	32[3]
	Pond/Wetland	13	15	54	39
Infiltration	All Infiltration	60-70[1]	ND	65-75[1]	ND
Filters	Sand or Organic Filters	44	-13	51	-31[3]
Bioretention	Bioretention	ND	38[2]	9[2]	0[2]
Vegetative BMPs	Channels	0	2	-14	-15[3]
	Designed Swales	ND	38	9	0[3]
	Filter Strips	ND	-4[3]	8[3]	ND

1: Not based on actual monitoring data. Source: Schueler, 1987
2: Assumes the same removal efficiency as designed swales.
3: Based on fewer than 5 data points.
ND = No or insufficient data, ED = Extended detention

4.1.4 Pathogens

Bacteria and other pathogens can cause effects to human health, impact wildlife, and cause unwanted economic impacts such as shellfish bed closings. The three most common bacteria measured in BMP performance studies are Fecal Coliform, Fecal Streptococci and E. Coli. The ability of various BMPs to remove bacteria has not been extensively documented, but some data are available (Table 34). Some removal mechanisms include: light, sedimentation, filtration, and growth inhibitors such as cool temperatures, low nutrients and low carbon (Schueler, 1998). Swales and channels appear to export bacteria based on monitoring studies. Two possibilities for this phenomenon are that pet droppings may be a source of bacteria, or that the moist, organic environment of "wet" swales may encourage bacterial growth.

Table 34. Effectiveness of Storm Water BMPs at Removing Pathogens
Source: Schueler, 1998

BMP		Median Pathogen Removal (%)		
		Fecal Coliform	Fecal Streptococci	E. Coli
Ponds	Detention Pond	ND	ND	ND
	Dry ED Pond			
	Wet Pond	65	73[1]	51[1]
	Wet ED Pond			
Wetlands	Shallow Marsh	ND.	ND	ND
	ED Wetland			
	Pond/Wetland			
Infiltration	All Infiltration	98[1]	98[1]	98[1]
Filters	Sand or Organic Filters	51	58	ND
Bioretention	Bioretention	ND	ND	ND
Vegetative BMPs	Channels/Swales	-58	ND	ND
	Filter Strips	ND	ND	ND

1: Based on fewer than 5 data points.
ND = No or insufficient data, ED = Extended detention

4.1.5 Petroleum Hydrocarbons

Petroleum hydrocarbons originate primarily from automotive sources in the urban landscape. Hydrocarbons can be measured as polycyclic aromatic hydrocarbons (PAHs), total petroleum hydrocarbons (TPH) or oil and grease. Total petroleum hydrocarbons (TPHs) are the only parameter that is measured frequently enough to assess pollutant removal (Table 35). Hydrocarbons are hydrophobic, meaning that they tend to bind to sediment rather than go into solution. BMPs that are effective at removing suspended solids also tend to be effective at removing hydrocarbons. Special attention must be given to disposal of sediment during maintenance of BMPs that serve high-petroleum land uses.

Table 35. Effectiveness of Storm Water BMPs at Removing Hydrocarbons Source: Schueler, 1997

BMP		Median TPH Removal (%)
Ponds	Detention Pond	ND
	Dry ED Pond	
	Wet Pond	83[2]
	Wet ED Pond	
Wetlands	Shallow Marsh	90[2]
	ED Wetland	
	Pond/Wetland	
Infiltration	All Infiltration	ND
Filters	Sand or Organic Filters	81[2]
Bioretention	Bioretention	62[1]
Vegetative BMPs	Channels	ND
	Designed Swales	62[2]
	Filter Strips	ND

1: Assumes the same removal efficiency as designed swales.
2: Based on fewer than 5 data points.
ND = No or insufficient data, ED = Extended detention

4.1.6 Metals

Metals, like nutrients, have both dissolved and solid phases in storm water. Solid phase metals tend to attach to sediments, and can be removed by settling. Dissolved phase, or ion, forms of metals can only be effectively removed by being converted into another form or by attaching to sediment. Another concern with metals is that, during peak events such as snowmelt, an acute concentration will occur. BMPs that dilute storm water runoff, such as ponds and wetlands, can help to prevent these acute events. Metal pollutant removal data are included in Table 36.

Table 36. Effectiveness of Storm Water BMPs at Removing Metals
Source: Schueler, 1997

BMP		Median Metals Removal (%)			
		Cd	Cu	Pb	Zn
Ponds	Detention Pond / Dry ED Pond	54[3]	26[3]	43	26
	Wet Pond / Wet ED Pond	24[3]	57	73	51
Wetlands	Shallow Marsh / ED Wetland / Pond/Wetland	69	39	63	54
Infiltration	All Infiltration	95-99[1]	95-99[1]	95-99[1]	95-99[1]
Filters	Sand or Organic Filters	ND	34	71	80
Bioretention	Bioretention	42[2]	51[2]	67[2]	71[2]
Vegetative BMPs	Channels	55[3]	14	30	29
	Wet and Dry Swales	42[3]	51	67	71
	Filter Strips	ND	ND	17[3]	51[3]

1: Not based on actual monitoring data. Source: Schueler, 1987
2: Assumes the same removal efficiency as designed swales.
3: Based on fewer than 5 data points.
ND = No or insufficient data, ED = Extended detention

4.1.7 Synthetic Organics

Synthetic organics include materials such as pesticides, household materials and other manufactured compounds. These materials are detected at very low concentrations in urban runoff, and are very expensive to monitor. Thus, little information is available on the effectiveness of structural BMPs at removing these pollutants. Like hydrocarbons and organic carbon, these materials tend to bind to sediment, and can also be treated through transformations to less damaging substances. However, since these materials are found in such low concentrations, it is not clear that traditional BMPs can remove them. Non-structural strategies, especially pollution prevention, may be more reliable.

4.1.8 Temperature

Stream warming is a common problem in urban settings, and occurs primarily because rainfall flows over the ground surface on hot pavement. Most BMPs (such as storm water ponds) appear to increase stream temperature, rather than decrease it, due to surface heating. One study in Maryland investigated the impact of various storm water BMPs on water temperature, based on the change in temperature between the inflow and outflow points (Table 37). Although all BMP options result in an increase in temperature, the wet pond appears to have the highest temperature increase, while the infiltration BMP has the lowest. It is important to note that the infiltration facility failed during part of the study, and thus water was ponded for a long period of time, allowing it to heat up.

Features can be incorporated into any BMP to reduce the impacts of stream warming. Some of these features include providing shade along channels and directing low flows through a pipe below the ground surface, rather than over heated rock. In streams that are very sensitive to warm temperatures, such as trout streams, some BMPs should be avoided entirely. For example, most ponds and wetlands with a permanent pool are restricted in cold water streams (CWP et al., 1997).

Table 37. Temperature Increase in Various BMPs
Source: Galli, 1990

BMP	Temperature Increase (°F)
Infiltration- Dry Pond	2.5
Extended Detention Wetland	3.2
Extended Detention Dry Pond	5.3
Wet Pond	9.1

4.1.9 pH

Most traditional BMPs are not effective at increasing the pH of storm water, which may be acidic. One possible role is for permanent pool BMPs to dilute toxic waves of pollutants that may occur during seasonal events, such as the spring snowmelt. The goal is not necessarily to reduce pollutants, but to reduce the shock associated with high volumes of low pH water occurring during a short time period. In addition, design features that limit anoxic conditions can prevent low pH conditions. When anoxic conditions develop in a storm water BMP, the pH of the water in this BMP drops, increasing the chances of acidic water being released.

4.2 Pollutant Reduction: Non-Structural BMPs

Unlike structural BMPs, it is generally not possible to associate specific pollutant removal rates with non-structural BMPs, with the exception of street sweeping (Table 38). However, some non-structural BMPs are targeted at specific pollutants. Table 39 outlines the most effective BMPs for removing specific types of pollutants.

Table 38. Sweeper Efficiencies (%)
Source: Satterfield, 1996

Sweeper Type	Constituent				
	Solids	BOD	TP	TN	Pb
Mechanical	55	43	40	42	35
Vacuum-Assisted	93	77	74	77	76

Note: These removal rates represent the fraction of pollutants picked up off the street, and thus overestimate actual reduction in storm water concentrations.

Table 39. Non-Structural BMPs Suited to Treating Various Pollutants

Pollutant	Appropriate BMPs	
Solids	Street Sweeping	Land Use Modifications
Oxygen Demanding Substances	Street Sweeping Education: Storm Drain Stenciling Land Use Modifications	Education: Pet Scoop Ordinance Illicit Connections Identification
Nitrogen and Phosphorous	Street Sweeping Education: Pet Scoop Ordinance Land Use Modifications Proper Materials Handling	Illicit Connections Identified Education: Lawn Care Materials Storage and Recycling
Pathogens	Illicit Connections Identified Land Use Modifications	Education: Pet Scoop Ordinance
Petroleum Hydrocarbons	Street Sweeping Education: Storm Drain Stenciling Proper Materials Handling	Illicit Connections Identified Materials Storage and Recycling Land Use Modifications
Metals	Street Sweeping Education: Storm Drain Stenciling Proper Materials Handling	Illicit Connections Identified Materials Storage and Recycling Land Use Modifications
Synthetic Organics	Illicit Connections Identified Education: Storm Drain Stenciling Proper Materials Handling	Education: Lawn Care Materials Storage and Recycling Land Use Modifications
Temperature	Land Use Modifications	
pH	Illicit Connections Identified Proper Materials Handling	Materials Storage and Recycling Land Use Modifications

4.2.1 Solids

Both highway runoff and soil erosion can be sources of solids in urban runoff. Street sweeping can reduce solids in urban runoff by decreasing the solids on the roadways when runoff occurs. The benefits associated with street sweeping depend largely on the climate. In arid regions, airborne pollutants are a serious concern, and there is a long time between storms for pollutants to accumulate. In humid regions, on the other hand, frequent rainfall makes the use of sweepers between storms less practical. In colder regions, sweeping is recommended twice per year: once in the fall after leaves fall and once in the spring in anticipation of the spring snowmelt (MPCA, 1989).

Modifying land use to preserve open space and to limit the impervious cover can also reduce solids loads in two ways. First, by preserving open space the amount of land cleared is limited, thus reducing erosion during construction. Natural vegetated cover has less than one percent of the erosion potential of bare soil (Wischmeier and Smith, 1978).

4.2.2 Oxygen Demanding Substances

Since the primary oxygen demanding substances are organic materials, BMPs that target these substances are the best suited to reducing the oxygen demand in storm water. BMPs that reduce sediment loads often also reduce the loads of the organic material associated with that sediment. Pet waste is also a significant source of organic pollutants, and its control can reduce the loads of oxygen demanding substances in urban runoff. Finally, programs geared at reducing illegal dumping and accidental spills of materials can reduce the oxygen demand associated with these substances.

4.2.3 Nitrogen and Phosphorous

Nitrogen and phosphorous are prevalent in urban and suburban storm water, as a component of the soil, due to the use of fertilizer on urban lawns, and due to airborne deposition. Street sweeping can reduce nutrient loads by removing deposited nutrients from the street surface. Programs that focus on lawn chemical handling or replacing turf with natural vegetation also act to reduce nutrient loading. Finally, programs that educate the public or industry about illegal dumping to storm drains can reduce the nutrient loads associated with dumping chemicals that have high nutrient content. Energy conservation and reduced automobile use can reduce airborne nitrogen deposition.

4.2.4 Pathogens

Pathogens, or bacteria, are prevalent in urban runoff, largely due to animal sources. Dogs in particular are a significant source of pathogens in the urban landscape. Thus, pet scoop ordinances (replacing "curb your pet") and associated education are effective tools at reducing bacteria in urban runoff. Illicit connections of sewage may also be a source of pathogens.

4.2.5 Petroleum Hydrocarbons

Petroleum hydrocarbons are present in many chemicals used in the urban environment, from gasoline to cleaning solvents. Since roadways are a major source of petroleum, scheduled street sweeping can be used to remove hydrocarbon build-up prior to storm water runoff. All programs geared at preventing spills of chemicals to the storm drain, either through deliberate or accidental dumping, are the most effective at reducing hydrocarbon loads. Finally, modifying the way land is developed can reduce hydrocarbon loads on both a site and a regional level by reducing the use of the automobile and replacing impervious surfaces with natural vegetation, which has virtually no hydrocarbon loading.

4.2.6 Metals

Metals sources in urban runoff include automobiles and household chemicals, which often have trace metals. Street sweeping can reduce metals loads deposited on the road surface. In addition, programs that focus on reducing dumping and proper material storage can reduce accidental or purposeful spills of chemicals with trace metals to the storm drain system. Finally, modifying land use can reduce metals loads by reducing impervious cover, thus reducing total runoff containing metals, and reducing the roadway length, which is often a source of runoff containing metals.

4.2.7 Synthetic Organics

Much of the source of synthetic organics in the urban landscape is household cleaners and pesticides. Thus, all education programs geared at reducing chemical and pesticide use, and proper storage and handling of these chemicals, can reduce their concentrations in urban runoff. In addition, land use modifications that replace turf with natural vegetation will reduce pesticide use.

4.2.8 Temperature

Most non-structural BMPs are not able to prevent the increase in temperature associated with urban development. One exception is the use of site designs that more closely mimic the natural hydrograph by reducing impervious cover and encouraging infiltration.

4.2.9 pH

The primary source of low pH in urban runoff is acid rain, and most non-structural BMPs are not used to treat this problem. BMPs that focus on proper materials handling and disposal can prevent dumping of chemicals with extremely high or low pH, but this is generally not a major problem in urban watersheds.

4.3 Hydrological and Habitat Benefits

As reviewed in Task 5, one major impact of urbanization is induced through the conversion of farmland, forests, wetlands, and meadows to rooftops, roads, and lawns. This process of urbanization has a profound influence on surface water hydrology, morphology, water quality, and ecology (Horner et al, 1994). In this section, the hydrologic and related habitat impacts are briefly discussed as well as the potential benefits that can be achieved by managing storm water runoff using structural and non-structural BMPs.

Many of these impacts can be directly or indirectly related to the change in the hydrologic cycle from a natural system to the urban system. Figure 5 (Task 5) illustrates the fundamental principles that occur along with the development process. In the natural setting, very little annual rainfall is converted to runoff and about half is infiltrated into the underlying soils and water table. This water is filtered by the soils, supplies deep water aquifers, and helps support adjacent surface waters with clean water during dry periods. In the urbanizing conditions, less and less annual rainfall is infiltrated and more and more volume is converted to runoff. Not only is this runoff volume greater, it also occurs more frequently and at higher magnitudes. The result is that less water is available to streams and waterways during dry periods and more flow is occurring during storms. A recent study in the Pacific Northwest found that the ratio of the 2 year storm to the baseflow discharge increased more than 20% in developed subwatersheds (impervious cover approximately 50%) verses undeveloped subwatersheds (May, 1997).

As a result of urbanization, runoff from storm events increases and accelerates flows, increases stream channel erosion, and causes accelerated channel widening and downcutting (Booth,1990). This accelerated erosion is a significant source of sediment delivery to receiving waters and also can have a smothering effect on stream channel substrates, thereby eliminating aquatic species habitat. As a result, aquatic habitat is often degraded or eliminated in many urban streams. The results are that aquatic biological communities are among the first to be impacted and/or simplified by land conversion and resulting stream channel modifications. Subsurface drainage systems which frequently serve urbanized areas also contribute to the problem, by bypassing any attenuation achieved through surface flows over vegetated areas.

A unifying theme in stream degradation is this direct link with impervious cover. Impervious cover, or imperviousness, is defined as the sum of roads, parking lots, sidewalks, rooftops, and other impermeable surfaces in the urban landscape. This unifying theme can be used to guide the efforts of the many participants in watershed protection. Figure 6 visually illustrates this trend in degradation for a series of small headwater streams in the Mid-Atlantic Piedmont. Here, four stream segments, each with approximately the same drainage area, and subjected to the same physiographic conditions, respond to the effects of increased impervious cover. Similar results have been observed in the Southern United States with studies in Virginia, North Carolina and Georgia evidencing this same decline in fish and macroinvertebrate populations with increasing impervious cover (Crawford et al., 1989; Weaver and Garman, 1994; Couch et al., 1996)

To mitigate for this impact, many local and state governments have required the installation of storm water management detention ponds to attenuate this increased runoff volume. It is important to recognize that the change in hydrology caused by urbanization affects more than just a single storm return interval (e.g., the 2 year event). Urbanization shifts the entire "runoff frequency spectrum" to a higher magnitude. As illustrated in Figure 7, the most significant change is to the smallest, most frequent storms that occur several times per year. In the undeveloped condition, most of the rainfall from these events is infiltrated into the underlying soil. In the developed condition, much of this rainfall is runoff. As the storm return interval increases, the difference between the undeveloped and developed condition narrows. Many jurisdictions only require management of specific storms, usually the two, ten and sometimes, the one hundred year events. The two-year storm is probably the most frequently used control point along this frequency spectrum. Hence, while BMPs may do a fairly good job of managing these specific control points, there have been very few locations across the country that have specific criteria in place to manage storm water over a wide range of runoff events.

Figure 6. Effects of Impervious Cover on Stream Quality

Sensitive Stream
(Impervious Cover ≤10%)
-Stable Channel

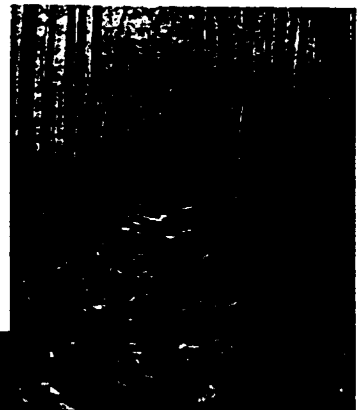
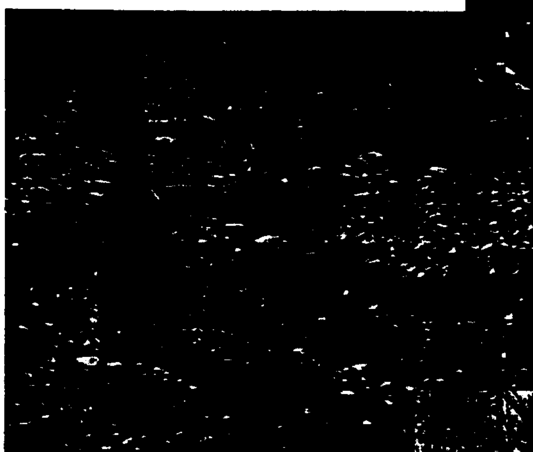
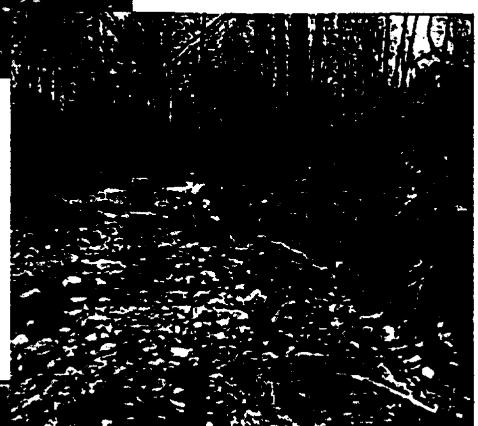
-Excellent Water Quality



Impacted Stream
(Impervious Cover 10-20%)
-Channel Becoming Unstable
-Fair to Good Biodiversity
-Fair to Good Water Quality



Restorable Stream
(Impervious Cover ≈ 40%)
-Highly Unstable Channel
-Poor Biodiversity
-Poor to Fair Water Quality



Non-Supporting Stream
(Impervious Cover ≈ 65%)
-Poor to No Biodiversity
-Poor Water Quality

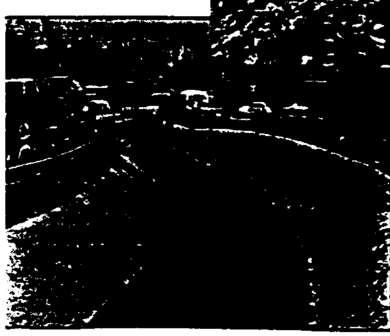


Figure 7. Rainfall Frequency Spectrum

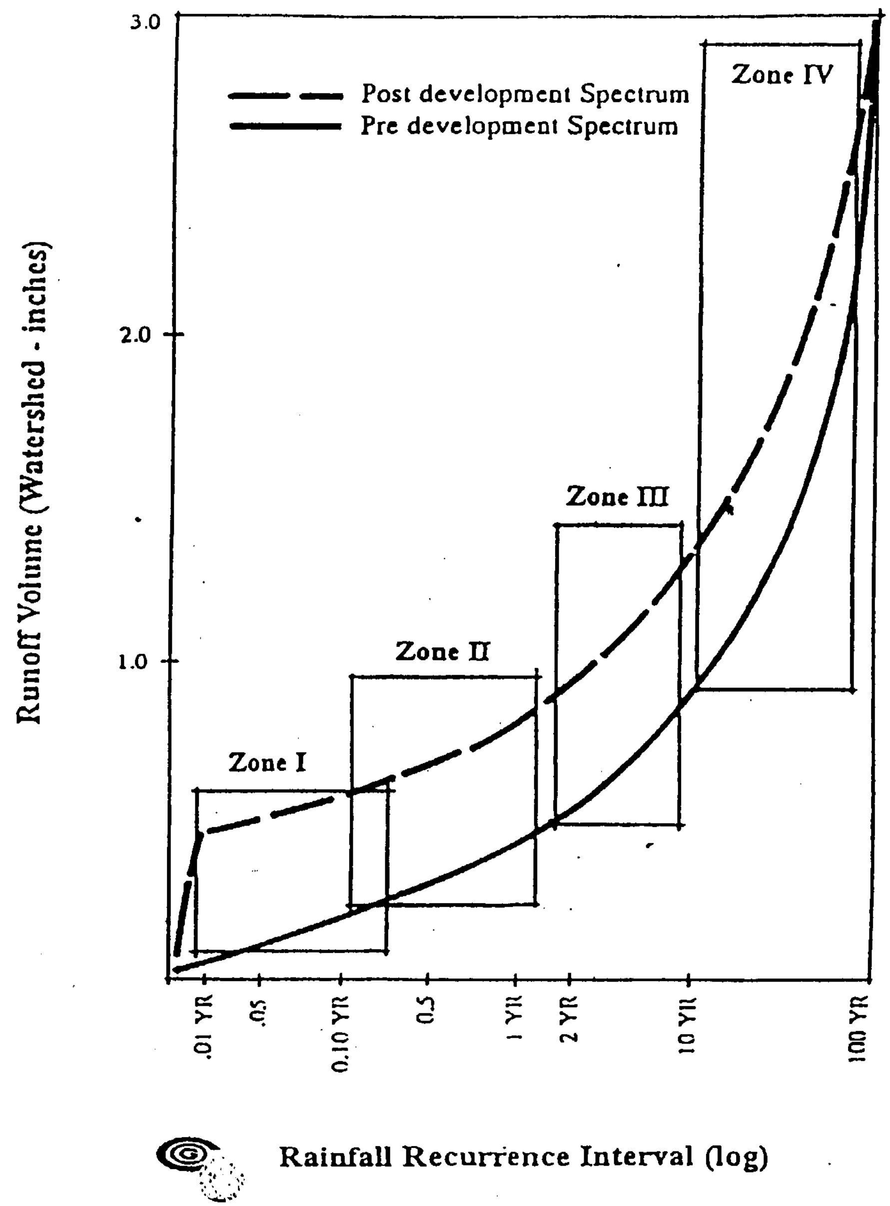

R0073137

One recent study by MacRae (1997) concluded that stream channels below storm water detention ponds designed to manage the two year storm experienced accelerated erosion at three times the predeveloped rate. His findings went on to suggest that the streams were eroding at much the same rate as if no storm water controls existed.

Other jurisdictions have employed an additional level of detention storage above and beyond that required for the two year storm. This concept is often called extended detention (ED). McCuen and Moglen (1988) conducted a theoretical analysis of this design criteria based on sediment transport capacity of the predeveloped channel versus that with ED control. This study found ED could produce an 85% reduction in the predeveloped peak flow of the 2 year storm. What it did not analyze however, was the erosion potential over a wide range of storms. MacRae (1994) suggested a different storm water control criteria called the distributed runoff control (DRC). Here, channel erosion is minimized if the erosion potential along a channel's perimeter is maintained constant with predeveloped levels. This is accomplished by providing a non-uniform distribution of the storage-discharge relationship within a BMP, where multiple control points are provided along the runoff frequency spectrum.

4.3.1 Benefits of BMPs to Control Hydrologic Impacts

Numerous prior studies have documented the degradation of aquatic ecosystems of urban and suburban headwater streams. As stated above, in general, the studies point to a decrease in stream quality with increasing urbanization. Unfortunately, the benefits of BMPs to protect streams from hydrologic impacts has only recently been investigated and only for a few studies.

Maxted and Shaver (1997), Jones, et al. (1997), and Horner, et al. (1997) attempted to isolate the potential beneficial influence of local storm water best management practices on the impervious cover/stream quality relationship. Horner, et al (1997) examined the possible influence of streamside management on stream quality as a function of urbanization. Coffman, et al. (1998) recently presented data on the potential hydrologic benefits of alternative land development techniques. Called the Low Impact Development approach, this methodology attempts to mimic predeveloped hydrology by infiltrating more rainfall at the source, increasing the flowpath and time of concentration of the remaining runoff, and providing more detention storage throughout the drainage network, as opposed to a one location at the end of the pipe.

The preliminary findings of Maxted and Shaver (1997) and Jones, et al (1997) suggest that, for the BMPs examined, stream quality (as measured by a limited group of environmental indicators) cannot be sustained when compared to reference stream conditions. Jones et al., (1997) assessed several BMPs by conducting biomonitoring (fish and macroinvertebrate sampling) above and below BMPs and comparing them to a reference watershed. He found that the biological community tended to be degraded immediately below BMPs as compared to the reference watersheds. One major flaw in the study was the lack of analysis in developed watersheds without BMPs. This would have compared the influence of BMPs on the aquatic community as compared to no BMPs.

Maxted and Shaver (1997) examined eight subwatersheds with and without BMPs. Their study also concluded that BMPs did not adequately mitigate the impacts of urbanization once watershed impervious reached 20% cover. While this study was useful in defining the cumulative impacts of BMPs on watersheds, several critical questions remain. First, since no subwatersheds with less than 22% impervious cover were analyzed, little is known about BMP ability to protect the most sensitive species seen in less developed watersheds. Data for subwatersheds with BMPs was collected approximately three years after data for the subwatersheds without BMPs, so climatic/seasonal constraints may have affected the outcome as much, or more than the BMPs themselves.

Horner et al (1997) evaluated several subwatersheds, with varying levels of impervious cover, but only tangentially related the effectiveness of BMPs to protecting stream quality. Horner found that at relatively low levels of urbanization (approximately 4% impervious area) the most sensitive aquatic biological communities (e.g., salmonids) were adversely affected, and stream quality degradation (as measured by a several indicators) continued at a relatively continuous rate with increasing impervious area. Horner's study demonstrates a link between urbanization and stream quality in the Puget Sound region, but since the effects of BMPs were not directly assessed, the question of whether BMPs could "raise" these thresholds could not be answered.

Horner did find a positive relationship between stream quality and riparian buffer width and quality. Here, the otherwise direct relationship of degrading stream quality with increasing impervious cover was positively altered where good riparian cover existed. In other words, increasing the buffer width and condition tended to keep the stream systems healthier.

Coffman (1998), demonstrated techniques for maintaining predeveloped hydrologic parameters by replicating the curve number and time of concentration. The analysis indicated the amount of storage required on-site to accommodate the change in site imperviousness. The benefits of this type of development, while not yet fully monitored in a field study, are likely to include, increased groundwater recharge, reduced channel erosion potential, and decreased flood potential.

One major hydrologic benefit of storm water management structures is the potential to mitigate for the potential flooding associated with medium to larger storms. Storm water detention and retention facilities have been applied in many parts of the country since about 1970 (Ferguson and Debo, 1990). These detention facilities include wet and dry ponds, as well as rooftop and parking lot detention and underground storage vaults. These last do not provide any water quality benefits beyond hydrologic modification. These *storage facilities* attempt to retain flooding downstream from developments by reducing the rate of flow out of the particular structure being used. Although the rate of flow is reduced, the volume of flow is generally not reduced. Instead, this volume is delivered downstream at a slower rate, and stretched out over a longer time. With the exception of wet and dry ponds, these structures do not provide any water quality benefit beyond the hydrologic modifications. This technique has proved to be a successful method of suppressing flood peaks when properly applied on a watershed-wide basis.

4.4 Human Health Benefits

Storm water can impact human health through direct contact from swimming or through contamination of seafood. Most human health problems are caused by pathogens, but metals and synthetic organics may cause increased cancer risks if contaminated seafood are consumed. BMPs that reduce pathogens, metals and synthetic organics will help to limit these health risks.

Economic benefits of avoiding human health problems can include swimming and recreation costs, as well as saved medical costs. One study in Saginaw, Michigan estimated that the swimming and beach recreation benefits associated with a CSO retention project exceeded seven million dollars (Apogee, 1998a). As another example, the EPA estimates that Phase II storm water controls would reduce the cost of shellfish-related illnesses by between $73,000 and $300,000 per year (US EPA, 1997).

4.5 Additional and Aesthetic Benefits

Storm water BMPs can be perceived as assets or detriments to a community, depending on their design. Some examples of benefits include: increased wildlife habitat, increased property values, recreational opportunities, and supplemental uses. Detriments include: mosquito breeding, reduced property values, and safety concerns. For the most part, these detriments can be avoided through careful design.

Property Values/ Public Perception

A survey of residents in an Illinois subdivision indicates that residents are willing to pay between 5% and 25% more to be located next to a wet pond, but that being located next to a poorly designed dry detention pond can reduce home values (Emmerling-Dinovo, 1995). One reason that pond BMPs increase home values is the wildlife habitat they provide, particularly for aquatic species. A "call survey" of frog species found that wet ponds had the highest diversity of frog species, for example (Bascietto and Adams, 1983).

Dual Use Systems

Since BMPs can consume a large amount of space, communities may opt to use these facilities for other purposes in addition to storm water management. Two examples are "water reuse" ponds and dual use infiltration or detention basins. In one study, a storm water pond was used to irrigate a golf course in Florida, decreasing the cost of irrigation by approximately 85% (Schueler, 1994a). In the southwestern United States, BMPs are often completely dry in between rain events. In these regions, it is very common to design infiltration basins or detention basins as parks that are maintained as a public open space (Livingston et al., 1997).

Preventing Nuisance BMPs

Although BMPs can enhance the urban environment, they can also detract from it if designed improperly. BMPs should be designed to reduce the opportunity for mosquito breeding, enhance aesthetics and promote safety. Mosquito breeding is perhaps the greatest concern among citizens regarding storm water BMPs. Some simple design features, however, can reduce mosquito habitat. Successful designs avoid shallow or stagnant water, and reduce large areas of periodic drying, as occur in a dry pond (McLean, 1995).

Safety and aesthetics are also a concern among the public. These concerns can be alleviated using such design features as gently sloping edges to any BMP, a safety "bench", and the use of vegetatic surrounding ponds and infiltration basins. All BMPs need to have trash and debris removea periodically to prevent odor and aesthetic liabilities.

Technical Note 116

Housing Density and Urban Land Use as Indicators of Stream Quality

A large number of indicators exist to measure the amount of urbanization in a watershed, and in turn, predict stream quality. Impervious cover has traditionally been the primary indicator of watershed urbanization, but two recent studies from Ohio and Illinois focus on housing density, urban land use, and population density as indicators of urbanization. These studies provide some of the first real data on relationships between urbanization and stream quality in the Midwest.

Midwestern streams have many attributes unique to the area. Most Midwestern streams flow across the gently sloping till and outwash plains created after the last great ice sheets receded from North America 10,000 years ago. Typically, these streams are low gradient, shallowly entrenched, alluvial systems with extensive associated wetlands (McNab and Avers, 1994). In terms of aquatic diversity, the Midwest has historically had the highest diversity of freshwater mussels in North America. Prior to settlement, over 80 species of freshwater mussels were present in the state of Illinois alone (INHS, 1996).

Unfortunately, over half of the remaining mussel species existing in the Midwest are now classified as endangered, threatened, or of special state concern (USFWS, 1998). The formerly extensive wetlands of the Midwest have been reduced by over 80% and intensive agricultural and land development practices have led to the straightening, channelization, and impoundment of many streams. These practices have resulted in high rates of sedimentation and nutrient enrichment in the region's streams and rivers.

Land development pressures are increasing in many Midwestern communities, rendering urbanization an even greater threat to the region's aquatic resources. For example, between 1970 and 1990, the northeastern Illinois area population grew by a modest 4%, yet the amount of land in urban/suburban use grew by more than 33% (NIPC, 1998). This pattern of growth appears to be continuing: Census Bureau estimates indicate that the region's population has grown as much since 1990 as it had in the previous two decades (NIPC, 1998).

> Numerous studies have demonstrated a link between increasing urbanization and stream degradation.

Over the past decade, numerous studies have linked increasing urbanization with stream degradation. The research by Chris Yoder and Ed Rankin perhaps best illustrates this relationship. They report, "Few if any, ecologically healthy watersheds exist in the older most extensively urbanized areas of Ohio and no headwater streams (i.e., draining <20 mi^2) sampled by Ohio EPA during the past 18 years in these areas have exhibited full attainment of the Warmwater Habitat (WWH) use designation" (Yoder, 1995; Yoder and Rankin, 1996).

A recent study by Yoder, Dale White, and Bob Miltner (1999) of the Ohio EPA further explored the effects of urbanization on a large number of Ohio streams. This study team utilized bioassessment techniques to link land uses with stream quality in two Ohio ecoregions. Fish, benthic macroinvertebrates, stream habitat and water chemistry were sampled in urban/suburban watersheds in the Cuyahoga River basin in northeastern Ohio and

Table 116.1: Sampling Parameters for the Cuyahoga and Area Streams

Columbus	<35	0	80	80	0

R0073146

smaller subwatersheds in the Columbus metropolitan area of central Ohio. The Cuyahoga watersheds are characterized by extensive development, including a mix of older residential, commercial, and industrial land uses, along with more recent suburban development. The Columbus watersheds are characterized by residential urban land use, much of which has developed within the last two decades. However, a significant difference between the Cuyahoga and Columbus study areas is that many of the sample points in the Cuyahoga drainage were located in larger watersheds that were subjected to significant point source discharges. The smaller subwatersheds of the Columbus study area had far less influence from point source discharges. Table 116.1 summarizes the team's sampling effort.

The researchers chose housing density and urban land use as surrogates of watershed impervious cover. These two indicators were chosen because census data, for calculating housing density, and state land use information, for calculating percent urban land, were readily available. In addition to the effects of urbanization, the study also examined the potential effects of watershed scale and significant other stressors in the urban environment. Table 116.22 lists the predominant stressor types in the Cuyahoga basin.

Results

Data from the Columbus area streams showed a significant decrease in fish assessment scores when watersheds exceeded 33% urban land use, although there was considerable variation above and below this percentage among individual watersheds (Figure 116.1). At this level of urbanization, fish communities displayed a shift in community composition indicated by the loss of intolerant darters and sculpins, a decrease in insectivorous fish, and an increase in the proportion of tolerant species.

Overall, the Cuyahoga basin streams depicted a significant drop in fish index of biotic integrity (IBI) scores at around 8% urban land use (Figure 116.2). This relatively low level of urban land use was related to a significant impact to the biological community primarily because of watershed scale and the presence of other stressors not generally found in the Columbus area streams. The researchers found that when streams with a watershed size of less than 100 mi^2 were analyzed separately, the level at which fish IBI scores dropped significantly increased to around 15% urban land use (Figure 116.3). Figure 116.4 illustrates this data further broken down by the type of impact. The study showed that sites affected by combined sewer outfalls, significant wastewater treatment plant outfalls, and highly modified habitats (i.e., channelized, impounded) failed to attain their appropriate biocriteria regardless of the degree of urbanization.

Urbanization

R0073147

Housing density was also strongly linked to stream quality, but with somewhat differing results (Figure 116.5). While urban land use depicted a more or less continuous decline in stream quality with increasing urbanization, housing density displayed a threshold response coinciding with approximately one housing unit per acre, above which sites generally failed to attain their appropriate biological criteria.

Similar results were obtained in a study undertaken by Dennis Dreher (1997) of the Northeastern Illinois Planning Commission (NIPC). Dreher's study utilized a similar bioassessment approach with the main difference between the two studies being the choice of urbanization indicator. The Illinois study utilized population density as an indicator of urbanization, rather than housing density or urban land use.

The six-county Northeastern Illinois study area (Cook, DuPage, Kane, Lake, McHenry, and Will counties) includes the extensively urbanized Chicago metropolitan area and its adjacent suburbs, as well as large areas of outlying rural/agricultural land. Even though discharges from point sources and combined sewer overflows in this region have been reduced dramatically over the past 20 years, many of this region's waterways remain seriously impaired.

In this study, population density was chosen as the urbanization indicator for several reasons, the most notable being the difficulty in accurately quantifying the impervious cover in a large number of watersheds on a regional scale. In contrast, digital population data was readily available for the region and could be utilized with existing GIS resources. In addition, the author felt that local land use planners and government officials readily understand population density, perhaps more so than impervious cover.

Dreher found a strong correlation ($r^2 = 0.77$) between population density and fish community assessments for the Northeastern Illinois region (Figure 116.6). The majority of the streams assessed in urban/suburban watersheds with population densities of 1.5 to 8.0+ people per acre had community assessment scores in the fair to poor range, indicative of significant degradation. In contrast, nearly all the rural/agricultural streams (0.05 to 0.5 people/acre) had assessments scoring in the good or better range However, only two of the 13 rural/agricultural streams studied scored in the excellent range. The study also found that most "suburbanizing" watersheds in the range of 0.5 to 1.5 people per acre scored in the fair to good range. With substantial additional development still occurring, these watersheds are at risk of significant further degradation.

Conclusions

Both the Dreher study and the Yoder *et al.* study demonstrate that there is a strong negative relationship between increasing urbanization and stream quality in the Midwest and that bioassessment can play an important role in assessing and managing urban streams. As both studies used similar biological assessment methodologies, the efficiency and utility of the different urbanization indicators can be compared to determine which provides the best predictor of stream quality over a wide range of land use intensities and watershed scales. And indeed, all three indicators appear to pro-

Table 116.3: Comparison of Different Land Use Indicators and Their Applicability to Local Watershed Planning

Land use indicator	Typical value for low density residential use	Level at which significant impact observed	Advantage	Disadvantage	Appropriate scale	Utility for Local Watershed Planning
% Impervious Cover	10%	10-20%	Most accurate	Highest level of effort and cost	Sub-watershed or watershed	High
Housing Density	1 units/acre	>1 unit/acre	Low accuracy in areas of substantial commercial or industrial development, Moderately accurate at larger scales	Less accurate at smaller scales	Watershed or larger	Moderate
Population Density	2.5 people/acre	1.5 to 8+ people/acre	Low accuracy in areas of substantial commercial or industrial development, Moderately accurate at larger scales	Less accurate at smaller scales	Watershed or larger	Moderate
% Urban Land Use	10-100%	33% (variable)	Moderately accurate at larger scales	Does not measure intensity of urbanization	Watershed or larger	Low

vide useful information. Population density and percentage of urban land use were found to depict a continuous negative response to urbanization. Housing density, on the other hand, depicted a threshold response to urbanization. This may indicate that housing density's utility for predicting stream quality at intermediate levels of urbanization is limited. However, additional investigation will be needed in this area.

Both studies appear to have derived similar conclusions regarding the level at which significant stream degradation occurs. In analyzing their results, Yoder and his colleagues identified a threshold at one housing unit per acre, beyond which fish and macroinvertebrate assessments increasingly fail to attain their appropriate biological criteria. Assuming that one unit per acre would represent a suburban medium to low density development (single-family detached homes), then 2.5 people per acre would be a reasonable estimate of population density (ULI, 1997). This would coincide with Dreher's category of 1.5 to 8+ people per acre, at which streams typically scored in the fair to poor range. Based upon the results of these studies, it appears that there is agreement between these two indicators of urbanization, at least in terms of a threshold for use attainment. However, population density may be a more useful tool for predicting stream quality due to its more continuous negative response to increasing urbanization.

Urban land cover was also found to be a good predictor of stream quality, but other factors such as historic development patterns, the level of direct channel alteration, and the array of land uses included as urban land may limit the precision of this indicator.

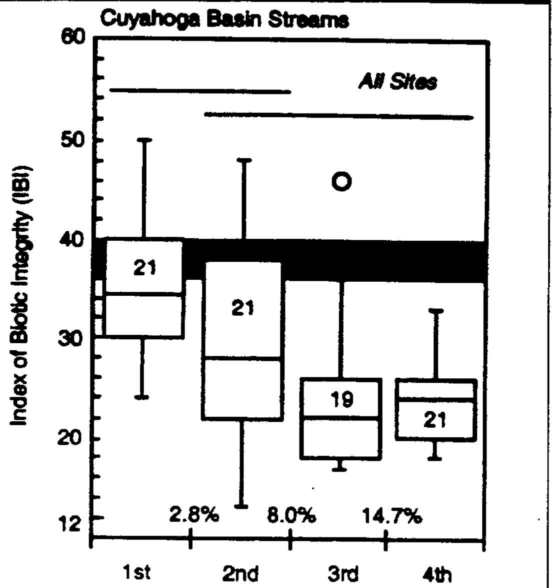
R0073149

Figure 116.5: Index of Biotic Integrity Scores Vs. Housing Density (quartiles) for All Sites in the Cuyahoga Basin



The Dreher study and the Yoder *et al.* study, as well as others, have demonstrated a clear negative relationship between increasing urbanization and stream quality. However, most assessments of this type to date have been conducted on large regional scales. Robert Steedman of the University of Toronto (1988) found that watershed scale played a significant role in the ability of the urban land use indicator to predict stream degradation. He found that large watersheds, with an average size of 112 mi^2, had poor land use/stream quality correlations (r^2=.11) when compared to small watersheds with an average watershed size of just 6.5 mi^2 (r^2=.78). This would appear to reinforce the idea that watershed scale is an important factor in assessing the utility of indicators of urbanization. As land use decisions are generally made at the local level, land use planners need tools that are applicable to smaller scale local planning areas. More work is still needed in identifying and applying these indicators at smaller scales to determine their practical usefulness in local watershed planning and management. Table 116.3 summarizes some of the advantages and disadvantages of several indicators of urbanization.

Overall, the results of these two Midwestern studies reflect the substantial impacts conventional land use practices have had on the biological integrity of rivers and streams, and may be used to forecast future quality if conventional practices continue. This does not bode well for our streams and rivers, as development pressures continue to grow in many Midwestern communities. However, these relationships may not predict the future quality of our streams and rivers if watershed planning and management practices are implemented to control both point and non-point source pollution. But the authors caution that planning and management decisions should not be based upon a single indicator of urbanization, without considering significant other physical and chemical stressors (i.e., historic alteration, CSO's, failing septic systems, etc.) that may be acting on the system. - ***KBB***

INTRODUCTION

Urban stormwater runoff is now regarded as one of the largest sources of pollution to the coastal waters of the United States. In Southern California, point source control and advanced sewage treatment have greatly reduced the emissions of contaminants from sewage treatment plant and industrial discharges into the ocean. As a consequence, mass emissions from stormwater runoff now constitute a much larger portion of the constituent inputs to receiving waters and may represent the dominant source of some contaminants such as lead and zinc.

Stormwater runoff is widely believed to be one of the largest sources of contaminants to coastal waters.

While stormwater runoff can produce impacts in both freshwater and seawater environments, effects on the ocean are of greatest concern in urban Southern California. Our coastal waters provide many beneficial uses, including recreation, aesthetic enjoyment, fishing, marine habitat, fish reproduction, industrial water supply, and navigation. Ocean-dependent activities contribute approximately $9 billion annually to the economies of coastal communities in Southern California.

Substantial resources are spent monitoring the chemical constituents in stormwater runoff, yet little is known about effects of these inputs once they enter the ocean. Of greatest concern to the public are whether impairments are occurring to the beneficial uses that relate to human health (safety of swimming and seafood consumption) or ecosystem health (presence of a natural balance of species). Stormwater discharge has the potential to impair these beneficial uses through: 1) contamination of recreational waters or seafood with disease-causing microbes, 2) aesthetic degradation from trash and reduced water clarity, and 3) ecosystem degradation from contaminants or other stormwater constituents.

Current water quality monitoring programs do not assess the effects of stormwater runoff on the environment.

Understanding the effects of stormwater on beneficial uses is essential. Information about the extent and type of adverse impacts is useful to guide and refine management actions to improve water quality. The monitoring programs of various agencies collect information that is useful for assessing some beneficial use impairments, primarily those related to human health. For example, public health and sanitation agencies regularly conduct shoreline microbiological monitoring near storm drain discharges, which indicates impacts to swimming and shellfish consumption. However, very little information is available to assess the impacts of urban stormwater on ecosystem health. Studies of impacts to freshwater systems (particularly in the west) are rare; impacts to the coastal ocean have never been assessed.

This report summarizes a three-year study funded by the Los Angeles County Department of Public Works, Southern California Coastal Water Research Project (SCCWRP), and University of Southern California (USC) Sea Grant Program.

This study is one of the first to assess stormwater impacts on the marine ecosystem.

This study examined plume haracteristics, water column and seafloor biology.

The purpose of the study was to assess the impacts of urban stormwater runoff to the receiving waters of Santa Monica Bay. The goal of this study was to examine impacts that were relevant to ecosystem health, rather than impacts related to human health or recreation issues. This effort was conducted by an interdisciplinary team of scientists from SCCWRP, the University of Southern California, and the University of California at Santa Barbara.

The Santa Monica Bay Receiving Waters Study incorporated four design elements. The first element used physical and optical oceanographic instruments to characterize the size, composition, and mixing of stormwater plumes, providing information on the impacts to beneficial uses that are associated with water clarity. The second element used toxicity tests to assess the biological effects of runoff on water column biota and to identify the responsible toxicants. The third element examined seafloor biota and chemistry in order to assess the long-term effects of storm-discharged particles with their associated contaminants.

Comparisons between Ballona and Malibu Creeks evaluated effects of different watershed types.

The fourth element of the study design was a comparison of stormwater impacts from different watershed types. Land use patterns and development within a watershed are thought to influence the composition and quantity of stormwater runoff. The influence of watershed type was investigated by comparing stormwater impacts in the receiving water offshore of the highly urbanized Ballona Creek watershed with impacts in the receiving water offshore of the less-urbanized Malibu Creek watershed (Figure 1).

Sampling and analysis were conducted over three wet seasons (1995/96 to 1997/98). This document provides a summary of the study and focuses on major concepts and important findings. For the detailed results and raw data, we encourage readers to consult the Annual Progress Reports, available through USC Sea Grant.

STORMWATER PLUME CHARACTERIZATION

The impact of stormwater on the coastal ocean is determined by the composition of the stormwater and the dynamics (mixing, transport, and persistence) of the stormwater plume once it enters the coastal ocean. These dynamics influence the location, duration, and magnitude of impacts from stormwater.

The low salinity and high turbidity of stormwater provide markers that allow plumes to be mapped in the ocean.

The research team mapped the three-dimensional distribution of the stormwater plumes resulting from several winter storm events during 1996-1998. Mapping was performed using a towyo system, which carried sensors to measure temperature, salinity, light transmission (turbidity), chlorophyll fluorescence (plant biomass), and ambient visible light. The towyo was towed through the water in a vertical zigzag pattern that enabled us to map the horizontal and vertical distributions of the measured parameters. In addition, surface water was pumped to similar sensors on the boat so that the distribution of these parameters at the water's surface could be mapped. Maps were constructed for two regions of Santa Monica Bay, the receiving waters offshore of Ballona Creek and those offshore of Malibu Creek.

The characteristics of stormwater discharged into Santa Monica Bay from the two watersheds were similar in several respects. The most obvious and important physical characteristic was that the stormwater, being primarily composed of freshwater, had very little salinity. This low salinity enabled us to trace the stormwater plume in the ocean and differentiate it from the ambient seawater, which was not directly influenced by stormwater discharge. The stormwater also contained high concentrations of suspended particulate material, derived from various sources such as land erosion, street dust, aerial deposition, and litter. Suspended particulate material increased the turbidity of water by scattering and absorbing light. The turbidity and salinity together allowed the differentiation of seawater influenced by stormwater discharge from seawater containing freshwater from direct rainfall input.

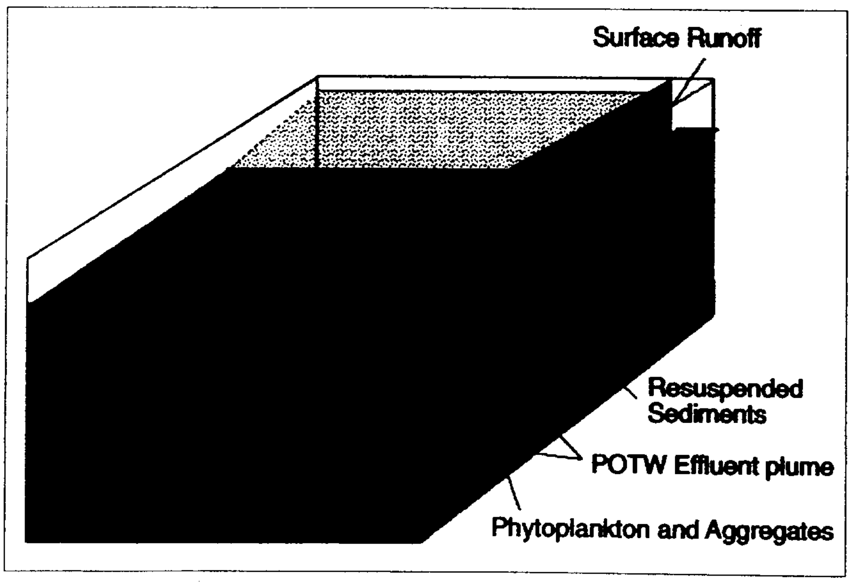

FIGURE 2

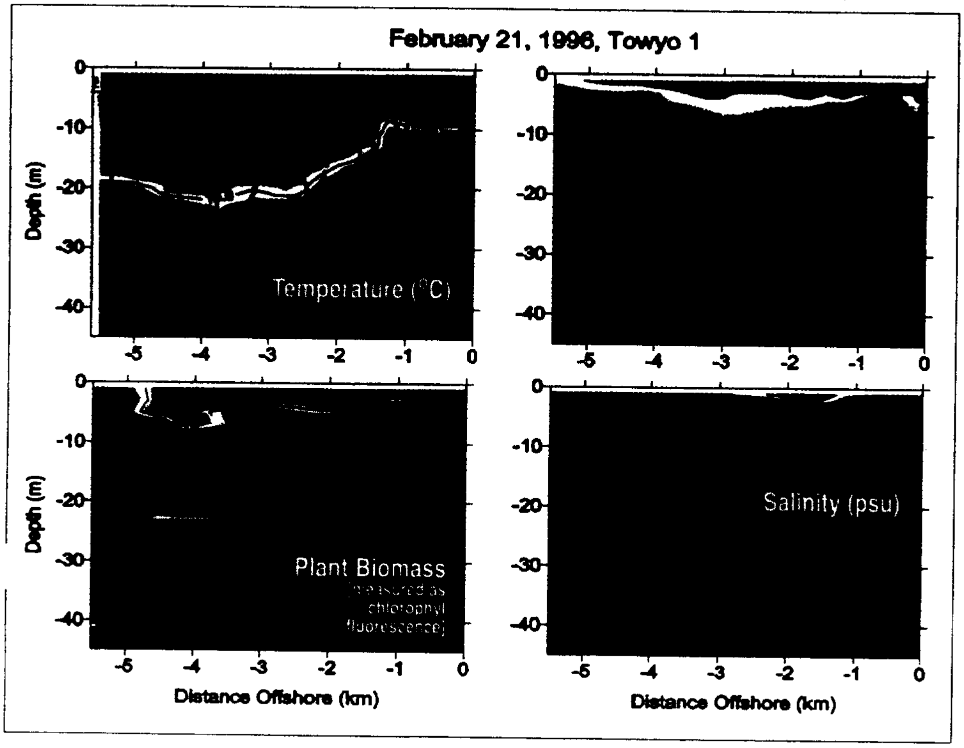
Schematic of coastal ocean with several sources of suspended particulate matter. Sources include surface runoff, Publicly Owned Treatment Works (POTW) discharge, bottom resuspension, and naturally occurring phytoplankton and detiritus.

The stormwater plume was most concentrated in the surface layer.

Understanding the dispersion and fate of stormwater plumes is a complex task. The distribution of dissolved components such as nutrients and small particles is dependent upon the amount of rainfall, the coastal currents, and the winds, which can drive currents and cause vertical mixing (Figure 2). Large stormwater particles often have a different fate; they settle out of the low salinity plume, become incorporated into bottom sediments, and may be redistributed later by wave resuspension and transport. As the plume disperses, the components of stormwater mix with other sources of suspended particles, nutrients, and freshwater in the receiving water. These sources include bottom resuspension, phytoplankton growth, and wastewater discharge.

FIGURE 3



Vertical cross-shelf sections of the Ballona Creek discharge plume following a storm event in February, 1996. The maps shown were generated using a towyo system, which carried sensors for temperature, salinity, turbidity (beam attenuation), and plant biomass (chlorophyll fluorescence). The zigzag pattern on the temperature section indicates the path of the towyo. The stormwater plume is indicated by water with a salinity less than 33.0 practical salinity units (psu).

Stormwater plumes usually formed relatively thin layers at the surface of the ocean that are 2-10 m deep (Figure 3). The depth of penetration increased with time as winds mixed the upper layer vertically. The horizontal scales of the plumes studied in Santa Monica Bay were variable, with plumes extending from 1 to 6 miles cross-shelf (offshore) for storms of 1- to 2-year frequencies (0.8 to 4 in. of rainfall). During the February 19-21, 1996 storm (4 in. of rainfall), the plume spread approximately 4 miles offshore of Ballona Creek (Figure 4).

The speed and direction of coastal currents determine the cross-shelf scale of the plume. The Coriolis force (an apparent force that acts on oceans and lakes) also has an influence on the distribution of stormwater plumes. This force is due to the rotation of the earth and its motion through space, resulting in a tendency for currents to turn toward the right in the Northern Hemisphere. If the plume is carried to the north when it enters the ocean, it will be more likely to remain near the coast due to the influence of the Coriolis force.

The distribution of stormwater plumes along the coast depended upon the tidal variations in the currents, the presence of additional runoff sources, and the amount of runoff. Longshore distances of up to 6 miles were measured for plumes within Santa Monica Bay.

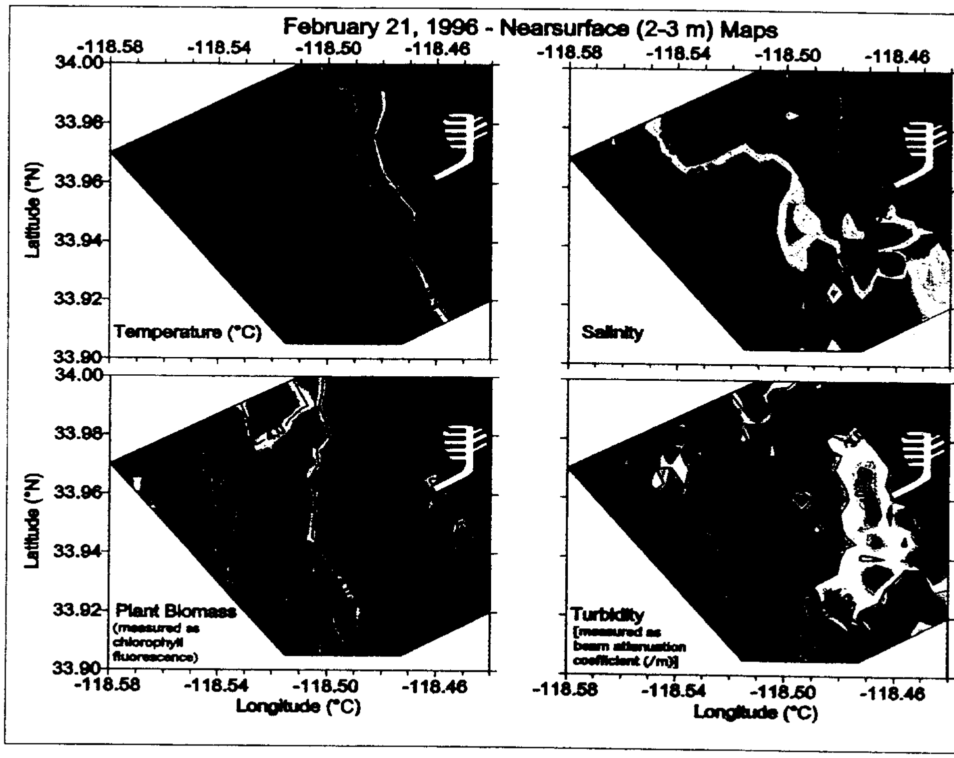
Spatial gradients in the dissolved and particulate components of the plume occurred as it was diluted through mixing with the receiving water. Although larger stormwater particles tended to settle out from the plume rapidly, smaller, lighter particles remained in suspension near the surface (Figures 3 and 4), where they can reduce the amount of light available for photosynthesis by marine plants. Measures of primary production were not part of this study, so adverse effects on phytoplankton in Santa Monica Bay resulting from turbid stormwater plumes were not determined.

Stormwater plumes reduced surface water clarity and persisted for several days after a storm.

The duration of stormwater plumes depends upon the rate of plume dispersion and particle sinking. Stormwater plumes were observed to persist in Santa Monica Bay for at least three days, even for the smallest storm sampled (0.8 in. rainfall). The maximum duration of stormwater plumes could not be assessed in this study because measurements did not extend more than three days after a storm.

High concentrations of the plant pigment chlorophyll were present in the surface layer during some storm events, indicating the presence of increased phytoplankton populations. Phytoplankton growth may have been stimulated by stormwater discharge due to the addition of nutrients to the surface layer, where light is readily available. Dense patches of phytoplankton were observed off of Malibu Creek on the boundary of stormwater plumes 1-2 days after rain events. Off of Ballona Creek, we observed increased phytoplankton in the plume even while a large proportion of suspended particulate material was still present in the surface water. The ecological effects of these changes in phytoplankton density were not determined in this study.

FIGURE 4



Near surface map of the February, 1996 stormwater plume from a 2-year storm off of Ballona Creek. The plume (surface water with a salinity less than 33.0 psu) extended approximately 4 miles offshore.

R0073157

WATER COLUMN BIOLOGY

The initial and most concentrated exposure to stormwater occurs in the upper few meters of the water column. A diversity of organisms occupies this habitat, ranging from mobile fish and mammals to drifting microscopic plants and animals (plankton). Plankton have a relatively high potential to be affected by stormwater toxicants because they have a limited ability to avoid the plume and are often more sensitive to contaminants than larger animals. Changes in the abundance and type of plankton present can have important consequences for the marine ecosystem. This group of organisms constitutes the base of the food chain for most marine life, so changes in plankton numbers may affect populations of other species. The larvae of many fish and other animals such as sea urchins, clams, and shrimp occur in the plankton, providing the potential for diminished reproductive success if their survival is reduced by water column toxicity.

Water column effects were measured using toxicity tests.

Toxicity tests were used to determine whether stormwater plumes contained harmful concentrations of dissolved constituents. Surface water samples were collected offshore of the two study sites in conjunction with measurements of the plume characteristics so that the data could be related to the concentration of the stormwater discharge plume. Samples of stormwater collected from Ballona Creek were also measured for comparison. The toxicity tests used sensitive stages of marine species that occur in Southern California. Most samples were measured using the sea urchin fertilization test, in which the effect of the sample on the ability of sea urchin sperm to fertilize eggs is measured. Sea urchin sperm are highly sensitive to some types of dissolved metals. The fertilization test is appropriate for stormwater monitoring because it is rapid (40 min exposure) and uses an organism which spends a portion of its life cycle in the water column of Santa Monica Bay. All tests were adjusted to the appropriate salinity prior to exposure so only the effect of chemical constituents were evaluated.

Virtually every sample of Ballona Creek stormwater tested was toxic.

Undiluted samples of urban stormwater collected from drainage channels (before discharge into the ocean) usually contained toxic concentrations of constituents. Toxicity was detected in virtually every sample obtained from Ballona Creek and this toxicity was often present even after the sample was diluted 10-fold in the laboratory. The results indicated that even though a large portion of the constituents present in stormwater may be bound to particles, the dissolved concentrations of some materials are high enough to cause toxicity. Prior research by SCCWRP and others has detected toxicity in stormwater from other watersheds in Los Angeles, Orange, and San Diego Counties.

The first storms of the year produced the most toxic stormwater.

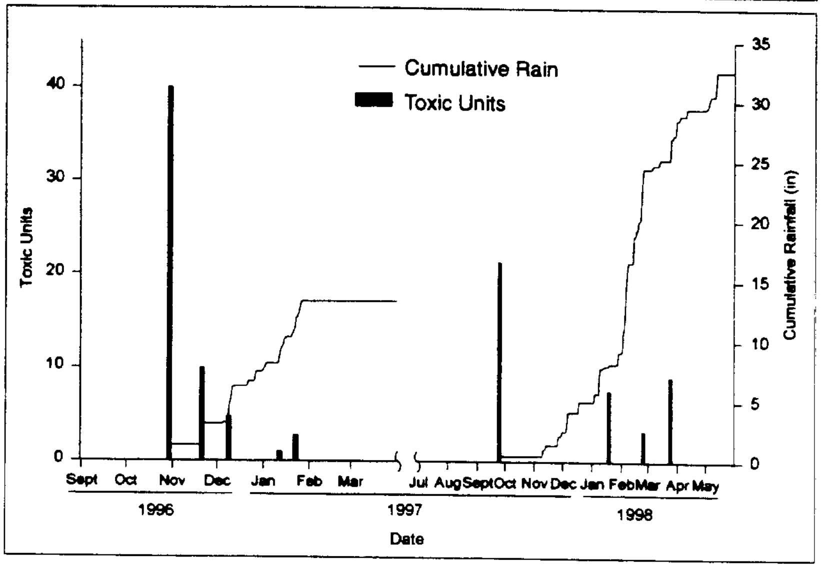
The results showed that time of year was an important variable influencing stormwater toxicity (Figure 5). Samples of Ballona Creek stormwater, obtained from the first storm of the season, were between two and ten times more toxic than samples from later storms. These

R0073158

data indicated that the first storms of the year provide the most concentrated inputs of toxicants to the environment.

Toxicity was frequently detected in surface water within the stormwater plume offshore of Ballona Creek, indicating that the initial dilution of stormwater discharge from this watershed was not sufficient to reduce the concentrations of stormwater toxicants below levels that are harmful to marine organisms. The magnitude of toxicity was greatest in the portion of the plume nearest the mouth of Ballona Creek (Figure 6), where the highest concentrations of stormwater were present. Within the plumes studied, toxicity was usually present whenever stormwater concentrations above 10% were present. The duration of toxicity in surface waters was not specifically addressed in this study, but can be expected to be determined by the rate of plume dispersion. In this study, toxicity was detected in surface water near the mouth of Ballona Creek two days after a storm event.

FIGURE 5

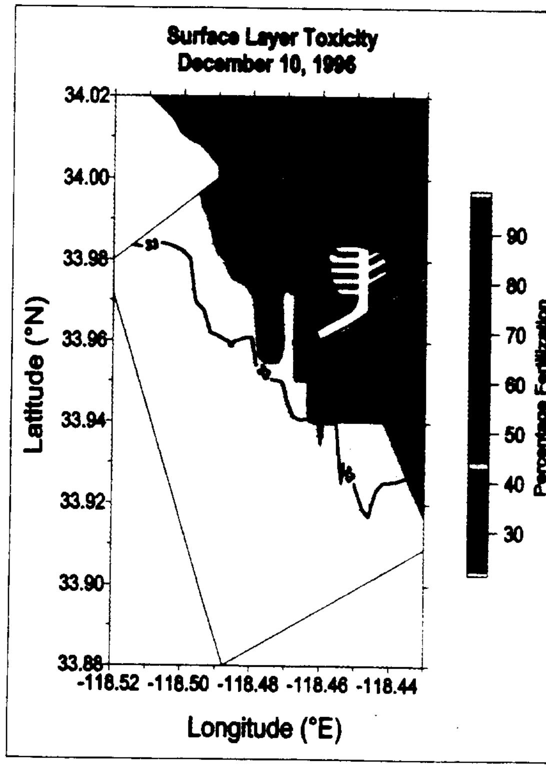


Seasonal changes in the toxicity of Ballona Creek stormwater over two storm seasons. Toxicity was measured using the sea urchin fertilization test. The greatest toxicity was observed in stormwater obtained from the first storm of each year.

Toxic portions of the stormwater plume were variable in size, extending from 1/4 to 2 miles offshore of Ballona Creek.

The spatial extent of surface water toxicity varied between storms, and was influenced by the amount of storm flow, the degree of toxicity of the stormwater, and the amount of mixing that occurred upon discharge. The greatest offshore extent of toxicity was measured following a storm on February 21, 1996, a two-year event, when toxicity was detected 2 miles offshore of Ballona Creek. For other storms, the toxic portion of the plume extended ¼-1 mile offshore. The distribution of toxicity along the shoreline was not determined in this study. The boundaries of stormwater plumes can be described using a number of parameters (i.e., salinity, turbidity, and toxicity) each with different thresholds of detection. Because a relatively high concentration of stormwater is

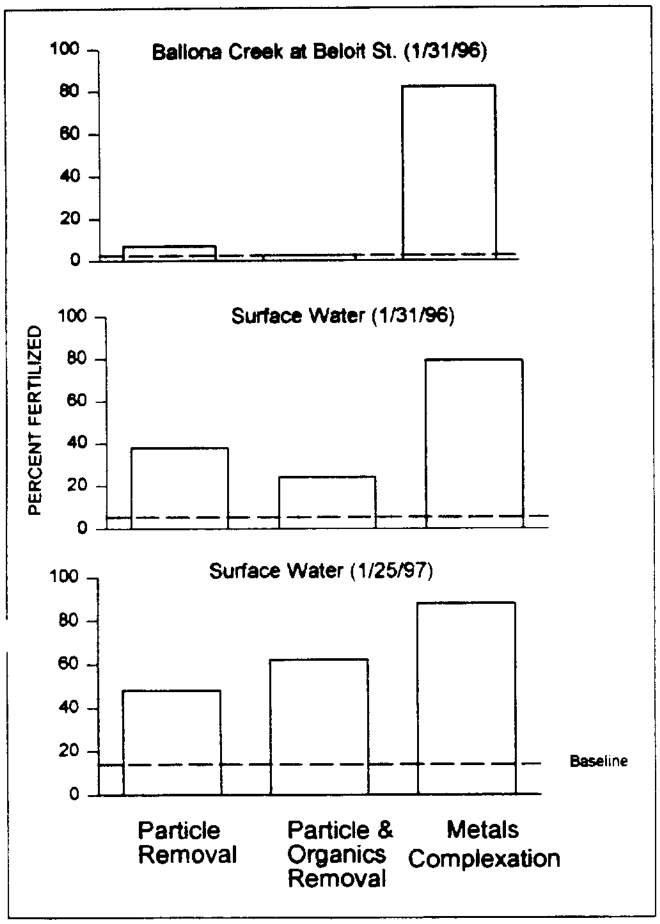
FIGURE 6



Map of surface layer toxicity (effect on sea urchin fertilization) from Ballona Creek stormwater discharge following a 2-year storm in December, 1996 (3.1 in. rainfall). Expected toxicity was calculated from measurements of salinity (indicates concentration of stormwater) and the concentration dose-response curve for the effects of stormwater on sea urchin fertilization. The greatest toxicity (lower fertilization percentage) was present closest to the point of discharge. The area of toxicity was smaller than the physical extent of the plume, as indicated by the solid line showing a salinity of 33 psu. This figure illustrates the relative size of the toxic portion of the plume for a single storm, but does not represent the largest plume offshore for other storms.

Surface water toxicity caused by unidentified sources was frequently encountered during dry weather.

FIGURE 7



Effect of toxicity identification evaluation treatments on the toxicity of Ballona Creek stormwater and two samples of surface water collected within the Ballona Creek discharge plume. Complexation of metals by addition of EDTA usually eliminated toxicity, as shown by the large increase in sea urchin fertilization above the untreated (baseline) value. Other treatments, removal of particles by filtration and removal of organic compounds, were of limited effectiveness. Similar results were found for other samples of stormwater and surface water.

needed to produce toxicity, the area of potential biological impact within a plume will be smaller than the region defined by physical characteristics such as salinity (Figure 6).

An unexpected result of this study was the detection of toxicity in receiving waters that appeared to be due to sources other than urban runoff. An average of 53% of the surface water samples collected offshore of Ballona and Malibu Creeks during periods of dry weather were found to be toxic. The location of the toxic samples was variable and there was no relationship between toxicity and the amount of freshwater in the samples, indicating that dry weather urban runoff was not the cause. Additional sources of receiving water toxicity were also indicated during the wet weather sampling, as some water samples were more toxic than could be accounted for by the amount of stormwater present.

The dry weather toxicity results suggest that factors other than stormwater discharge have a major influence on surface water quality in Santa Monica Bay. While the cause of dry weather toxicity was not determined, its frequent detection indicates that impaired surface water quality in Santa Monica Bay extends beyond the spatial and seasonal boundaries associated with stormwater discharge. Potential sources of dry weather toxicity include the deposition of contaminants from the atmosphere, biological events such as red tides, and inputs from boating activities.

Dissolved metals in stormwater were identified as important contributors to impaired water quality in Ballona Creek stormwater plumes. This conclusion was the result of experiments that combined chemical treatments designed to remove specific types of constituents in water samples with sea urchin toxicity tests, a process known as Toxicity Identification Evaluation (TIE). The toxicity of Ballona Creek stormwater and receiving water samples was usually eliminated when treatments were applied that neutralized toxic trace metals by complexation (Figure 7). Chemical analysis confirmed that dissolved concentrations of zinc, and occasionally copper, were at toxic levels in undiluted stormwater. The dissolved concentrations of other metals were below toxic levels for the sea urchin test. Measurements of receiving water also detected elevated concentrations of zinc (but not copper) in the stormwater plume offshore of Ballona Creek.

Chemical analysis were unable to attribute all of the toxicity measured to zinc and copper, indicating that additional constituents may contribute to the toxicity of stormwater discharged into Santa Monica Bay. The measured concentrations of zinc and copper in Ballona Creek stormwater were estimated to account for only 5-44% of the observed toxicity. Zinc concentrations in the toxic portion of the discharge plume were usually below levels shown to cause toxicity in the laboratory. The unaccounted-for toxicity may be due to synergistic interactions between toxic metals, variability in the

R0073160

chemical analysis, or the influence of other toxic chemicals, such as pesticides. Additional research is needed before these alternatives can be evaluated. TIE studies have not been completed for other stormwater discharges into the Bay, so we do not know if the pattern demonstrated for Ballona Creek is representative of other sites.

Zinc was the most important toxic constituent identified in stormwater. Copper and other unidentified constituents may also be responsible for some of the toxicity measured.

SEAFLOOR BIOLOGY

Much of the natural diversity and many of the commercially important species in the ocean occur on the seafloor. Clams and shrimp live in this environment, as well as worms and starfish, all of which serve as food for fish. This is also the location where stormwater particles, and associated contaminants, eventually settle. Unlike the water column, where a stormwater plume eventually mixes and disperses, the sediments on the seafloor can accumulate runoff inputs over an entire storm, over several storms, or over several seasons. These inputs can alter the seafloor biology by either changing the habitat, such as altering sediment grain size, or by the build-up of pollutants. The potential for impacts to seafloor organisms is great because they are not mobile and are therefore subjected to the accumulated stormwater inputs for long periods of time. Typically, these seafloor organisms are relatively sensitive and changes to the number or types of organisms may result in changes to fish populations.

The deposition of stormwater particles influences the physical and chemical characteristics of the seafloor.

We estimated impacts of stormwater runoff discharges on the seafloor by collecting samples from the ocean bottom between one and two weeks following large storm events, after the stormwater plumes had dispersed and particles had time to settle, and then again during dry weather. Seafloor samples were collected directly offshore of Ballona and Malibu Creeks at 75 ft. depth in the heart of the stormwater plumes, along intervals upcoast and downcoast representing gradients of plume impact, and then outside the area of the plume. The top 2 cm (< 1 inch) of these seafloor samples, which represented the most recent seafloor accumulations, were collected for contaminant analysis and toxicity testing. Sediment samples were analyzed for contaminants including trace metals, chlorinated hydrocarbons (DDTs and PCBs), and petroleum hydrocarbons (PAHs). The toxicity tests included survival of crustaceans (an amphipod) and sea urchins, fertilization success and development of sea urchin embryos, and bioaccumulation of contaminants from seafloor mud in adult sea urchins. A second sediment sample was collected, sieved through a fine mesh screen, and the organisms were enumerated to determine the abundance and diversity of the native seafloor fauna.

An increase in sediment constituents was present on the seafloor offshore Ballona Creek.

TABLE 1

		Sediment Concentration	
		Ballona Ck (n=8)	Malibu Ck (n=7)
Fines	% dry	31.6	53.1
TOC	% dry	0.594	0.963
Aluminum	µg/dry g	11492	17280
Arsenic	µg /dry g	5.1	5.6
Cadmium	µg /dry g	0.5	0.7
Chromium	µg /dry g	40.7	52.6
Copper	µg /dry g	12	13
Iron	µg /dry g	14997	21720
Lead	µg /dry g	26.4	10.3
Mercury	µg /dry g	0.18	0.08
Nickel	µg /dry g	14.29	27.76
Silver	µg /dry g	0.95	0.31
Zinc	µg /dry g	54	56
Total DDTs	ng/dry g	25.6	15.5
Total PCBs	ng/dry g	21.5	3.0
Total PAHs	ng/dry g	240.6	56.2

Average concentrations of sediment constituents offshore (75 ft. depth) of creek mouths in Santa Monica Bay following storm events between 1995 and 1997. Boxed numbers indicate significantly higher concentrations. Sediment offshore of the less urbanized watershed (Malibu Creek) had higher levels of naturally occurring constituents such as aluminum and iron. Higher concentrations of anthropogenic constituents such as lead and PAHs were present offshore of the more urbanized watershed (Ballona Creek).

Alterations to the seafloor habitat and sediment constituent concentrations had occurred offshore of the Ballona Creek watershed (Table 1). The sediments offshore of Malibu Creek generally had higher concentrations of naturally abundant constituents including fine-grained particles, organic carbon, and trace metals such as chromium. In contrast, the sediments offshore of Ballona Creek generally had higher concentrations of urban contaminants including common stormwater constituents such as lead and zinc, as well as other rarely detected constituents in routine stormwater monitoring programs, such as DDTs, PCBs, and PAHs. Moreover, sediments offshore of Ballona Creek showed evidence of stormwater impacts over a large area. Concentrations of copper, lead, zinc, DDTs, PCBs, and PAHs were highest directly offshore of the creek mouth and then decreased in both the upcoast and downcoast directions at distances up to 3 miles away (Figure 8). The increased sediment contamination was also observed more than 1 mile offshore, where water depths reached over 100 feet.

Biological communities offshore of Ballona Creek were similar to those offshore of Malibu Creek (Table 2). Both areas had comparable abundance and similar species composition. Seventeen of the 19 most commonly found taxa offshore of Ballona Creek were present offshore of Malibu Creek, and both watersheds had a low abundance of so-called "pollution indicator" organisms. Both areas had healthy benthic communities, as measured by the Benthic Response Index, which is a tool for assessing the relative importance of pollution indicator species at a site. Species richness and diversity were statistically higher near Malibu Creek than Ballona Creek.

Biological communities offshore of Ballona and Malibu Creeks were also similar to background reference conditions established in previous studies of Southern California (Table 2). The mean abundance, mean number of taxa per sample, and mean diversity at the creek sites were comparable to reference sites located in waters of similar depth, but distant from river and creek mouths. The present study was limited to the area offshore of the Ballona Creek jetty; previous studies by other scientists have shown impacts to benthic communities and the presence of pollution indicator organisms inside of the jetty (adjacent to Marina del Rey).

The seafloor biology results were consistent with the results from sediment toxicity tests. Seafloor sediments offshore of Ballona Creek did not kill amphipods or impair the fertilization success or normal embryo development of sea urchins. However, seafloor sediments were found to be a potential source of contaminants that bioaccumulate in seafloor organisms such as adult sea urchins. Concentrations of lead, DDTs, and PCBs were three to ten times higher in sea urchins exposed to sediments collected offshore of Ballona Creek than in sea urchins living on sediments from our reference location. While the effect of this bioaccumulation on the sea urchin is not known, it does represent a mechanism by which sediment- associated pollutants can enter the food chain and biomagnify within fish.

The fate of most stormwater constituents is unknown.

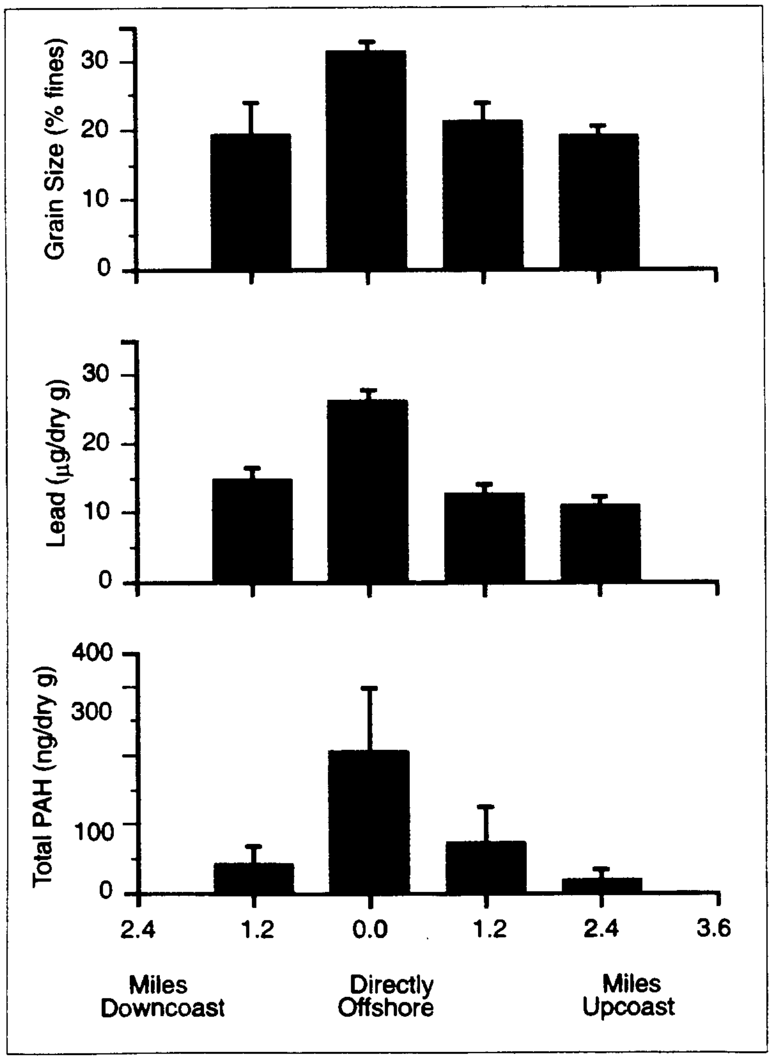
One significant finding of this study was that the fate of most stormwater constituents discharged to Santa Monica Bay is unknown. Although we documented the accumulation of contaminants on the seafloor offshore of Ballona Creek, these amounts were not permanent and represent only a fraction of the total mass emissions discharged. Further, reductions in constituent concentrations were observed at some locations that may have resulted from the resuspension and transport of sediments by waves and currents. Until the location where this material eventually settles is known, we cannot be certain that we have examined the seafloor areas having the greatest influence from stormwater or dry weather discharges. An additional concern is that constituents from other sources may have similar transport and fate mechanisms, producing enhanced impacts from the cumulative effects of multiple sources.

TABLE 2

	Ballona (n=8)	**Malibu** (n=7)	**Reference** (n=29)
Abundance (No. organisms/ 0.1 m²)	238 (±51)	316 (±55)	276 (±61)
No. Species (No. taxa/ 0.1 m²)	75 (±6)	91 (±8)	71 (±9)
Diversity (Shannon-Wiener H')	1.65 (±0.02)	1.73 (±0.04)	1.55 (±0.15)
Benthic Response Index (BRI units)	24.0 (±1.7)	1.65 (±0.7)	3.0 – 30.6

Biological community parameters offshore of a highly urbanized watershed (Ballona Creek), a less urbanized watershed (Malibu Creek), and other reference areas in near-coastal waters of Southern California at similar depths (30 to 75 feet). Values are the mean (±95% confidence limits).

FIGURE 8



Grain size and contaminant concentrations in surface sediments across the gradient of stormwater influence offshore of Ballona Creek. Sampling stations were located 1.5 miles offshore (75 ft. depth) and at various distances upcoast or downcoast of the creek. Each value represents the mean (±95% confidence interval) of eight samples, each collected after a storm event. The influence of stormwater particle deposition is shown by the elevated values directly offshore of Ballona Creek.

R0073163

EFFECTS OF WATERSHED TYPE

The comparison of receiving water impacts from different watersheds is a powerful tool to distinguish between natural and man-made effects. Although the Ballona Creek and Malibu Creek watersheds are similar in size and discharge into the same body of water (Santa Monica Bay), they differ in their degree of urbanization (Figure 1). The measurement of similar parameters in each receiving water area provides the information needed to distinguish between natural processes and impairment due to man-made factors. This approach also identifies which monitoring methods are most useful for detecting man-made impacts.

Different impacts to Santa Monica Bay were produced by an urbanized and an unurbanized watershed.

The characteristics and impacts of stormwater from the Ballona Creek and Malibu Creek watersheds were found to differ in a number of respects (Table 3). The impacts observed were the result of the interaction of three key factors: land use, flow characteristics, and receiving water conditions. Receiving water impacts were less near Malibu Creek and were related to the discharge of less toxic stormwater and lower peak flows.

Ballona Creek watershed is highly urbanized. Stormwater entering the concrete channel is rapidly transported to the ocean, with little opportunity for dilution.

Malibu Creek drains a mostly undeveloped watershed. Stormwater flow and particle inputs into the ocean are moderated by the presence of a natural creekbed and coastal lagoon.

R0073164

TABLE 3

	Ballona Creek	Malibu Creek
Watershed Characteristics	The largest watershed draining to Santa Monica Bay, 83% of its 130 square miles is developed. The principal land use is residential.	Similar in size to Ballona Creek (110 square miles), 88% of this watershed is undeveloped.
Flow Characteristics	The largely impermeable surface area (41% overall) and concrete channel drainage system results in rapid changes in flow following rainfall. Peak flows are relatively high and of shorter duration compared to other areas.	More permeable surface area (96% overall) absorbs early season rainfall and increases lag time between rainfall and peak flow. Discharges have relatively lower peak flows but duration can be days longer than concrete channelized systems. Discharge into Malibu Lagoon may reduce flows and particle loads to ocean.
Plume Characteristics	The stormwater plume in both areas consisted of a thin buoyant layer of low salinity water floating at the surface. The dissolved and particulate components of stormwater were most concentrated in the upper 2 m of the water column. Plumes extended up to 6 miles offshore and were widely distributed along the shore.	
	Higher flows and less mixing produced well-defined plumes that contained higher concentrations of stormwater near Ballona Creek.	Lower flows, more mixing, and discharges from adjacent canyons resulted in more complex and ill-defined plume boundaries near Malibu Creek.
Debris	Floating debris was often concentrated near the margins of the plume and contained many items of man-made origin, such as plastic.	Floating debris was dominated by organic materials of natural origin, such as twigs and charred wood.
Water Clarity	Less mixing of stormwater usually produced larger areas of reduced water clarity.	Stormwater inputs were often more turbid, but lower flows and greater dilution near the mouth resulted in better clarity.
Stormwater Toxicity	Samples from the creek were always toxic to sea urchins. Concentrations higher than 10% stormwater usually produced adverse effects in laboratory tests.	Samples were less toxic than Ballona Creek stormwater and occasionally nontoxic. High concentrations (>25%) usually needed to produce toxicity.

Characteristics of a highly urbanized watershed (Ballona Creek) and a less urbanized watershed (Malibu Creek) adjacent to Santa Monica Bay, California.

TABLE 3 Continued

	Ballona Creek	Malibu Creek
Receiving Water Toxicity	Surface water in most concentrated portion of plume was often toxic to sea urchins. Toxicity was detected in receiving waters up to 2 miles from discharge.	Toxicity in water column was rarely present and was not related to plume concentration.
Cause of Toxicity	Zinc is responsible for a portion of the stormwater toxicity. The influence of pesticides and other organics is uncertain.	Metals are implicated but have not been confirmed as important toxicants.
Seafloor Habitat	Sediments were higher in urban stormwater associated contaminants, such as lead and zinc.	Higher concentrations of constituents were derived from natural sources, such as fine sediments and organic carbon.
Sediment Toxicity	Changes in sediment toxicity were minor and not related to stormwater discharges.	
Seafloor Biological Communities	Biological communities were similar among Malibu Creek, Ballona Creek, and background reference sites.	

R0073166

RECOMMENDATIONS FOR FUTURE STUDIES

The Santa Monica Bay Receiving Waters Study produced the first integrated assessment of impacts from stormwater discharges into the Bay. The presence of well-developed plumes containing toxic materials demonstrates the need for continued studies of the impacts from urban stormwater runoff in Santa Monica Bay and elsewhere. Additional information regarding the sources, characteristics, and extent of the receiving water impacts should be determined in order to refine management actions.

A high priority should be placed upon locating sources of toxicity and contamination within the Ballona Creek watershed. Identification of the land uses or regions of the watershed that contribute most to the impacts will enable management actions to be targeted where they will have the greatest beneficial impact. Source identification studies should include sampling of systems tributary to Ballona Creek for measurement of toxicity and chemical constituents.

Additional receiving water studies are recommended for Santa Monica Bay to provide a more complete understanding of the nature and magnitude of stormwater impacts. Future studies should include constituents of concern that were not emphasized in this study, such as bacteria, nutrients, pesticides, and trash. These constituents should be incorporated into studies of plume persistence, cause of toxicity, and constituent fate.

Information on the duration, size, and cause of adverse impacts is needed to identify appropriate stormwater management actions.

Plume persistence information is needed to estimate the duration of exposure of: 1) swimmers to bacteria and 2) marine life to stormwater toxicants and nutrients. Improved information on plume persistence can be obtained by the use of moored sensors in the discharge area in combination with data from remote sensing instruments (e.g., satellites). A goal of these studies should be to develop plume dilution and/or tracking models of plume duration and magnitude. This information is valuable because different management responses may be appropriate for stormwater discharges that produce short- versus long-lived impacts.

Toxicity testing using multiple marine species is also needed to provide a more complete assessment of the causes of toxicity in stormwater discharged into Santa Monica Bay. Identification of zinc and copper as contaminants of concern was based primarily on studies with a single species (sea urchin). Because different species vary in their sensitivity to contaminants, tests with multiple species are needed to determine if other contaminants are present at toxic concentrations. Tests with crustaceans (e.g., shrimp) are especially recommended as they are likely to be sensitive to pesticides such as diazinon and chlorpyrifos, which have been found to be important factors in the toxicity of stormwater from other watersheds. These tests should include toxicity identification procedures so that potential constituents of

A suite of species should be used to identify toxicants in stormwater.

R0073167

concern (e.g., metals and pesticides) can be confirmed and others can be discounted. Toxicant identification is needed to prioritize chemical-specific management actions.

The fate of stormwater particles must be determined in order to assess seafloor impacts.

Chemical and oceanographic studies are needed to determine the fate of stormwater particles discharged into Santa Monica Bay. Although some of the particles in Santa Monica Bay stormwater plumes may be deposited near the mouth of an urban watershed, they do not necessarily persist there for long periods of time. Since the spatial extent of particle dispersal in Santa Monica Bay was not determined, there may be areas of significant accumulation that were not investigated. Studies of currents, sediment resuspension, and sediment transport, coupled with chemical source identification methods, should be conducted to determine whether stormwater discharge is a significant source of adverse sediment contamination within Santa Monica Bay. This information is needed to identify areas of the seafloor with the greatest potential for biological impacts from stormwater discharge.

Additional receiving water systems should be studied to identify impairments from other watersheds.

The impacts of stormwater runoff on other receiving water systems should also be studied. This is because differences in watershed size and land use patterns will likely result in different levels of risk to the receiving water beneficial uses. For example, changes in land use may contribute different toxicants, and changes in watershed size will influence the magnitude of the toxicant input. The nature of the receiving water environment is also important. Semi-enclosed water bodies, such as most bays and harbors, do not have the mixing and dilution capacity of the open coastal environment studied in Santa Monica Bay. The potential for impairment will be greater in these areas because organisms will have an increased exposure to the stormwater plume and more stormwater particles will settle nearby and influence sediment quality. Until the effects of variations in watershed or receiving water characteristics can be accurately predicted, additional integrated studies will be necessary to assess impacts to receiving waters in other areas.

"STORMWATER MANAGEMENT: Pointless Pollution"
Techno 2100 **TV Special to Air on February 26**

Boca Raton, FL – Stormwater discharges are the largest contributor of pollutants to the nation's lakes, rivers and estuaries. Many of these nonpoint pollutants are generated by the everyday activities of all the people who live, work, play, or travel through a watershed.

Sediments, nutrients, oxygen-demanding substances, metals, oil and grease are examples of the types of pollution found in urban stormwater. Where do they come from? Construction sites, golf courses, parking lots...all common within our cities. These stormwater pollutants destroy habitats, make our drinking water unsafe, and cause severe environmental and health problems. What can we do to help control these types of pollutants?

Two back to back 30-minute episodes of the award-winning TV series TECHNO 2100 will explore **Stormwater Management: Issues & Answers**. Co-host Eric Livingston of the Florida Department of Environmental Protection details stormwater pollution issues and focuses on structural and nonstructural "Best Management Practices." These practices are being implemented to reduce or prevent these sources of non-point pollution. The program will also feature new technologies, programs and strategies being used to retrofit presently developed lands.

Stormwater Management: Issues & Answers is produced by Information Television Network with special thanks to: Virginia Dept. of Conservation and Recreation; Maryland Dept. of the Environment; Florida Dept. of Environmental Protection; Illinois Environmental Protection Agency; California State Water Resources Control Board; Louisiana Dept. of Environmental Quality; Wisconsin Dept. of Natural Resources; DNREC Soil and Water Conservation (Delaware); National Association of Counties Organization (NACO); U. S. Environmental Protection Agency (EPA); and the Association of State and Interstate Water Pollution Control Administrators.

Stormwater Management: Issues & Answers is scheduled to air on Saturday, February 26, from 1-2 PM Eastern, 12 noon-1 PM Central, 11 AM – 12 noon Mountain and 10-11 AM Pacific time on CNBC as paid programming. For additional information, please call 1-888-380-6500. The show will also be streamed on the Internet at ITV's website: www.itvisus.com.

Subject: DEFINITION OF "MAXIMUM EXTENT PRACTICABLE"

ISSUE

What is the meaning of the standard "maximum extent practicable" (MEP) as used in the Clean Water Act's storm water provisions, and how can this standard be communicated to the regulated community? How can this concept be included in the draft BMP manual?

CONCLUSION

The standard "maximum extent practicable" is not specifically defined for use in the storm water program. It has been defined in other rules, however, to require taking all actions which are technically feasible. I have included draft language for the manual.

DISCUSSION

Section 402(p) of the Clean Water Act (33 U.S.C. § 1342(p)) provides that permits issued for discharges from municipal separate storm sewers must require controls to reduce the discharge of pollutants "to the maximum extent practicable". The statutory language provides that municipal permits:

> "Shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other

R0073172

> provisions as the [EPA] Administrator or the State determines appropriate for the control of such pollutants." Clean Water Act Section 402(p)(3)(B)(iii); 33 U.S.C. § 1342(p)(3)(B)(iii).

Neither Congress nor the U.S. Environmental Protection Agency (EPA) has defined the term "maximum extent practicable", and yet this is the critical standard which municipal dischargers must attain in order to comply with their permits. (The State could have spelled out the specific controls which the municipalities were required to undertake. However, such an approach would have relinquished the municipal dischargers of any flexibility in implementing their storm water programs.)

On its face, it is possible to discern some outline of the intent of Congress in establishing the MEP standard. First, the requirement is to reduce the discharge of pollutants, rather than totally prohibit such discharge. Presumably, the reason for this standard (and the difference from the more stringent standard applied to industrial dischargers in Section 402(p)(3)(A)), is the knowledge that it is not possible for municipal dischargers to prevent the discharge of all pollutants in storm water. The second point which is clearly encompassed in the standard is that it is the permitting agency, and not the discharger, which is the ultimate arbiter on whether there has been sufficient reduction of pollutants.

The most difficult issue is determining how much pollutants must be reduced, or, in other words, which best management practices (BMPs) must be employed in order to comply with the MEP standard. While the term is not defined in the Clean Water Act or the EPA regulations, the same term does appear in other federal laws and regulations, and there are some definitions or interpretations which may be useful to the storm water program.

In the Uranium Mill Tailings Radiation Control Act of 1978 (42 U.S.C. § 7901, et seq.), the Department of Energy was required to designate within one year of the Act's adoption "to the maximum extent practicable" contaminated areas within the vicinity of uranium processing sites. In addressing a lawsuit brought after the Department designated very few of the "vicinity properties", the federal court declared that MEP means "a substantial majority of the locations" should have been designated within the year. Sierra Club v. Edwards (D.C.D.C. 1983) 19 ERC 1357. Where a NEPA regulation required that "to the maximum extent practicable" environmental clearance was required for uncompleted projects which had never undergone NEPA review, a court held that the regulation "mandates a meaningful environmental review" rather than a "perfunctory evaluation". Save the Courthouse Committee v. Lynn (S.D.N.Y. 1975) 408 F.Supp. 1323.

In an interim final regulation recently promulgated by the Department of Transportation, MEP is defined, where operators of onshore oil pipelines must have resources "to the maximum extent practicable" to remove and to mitigate or prevent worst case discharges. 49 CFR Part 194. MEP is defined to mean:

> "The limits of available technology and the practical and technical limits on an individual pipeline operator in planning the response resources required to provide the on-water recovery capability and the shoreline protection and cleanup capability to conduct response activities ...."

Finally, the term MEP is used in the Superfund legislation, wherein permanent solutions and alternative treatment technologies must be selected "to the maximum extent practicable". CERCLA, Section 121(b). The legislative history of the language indicates that the relevant factors in determining whether MEP is met include technical feasibility, cost, and state and public acceptance. 132 Cong. Rec. H 9561 (Oct. 8, 1986).

While each of the above interpretations and definitions varies, they do follow a pattern. The pattern that emerges is that there must be a serious attempt to comply, and that practical solutions may not be lightly rejected. If a municipality reviews a lengthy menu of BMPs, and chooses to select only a few of the least expensive, it is likely that MEP has not been met. On the other hand, if a municipal discharger employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit to be derived, it would have met the standard. In any case, the burden would be on the municipal discharger to show compliance.

The definitions contained in the pipeline regulation and the Superfund legislative history are most analogous to storm water regulation. The major emphasis in both of these rules are technical feasibility. Similarly, the municipal dischargers should be required to employ whatever BMPs are feasible, i.e., are likely to be effective and are not cost prohibitive. Thus, where a choice may be made between two BMPs which should provide generally comparative effectiveness, the discharger may choose the least expensive alternative and exclude the more expensive BMP. However, it would not be acceptable either to reject all BMPs which would address a pollutant source or to pick a BMP based solely on cost, which would be clearly less effective.

As you know, the BMP Guidance manual is being published by the Task Force, which is made up of dischargers, rather than by the State Water Board. As far as I know, there is no intention for the State Water Board to adopt the manual as its own guidance document. Therefore, it is important to stress in the manual, both in the section on MEP and in the front of the manual, that this manual is not a publication of the State or the Regional Water Boards, and that these Boards have not specifically endorsed the contents. Rather, the manual was assembled by a group of dischargers in the interest of assisting themselves and others to comply with the storm water permits. In the section on MEP, it should be stated that the final determination regarding whether a discharger was reduced pollutants to the maximum extent practicable can only be made by the Regional or State Water Boards, but that selection and implementation of BMPs through consideration of the listed factors should assist dischargers in achieving compliance.

The following language is suggested in order to clarify that the manual is not the product of the State Water Board:

> "This Manual was produced and published by the Storm Water Task Force, an advisory body of municipal agencies regulated by the storm water program. This Manual is not a publication of the State Water Resources Control Board or any Regional Water Quality Control Board, and none of these Boards has specifically endorsed the contents thereof. The purpose of this manual is to assist the members of the Task Force and other dischargers subject to storm water permits, in attaining compliance with such permits."

The following language is recommended in place of Insert A in the manual for municipal dischargers:

> "Although MEP is not defined by the federal regulations, use of this manual in selecting BMPs should assist municipalities in achieving MEP. In selecting BMPs which will achieve MEP, it is important to remember that municipalities will be responsible to reduce the discharge of pollutants in storm water <u>to the maximum extent practicable</u>. This means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive. The following factors may be useful to consider:
>
> "1. Effectiveness: Will the BMP address a pollutant of concern?

"2. Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?

"3. Public acceptance: Does the BMP have public support?

"4. Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?

"5. Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc.?

"After selecting a menu of BMPs, it is of course the responsibility of the discharger to insure that all BMPs are implemented."

Mr. Dennis Dickerson
Executive Officer
Los Angeles Regional
Water Quality Board
320 W. 4th Street, Suite 200
Los Angeles, California 90013

Re: Failure of Executive Officer to Respond to Notice of Intent to Implement Permittees' August, 1999 SUSMP--Order No. 96-054, Part 2.I.G.1.A

Dear Mr. Dickerson:

On May 5, 2000, I informed you of the Cities of Bellflower, Bell Gardens, Burbank, Cerritos, Commerce, Compton, Diamond Bar, Downey, Hawaiian Gardens, Huntington Park, Industry, Irwindale, La Canada-Flintridge, La Mirada, La Verne, Lakewood, Lawndale, Monrovia, Montebello, Palos Verdes Estates, Paramount, Pico Rivera, Pomona, Rancho Palos Verdes, Rosemead, San Gabriel, Santa Fe Springs, Signal Hill, South Gate, Vernon, Walnut, and Whittier ("Cities") intent to implement the Standard Urban Storm Water Mitigation Plan submitted to you on behalf of the Permittees in August of 1999. I further notified you that because of your office's failure to take action on this SUSMP within 120 days of its submittal, as required by the Administrative Review Process under Order No. 96-054, that the Cities herein intended to move forward with this SUSMP. As of this date, more than ten (10) days has now elapsed since the May 5 Notice, without a response from the Executive Officer to this Notice.

Accordingly, in accordance with the Administrative Review Process under Order No. 96-054, and given your failure to respond to our Notice of Intent to implement this August, 1999 SUSMP Program within the requisite ten (10) day period, the Cities herein must now be permitted to proceed and implement their August, 1999 SUSMP Program ***without*** modification by the Executive Officer.

If you have any questions with respect to the above, or need any additional information in connection with this matter, please do not hesitate to contact the undersigned. Thank you for your attention to this matter.

Respectfully submitted,

May 31, 2000

Ms. Elizabeth M. Jennings, Esq.
Office of Chief Counsel
State Water Resources Control Board
P.O. Box 100
Sacramento, CA 95812-0100

And,

Mr. Xavier Swamikannu
Storm Water Program
California Regional Water Quality Control Board – LA Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Dear Ms. Jennings and Mr. Swamikannu:

Enclosed are several items that may help you understand the goals attributed to Maryland's stormwater management program. The Maryland Department of the Environment is nearing 20 years worth of experience in administering an urban runoff program. Some basic tenets of the program and the successes and failures are described in the three reports provided.

Additionally, a brief background summary is provided in order to explain the transition we are making from current requirements to those proposed in the "2000 Maryland Stormwater Design Manual." This summary also helped to better answer the design and performance standards questions that you posed regarding stormwater management in our State. We hope this material will be of some use to you.

If you have any questions or need any more information, please call me at 410-631-3543.

Sincerely,

Brian S. Clevenger

MARYLAND'S STORMWATER MANAGEMENT PROGRAM SUMMARY

Introduction

The State of Maryland has recently completed the development of the "*2000 Maryland Stormwater Design Manual*" (Manual). This document took nearly 5 years to compose and is intended to improve the State's stormwater management program that has been in existence since 1982. The Maryland Department of the Environment, Water Management Administration (MDE/WMA) provides here a synopsis of Maryland's program's evolution over the last 18 years. This summary will provide the perspective needed to answer questions regarding programmatic goals, performance standards, and strengths and weaknesses. Apologies for the lack of brevity.

Background

Maryland's stormwater management program was a logical progression from its erosion and sediment control efforts. The Attorney General of the State declared "sediment" a pollutant in 1969. The next year a statute was passed that required sediment control practices to be implemented for any earth disturbing activities over 5,000 square feet. Maryland's erosion and sediment control program was implemented statewide by local government beginning in 1970.

The next step from controlling runoff from grading and construction would obviously be controlling runoff after development has been completed. This progression then, is stormwater management. Recognizing that urban runoff was a contributing factor to water quality degradation, the Maryland legislature passed the Stormwater Management Act in 1982. This law, and commensurate regulations adopted the following year, sought to ensure that pre-development runoff characteristics were maintained after development.

During the mid 1980s when Maryland's program was first conceived and implemented, the prevailing attitude was that if peak discharge increases caused by urbanization were controlled, the receiving waters would be protected from excess volume, increased velocities, channel erosion, sedimentation, flooding, etc. Therefore, Maryland's program was, and is currently, based on this flood control perspective. Current State regulations require that all new development project designs include provisions for reducing peak discharge increases for the 2 and 10 year frequency storm events back to pre-development conditions. Clearly, this requires a best management practice (BMP) approach and typically, the BMP of choice is a pond.

Because of the prevailing attitudes regarding how best to control stormwater (e.g., flood management), very little specific design criteria were included in Maryland's stormwater management program. The approach taken, and the one we work under currently, was a "preferred practices" list. State regulations require that infiltration be considered first and, if not feasible, the designer would then progress through a list of BMPs each with lesser water quality efficiency than the one previous. In latter years, rules-of-thumb for water quality design were implemented sporadically throughout the State (e.g., one half inch times total site imperviousness). However, Maryland still operates under its original design criteria (e.g., 2 and 10 year management and the preferred practices list).

Chesapeake Bay Protection and Environmental Awareness

Given the above historical explanation, several points need to be made that will provide other factors affecting program implementation and help explain why a major change of philosophy has been contemplated with the Manual. First, it cannot be overemphasized how much Chesapeake Bay restoration efforts play on bringing to the forefront environmental concerns, especially those related to water quality. Chesapeake Bay garners much attention in the State, region, and, arguably, the world for protection and restoration. This was the case in 1983 when the Six Bay states and Washington, D.C signed the original "Chesapeake Bay Agreement." Therefore, the protection of this valuable resource was very much a factor for implementing an urban runoff program.

Another factor contributing to Maryland's stormwater management program development was the groundswell of environmental awareness caused primarily by nutrient enrichment of the Chesapeake Bay. Nutrient reduction goals, wetland protection, and sediment control all served as catalysts for grass roots organizations to bring to light the importance of environmental issues. This public and sometimes political support cannot be overlooked.

Technical Program Improvements Needed

Finally, because of over 12 years of program oversight and experience, changes with our program were clearly needed in the mid 1990s. Some issues have been mentioned above (e.g., no specific water quality design standards; too much flood control emphasis). However, explaining a couple of technical issues related to our program will address questions regarding stormwater management program goals and specific issues such as redevelopment.

As originally conceived, the State program makes no mention of where new development takes place. Nor does it specify what land use types are affected. If 5,000 square feet of earth is disturbed with new development, you must address stormwater runoff. This would presumably include redevelopment or in-fill situations. However, as with most regulatory programs, Maryland's stormwater regulations contain exemptions and allow for waivers provided certain conditions are met. Since 1982, certain projects have been waived depending on hydrological circumstances. Three major waiver categories have been allowed and these demonstrate the flood management program emphasis on which the program was founded. These categories are:

1) Less than a ten percent increase in the pre-development 2 year storm event,
2) Direct discharges to tidewater, and
3) Projects completely surrounded by an existing storm drain system of sufficient capacity to convey the increase in discharge caused by the new development.

The emphasis on peak management and flood control is quite obvious. It was MDE's want to change this emphasis when regulatory changes were proposed and the Manual was conceived in

1995. Beginning with the Manual's composition, the issue of stormwater control for redevelopment projects was debated vigorously.

The above waiver provisions that local jurisdictions applied to certain "new development" caused most redevelopment and in-fill work to avoid BMP implementation. A fast food restaurant built in the corner of a shopping mall parking lot would surely not change hydrologic characteristics, especially peak discharge. Additionally, this and similar urban "redevelopment" would most likely be surrounded by an existing storm drain system of adequate capacity. Therefore, most redevelopment is waived under Maryland's original and current stormwater regulations. This was an additional reason why MDE felt improvements were warranted.

Summary

Under increased environmental awareness caused by Chesapeake Bay protection concerns, Maryland instituted a stormwater management program that emphasized peak flood management for new development projects disturbing 5,000 square feet of earth. Relatively little specific water quality control design criteria were included in original regulations as a "preferred practices" list was used. With an obvious flood control emphasis, most redevelopment projects were waived because pre-development hydrologic conditions remained after construction completion.

With over 12 years of program implementation experience, a recognition that improved water quality management was needed, and a need to eliminate many waivers of stormwater management requirements for such things as redevelopment, MDE developed the "*2000 Maryland Stormwater Design Manual.*" This document, along with major regulatory modifications, is intended to address many of Maryland's stormwater management program weaknesses. When adopted later this year, major improvement to controlling urban runoff is expected.

POLICY STATEMENT ON CONTROLS AND REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT IN THE STATE OF MARYLAND

i) Why did your state elect to have requirements on new development and redevelopment?

In 1982, restoration and protection of Chesapeake Bay was one of the most important factors contributing to the development of Maryland's stormwater management program. Heightened environmental awareness and a recognition that urban runoff contributed to water quality degradation combined to produce a program that emphasized peak flood control. Because of this emphasis on peak management, typical redevelopment projects were often waived from stormwater controls.

To address various program shortcomings, MDE development the "*2000 Maryland Stormwater Design Manual*" (Manual). This document is intended to provide better water quality control, an area not specifically addressed currently. Relative to redevelopment, the choice to impose requirements was based primarily on "everyone contributes runoff, everyone ought contribute management." However, a balance between management contributions for environmental purposes, and, practical requirements that make economic sense must be struck. Everyone should contribute management. However, conventional BMPs (e.g., ponds) are not feasible in major metropolitan areas where land values prevent typical management strategies. Flexibility is key.

ii) Does your state have design standards and performance standards for treatment control BMPs for new development/redevelopment?

Currently, there are no performance standards for BMPs only design standards. Maryland requires that BMPs be designed to maintain pre-development peak discharges for the 2 and 10 year storm events in most of the State.

Maryland's proposed Manual contains both design standards and performance standards. A suite of design volumes has been developed to address recharge (Re_v), water quality (WQ_v), channel protection (Cp_v), and overbank flood protection (Q_p). All of these volumes need to be included in new development designs. Additionally, BMP performance standards are implicit in Maryland's proposed Manual. Based on pollutant removal efficiency studies, all BMPs in the Manual have been equated in terms of efficiency. If a BMP is designed according to the criteria specified in the Manual, an 80% total suspended solids (TSS) and a 40% total phosphorus (P) reduction will both be realized. In fact, this 80:40 criteria is used to judge whether new technology is allowed to be used to address the required suite of volumes above. If the proverbial "new mousetrap" can meet 80% TSS and 40% P removal, it can be used as a stand alone BMP.

iii) Do you have thresholds for new development and or redevelopment (impervious area; size; etc.) for requirements to apply?

If a project disturbs 5,000 square feet of earth in Maryland, the site design must address stormwater management.

iv) What development categories do the requirements apply to [i.e. commercial; parking lots; residential, etc.]?

There are no specific development categories. If you disturb 5,000 square feet with any new development, you automatically are included. State regulations, however, do "exempt" agricultural land management activities.

v) How long have such requirements been in place? Are they statewide or region specific?

Stormwater management has been on the books since 1982. This is a statewide program that does have design variations based on hydrologic areas of the State (e.g., no 10 year management requirements in the Coastal Plain on our "Eastern Shore."

vi) Have the design standards and performance standards unduly burdened cities and builders with unsupportable costs? Has compliance been difficult? Has change been for the better or have you seen none? Any noticeable improvements in water quality?

All of these questions have been, are, and will not doubt continue to be debated. Volumes could be written to explain perspectives for burdens, costs, compliance, or noticeable improvements. To avoid this, some very random thoughts about these issues.

Generally, the answer to all of these questions could be "it depends on whom you ask" or "it depends on where you ask it." Maryland has three distinct geographic areas. These are a "Western" section; a central, "Urban" area; and our "Eastern Shore." The Urban area houses most of the State's population; can be defined in terms of the corridor between Washington, D.C., Baltimore, and toward Philadelphia, PA; and, not coincidentally, contains the most sophisticated stormwater programs in our State. It is not uncommon for a central Maryland county to have 8 or 10 plan reviewers and as many field staff dedicated solely to stormwater functions. The burden on these places currently is minimal.

As you travel west or east from this Urban region, the stormwater programs locally tend to become more burdensome. There is less sophistication technically, less resources, and obviously less compliance. In Western Maryland and on our Eastern Shore, localities may only have a single staff person to perform both review and inspection. The burden associated with changing to the proposed Manual in these regions will increase dramatically. However, again, it depends on whom you ask.

Environmental groups have told us we are not doing enough and have actually demanded "zero discharge" from new development. Developers and builders believe we are making them do too much now and are severely questioning our proposed changes and the Manual requirements. Frankly, and with tongue only partially in cheek, we believe we are close to where we need to be with the Manual because we have aggravated an equal number of people on both sides of this regulatory fence.

Some really random thoughts:

- In the beginning of the program (circa 1982), the design standards were very burdensome. Localities had to hire staff and purchase vehicles and equipment. Developers endured the added cost of BMP construction.
- Currently, stormwater management on both sides is a routine part of the development process.
- Compliance varies with the level of resources and the distance from Urban Maryland as described above. One difficulty we do have is the interpretation of the same requirement differently from locality to locality.
- We have seen only modest water quality improvement. This is expected to change dramatically with our Manual.

vii) Typically, what is your estimate of the range in additional cost (in percent of project cost) that the requirements have imposed on builders?

Obviously, this depends on that real estate saying "location, location, location." However, currently, stormwater management for 2 and 10 year control ranges from 0% to 20%. We have proposed to make optional the control of the 10 year storm. Because "lots are money" and "more stormwater means less lots," costs are anticipated to decrease about 20% of current costs without 10 year management. Costs will increase commensurately with 10 year management under the Manual.

viii) How have municipalities ensured that the post construction BMPs O & M has been provided and/or BMPs are properly maintained?

Operation and Maintenance Agreements are required as a condition of plan approval and permit issuance. Localities are required by State regulation to inspect and cause to be maintained BMPs every three years. Some jurisdictions assume ownership of BMPs. This is best for ensuring future maintenance. Other localities require private ownership, which makes it difficult for requiring maintenance due to the limited resources of entities such as homeowners' associations.

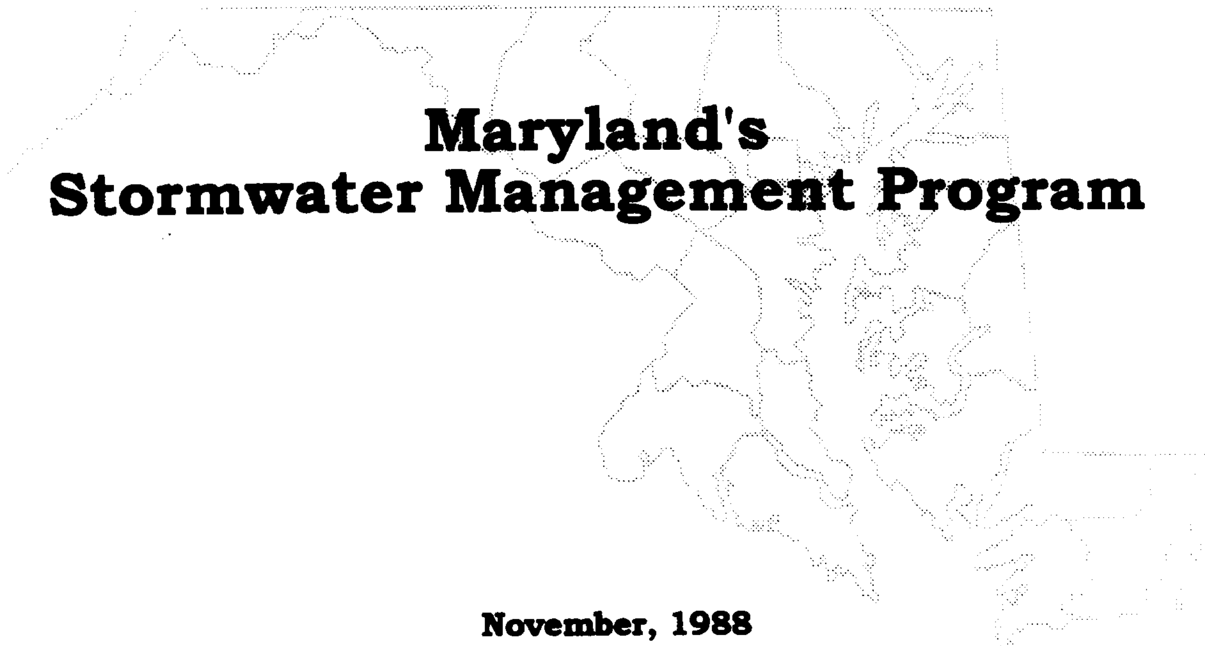
ix) What are the policy goals that the standards are intended to achieve (reverse impairment; hold the line; etc.)?

Basically, the best way to describe our proposed program's goal is to minimize damage caused by urban runoff. For us, this boils down to basic hydrology. When you change natural conditions to developed conditions, bad things happen to water quality. We also know that all soils have some recharge value, sustained bankfull discharges create severe channel erosion, and minimizing impervious surfaces is the best way to mimic pre-development hydrology. Therefore, we are hoping to change how development occurs. Hopefully, we can incorporate water management early in the site design process rather than having a BMP placed at the bottom discharge point of a site as an afterthought.

Individual volume goals and design criteria:

1) Recharge (Re_v) – mimic existing annual groundwater recharge rates.
2) Water quality volume (WQ_v) – 80% TSS removal (a Coastal Zone Management Act requirement), 40% P removal (a Chesapeake Bay Program goal), and treatment of 90% of the average annual rainfall.
3) Channel protection volume (Cp_v) – the 2 year storm control policy has actually created more channel erosion in some cases. This method sustains bankfull discharges over a longer period of time. Therefore, more frequent storm event control is essential. We are choosing the 1 year storm using extended detention. This is delaying the 1 year storm's inflow hydrograph by 24 hours.
4) Overbank flood protection (Q_p) – 10 year storm control is optional provided no additional downstream flooding occurs.

5) Redevelopment – the goal is to reduce by 20% the total site imperviousness. If not feasible, BMPs elsewhere in the watershed, stream restoration, fees paid are all acceptable but subject to local approval.



Maryland's Stormwater Management Program

November, 1988

Prepared By:
Robert L. Kort

Baltimore, Maryland 21224

The Sediment and Stormwater Administration (SSA) was incorporated into the Water Management Administration (WMA) in October, 1992. For additional information concerning this publication, please contact WMA (410) 631-3543.

MARYLAND'S STORMWATER MANAGEMENT PROGRAM

Robert L. Kort[1]

ABSTRACT

The adverse impacts of urbanization have contributed to a decline in the water quality of some of Maryland's streams and rivers, and the Chesapeake Bay. One of the state of Maryland's initiatives in response to this was the creation of a statewide stormwater management (SWM) program in 1982. This multipurpose program addresses a full range of hydrologic consequences and not just traditional runoff peak control. The Maryland Department of the Environment administers the program and is responsible for program implementation, plan review and approval, grants administration, education and training, and inspection and enforcement. Local jurisdictions administer their own programs that must meet minimum State standards. Water quality measures to enhance pollutant removal are emphasized. Practices used for the treatment of stormwater include infiltration structures, shallow marsh creation, extended detention basins, and water quality inlets. Retrofitting of existing SWM structures is done to enhance pollutant removal. Maryland's erosion and sediment control program is a key part of management efforts. Research and monitoring are conducted, and the use of innovative practices is encouraged.

INTRODUCTION

Urbanization generates detrimental changes to the hydrologic equilibrium of the land surface and the receiving fluvial estuarine environments. These changes include: increases in peak flow and total volume of stormwater runoff; accelerated stream channel erosion; decreases in low flow volumes in receiving streams; and decreases in water quality and the stream environment.

Efforts to control these conditions in the state of Maryland have resulted in statewide programs for erosion and sediment control, stormwater management (SWM), and flood plain management. Impetus for the control of runoff from new developments came from pressure by environmental groups because of the declining water quality of some of the state's streams and rivers, and the Chesapeake Bay; and the U.S. Environmental Protection Agency report on the Bay. The report documented the declining water quality of the Bay and identified urban stormwater as one of the causes. Nutrients, sediments, toxics, and other pollutants from surface runoff entering the Bay are not readily flushed out into the ocean but accumulate within the Bay.

Prior to a statewide program, stormwater management efforts in Maryland had focused on the control of increased peak flows and were not universally implemented. Water quality as well as quantity control implemented on a statewide basis had to be addressed if the program was to protect and improve the quality of surface waters in Maryland. The State's multipurpose program was designed to address the full range of hydrologic consequences resulting from urban development, and reduce the adverse effects of stormwater runoff. Erosion and sediment control is a key part of management efforts - runoff during construction is often greater than after site stabilization.

LAWS AND REGULATIONS

Legislation creating a statewide stormwater management (SWM) program in Maryland was enacted in 1982. It required each county and municipality to adopt a stormwater management program by July, 1984 subject to minimum criteria established in Regulations promulgated in July, 1983. For the first time in Maryland, water quality protection became a major component of all stormwater programs. Highlights of the act include:

1. Providing for an approved SWM plan for residential, commercial, industrial, or institutional land development. Agricultural land is exempt from these requirements;

----

[1] Water Resources Engineer, Maryland Department of the Environment, Sediment & Stormwater Administration, 2500 Broening Highway, Baltimore, MD 21224

2. Permitting each county and municipality to adopt a fee system to cover the cost of SWM plan review and program implementation;

3. Requiring the State to review the local SWM programs at least once every 3 years;

4. Providing for civil and criminal penalties for violations of the SWM Law;

5. Requiring the State to provide technical assistance, training, research, and coordination in SWM technology to the local governments;

6. Requiring that Rules and Regulations be adopted, and outlining the items to be addressed by these;

Rules and Regulations established criteria and procedures for SWM in Maryland to ensure effective implementation of the local programs as well as the State program. The Regulations contained:

1. Responsibilities of the State for implementation and supervision of the SWM program.

2. The minimum content of the local county and municipal SWM ordinances;

3. Exemptions from the provisions of the regulations;

4. Allowance for waiver provisions in local ordinances for individual developments;

5. Minimum control requirements based on the hydrologic characteristics and SWM needs of different parts of the state;

6. A preferential list of SWM measures plus design criteria that must be used in developing a SWM plan;

7. Requirements for proper construction inspection of SWM facilities;

8. Provisions for periodic inspection and maintenance of stormwater facilities.

The Regulations were not universally accepted throughout Maryland, especially in the nine counties with existing programs (Maryland has 23 counties) and some municipalities for which SWM programs also existed. There was some resentment by local governments to the State redirecting the local programs. Change was not always easily accepted. One newspaper article from a county with no SWM program told how "the County Commissioner's room shook under the specter of a monster... Armageddon? No. Stormwater Management Regulations." It then related how the requirements "...could put an end to life as we know it." Nine public hearings were held throughout the state and there was considerable consultation with the local jurisdictions.

An amendment to the SWM law was enacted in the spring of 1988 that provides for the use of stormwater management practices to enhance water quality when land is redeveloped, even when the amount of impervious area does not increase. The SWM Rules and Regulations will be updated to reflect this change.

IMPLEMENTATION

The Sediment and Stormwater Administration of the Maryland Department of the Environment is responsible for administering the state's stormwater management and sediment control programs. The Administration is currently composed of three Programs: the Policy and Evaluation Program, the Construction Management Program, and the Compliance Program.

The Policy and Evaluation Program is responsible for promulgation of Rules and Regulations which establish criteria and procedures for State, county, and municipal programs. Publications are produced to provide technical guidance for local jurisdictions in the implementation of their programs. Research is conducted to refine current practices and evaluate innovative approaches initiated by the Program.

This Program administers the State's nonpoint source management program. The primary goal of the program is to implement Maryland's Chesapeake Bay Nutrient Reduction plan which calls for a 40% reduction in nutrient loadings to the Bay.

The Program oversees local stormwater management programs which are reviewed and evaluated every three years. The county or municipal stormwater management ordinance, the administrative procedures that guide implementation of the program, the plan review and approval process, the use of State funding for program implementation, and the effectiveness of inspection and enforcement procedures to correct violations are considered during the review.

Education and training opportunities are available for government agencies, consultants, developers and home builders, and environmental groups. Events include: a sediment and stormwater conference, inspectors workshops, technical assistance, presentations to groups upon request, and displays at various events.

The Construction Management Program reviews and approves sediment control and SWM plans for State and Federal construction projects to ensure compliance with SWM Regulations. Coordination occurs with inspectors from the Enforcement Division to evaluate field implementation and approve field modifications as required. In FY89 there were 400 new State and Federal projects for which over 1000 submittals were received and reviewed.

Funding is provided by the State for stormwater management retrofit projects and local SWM programs. Retrofit funds are used for the implementation of state-of-the-art best management practices and the modification of existing SWM structures in urban areas to enhance water quality benefits. Since 1984 five million dollars has been awarded under this program. Funds come from the sale of State bonds. The grant program funds plan review, inspection, and other personnel to implement the local programs. Grant funds of approximately $1.6 million per year have been authorized for the 23 counties and 9 municipalities with approved SWM programs. Funding is from the financial commitment included in Maryland's "Chesapeake Bay Initiatives" and comes from state general funds.

The Compliance Program is responsible for inspection and enforcement of sediment control and SWM for all State and Federal construction projects. It is also responsible for sediment control inspection and enforcement for some of Maryland's counties and municipalities. The Program is organized into four field regions. Periodic and unscheduled inspections of approved projects are made to ensure compliance with approved plans.

A majority of the inspector's time is spent on erosion and sediment control as opposed to SWM. Good erosion and sediment control is crucial for innovative SWM practices such as infiltration and shallow marshes - sediment can clog infiltration structures or smother young marsh plants. Stormwater responsibilities include inspection of structures during construction, coordinating field modifications to the approved plans, and responding to citizen's complaints about drainage problems due to a particular project. Twelve to fourteen thousand site inspections of approved projects are made annually.

Enforcement actions, either administrative or legal, are based on the nature, extent, and impact of the violations. Primary emphasis is given to "in the field" corrective action and follow-up. Administrative civil penalties of $1,000 per day for sediment control violations are possible. Fifteen to twenty criminal or judicial civil actions are initiated yearly. The Program is responsible for emergency response and immediate enforcement actions for violations of the Laws and Regulations.

PRACTICES

The primary goal of the Maryland SWM Program is to maintain after development, as nearly as possible, the predevelopment runoff characteristics. Achieving this goal requires that the full range of hydrologic consequences resulting from urban development be addressed. In addition to the traditional control of peak flow, consideration of flow volume reduction, stream low flow augmentation, water quality control, and ecological protection is necessary.

A preferential list of SWM Practices to be considered on each proposed development is used. Justification needs to be provided by the person developing land for rejecting each practice based on site conditions. Ranking is determined by the water quality benefits associated with each practice. A combination of successive practices may be used to achieve the applicable water quantity control requirements. Minimum control requirements are established based on the hydrologic characteristics and SWM needs of different parts of the state. Most of the state has a 2 and 10-year control requirement because stream channel erosion and flood increases are of equal concern. Only 2-year control is required for the extremely flat terrain of Maryland's Eastern Shore.

State Regulations require consideration of infiltration practices first because of the many benefits they provide to negate the adverse environmental impacts resulting from land development. Infiltration of stormwater from a site can recharge groundwater, augment low stream flows, reduce the total runoff volume, and enhance water quality. If their use for peak discharge control is not feasible due to limiting constraints, the practice can be designed to capture the first flush of runoff. The first flush is recommended to be 0.5 inches of runoff per impervious area (MDE, 1986). Capturing this volume will result in the removal of many waterborne pollutants.

"Standards and Specifications for Infiltration Practices" (MDE, 1984) were developed to provide design guidance to consultants and regulatory agencies. The document establishes minimum criteria for the design, review, approval, construction, and maintenance of infiltration practices. Practices detailed include the infiltration basin, infiltration trench, dry well, porous asphalt pavement, and vegetated swales with check dams. Feasibility tests to determine if infiltration is suitable for a specific site, and the extent to which it may be applied are included.

The use of infiltration throughout the state has proceeded in a somewhat cautious manner due to concerns and unanswered questions. Research is currently in progress to investigate the potential for ground water pollution through the entry of runoff into the soil subgrade. Premature failure of infiltration practices due to a lack of adequate runoff filtering in the design, poor construction techniques, or a lack of proper sediment control during construction has been a problem. Maintenance of these structures may be difficult to accomplish or neglected. A utility approach that would include the financing of SWM maintenance is being pursued to address this. This involves the creation of a local government enterprise that provides services of stormwater management (quantity and quality control), drainage, and flood control. It is funded by user charges based on runoff volumes or impervious area, not property taxes.

The second item on the preferential list is open vegetated swales which have a high resistance to flow, and natural depressions. These practices retard the runoff and provide some water quality benefit. Vegetative methods, when kept within erosion control design limitations, are generally preferred over structural methods. The State's intention with this preference is to encourage local jurisdictions to be more flexible in the utilization of curb and gutter.

The third item on the preferential list is stormwater retention structures or wet ponds. The benefits of retention ponds regarding water quality enhancement are well documented in the U.S. EPA Nationwide Urban Runoff Program (NURP) studies (Wash. COG, 1983). In addition to water quality benefits, retention ponds provide aesthetic and possible wildlife benefits when properly designed. They provide an excellent opportunity for creation of shallow marsh habitat. Design criteria for the creation of artificial wetlands have been prepared (MDE, 1988). The guidelines contain physical and biological requirements for constructing wetlands. Research is currently proceeding at three artificial wetlands in Maryland to monitor water quantity and quality benefits.

The last item on the preferential list is detention structures (dry ponds) which generally only provide shaving of peak discharge rates to a specified level. Detention ponds have little or no water quality benefits, which accounts for their lowly position on the State preferential list. The use of extended detention is encouraged since it allows additional time for the settling of particulate pollutants and decreases downstream erosion of the receiving stream. The State has used a criteria that requires the runoff volume generated from the one year frequency storm be released over a minimum of 24 hours. Recent research has indicated that even slower runoff release rates than currently required are preferable to adequately protect stream channels (McCuen et al, 1988). Forthcoming changes to SWM Regulations will require the use of extended detention instead of detention.

CONCLUSION

Maryland's statewide SWM program is six years old. The decline of some of the state's streams and rivers, and the Chesapeake Bay was years in the making, and it will be years before SWM and other initiatives to restore surface water quality will fully achieve that goal. What has been learned in the short term can provide guidance for those considering the implementation of a SWM program:

1. The SWM program should have a clearly defined direction and the enabling legislation and regulations should reflect this;

2. Innovation, research, and monitoring are needed for successful evolution of a program;

3. A commitment to program implementation requires adequate monetary and manpower support;

4. Erosion and sediment control should be included as an integral part of the program;

5. Inspection of SWM practices is critical to avoid failure due to improper construction;

6. Maintenance of SWM structures is critical. A funding mechanism, such as a stormwater utility, is required;

7. An education and training program is essential. A lack of understanding SWM concepts can lead to poor design, plan review, and construction;

8. Enforcement penalties for non-compliance with stormwater requirements that are extreme enough to act as a determent are necessary;

9. Implementation of "natural engineering" techniques and practices which preserve and enhance existing features of a site should be addressed;

Stormwater management is not an exact science and will continue to evolve as our knowledge and experience increases. Implementation of Maryland's program has not been a simple process... the stormwater problem is multifaceted and has to be approached that way.

INTRODUCTION

The State of Maryland has implemented a number of programs designed to control nonpoint source pollution. Maryland's Stormwater Management Program is the cornerstone of efforts to control urban nonpoint source pollution and has received national and international attention. This paper provides a synopsis of State efforts to control stormwater, a review of the strengths and weaknesses of the programs, and some observations about the implications of new federal programs and regulations for Maryland programs. Lessons from the Maryland experience are summarized.

STORMWATER MANAGEMENT IN MARYLAND

The Stormwater Management Act

Programs to control urban stormwater in Maryland are a subset of a wide variety of programs aimed at controlling urban nonpoint source pollution. Related programs not reviewed here include, for example, a parallel, complementary Erosion and Sediment Control Program also administered by the Sediment and Stormwater Administration; the Department of Natural Resources' Chesapeake Bay Critical Areas Program; and the Department of the Environment's Water Quality Certification Program. Figure 1 is a timeline that includes significant events in the evolution of programs to manage stormwater in Maryland.

The Stormwater Management Act was passed by the Maryland General Assembly in 1982. The primary goal of State and local programs established by the Act is to "maintain after development, as nearly as possible, the predevelopment runoff characteristics." Regulations promulgated by the State in 1983 define this to mean, for quantity control for most of Maryland, on-site control of the 2 and 10 year storm events. In addition, for quality control, the Administration has established a list of preferred management practices. Pursuant to this list, local officials responsible for plan review are required to investigate the feasibility of infiltration of the first half inch of runoff -- the so-called first flush that contains most of the pollutants in runoff. If infiltration is not feasible, other practices may be used. These other practices, in order of preference, are vegetated swales, retention ponds, extended detention ponds, and detention facilities. The position of each practice on the list was determined primarily by its potential to provide pollutant removal. Infiltration is preferred because it offers the highest potential for reduction in pollutants such as sediment and phosphorus, has potential for groundwater recharge and maintenance of base flow, and mitigates thermal impacts. All incorporated counties and municipalities in Maryland were required to adopt ordinances, by 1984, that establish programs which, at minimum, provide these controls on every development that disturbs more than 5,000 square feet of land and significantly changes sit hydrology (waivers may be issued if the differences in pre- and post- two and ten year discharge are less than 10%).

SWM=STORMWATER

The Act is quite broad, and those who drafted it recognized that it would significantly change the way development occurs throughout the State. The authors also recognized that the mandates of the law would push technical knowledge in the area of stormwater management and that significant assistance would have to be provided to local governments to achieve successful implementation. The Act authorized local governments to establish fee systems to cover the cost of plan review and program implementation, mandated that State regulatory officials review local programs at least triennially, required that the State conduct research and provide technical assistance and training in the application of stormwater management technology and program implementation, and provided for civil and criminal penalties for violation of the law.

In addition to establishing minimum controls and preferred practices, the 1983 regulations established state responsibilities, criteria for exemptions and waivers, and requirements for construction and maintenance inspection and enforcement. State regulatory staff responsible for program review are required to determine whether local programs are "acceptable." To be acceptable, local programs must have (1) an approved ordinance, (2) adequate administrative procedures, (3) adequate plan review, (4) acceptable construction inspection and enforcement, and (5) acceptable maintenance inspection and enforcement.

Since 1982, the Administration has worked with Maryland's 23 counties and 151 municipalities to implement local programs. Forty-seven municipalities chose to implement programs; the remaining 104 adopted resolutions that gave the County governments the authority to implement programs within their respective jurisdictions. The Administration has conducted 25 local program reviews, completed a number of research studies, and held several training conferences and workshops to assist local officials. Details concerning implementation are summarized below.

Stormwater Program Grants-in-Aid

In 1984, as part of a legislative package known as the Chesapeake Bay Initiatives, the General Assembly authorized two additional programs related to stormwater management. One of these was the Stormwater Management Grants-in-Aid Program. This program, which became effective in 1985, has allocated approximately $1.5 Million annually to local governments to assist them with implementation. Grants-in-Aid may be used to fund personnel; to apply, local governments must have an Administration-approved program. Criteria used to evaluate funding requests are not rigorous and pertain mainly to the "reasonableness" of the request. In general, this refers to whether there appears to be sufficient work to justify the proposed positions. To assist local jurisdictions in estimating manpower requirements, the Administration provides productivity guidelines to local jurisdictions. Most funds are used to pay plan review staff and inspectors; some clerical and administrative positions also are funded. The grants program is competitive; some local governments choose not to seek support. The program is not an entitlement program.

Stormwater Pollution Control Cost-Share Program

The Stormwater Pollution Control Cost-Share Program, which also was authorized in 1984 and implemented in 1985, is a grant program that provides matches of up to 75% of the cost of stormwater management retrofits -- projects to serve areas developed without stormwater management. The objectives of the Cost-Share Program are to demonstrate best management practice (BMP) pollutant removal efficiency, cost effectiveness, social acceptability, and maintenance requirements. Grants are awarded competitively; funds for the projects are raised through the sale of state bonds. In total, between 1984 and 1990, the General Assembly authorized $5 Million for capital projects.

Chesapeake Bay Agreements

In 1987, the Governors of Maryland, Virginia, and Pennsylvania, the Mayor of Washington DC, the Chairman of the Chesapeake Bay Commission, and the Administrator of the USEPA signed an agreement calling for a 40% reduction in nutrient loadings to the Chesapeake Bay. In 1988, Maryland's Nutrient Reduction Plan was completed. This Plan outlines a strategy for implementation of the nutrient reduction objectives. In general, the Plan calls for a 40% reduction in all point and nonpoint sources, including urban stormwater. To control urban runoff, three programs are identified: (1) the continuation of the existing cost share program; (2) a massive new retrofit program to be funded by stormwater utilities; and (3) a redevelopment program aimed at "explicit management of development intensity. No complete cost estimates for implementing these programs are available. Although direct construction costs for retrofits have been estimated at $71,000,000, this estimate is extremely low and does not include any ancillary costs such as planning, modeling, or design.

EPA Nonpoint Source Control Programs

In 1987 Congress passed the Water Quality Act, a comprehensive overhaul of the Clean Water Act. In Section 319, the Act required that all states develop assessment and management reports that identify and categorize sources of nonpoint pollution and outline coordinated strategies for implementation of programs to control them. The primary goal of Maryland's Assessment and Management Reports is to implement the Nutrient Reduction Plan. State officials made nutrient reduction the focus of the nonpoint source program because significant effort had been put into developing the Nutrient Reduction Plan, quantitative goals already were in place (i.e., the 40% reductions), and steps towards implementation already were underway. Maryland's Assessment and Management Reports were approved in August and December, 1989, respectively. In 1989, Congress authorized $40 Million for implementation of nonpoint source management plans, and in March, 1990, EPA awarded to Maryland a grant for FY 1990 for $447,771.

NPDES Permits for Stormwater Discharges

The 1987 Water Quality Act also directed EPA to promulgate regulations to require National Pollutant Discharge Elimination System (NPDES) Permits for stormwater discharges. It appears that numerous industries and at least five major jurisdictions in Maryland will be required to apply for permits. To receive permits, local jurisdictions must have in place, among other items, programs to control pollutants from urban runoff from both existing and new development. Final regulations are to be issued in July 1990. Like existing NPDES programs for wastewater treatment facilities and hazardous waste management operations, the program is designed to be administered by the States.

Observations

To summarize, Maryland requires by statute and regulation that local governments manage both the quantity and quality of runoff from new development; the State assists local governments in implementation with both program grants and technical assistance. The State also has established a grants program for capital projects to address pollution problems in older areas developed without stormwater controls. Since creation of these programs, the State has established an extremely ambitious objective: a 40% reduction of nitrogen and phosphorus loadings from urban runoff from existing areas. More recently, the USEPA has required that the State develop nonpoint source management plans to address urban stormwater runoff. Finally, EPA will soon begin regulating some stormwater systems and facilities. Thus, the government apparatus to manage stormwater in Maryland includes the State's regulatory program, two grant programs, and the nutrient reduction program, all of which now are overlain by two federal programs, one of which is regulatory. This may seem complicated, but readers should keep in mind that this is only a partial picture. We have not described at all, for example, the State's Erosion and Sediment Control Program, which in certain ways is more complex than the regulatory program required under the Stormwater Management Act. In addition, the Maryland's Critical Areas Law establishes special stormwater-related requirements for projects in the Critical Area (the strip of land 1000 feet wide that surrounds the high tide area of the Chesapeake Bay). The Department of Environment's Water Quality Certification Group has issued special guidance and requirements for stormwater discharges into wetlands. Though incomplete, these brief summaries provide a good snapshot of some of the major state and federal activities that impact the stormwater management component of nonpoint source management program.

IMPLEMENTATION

We provide here some results -- an overview of the status of implementation of each of the programs summarized above. We conclude this section with a subjective evaluation of progress. When possible, we make judgements of both technical progress (i.e., an assessment of progress towards objectives) and administrative performance.

The Stormwater Management Act and Implementation of Local Programs

Local jurisdictions implemented stormwater management programs in 1984 following approval of local ordinances by the Administration. In late 1984 and early 1985, the State completed a cursory review to determine whether the local jurisdictions had begun implementation. The data that were collected were used to set priorities for the first round of triennial field reviews. To date, the Administration has reviewed all the counties but one and Baltimore City (a total of 23 jurisdictions have been reviewed). None of the 47 smaller municipalities that opted to implement their own programs has been reviewed. Using the five criteria noted above, the Administration determined that 13 of the programs were acceptable; 10 were found to be unacceptable. Since the initial review, two programs have been brought into compliance and are now acceptable. Presently, according to the most recent data available, 15 of the major programs in the State are acceptable, while 8 are unacceptable (Table 1).

These findings require some interpretation. Per the regulations (COMAR 26.09.01), programs can be unacceptable if they are deficient in any of the categories. In general, programs found to be deficient had inadequate administrative procedures or documentation in files, were failing to provide adequate plan review, were issuing waivers for too many projects, or were failing to provide adequate construction inspection. Reviewers during the first round of reviews essentially ignored the issue of maintenance: the program was too new for local officials to establish a performance record in this area. While a about a third of the counties apparently are operating unacceptable programs, these data may be misleading. Many of the findings were made four to five years ago when programs were new and few data were available for evaluation. During the early reviews, programs were judged to be acceptable if all programs elements were in place; track records for performance evaluations were not available. The findings of program evaluations are summarized by year in Table 2. We conclude from these data that the Administration has become more stringent in its review of local programs. This makes sense; as local officials gain experience, it seems reasonable to expect more of them. However, given that almost a third of the programs were last reviewed in 1985 and 1986 when reviews were less rigorous, it may be that more than eight of the major jurisdictions are not operating acceptably.

Although a number of programs may be unacceptable, it is difficult to judge what this means in terms of environmental impact. For example, a finding of unacceptable for failure to provide adequate documentation in plan review files may be nothing more than a paper deficiency. On the other hand, it may be a clue that local officials are issuing waivers in situations in which stormwater management, at least quality controls, ought be required. In and of itself, issuance of a waiver may not be significant, either in terms or runoff quantity or quality. However, the cumulative effects of waiving projects are precisely those that the regulations are intended to prevent.

Several problems emerged consistently during the reviews. These include the issuance of waivers for development of agricultural land in row crops because hydrologic models show that runoff volumes will decrease following development, failure to adhere to the preference list for facilities, no construction inspections, failures to require submittal of as-built plans, no maintenance of facilities (including failure to maintain inventories), and the failure to notify homeowners' associations that responsibility for maintenance had been transferred to them. While some of these problems can and have been corrected during the review process, others will require changes in regulations.

Table 1. Most Recent Sediment and Stormwater Administration Stormwater Reviews.

County/ City	Date of Review	Finding
Allegany	2/87	Acceptable
Anne Arundel	6/89	Acceptable

1989*	1	4	5
1990*	2	0	2
Total	15	10	25

* Includes one re-review in which one county was upgraded from unacceptable to acceptable.

R0073199

In assessing the review process, we also examined our own performance. First, reviews have not been completed as frequently as required by the Stormwater Management Act. Not only have the major jurisdictions not been reviewed triennially (in 1990 a second round of reviews should be completed), but only one of the 47 municipalities (Baltimore City) which elected to implement their own programs has been reviewed. The failure to achieve timely reviews is attributable primarily to staff shortages; only two to three individuals have been available at any one time to undertake reviews, and these individuals also have had other responsibilities.

The 23 reviews completed initially have been conducted by nine individuals, including several engineers, a geographer, and a planner. Despite general guidance in the regulations, reviewers have emphasized different criteria, and the reviews reflect this. We examined each of the reviews in detail to determine if the reviewers addressed the same program elements. We established seventeen items pertinent to the review and noted whether reviewers commented on that program aspect. For example, we found that each review included a summary comment on the quality of plan review, but that comments about the quality of hydrologic and hydraulic calculations were included in only 15 of the 23 reviews. Seventeen of the reviews included the number of inspectors on staff, but only eight noted the types of enforcement tools available to the inspectors, and nine reviewers included findings relative to enforcement activity and the use of enforcement tools. Of the 17 program elements that were included in the review, the only single program element that was mentioned explicitly in each of the 23 initial reviews was the quality of plan review and design. Staff responsible for program review have used the assessment of past reviews to develop new procedures for conducting triennial reviews to ensure consistency in administration. These include a requirement for annual administrative reviews based on data supplied by each local jurisdiction in a detailed 20 page data form.

<u>Stormwater Program Grants-in-Aid</u>

Data on the program grants-in-aid awarded by the Administration are presented in Table 3. Between 1985 and 1988, the State of Maryland has awarded almost $9 Million in grants-in-aid. Twenty-one of Maryland's 23 Counties have requested and received funds; nine of the 47 municipalities have requested and received funds. Slightly over 82% of the total funds have been awarded to counties; almost 18% has been awarded to municipalities. Of the counties that have received funds, 14 of the programs at the last review were acceptable; seven were unacceptable. One of the two counties that has not requested funds was unacceptable; a review has not been completed for the other. The City of Baltimore is the only municipality to receive funds that has been reviewed. In sum, 65% of the grants has gone to counties with acceptable programs; just over 17% has gone to counties with unacceptable programs. Just over 6% of the total grants has been given to Baltimore City, which operates an acceptable program. Program reviews have not been completed for the other eight municipalities that have received almost 12% of the total awards.

It is difficult to assess the effect that the grants have had on jurisdictions responsible for implementing stormwater programs, let alone the effects of the grants on mitigating adverse effects of development on water resources. We do not even know, for example, the percentage of each local stormwater budget that is comprised of state funds. Thus, we cannot assess the extent to which state funds have helped local jurisdictions to establish successful program. We noted above that just over 17% of the grants ($1.56 Million) has been allocated to seven counties that operate unacceptable programs; we do believe that the number of unacceptable programs would be higher if state funds were not available.

With respect to impact on the environment, enough data are available for us to make a general assessment of whether the funds are being allocated to the "right" jurisdictions. Intuitively, we would hope to grant funds to those jurisdictions where the greatest impact on the environment is occurring, which is, in this case, where the most amount of development is occurring. We present in Table 4 the total funds granted to each major jurisdiction between 1985 and 1990 along with the total number of housing starts between 1985 and 1988. Although the grants are not tied directly to development levels, we would expect to see the funds track the development. This generally seems to be the case: the difference between the percentage of total funds received and the percentage of total housing starts in most cases is very small. We conclude the following: for those smaller jurisdictions, the percentage of funds received generally corresponds to the percentage of housing starts. However, among the larger jurisdictions, there is greater var[illegible] example, Prince George's County has received more than 22% of the total grants, although [illegible] percent of the total housing starts have

Table 4.Stormwater Grants-in-Aid and Housing Starts

COUNTIES	Program Grants TOTAL FY 1985 FY 1990	PERCENT OF TOTAL GRANTS	HOUSING STARTS 1985-1988	PERCENT OF TOTAL
Allegany	219,542	2.4%	877	0.5%

Baltimore	695,750	7.8%	21,222	12.8%
Calvert	197,451	2.2%	3,515	2.1%
Caroline	0	0.0%	954	0.6%
Carroll	165,049	1.8%	6,698	4.0%
Cecil	108,707	1.2%	3,252	2.0%
Charles	344,645	3.8%	6,242	3.8%
Dorchester	127,409	1.4%	721	0.4%
Frederick	75,234	0.8%	7,844	4.7%
Harford	442,359	4.9%	11,338	6.8%
Howard	309,855	3.5%	15,805	9.5%
Garrett	134,840	1.5%	1,200	0.7%
Kent	128,917	1.4%	399	0.2%
Montgomery	622,146	6.9%	30,342	18.3%
Prince George's	2010,816	22.4%	20,121	12.2%
Queen Anne	173,204	1.9%	2,182	1.3%
Somerset	8,790	0.1%	674	0.4%
St. Mary's	533,382	6.0%	3,327	2.0%
Talbot	65,751	0.7%	1,426	0.9%
Washington	0	0.0%	2,955	1.8%
Wicomico	203,862	2.3%	2,829	1.7%
Worcester	13,477	0.2%	3,730	2.3%

occurred within the County. For Baltimore, Howard, and Montgomery Counties and Baltimore City, the percentage of housing starts that have occurred in the jurisdiction is higher than the percentage of total program grants that have been awarded to the jurisdiction. Howard County is the only one of these five major jurisdictions that had an unacceptable program at the time of review. It appears that local officials in Prince George's County have been more aggressive in seeking funds than other local jurisdictions. One other program that stands out in this crude analysis is St. Mary's County. St. Mary's County has received approximately 6% of the total grants awarded, although the number of housing starts in the area comprises just two percent of the total. Despite receiving funds disproportionate to development activity, St. Mary's program was unacceptable at the time of the last review.

Stormwater Pollution Control Cost-Share Grants

Since 1984, the General Assembly has authorized approximately $5 Million for stormwater pollution control grants. The Sediment and Stormwater Administration has obligated 47 grants totalling $4.97 Million. The funds have been used to support a variety of projects, including seven infiltration facilities, 19 extended detention facilities with wetlands, two extended detention dry ponds, eight wetlands, one sand filter, and 10 other practices. The projects are at various stages of implementation.

Overall, 14 jurisdictions have received cost-share grants (11 counties and three municipalities). Of the counties that received grants, four had unacceptable stormwater programs at the time of the last review. Two of the municipalities that received grants never have been reviewed. Prince George's County has received a disproportionate share of funds (21.7%); Baltimore County has received an unexpectedly small share (3%; Table 5). Like the grants-in-aid, the cost share program is not an entitlement program. Since retrofits are not required by state law or regulation, the effort put forth at the local level to identify and rectify stormwater pollution problems varies greatly. To a significant degree, the allocation of cost-share funds to local jurisdictions reflects the sophistication of local programs.

Table 5. Stormwater Pollution Control Cost Share Grants by County.

County City	Number of Projects	Total Funds ($)	Percent of Funds
Allegany	1	65,000	1.3%
Anne Arundel	5	777,000	15.6%
Baltimore	2	147,000	3.0%
Calvert	1	24,578	0.5%
Caroline	1	25,000	0.5%
Dorchester	2	320,908	6.5%
Harford	4	416,750	8.4%
Howard	1	37,500	0.8%
Kent	1	45,000	0.9%
Montgomery	9	826,000	16.6%
Prince George's	12	1,080,000	21.7%
Baltimore City	3	628,508	12.6%
Crisfield	1	303,750	6.1%
Ocean City	4	272,400	5.5%
Total	47	4,969,394	100%

Chesapeake Bay Agreements

Regionally, implementation of the Chesapeake Bay Agreements is being coordinated through an Interstate Implementation Committee. In Maryland, The Sediment and Stormwater Administration has been designated as the lead agency for nonpoint source pollution controls. An Interagency Steering Committee has been established to coordinate all state-wide efforts to control all types of nonpoint source pollution, including nutrients, conventional pollutants, and toxics. The Committee presently is updating Maryland's Nutrient Reduction Plan, which is the best developed statement of the State's overall efforts to control pollution in the Bay. Sections of the Nutrient Reduction Plan concerning nonpoint pollution have been extracted and used to develop Maryland's nonpoint source management plan for USEPA pursuant to Section 319 of the Water Quality Act. Specific implementation activities have included extensive retrofit efforts in selected or targeted watersheds.

EPA Nonpoint Source Control Programs

While the State of Maryland has been active in stormwater management, direct federal support for implementation of related nonpoint source management programs has evolved more recently. The State of Maryland has redefined existing programs to control nonpoint pollution in the Bay, particularly the Chesapeake Bay nutrient reduction plan, to fit into the framework outlined by EPA pursuant to Section 319 of the Clean Water Act. In March, 1990, the State of Maryland received its first nonpoint source implementation grant. Projects, activities, and items funded include:

1. One staff position to coordinate nonpoint source programs;
2. Two staff positions to implement stormwater utilities;
3. One stormwater retrofit project manager;
4. Four agricultural soil conservation planners;
5. Groundwater modeling study;
6. Demonstration wetlands joint use project;
7. Cooperative Extension Service nonpoint source conference.

These projects were identified by a statewide, interagency task force that was created to guide implementation of projects funded by EPA. As is evident from the projects, about half of the programs are for projects related to urban nonpoint source programs. The coordinator position will be based in the Sediment and Stormwater Administration to strengthen existing programs. The staff to assist with utilities will build on ongoing technical assistance activities to help local jurisdictions identify adequate financing for programs, and the stormwater retrofit project manager will improve the existing cost-share program by strengthening management capabilities, including capabilities for project evaluation. At this time, we anticipate that funds will be available under Section 319 for the next three or four years and that in years hence funds will be used increasingly for implementation of capital and educational projects.

NPDES Permits for Stormwater Discharges

EPA expects to issue final regulations for implementation of the permit system in late July or August of 1990. The State of Maryland has determined that municipal permits will be issued by the Sediment and Stormwater Administration; industrial permits will be issued by the Hazardous and Solid Waste Management Administration. While details of the permitting program have not been developed, it is clear that implementation of the program will require substantial effort and resources not presently available to the Administration.

Administration

Primary responsibility for implementation of the Stormwater Management Act initially was delegated to the Sediment and Stormwater Division within the Maryland Department of Natural Resources (DNR). In 1984, the Division included only three staff members. In 1987, a new Department of the Environment (MDE) was created, and programs were transferred from DNR to

LESSONS LEARNED

To sum up, the State has made significant investments in managing stormwater. Since 1984, the State has awarded $9 Million in program grants-in-aid and about $5 Million for pollution control cost share projects. We estimate that the annual costs to administer these programs (including stormwater regulatory reviews) is about $1 Million annually. We believe these investments have resulted in significant progress. all the counties have implemented programs. Literally thousands of best management practices (BMPs) have been built in Maryland. Most of these are functioning, though perhaps not as designed. With respect to existing programs, we need to improve in a number of areas, both at the local and state levels. The pending stormwater regulations have the potential to significantly impact the Administration's current operations and budget. We are not optimistic that implementation of new federal permit requirements will proceed smoothly. For example, the draft regulations specify that, to obtain a permit, local governments must have water quality monitoring and modeling programs as well as stormwater management programs, sediment and erosion control programs, retrofit programs similar to those already in place in Maryland. These will require significant new resources. We would like to share the following observations.

* State law and regulations are making a difference. On-site controls are helping to mitigate the effects of urbanization. With respect to pollution control, however, these controls simply slow the rate of pollution. BMPs are not 100% effective. Regulators and stormwater managers should be emphatic about the limitations of the practices that are being used.

* Effective stormwater management requires a commitment by elected decision makers at the local level. Despite the existence of state regulations and technical assistance activities, a number of programs at the local level in Maryland are not acceptable. We believe that this results, in large part, from the failure of local officials to allocate adequate resources to the programs. This is particularly a problem in moderately populated jurisdictions that now are experiencing significant growth.

* Given that BMPs have limitations in their ability to control pollutants, growth management must be viewed as a key element of nonpoint source control efforts. Planning at the watershed scale to mitigate against nonpoint source pollution will be required for efficient allocation of scarce resources. For example, major, yet-to-be defined elements of Maryland's Nutrient Reduction Plan involve definition of growth management objectives through watershed planning processes.

* The State's plans for implementation of the federal NPDES program are not well developed. We do not know at this time exactly what the regulations will require or the number of people that will be required to administer the permit system -- even though, according to timetables set forth by EPA, implementation should be occurring.

* Finally, the Maryland experience suggests that evolution of programs will be required to control urban nonpoint source pollution effectively. Despite the existence of path breaking regulations and significant financial and technical assistance, there have been problems with implementation. Recognition of the pervasiveness of the nonpoint source problem and the limitations of even innovative structural approaches leads to the conclusion that growth management approaches are essential; Maryland's program must evolve to incorporate these. Responding to federal regulatory requirements will require additional new elements in the State's stormwater programs. Continual evaluation and reevaluation will be essential to achievement of objectives.

MDE. The Division was elevated to the Sediment and Stormwater Administration (SSA), an organizational leap of two steps. The Administration now includes three programs: (1) the Policy and Evaluation Program, which is responsible for local program reviews, (2) the Construction Management Program, which administers the two State grant programs, and (3) the Compliance Program, which is responsible for sediment and erosion control inspection and enforcement and is the largest program. Table 6 includes a summary of the Administration budget and number of staff for Fiscal Years 1987 through 1991. The budget remained relatively constant between FY 1987 and FY 1989, but increased significantly between FY 1989 and FY 1991. The growth primarily has been for more inspectors to strengthen the erosion and sediment control inspection and enforcement. The Compliance Program is by far the largest in the Administration, accounting for over two-thirds of the staff (in FY 1990), very few of whom have any involvement with stormwater management. The Construction Management Program is the second largest in terms of budget and personnel. The FY 1991 budget figures for this program include, however, about $1.6 Million for the Stormwater Program Grants-in-Aid, about 89% of the Program budget. The Policy and Evaluation Program, which has primary responsibility for review of local stormwater programs, is the smallest of the three Program, accounts for fewer than 10% of the Administration employees and about 12% of the Administration Budget. The Division responsible for review of local programs presently includes only three staff members.

Excluding administrative and clerical staff, approximately five to six technical staff (planners and engineers) actually work to administer stormwater regulations and grant programs. No new positions have been authorized to the Administration specifically for development of programs to achieve the 40% reductions in nutrients in urban nonpoint source loadings to the Bay, although the sediment and erosion control initiatives work towards this goal. The Sediment and Stormwater Administration has been designated the lead agency in Maryland to administer EPA's nonpoint source programs; the 319 grant will fund four additional staff people in the SSA. The SSA also has been assigned responsibility for development and administration of the NPDES system; however, no positions have been authorized to assist with development of the program.

Stormwater Management in Maryland
An Administrative Evaluation of Local Programs

June, 1992

MDE

Maryland Department of the Environment
Water Management Administration

2500 Broening Highway
Baltimore, Maryland 21224

The Sediment and Stormwater Administration (SSA) was incorporated into the Water Management Administration (WMA) in October, 1992. For additional information concerning this publication, please contact WMA (410) 631-3543.

INTRODUCTION

Since 1984, the Maryland Department of the Environment (MDE), has been mandated by law to periodically, but at least once every three years, inspect and review county and municipal stormwater management programs. All 23 counties have been formally evaluated at least once. To help meet the statutory requirements for stormwater management program review, the MDE's Sediment and Stormwater Administration (SSA) developed a data form designed to routinely provide a comprehensive description of local programs. The data form is used to evaluate whether a jurisdiction's procedures are adequate to administer an effective stormwater management program. The first data form requested information for the years 1985-90 and was sent to the counties in March, 1990. All but one form has been received by the SSA. A sample data form is attached (Appendix 1). The results of the administrative evaluations are summarized below and provide an overview of how well the State's stormwater management program is being implemented.

PROGRAM REVIEW CRITERIA

According to State Stormwater Management Regulations (COMAR 26.09.02.), to be found acceptable, a stormwater management program must have: an Administration approved ordinance; planning and approval processes that provide stormwater management for all development subject to the ordinance and information necessary to review proposed facility construction and maintenance measures; and inspection and enforcement procedures that ensure proper construction and maintenance of facilities. The data form was designed to provide specific information regarding these program elements. Additional information regarding program activity (e.g., number of plan reviews, inspections, enforcement actions, personnel, and budget information) was also requested.

EVALUATION OF THE LOCAL PROGRAMS

Ordinance, Regulation, and Policy

Maryland's Stormwater Management Act (Environment Article, Title 4, Subtitle 2) required counties and municipalities to adopt ordinances necessary to implement effective stormwater management programs by July, 1984. Each local ordinance is required to provide for: submission and approval of stormwater management plans; exemptions and waivers; criteria and procedures for stormwater management; proper implementation of stormwater management in accordance with approved plans; maintenance responsibilities and requirements including periodic inspection; and penalties for noncompliance. All County stormwater management ordinances received State approval by 1985. However, five jurisdictions were found to have unacceptable ordinances during the recent administrative evaluations. In one instance, a Zoning Ordinance was being used to administer the individual locality's stormwater management program. Many of the required provisions, as stated above, were missing from the ordinances determined to be unacceptable. Similarly, the required construction and/or maintenance inspection and enforcement provisions were missing in 7 ordinances. Although 7 jurisdictions reported pending changes to their ordinances, 12 additional ordinances require minor modifications in order to maintain consistency with current State law and regulations. Proper references to State agencies and Code of Maryland Regulations (COMAR) were the typical changes needed to most of the ordinances requiring modification.

Maryland regulations require stormwater management for all development activities except: additions or modifications to existing single-family detached residential structures; developments that do not disturb over 5,000 square feet of land area; land development activities that the SSA determines will be regulated under specific State laws which provide for managing stormwater runoff; and residential developments consisting of single-family houses, each on a lot of 2 acres or greater. One jurisdiction exempts redevelopment projects provided that the site size does not exceed the original development area and that the runoff characteristics are not changed. Additionally, another jurisdiction exempts development activities on agricultural property instead of agricultural land management activities. Five ordinances contain "grandfather" clauses that set forth procedures for exempting stormwater management for projects approved prior to the adoption of the local jurisdiction's ordinance. These provisions may have been warranted as a transitional mechanism during the onset of local stormwater management programs, however, their continuation is inappropriate.

Local ordinances may contain stormwater management waiver policies for individual developments, provided that they have been approved by the SSA. The SSA will approve local waiver policies if they ensure that developments, based on a case-by-case review, will not adversely impact stream quality due to channel erosion, pollution, sedimentation, and local flooding. Typical waiver provisions that are approved by the SSA include: developments that do not generate more than a 10 percent increase in the 2-year pre-development peak discharge rate; sites that are completely surrounded by existing developed areas which are served by an existing network of public storm drainage systems of adequate capacity to accommodate the runoff from the additional development; or when provisions to control direct outfall to tidewater are provided. A development may be eligible for a waiver of stormwater management quantitative control if the applicant can conclusively demonstrate that the first one-half inch of runoff can be managed according to the infiltration standards and specifications promulgated by the SSA. The SSA typically recommends that alternate water quality facilities should be provided when the required soils tests eliminate infiltration as a viable practice.

Only four jurisdictions specifically require quality control in their ordinances. Two additional jurisdictions require quality control in a directives document used for the administration of their stormwater management programs. Two jurisdictions waive stormwater management requirements if project development occurs in watersheds less than 5 acres or on lots of 2 acres or less provided that an adequate storm drain system exists. Similarly, one jurisdiction allows stormwater management to be waived for residential developments consisting of single-family houses on lots of 40,000 square feet or greater while another allows waivers for residential subdivisions that do not create new streets and has frontage on any county maintained road. From a conceptual standpoint, complete development of a watershed could occur without benefit of stormwater management if these waiver provisions are widely applied.

Furthermore, one jurisdiction grants waivers on the basis of high groundwater conditions. Infiltration may not be practicable for stormwater management in this instance, however, shallow marshes, wetland ponds, or other alternative measures may be possible. Another waiver provision used by a local jurisdiction, termed "rapid release", is predicated on the notion that a particular site's peak discharge can be passed prior to the overall watershed's peak discharge. This timed discharge could in fact be proven true at a specific point of investigation, however, somewhere downstream the adverse effects of not implementing stormwater management may be realized. The SSA believes that the intent of the State's stormwater management program is being subjugated by all of these exemption and waiver provisions. Typical recommendations made to localities included eliminating these provisions and a significant effort will be made during future triennial evaluations to ensure that all waiver policies are acceptable and appropriate.

<u>Administrative Procedures</u>

Stormwater management program implementation is typically administered by the local Department of Planning and Zoning, Department of Public Works, or Department of Engineering. In one jurisdiction, the County Highway Department administers implementation of the stormwater management program. Others use various County Departments of the Environment. Written policies, guidelines, or checklists outlining the planning and regulatory requirements are an important component for the proper implementation and administration of local stormwater management programs. In addition to their stormwater management ordinance, 12 jurisdictions supplement their program implementation by use of procedural guidance documents. Design manuals, standard operating procedures, and plan submission packages are the most common types of guidance used. These documents reiterate the requirements contained in local ordinances and often establish additional minimum requirements for plan development and submittal. Comprehensive and consistent implementation of local programs can be obtained by clarifying the multitude of procedures that may be required to address appropriate project development. Accordingly, the SSA recommended that the remaining jurisdictions develop and implement written policies and procedures for plan submittal and permit issuance to provide guidance to the development and engineering communities, as well as local staff. As required by State law, building or grading permits are to be issued only after stormwater management plan approval has occurred. Procedurally, all jurisdictions reported that building and grading permits are not issued until stormwater management plan approval has occurred.

Plan Review and Approval

Stormwater management plan review is typically administered by the local Department of Public Works, Department of Engineering, or Soil Conservation District. Only 9 jurisdictions were found to have complete and adequate procedure documents for the plan review process. Statewide, a total of 225,960 building permits were issued for FY85-89. Figure 1 shows that 13,110 of the building permits issued required submittal of stormwater management plans for review.

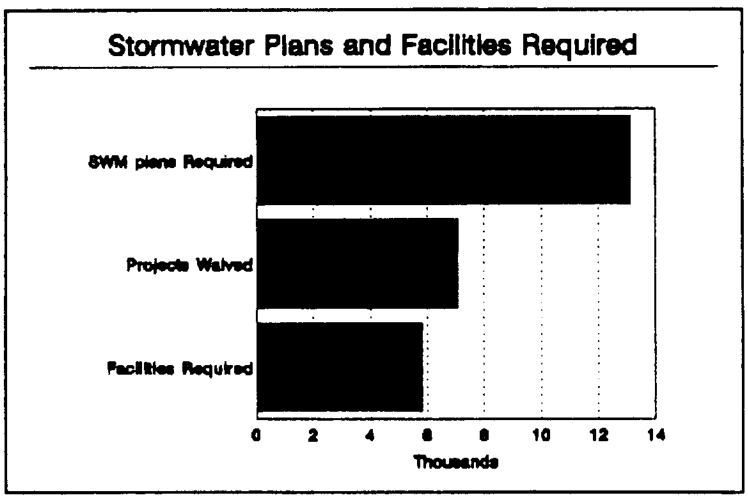

Figure 1

Minor development (house additions, pools, decks, etc.) typically accounts for the majority of building permits issued by local jurisdictions. Additionally, out of the 13,110 projects requiring stormwater management plan review, 7,103 were granted waivers. Statewide, approximately 75% of the requests for stormwater management waivers have been granted. Seven jurisdictions reported that they have granted each and every waiver requested. The number of waivers granted (7,103) greatly outnumber the stormwater management facilities that have been required (5,856).

Many requests for quantity control waivers may be granted if a local jurisdiction allows waivers for projects that generate less than a 10% increase in the 2-year pre-development peak discharge. In an attempt to reduce the number of waivers for quantity control, three jurisdictions have restricted the way that pre-development runoff conditions are computed. One jurisdiction requires pre-development runoff to

R0073209

be computed using a "meadow" land use condition making the difference between pre-development and post-development peak discharges more pronounced. Similarly, two jurisdictions require the pre-development curve number to be averaged over the three year period preceding development. The SSA recommends that pre-development land use conditions be specified in jurisdictions where waivers are granted liberally.

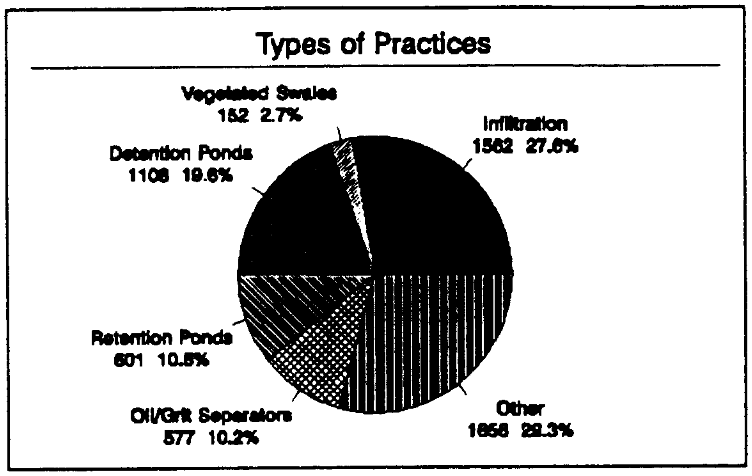

Figure 2

Maryland's regulations require that stormwater management be implemented according to the following order of preference: on-site infiltration of runoff; flow attenuation by use of open vegetated swales and natural depressions; retention structures; and detention structures. The preferred order of facilities is related to the water quality benefits of each practice. As shown in Figure 2, 1,562 (28%) of the 5,656 required stormwater management facilities have been infiltration practices. Vegetated swales account for 152 (3%) of the 5,656 facilities required for stormwater management. Additionally, 1,108 (65%) of the 1,709 ponds have been detention or extended detention structures while 601 (35%) have been wetland/shallow marshes or retention structures. A total of 1656 (29%) of the structures were reported as *Other* stormwater management facilities.

Inspection and Enforcement

For the most part, local Departments of Public Works are responsible for inspection and enforcement of stormwater management construction and maintenance. In two jurisdictions, the County Highway Department is responsible for inspection and enforcement and the Department of Planning and Zoning in two others. As stated in the ordinance section of this report, seven of the local ordinances do not contain the required stormwater inspection and enforcement provisions. These requirements are to provide for the proper implementation of stormwater management in accordance with the approved plan; maintenance responsibilities and requirements including periodic inspection; and penalties for noncompliance with the ordinances including suspension of construction activities when appropriate. Policies and procedures for guidance of stormwater management facility inspection and enforcement requirements were found to be adequate in 5 of the 22 jurisdictions reviewed.

The local jurisdiction or a registered professional engineer licensed in Maryland is required to conduct inspections at specific stages during stormwater management facility construction. Although 18 jurisdictions reported that they conduct periodic construction inspections, 15 do not require engineering certification at specific stages of stormwater facility construction. Four of the 15 jurisdictions that do not require engineering certification also reported that they do not conduct regular stormwater facility construction inspections. Furthermore, one of these 4 jurisdictions and 6 others do not require as-built final plans upon completion of the stormwater facility. A total of 3,122 (55%) of the 5,656 required stormwater facilities have been constructed for the period 1985-90. A total of 1,431 facilities were reported to be under construction during FY90. This leaves 1,203 facilities that are unaccounted for. A total of 35,898 inspections have been conducted as a result of past and current construction activities. This results in an average of 8 construction inspections for each completed facility.

According to State stormwater regulations, inspection and preventive maintenance is to be ensured by local jurisdictions for all infiltration systems, retention, and detention structures. Inspections are to be conducted during the first year of facility operation and at least once every three years thereafter. Five jurisdictions reported that they do not conduct the required maintenance inspections and an additional eight did not report any history of maintenance inspections. A total of 1,637 maintenance inspections of privately owned and 756 inspections of publicly owned stormwater management facilities have been performed. Typically, the local agency responsible for construction inspection also conducts maintenance inspections. However, one particular program segregates the responsibility for maintenance inspection between two separate local agencies. One agency inspects publicly owned facilities while the other inspects privately owned facilities.

Noncompliance with provisions of local stormwater management ordinances are subject to penalties including suspension of construction activities when appropriate. Criminal action, civil action, or injunctive relief are the typical penalties specified in local ordinances. Documentation of enforcement efforts was not reported for 13 jurisdictions. A total of 793 (2%) of the 35,898 construction inspections resulted in enforcement action. A total of 256 (16%) of the 1637 maintenance inspections of privately owned facilities have resulted in enforcement action.

Personnel and Budgets

Adequate personnel and financial resources are essential components of any successful stormwater management program. As reported in the data forms received, a total of 152 full time positions are allocated for stormwater management program administration (see Figure 3). On a statewide basis, this is an average of 7 full-time positions in each County.

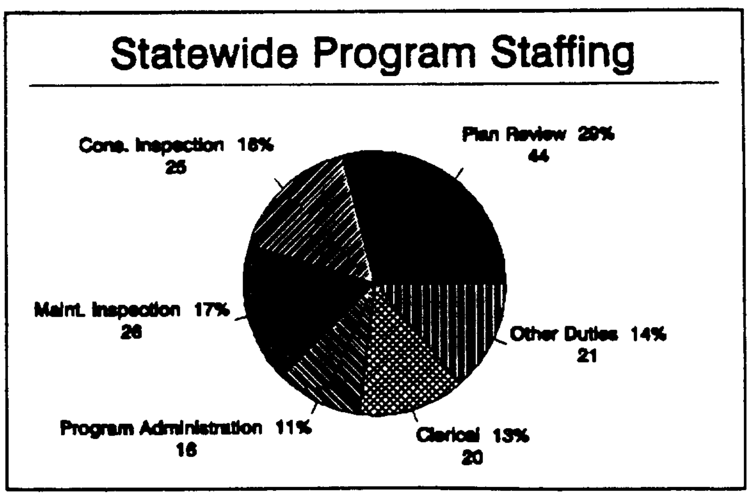

Figure 3

Only 4 jurisdictions reported that they include separate line items in their budget for stormwater management related expenditures. Totals from the data forms indicate that the estimated annual operating expenses for stormwater management in 1990 was $3,939,476.00. This includes expenses for administration, plan review, inspection, and maintenance.

R0073211

Capital improvement expenditures were estimated to be $13,235,500.00 for 1990. This would include expenses for land acquisition (including easements and rights-of-way), and the study, engineering, design, purchase, construction, expansion, repair, maintenance, landscaping, and inspection of public stormwater management systems. The total expenditures for stormwater management was $17,174,976.00 for 1990.

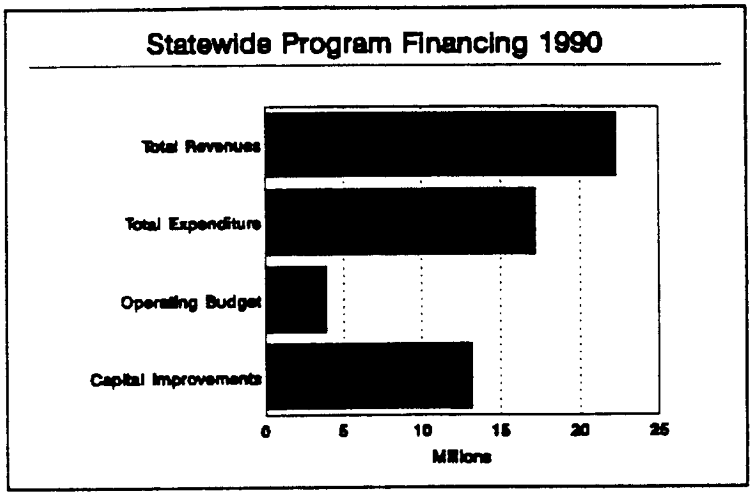

Figure 4

Total revenues generated to finance stormwater management were reported to be $22,324,827.00 for 1990. These revenues include property taxes, plan review fees, inspection fees, fees-in-lieu of providing on-site stormwater facility construction, state grants, special assessments, and other sources (see Figure 5). This leaves a surplus balance of $4,050,654.00 without consideration for the expenditures needed for off-site stormwater facility construction that will be necessary as a result of collecting fees-in-lieu. The annual expenditures for capital improvements for stormwater management has averaged $6,320,250.00 since 1987.

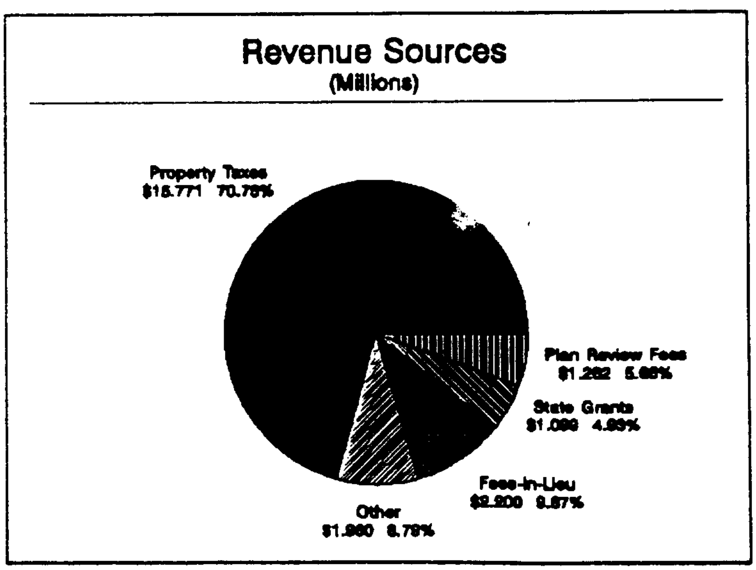

Figure 5

Seven jurisdictions reported that they require plan review fees and one requires an inspection fee. The combined revenue from both of these sources in 1990 was $1,406,813.00. The total revenue generated from plan review and inspection fees accounts for 6% of the total revenue required to support local stormwater management programs.

SUMMARY

Five programs were found to be unacceptable during the recent administrative evaluations. On an individual basis, 5 of the 22 jurisdictions were found to have adequate policies and procedures to effectively implement an acceptable stormwater management program. Three programs required only minor improvements to be considered acceptable while nine were in need of major improvements. As stated above, the required construction inspection, maintenance inspection, and enforcement provisions are missing in many ordinances. Without these provisions it is unlikely that the local jurisdiction would have an adequate foundation for successful legal action in the event improper stormwater facility construction or maintenance occurs.

Application and procedural documents need to be developed that ensure consistent and comprehensive administration of local programs. Water quality goals for stormwater are being addressed by only a few jurisdictions. Similarly, construction and maintenance inspections are not being conducted as required by State regulations or local ordinances. This failure to ensure proper facility construction and maintenance could result in jeopardizing public safety. Furthermore, the lack of documentation regarding maintenance inspection and enforcement efforts indicates that these program elements have not been a priority for local jurisdictions.

Present staffing levels appear to be adequate to administer effective stormwater management programs. However, current revenues are less than the needed expenditures required to sustain the current operating expenses for local stormwater management programs. The local jurisdictions need to acquire additional sources of revenue to cover the cost of the services they provide.

The administrative evaluations of the data forms indicate that program deficiencies exist in many local jurisdictions. Implementation of the SSA's recommendations for program improvement will result in meeting State and local stormwater management goals. As a result of these administrative evaluations, the findings can serve as a guide for the triennial review process. Review personnel will know what information needs to be verified and also be aware of any procedural deficiencies. Hopefully, this will result in a more timely review process and it is anticipated that the SSA will be able to maintain its review per the required frequency. Additionally, the SSA can tailor the review process to provide the information and education necessary for each jurisdiction to initiate the needed program improvements.

APPENDIX I

MARYLAND DEPARTMENT OF ENVIRONMENT
SEDIMENT AND STORMWATER ADMINISTRATION

DATA FORM FOR LOCAL STORMWATER MANAGEMENT PROGRAM REVIEWS

Jurisdiction **22 of the 23 Counties have reported** Date **February 14, 1992**

Bold numbers in parenthesis or small numbers equal the number of jurisdictions indicating a response [eg. (00),(03), 02, 11].

Small, bold type in the narrative sections of the data form indicates a representative response of various local jurisdictions.

Local liaison for program review

Name ______________________________

Title ______________________________

Address ______________________________

____

____

Phone ______________________________

INCLUDE PROGRAM REVIEW ATTACHMENTS FOR YOUR JURISDICTION:

1. Ordinance, Regulation, and Policy
2. Administrative Procedures
3. Plan Review and Approval Procedures
4. Construction Inspection and Enforcement Procedures
5. Maintenance Inspection and Enforcement Procedures
6. Program Activity (including an organizational chart)

Each of these attachments will be used to evaluate whether the jurisdiction's stormwater management program is acceptable pursuant to stormwater management regulations (COMAR 26.09.01 - 26.09.10). To be found acceptable, a stormwater management program shall have:

(a) an Administration-approved ordinance in effect (1);
(b) planning and approval processes that provide stormwater management for every development subject to the ordinance and information necessary to review proposed facility construction and maintenance measures (2,3); and
(c) inspection and enforcement procedures that ensure proper construction and maintenance of facilities (4,5,6).

The numbers in parentheses following the regulatory requirements refer to the numbers of the program attachments listed above. The program attachments have been cross-referenced with the regulatory requirements so that it is clear why the information is being requested.

d. How does your jurisdiction evaluate stormwater management requirements, approve plans, and conduct construction and maintenance inspections for its own capital projects?

Same process as privately owned/constructed stormwater management systems.

3. PLAN REVIEW AND APPROVAL PROCEDURES

a. Are checklists used to guide plan reviews?

01 NO **(07)** ===> Why not? **Ordinance is used to provide plan review guidance.**

02 YES **(15)** ===> Enclose copies.

b. Describe plan review procedures.

<u>For subdivision plans:</u>
Preliminary plans submitted through XXX to YYY for concept review.
Comments on the submittal are presented to the applicant at weekly subdivision review meetings.
When the comments are satisfied, YYY will issue a Stormwater Management concept plan approval through the XXX.

<u>For non-subdivision plans:</u>
Development plans are submitted directly to YYY for Stormwater Management concept review and approval.

<u>Plan review for permit issuance</u>:
Plans are reviewed for compliance with local, state, and federal criteria and the approved Stormwater Management concept.
Various checklists are used.
Incomplete plans are returned for correction and resubmission.
The procedures are repeated until the plan is acceptable and approved for permit issuance.

(Attach additional sheets if necessary)

c. How do procedures for plan review require developers to document reasons for departures from the state priority list for stormwater management practices for each project?

Documentation based on soils, engineering feasibility, public safety, economics, and environmental analysis.

d. Does the jurisdiction allow fees-in-lieu to be paid in exchange for waivers for on-site stormwater controls?

01 NO (19)
02 YES (03) ===> Explain system, and attach a fee schedule.

Approved requests for waivers must demonstrate an insignificant increase in runoff, conflicting peaks, or joint stormwater management participation. Once a waiver is granted, an estimate is submitted to YYY according to the adopted fee schedule. Once the amount is approved, the waiver fee is collected prior to the issuance of any grading or building permits.

e. Do procedures require developers to submit data to document how adequacy of facility/dam construction has been ensured?

01 NO (07) ===> How do you ensure minimum construction standards are met?
02 YES (15) ===> Describe data that are required.

A registered engineer must sign and seal a certification on the as-built plans stating that the pond has been constructed per the approved plans and specifications. The construction stages per the inspection and construction control schedule specified on the approved stormwater management plan must be inspected and certified.

f. Do procedures require developers to submit data which document how existing and future downstream hazards for dams have been addressed?

01 NO (09) ===> Why not?
02 YES (13) ===> Describe data that are required.

At the stormwater management concept review, any proposed development will be required to submit a Dam Breach analysis for proposed dams and also evaluate the downstream impact of their proposed stormwater management facilities. The following information is required:

1. **Information on the proposed dam; storage volume, dam height, etc.**
2. **Dam Breach analysis using HEC-1, Hec-2, Dambrk, TR-66, or other appropriate models.**
3. **Topographic map showing the Danger Reach section, its associated cross-sections and WSELs.**

R0073218

g. Submit typical sequences of construction for the following types of facilities:

* Infiltration trench;
* Retention pond (including dam construction);
* Detention pond;
* Artificial wetland or marsh;
* Oil-grit separator.

h. Does your jurisdiction ever impose stream improvement or conveyance conditions when stormwater management waivers are granted?

01 NO **(08)** ===> Why Not?
02 YES **(14)** ===> Explain Procedures

Waivers of stormwater management requirements are rarely given. Modifications of the requirements may be granted and these modifications may include various stream improvements or retrofit of existing stormwater management facilities.

i. Are stormwater management maintenance easements and covenants/agreements required for each stormwater management facility prior to plan approval?

01 NO **(02)** ===> How is maintenance assured?
02 YES **(20)**

j. How does your jurisdiction ensure that information about facilities including maintenance agreements is conveyed or communicated to the future owners of the property?

Easements and maintenance covenants are required for all structures on private property. These convey if/when the property is transferred. A typical title search should provide the future owners of their obligations for facility maintenance.

4. CONSTRUCTION INSPECTION AND ENFORCEMENT PROCEDURES

a. How does your jurisdiction ensure that stormwater management requirements are implemented in the field? (Circle all that apply.)

NO	YES	Administrative Measure
01 **(02)**	02 **(20)**	Regular stormwater construction inspections
01 **(15)**	02 **(07)**	Developer's engineer required to submit certification of construction approval for each stage of construction
01 **(06)**	02 **(16)**	Developer's engineer required to submit as-built drawings
01 **(01)**	02 **(21)**	Developers required to post construction bonds
01 **(05)**	02 **(05)**	Other (please describe) **(12 = no response)**

b. Are checklists used to guide construction inspections?

01 NO **(08)** ===> Explain how inspections are documented.
02 YES **(14)** ===> Enclose copies.

c. Do inspectors complete daily written logs for each construction inspection?

01 NO **(09)** ===> Why not?
02 YES **(13)** ===> Enclose representative copy.

d. Describe construction inspection procedures for stormwater management facilities. Note inspection frequency. Explain how the jurisdiction responds to complaints.

A pre-construction meeting with the permittee, contractor, and inspector is mandatory. Mandatory notification and inspection points are identified. The inspector makes mandatory inspections and spot checks. The design engineer is responsible for construction inspection, materials certification, and final certification. Inspection frequency varies with the type of structure and the scope of work. The inspector investigates complaints, responds to complaints, and takes enforcement action as appropriate.

e. Are soil compaction tests required for construction of dams?

01 NO **(08)**
02 YES **(14)** ===> What type of test?

See MD. 378 pond design criteria. AASHTO: T-99 Method A.

f. How are soil conditions verified when infiltration facilities are being constructed?

Inspection by County staff and certification of a geotechnical soils engineer.

g. Have infiltration facilities ever been rejected in favor of other types of stormwater management facilities based on data obtained in field inspections?

01 NO **(13)**
02 YES **(09)** ===> Submit an example.

h. Describe enforcement procedures for stormwater construction activities, including the sequence in which enforcement tools are used if violations continue. Explain how inspectors define a "violation' and "stop work."

The inspector issues a Notice of Violation if a violation of the approved plan occurs. Construction may not proceed to the next phase when visual observation or review of the engineer's reports indicate a discrepancy. If those measures fail to obtain compliance, a stop work order and/or civil citation is issued. A stop work order stops work associated with the stormwater facility and, if necessary, all building construction.

i. Enclose copies of a violation notice and a stop-work order.

j. Are as-built drawings required for stormwater management facilities after they have been built?

01 NO **(05)**
02 YES **(17)** ===> Summarize procedures (or attach copies).

k. Does your jurisdiction have a formal acceptance process for ownership of stormwater facilities?

01 NO **(10)** ===> Why not?
02 YES **(12)** ===> Summarize procedures.

5. MAINTENANCE INSPECTION AND ENFORCEMENT PROCEDURES

State regulations require that each jurisdiction maintain an inventory of, and records of maintenance inspections for, all facilities built pursuant to the Stormwater Management Act. The inventory shall include, at minimum, the following:

1. Facility name;
2. Facility owner;
3. Facility location;
4. Facility type;
5. Maintenance responsibility (public or private);
6. Drainage area served by the facility;
7. Date of plan approval;
8. Date construction completed;
9. Date of last maintenance inspection.
10. General condition of facility.

a. How does your jurisdiction maintain its inventory of stormwater management facilities?

Y	N	O		Method used to Maintain Inventory
12	**09**	**01**	01	Information is kept, unassembled, in project files
03	**18**	**01**	02	Information is kept in index card file
13	**07**	**02**	03	Information is computerized in data base program*
04	**16**	**02**	04	Other (describe below)

____

____

* attach copy if available

b. Do you use checklists to guide maintenance inspections?

01 NO **(06)**
02 YES **(16)** ===> Enclose copies.

c. How frequently are maintenance inspections conducted?

Private Facilities	Public Facilities	Frequency
01 **(01)**	01 **(02)**	2 times/year
02 **(07)**	02 **(06)**	1 time/year
03 **(04)**	03 **(02)**	1 time/2 years
04 **(06)**	04 **(05)**	1 time/3 years
05 **(01)**	05 **(01)**	When time is available
06 **(02)**	06 **(02)**	Only in response to complaints
07 **(01)**	07 **(01)**	Have never been done
00 **(00)**	00 **(03)**	**No Response**

d. Describe stormwater facility maintenance procedures. State clearly whether your jurisdiction prefers public or private ownership and maintenance, who is responsible for inspection, and who actually performs necessary maintenance of both public and private facilities. Explain procedures used to respond to complaints.

The County prefers private ownership of stormwater facilities but does construct and own some public facilities. Structural maintenance and dredging of publicly assisted projects is provided by the County. Maintenance of private facilities is provided by the owners; but there is a strongly stated interest among homeowner associations (HOA) that the County take over major maintenance responsibilities. In all cases, aesthetic maintenance is provided by the owner.

Current resource levels do not allow for periodic maintenance inspections of stormwater facilities. Complaints are responded to by inspection. Where maintenance is required, the entity obligated by the recorded maintenance agreement is instructed to make the specified corrective actions.

6. PROGRAM ACTIVITY

This section of the report requires you to record information that provides an indication of the overall level of activity in your program. You must record the number of projects that you are tracking, the number of plan reviews and approvals, the number and type of facilities that have been required, the number of construction inspections and violations, the number of maintenance inspections, and related information.

The categories below may not be consistent with the categories that you use in your record keeping. The following definitions should help make clear the types of information we want in each category. If the data in your records cannot be adjusted to match these categories, explain the differences in the place for comments at the end of this section.

Definitions

a. Building Permits -- Record the total number of building permits issued by your jurisdiction, regardless of whether stormwater management was required.

b. Project -- A project is a proposed development on a specific site or geographic area. There may be more than one point of investigation and more than one stormwater management plan for a project. In addition, a project may be developed in stages. For purposes of classification, use the following conventions:

1. If all plans and computations for the total area of a development site are submitted at the same time (regardless of the number of points of investigation or number of plans), count the submittal as a single project.

2. If plans and computations are submitted by section of the total development over a period of time, count the submittals as separate projects.

Projects exempt from stormwater management are those that qualify for one or more of the exemptions listed in your ordinance or in the Stormwater Management Act.

c. Plan Reviews -- Plan review refers to the administrative tasks of reviewing concept and sketch plans, detailed site plans, and revisions of site plans. For individual projects that require stormwater management, there may be several plans and probably will be multiple plan reviews. For purposes of classification, count each time each set of plans and computations is submitted for review as a separate review. For example, if a developer submits a sketch plan, a final plan, and revisions to a final plan, you should count three plan reviews.

d. Waivers -- For any given project, you may receive one or more requests for waivers. In addition, developers may request a waiver for both quantity controls and quality controls. Thus, for a single project with a single plan, you could receive two requests for waivers: one for a quantity controls and one for quality controls. Count each request for each type of waiver separately, regardless if they are for the same project or the same plan.

e. Fees-in-lieu -- Fees-in-lieu are distinct from waivers. Waivers are granted because developers are able to meet one or more criteria in an ordinance that establish conditions when controls are not necessary. Fees-in-lieu are paid in situations where controls are necessary but will be provided off-site. Record the total number of times that a fee-in-lieu was granted instead of on-site controls.

f. Plan Approvals -- Plan approvals may be granted for final plans for each point of investigation on a project. Thus, the number of plans approvals could be greater than the number of projects but would be less than the number of plan reviews.

g. Number of Facilities Required -- There may be several facilities required for a single project or on a single plan. Record here the total number of individual facilities that have required on all plans that have received final approved.

h. Number of Facilities Completed -- This refers to the number of facilities that have received as-built approval.

i. Acres of Land Developed -- List the total number of acres of land developed in your jurisdiction during the year. Also list the total number of acres served by stormwater management facilities.

j. Construction Inspections -- Each visit to a construction site for purposes of stormwater management should be counted as a separate inspection. The number of inspections should match the number of inspection reports in your files.

k. Maintenance Inspections -- The number of maintenance inspections should match the number of maintenance inspection reports in your files.

l. Complaints -- Record here only those complaints that concern stormwater management facilities. For example, count complaints that concern the need for maintenance of a facility. Include complaints about drainage as a separate category. Do not count complaints about sediment control violations or about sewer backups.

m. Staff Positions -- Record here the number of staff involved in each aspect of your program. If a single person has responsibilities in more than one function (e.g., plan review and approval and construction inspection), record the percentage of time that the individual spends on each function.

n. Jurisdictions Served -- Some counties are responsible for implementation of stormwater programs within incorporated municipalities. List all incorporated jurisdictions that are served by your jurisdiction's stormwater management program.

PROGRAM ACTIVITY

	1985	1986	1987	1988	1989

ADDITIONAL PROGRAM INFORMATION

a. Does your jurisdiction include separate line items in its budget for expenditures for the stormwater management program?

01 NO **16**
02 YES **04** ===> Attach copy of 1990 budget (if 1990 budget has not been completed, attach 1989 budget).
00 No Response 02

b. Estimate annual expenditures for stormwater management.

Budget Item	1987	1988	1989	1990
Operating Expenses* (9076710) **(17)**	1149131 **(14)**	1212529 **(14)**	2775573 **(15)**	3939476 **(17)**
Capital Improvements (25281000) **(05)**	1358000 **(02)**	1882000 **(02)**	8805500 **(03)**	13235500 **(05)**

* include all expenses for stormwater management (e.g., administration, plan review, inspection, and maintenance) except capital improvements.

c. What sources of revenues are used to finance operating expenses for stormwater management?

NO	YES	SOURCE OF REVENUES	AMOUNT	No Response
01 **(12)**	02 **(10)**	PROPERTY TAXES	15771257	**14**
01 **(13)**	02 **(09)**	PLAN REVIEW FEES	1261733	**15**
01 **(19)**	02 **(03)**	INSPECTION FEES	145080	**21**
01 **(21)**	02 **(01)**	FEES-IN-LIEU	2200000	**21**
01 **(04)**	02 **(18)**	STATE GRANTS	1099197	**05**
01 **(21)**	02 **(01)**	SPECIAL ASSESSMENTS	27000	**21**
01 **(16)**	02 **(06)**	OTHER ____________	1959537	**18**
		TOTAL REVENUES	22324827	**06**

The revenue amounts listed above are for Fiscal Year ____________

d. Has your jurisdiction considered stormwater utility charges to pay for maintenance of facilities?

01 YES **14**
02 NO **08** ===> Would you like information about utilities?

01 YES
02 NO

e. What is the total area of your jurisdiction?

8,956
_______________ square miles **20 responses**

f. Has your jurisdiction undertaken watershed planning?

01 NO **14**
02 YES **08** ===> continue

What is the total area included in watershed plans that have been prepared?

690.3
_______________ square miles **08 responses**

Briefly explain your jurisdiction's watershed planning process.

Determine flood elevations based on both existing and ultimate land use conditions
Delineate floodplain boundary so that flood prone structures can be identified
Select and evaluate flood management solutions to solve problems of all flood prone structures
Identify existing and potential water quality problem areas
Identify retrofit sites and point sources
Recommend regional water quality basins
Delineate wetland boundary and identify potential sites for wetland banking
Implement flood management and water quality improvement recommendations
Participate and coordinate the EPA's NPDES program

g. Are your files readily available to the public for review?

01 YES **22** ===> Describe procedures or attach procedures if available. **ALL COUNTIES**
02 NO **00**

Copies of files must be obtained from our main office and they must be requested in person. There are fees assessed for copies of files and plans ($1.50 for plans and $.15 for letter and legal size paper). We require that the requester review the files and plans first before requesting copies to ensure that only the information needed is copied.

h. Does your jurisdiction provide educational and/or training materials concerning stormwater and urban nonpoint pollution to the public?

01 YES **11** ===> List types below.
02 NO **11**

Subject	Video Tape	Audio Tape	Movie	Slide Show	Staff Presentation	Brochure/ Pamphlet	Other
Urban Pollution	01	02	03	04	05	06	07
Stormwater Management	01	02	03	04	05	06	07

Xavier Swamikannu
Storm Water Program
California Regional Water Quality Control Board – LA Region
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Elizabeth Jennings, Esq.
Office of Chief Counsel
State Water Resources Control Board
P.O. Box 100
Sacramento, CA 95812-0100

Mr. Swamikannu and Ms. Jennings:

This is in response to Mr. Swamikannu's e-mail correspondence to me dated May 19, 2000. In that correspondence, Mr. Swamikannu asked for responses to nine questions. Enclosure #1 provides responses from Ann Wessel and me to those questions. Ms. Wessel and I work on stormwater management issues for the Washington Department of Ecology (Ecology) in the Program Development Services Section of the Water Quality Program.

Because our time is limited, we have not elaborated in detail but have tried to give you enough information to satisfy your needs. In addition, I have enclosed a summary of the thresholds and minimum requirements for new development and redevelopment (Enclosure #2) from Ecology's 1992 *Stormwater Management Manual for the Puget Sound Basin.* I have also referenced other documents that are available to you, if you prefer.

Finally, Mr. Swamikannu should have received a draft of Volume 1 of the 1999 Dept. of Ecology Stormwater Manual for Washington State as an attachment to an e-mail message. Please note that the draft has no legal standing, as it has not been formally promulgated by the state. It could significantly change prior to its publication.

If you need a clarification of these responses or any additional information, please feel welcome to contact us. You have my e-mail address. My telephone number is 360/407-6438. Ann Wessel's e-mail address is awes461@ecy.wa.gov; her telephone number is 360/407-6457.

Sincerely,

Ed O'Brien

Enclosure #1

Response to Questions Posed by Xavier Swamikannu

1) Why did your state elect to have requirements on new development and redevelopment?

Response:

The state first became involved in developing requirements for new development and redevelopment as a result of the 1987 Puget Sound Water Quality Management Plan (The Plan). The Plan was developed as a comprehensive conservation and management plan under section 320 of the federal Clean Water Act. The Plan recognized that urban stormwater was a major contributor to the degradation of Puget Sound water and sediments, and its biological health. Consequently, The Plan specified a number of "program elements," or actions, to manage urban stormwater. One of the actions called for the Washington Department of Ecology (Ecology) to develop a manual to be used by local jurisdictions in stormwater management.

The Plan requires the manual to include: BMP's for controlling erosion from construction sites; hydrologic analysis procedures, including selection of design storms and runoff estimates; design, operation and maintenance standards for public and private structural facilities; and techniques for reducing or eliminating pollutants in runoff from problem land uses.

Subsequently, Ecology published its first *Stormwater Management Manual for the Puget Sound Basin* in February 1992. The Plan requires local governments to adopt requirements that are substantially equivalent to those in Ecology's manual.

In 1995, Ecology issued its first NPDES municipal stormwater permits. Because the permittees were all in the Puget Sound Basin, and so were already required by The Plan to have a "Comprehensive Stormwater Management Program," including a manual equivalent to Ecology's, Ecology issued permits that required permittees to develop and implement (Special Condition S.7.B.8.a.):

> A program to control runoff from new development, redevelopment and construction sites that discharge to the municipal separate storm sewers owned or operated by the permittee. The program must include: ordinances, minimum requirements, and best management practices (BMP's) equivalent to those found in Volumes I-IV of Ecology's Stormwater Management Manual for the Puget Sound Basin (1992 edition, and as amended by its replacement), permits, inspections, and enforcement capability. The program must also include a process to make available copies of the "Notice of Intent for Construction Activity" and/or copies of the "Notice of Intent for Industrial Activity" to representatives of proposed new development and redevelopment."

2) Does your state have design standards and performance standards for treatment control BMPs for new development/redevelopment?

Response:

A) 1992 Stormwater Manual
Washington State has design standards in its stormwater manual that are applicable to the Puget Sound Basin

and NPDES Phase I municipal permittees. The standards are not adopted into a state regulation. They are required by the Puget Sound Plan and by NPDES Phase I municipal stormwater permits.

The treatment design standard is the following:

> All projects shall provide treatment of stormwater. Treatment BMP's shall be sized to capture and treat the water quality design storm, defined as the 6-month, 24-hour return period storm. The first priority for treatment shall be to infiltrate as much as possible of the water quality design storm, only if site conditions are appropriate and ground water quality will not be impaired. Direct discharge of untreated stormwater to ground water is prohibited. All treatment BMP's shall be selected, designed, and maintained according to an approved manual.
>
> Stormwater treatment BMP's shall not be built within a natural vegetated buffer, except for necessary conveyance systems as approved by the local government. An adopted and implemented basin plan (Minimum Requirement #9) may be used to develop runoff treatment requirements that are tailored to a specific basin.

The following statements are offered for clarification:

The manual allows residential roof runoff to be infiltrated without having received treatment.

For most areas of the Puget Sound Basin, the 6-month, 24-hour storm is greater than the 90^{th} percentile, 24-hour rainfall amount.

Volume I of the manual provides a BMP selection process to determine which BMP is most appropriate for the development site. Volume II of the manual specifies hydrologic procedures for determining the runoff flow rates and volumes for the water quality design storm. Volume III specifies design criteria for each treatment BMP listed in the manual.

B) The Draft 1999 Stormwater Manual

The draft of the 1999 manual lists the same water quality design storm as described in the 1992 manual. However, the draft also includes a list of options for defining a new water quality design storm event and asks for recommendations. Volume I of the draft manual is available upon request.

The 1999 draft also distinguishes between pollution-generating surfaces and non-pollution generating surfaces. Runoff from non-pollution generating surfaces does not have to receive treatment if it is discharged without mixing with runoff from pollution-generating surfaces. The draft manual includes definitions for pollution-generating impervious surfaces and pollution-generating pervious surfaces. Non-pollution generating surfaces would include: residential roofs, commercial roofs that do not accumulate pollutants from vents and fugitive emissions, isolated bicycle lanes, other ground surfaces that are not subject to vehicular use.

The draft manual also suggests that Ecology establish performance criteria for treatment BMP's. A performance criterion for basic water quality treatment BMP's is likely to be established in the manual. The criterion is likely to be a specified percent removal of total suspended solids given certain conditions (e.g., influent TSS, flow rate or volume). The criterion will likely not be used to determine site-by-site compliance, but will be used as the standard against which to judge whether new BMP designs will be accepted for use in new and redevelopments.

The draft 1999 also includes:

- A proposal to have discharges into receiving waters that have a phosphorus related water quality problem, to use treatment BMP's that are more able to remove phosphorus.

- A proposal to have discharges from high volume traffic intersections (25,000/15,000 ADT) and "high use sites" (Average daily trips of 15 vehicles per parking space per day; or, commerical or industrial sites subject to petroleum storage and transfer in excess of 1,500 gallons/year; or, commercial/industrial sites subject to use, storage or maintenance of a fleet of 25 or more diesel vehicles that are over 10 tons gross weight) to use an oil removal BMP in addition to applying a "basic" or "enhanced" treatment BMP.

- A proposal to require "enhanced" treatment BMP's for discharges that are likely to violate water quality standards, despite the application of a "basic" treatment BMP, because of a lack of available dilution in the receiving water. The pollutants in question are dissolved copper, zinc, and lead.

3) Do you have thresholds for new development and or redevelopment (impervious area; size, etc) for requirements to apply?

Response:

A) 1992 Stormwater Manual
We have established thresholds that determine the set of requirements that apply to projects. I will fax a summary of the thresholds and corresponding minimum requirements. In brief:

Large Parcels:
Projects that disturb 1 acre or more of land have to meet all eleven of the Large Parcel Minimum Requirements.

Medium Parcels:
Development that disturbs less than 1 acre of land but adds or creates 5,000 ft2 or more of impervious surface, are subject to Large Parcel Minimum Requirements #2 through #11, and the Small Parcel Minimum Requirements for erosion control.

Small Parcels:
Construction of an individual single family residence or duplex; or, construction that adds or creates less than 5,000 ft2 of impervious area and disturbs less than 1 acre are only subject to the small parcel minimum requirements.

Redevelopment projects have some additional thresholds. I will fax a summary of the redevelopment requirement also.

B) The Draft 1999 Stormwater Manual
The draft 1999 manual has similar requirements to the 1992 manual, but there are some significant proposed changes:

- Single family residential projects could be subject to large parcel requirements if they exceed certain thresholds.

- The Small Parcel Requirements may be expanded to include onsite design requirements to maximize infiltration and flow dispersion and treatment without construction of structural facilities.

- All projects, regardless of size, will have to comply with all of the erosion and sediment control requirements or explain why a requirement is not necessary for the site (e.g., no silt fence around a site that is flat or is a closed depression).

- The Large Parcel Requirements allow use of Small Site Requirements for small isolated drainage areas of larger projects.

- The proposed Redevelopment thresholds are significantly changed. They are:

All redevelopment projects in which the total of *new plus replaced* impervious surfaces is 5,000 square feet or more must comply with Large Parcel Minimum Requirements #1 and #3 for the project site.

Redevelopment projects that add 5,000 square feet or more of *new* impervious surface must comply with all the Large Parcel Minimum Requirements for the new impervious surfaces. If the runoff quantity from the new surfaces is not separated from runoff from other surfaces prior to treatment or flow control, the stormwater facilities must be sized for the entire flow. Alternatively, the local government may allow the Large Parcel Minimum Requirements to be met for an equivalent (flow and pollution characteristics) area within the same site.

All redevelopment projects in which the total of new plus replaced impervious surfaces is 5,000 square feet or more, and whose valuation of proposed improvements – including interior improvements - exceeds 50% of the assessed value of the existing site improvements shall comply with all the Large Parcel Minimum Requirements for the entire site.

Local governments may exempt redevelopment projects from compliance with Large Parcel Minimum Requirements #4, #5, and/or #6 if they have adopted a plan that fulfills those requirements in regional facilities that will discharge to the same receiving water, AND if they have an implementation plan and a schedule for construction of those facilities. Redevelopment projects for public roads may be exempted from meeting Large Parcel Minimum Requirements #4, #5, and/or #6 for the entire site (i.e., the exemption does not extend to new surfaces that add impervious area) if there is an adopted Capital Improvement Program for retrofitting existing road surfaces.

4) What development categories do the requirements apply to (i.e., commercial; parking lots; residential, etc.)?

Response:

Washington's requirements for water quality treatment and flow control apply to impervious surface and to land disturbance (clearing and grading) regardless of the type of land use. Generally, the source control requirements specified in our Volume IV of the manual apply only to commercial and industrial operations.

5) How long have such requirements been in place? Are they statewide or region-specific?

Response:

In 1992 we adopted the Stormwater Management Manual for the Puget Sound Basin. The manual was guidance for the approximately 115 municipalities in the Puget Sound Basin that are required to adopt either the Ecology manual or a manual containing substantially equivalent technical standards. The requirement to adopt the manual was contained in a statute establishing the Puget Sound Water Quality Authority, and development of the Puget Sound Plan. The statute stated that local governments "*must evaluate, and incorporate as applicable, subject to the availability of appropriated funds or other funding sources, the provisions of the plan, including any guidelines, standards and timetables contained in the plan.*" The deadline in the plan for adopting the manual was 1994, however, given the weak statutory requirement and lack of consequences for failing to adopt a manual, few municipalities met the deadline. Regardless, many municipalities began amending and adopting ordinances to incorporate at least part of the requirements, and stormwater controls for new development are accepted practice.

Outside of Puget Sound, the 1992 Stormwater Management Manual was applied as best available science in permitting decisions made by Ecology and other State Agencies.

In 1995 we issued our first municipal stormwater NPDES permits covering the five largest municipalities and Washington State Department of Transportation (WSDOT). This permit established a requirement for adoption and implementation of technical standards and BMPs equivalent to those in the Ecology manual during the term of the permit.

We are currently updating the Ecology manual, and expanding it to a statewide manual. As soon as possible after completion of the new manual, we will reissue the municipal stormwater permit requiring updating of local ordinances and manuals. When we issue phase 2 permits we will also require adoption of the new manual.

6) Have the design standards and performance standards unduly burdened cities and builders with unsupportable costs? Has compliance been difficult? Has change been for the better or have you seen none? Any noticeable improvements in water quality?

Response:

There are substantial costs to implementing stormwater controls for new development and redevelopment, but they are incremental to existing development and permit review costs. The single largest cost driver for developers is land value, so vaults and other underground BMPs tend to prevail in the downtown core areas. Local governments struggle with adequate enforcement, but seem to manage costs through combinations of general fund, permit fee, and stormwater utility revenues. Given the pace of development in Puget Sound, even in the municipalities where stormwater controls for new development are more stringent than what is in the Ecology manual, stormwater controls have not proven to be an obstacle to development.

As for noticeable improvements in water quality, we have not been monitoring to specifically address this question. We are in the process now of developing monitoring requirements for the next permit term that will address the question of effectiveness of programs to control both quantity and quality of runoff from new development. We have anecdotal evidence of reduced sediment loads from erosion and sediment control programs at construction sites (our requirements go beyond the federal 5-acre minimum to require erosion control for all land disturbing activities). Also, data on sediment contamination in urban bays is showing some improvement that could be attributed to stormwater controls.

7) Typically, what is your estimate of the range in additional cost (in percent of project cost) that the requirements have imposed on builders?

Response:

A) 1992 Stormwater Manual
We have not run cost estimates as a percentage of construction. We developed cost estimates for compliance with our 1992 manual using three different types of development (residential, small and large commercial), and assuming infiltration was possible and not possible. For each instance, we developed cost estimates for erosion and sediment control during construction, for the permanent water quality treatment and flow control facilities, and for operation and maintenance.

Ecology did not consider the costs as unreasonable. Let me know if you want a copy of the cost analyses.

One of our Phase I NPDES municipal permittees developed a cost factor for determining whether it was reasonable to make a redevelopment site retrofit treatment BMP's to the entire site (even though only part of the site may be redeveloped). If the treatment BMP retrofit would increase total project costs by 10% or more, the county would allow a reduction in the area being treated in order to stay below the 10% threshold. But in any case, the runoff from the redeveloping portion of the site has to receive treatment. The state accepted this redevelopment requirement.

B) The Draft 1999 Stormwater Manual
We have not done cost estimates on our proposed treatment, flow control, source control, and other minimum requirements. Where those requirements do not substantially change from our 1992 manual, we do not think it is necessary to re-justify them. Through the previous cost analyses and because they have been implemented for eight years throughout Puget Sound, they are considered reasonable requirements.

We have two areas in which our updated requirements could impose significant new costs: 1) the proposed flow duration standard for discharges to streams; and 2) the possible requirement for BMP's to remove significant amounts of dissolved metals in discharges to small receiving waters. We intend to develop costs for these instances. However, costs may not be a factor in these decisions. Both of these proposed requirements are water-quality based. That is, they will be required in those situations where they are determined necessary to maintain beneficial uses and not violate water quality standards. Water-quality based requirements are not subject to cost reasonableness analyses. In addition, both of these requirements are already in effect in significant areas of King County (i.e., the Seattle metropolitan area) for almost two years. The application of these requirements to ongoing development projects could also speak to their cost reasonableness.

8) How have municipalities ensured that the post-construction BMP's operation and maintenance has been provided and/or BMP's are properly maintained?

Response:

The municipal stormwater NPDES permit requires adoption of an ordinance that requires maintenance of privately owned stormwater facilities that discharge into municipal separate storm sewers (ms4) owned or operated by the permittee. The permit also requires the permittee to inspect facilities draining to the ms4 for proper operation and maintenance, and to have enforcement capability.

9) What are the policy goals that the standards are intended to achieve (reverse impairment; hold the line, etc)?

Response:
The goal of the technical standards for new development is to hold the line. The goal of the standards applied to redevelopment is to begin to reverse impairment.

Enclosure #2

Stormwater Management Manual for the Puget Sound Basin
Minimum Requirements
(Chapter I-2)

SMALL PARCEL MINIMUM REQUIREMENTS:

- Individual single-family residences and duplexes, or
- <5,000 sf of new impervious surface area, and

<One acre of land disturbing activity

Compliance through Small Parcel Erosion and Sediment Control Plan to include the following:

Small Parcel Minimum Requirement #1 - Construction Access Route

- Construction vehicle access shall be, whenever possible, limited to one route. Access points shall be stabilized with quarry spall or crushed rock to minimize the tracking of sediment onto public roads.

Small Parcel Minimum Requirement #2 - Stabilization of Denuded Areas

- From 10/1 to 4/30, unstabilized not more than 2 days.
- From 5/1 to 9/30, unstabilized not more than 7 days.

Small Parcel Minimum Requirement #3 - Protection of Adjacent Properties

- Adjacent properties shall be protected from sediment deposition.

Small Parcel Minimum Requirement #4 - Maintenance

- All ESC BMPs shall be regularly inspected and maintained.

Small Parcel Minimum Requirement #5 - Other BMPs

- As needed other BMPs shall be required by the local government.

MEDIUM AND LARGE PARCEL MINIMUM REQUIREMENT:

Large parcel development:

- Development which includes ≥1 acre of land disturbing activity, or
- ≥5,000 sf of new impervious surface area, and ≥ 1 acre

Compliance through

- Large Parcel Erosion and Sediment Control Plan (ESC minimum requirements 1-15). and
- Large Parcel Stormwater Quality Control Plan (large parcel minimum requirements #1-11)

Medium Parcel Development:

- Development which includes ≤1 acre of land disturbing activity, but ≥5,000 sf new impervious surface area

Compliance through:

- Small Parcel Erosion and Sediment Control Plan (small parcel minimum requirements 1-5), and
- Large Parcel Stormwater Quality Control Plan (large parcel minimum requirements #2-11)

R0073242

Minimum Requirement #1 - Erosion and Sediment Control (large parcel development only)

ESC Requirement #1 - Stabilization and Sediment Trapping

- From 10/1 to 4/30, unstabilized not more than 2 days.
- From 5/1 to 9/30, unstabilized not more than 7 days.

ESC Requirement #2 - Delineate Clearing and Easement Limits

- Mark clearing limits, easements, buffers, sensitive areas, trees and drainage courses.

ESC Requirement #3 - Protection of Adjacent Properties

- Adjacent properties shall be protected from sediment deposition.

ESC Requirement #4 - Timing & Stabilization of Sediment Trapping Measures

- Construct sediment trapping BMPs first; must be functional before land disturbing activities take place.
- Stabilize in accordance with ESC Requirement #1.

ESC Requirement #5 - Cut and Fill Slopes

- Design and construct to minimize erosion.
- Stabilize in accordance with ESC Requirement #1.

ESC Requirement #6 - Controlling Off-site Erosion

- Protect downstream properties from erosion due to increases in volume, velocity and peak flow rate of stormwater runoff from the site.

ESC Requirement #7 - Stabilization of Temporary Conveyance Systems

- Prevent erosion from the expected velocity of flow from the developed condition 2-year, 24-hour storm.
- Outlets, etc. must be stabilized to prevent erosion.

ESC Requirement #8 - Storm Drain Inlet Protection

- Runoff must be treated to remove sediment before entering an inlet.

ESC Requirement #9 - Underground Utility Construction

- Where feasible, do not open up >500 ft. of trench at one time.
- Where possible, excavated material shall be placed on the uphill side of a trench.
- Trench dewatering must discharge into a sediment trap or pond.

ESC Requirement #10 - Construction Access Routes

- Minimize the transport of sediment onto paved roads.
- When it occurs, clean the road daily.
- Do not use street sweeping until sediment has been cleaned up first.

ESC Requirement #11 - Removal of Temporary BMPs **R0073243**

- Remove within 30 days of final site stabilization or after they are no longer needed.
- Remove or stabilize trapped sediment.
- Disturbed soil areas resulting from removal shall be permanently stabilized.

ESC Requirement #12 - Dewatering Construction Sites

- Dewatering devices shall discharge into a sediment trap or pond.

ESC Requirement #13 - Control of Pollutants Other Than Sediment on Construction Sites

- Handle and dispose of these pollutants in a manner which will not cause contamination of stormwater.

ESC Requirement #14 - Maintenance

- Maintain and repair all ESC BMPs as needed to assure continued performance of their intended function.
- Conduct maintenance and repair in accordance with an approved manual.

ESC Requirement #15 - Financial Liability

- Bonding or other appropriate financial instruments shall be required for all projects.

Minimum Requirement #2 - Preservation of Natural Drainage Systems

- Maintain natural drainage patterns and discharge at the natural location to the maximum extent practicable.

Minimum Requirement #3 - Source Control of Pollution

- Apply source control BMPs to all projects to the maximum extent practicable.
- Select, design, and maintain according to an approved manual.
- An adopted and implemented basin plan may be used to tailor BMPs to a specific basin; source control BMPs are always required for every site.

Minimum Requirement #4 - Runoff Treatment BMPs

- All projects shall provide stormwater treatment.
- Treatment BMPs should be sized to capture and treat the 6-month, 24-hour return period storm.
- Infiltration shall be emphasized wherever it is appropriate.
- Direct discharge of untreated stormwater to ground water is prohibited.
- Select, design, and maintain BMPs according to an approved manual.
- Treatment BMPs shall not be built within a natural vegetated buffer except for necessary approved conveyance systems.
- An adopted and implemented basin plan may be used to tailor BMPs to a specific basin.

Minimum Requirement #5 - Streambank Erosion Control

- Applies in addition to MR #4 if there is direct or indirect discharge to a stream (large water bodies, regional detention, and streams with >1000 cfs.)
- Control streambank erosion by limiting the peak rate of runoff to 50% of the existing condition 2-year 24-hour design storm, and maintaining the existing condition peak runoff rate for the 10-year and 100-year, 24-hour design storms.
- Infiltration shall be emphasized wherever it is appropriate.
- Select, design, and maintain BMPs according to an approved manual.
- Treatment BMPs shall not be built within a natural vegetated buffer except for necessary approved conveyance systems.
- An adopted and implemented basin plan may be used to tailor BMPs to a specific basin.

Minimum Requirement #6 - Wetlands

- Applies in addition to MR #4 if there is direct or indirect discharge to a wetland.
- Discharges to wetlands must be controlled and treated to the extent necessary to meet the state surface water and ground water quality standards.
- Discharges to wetlands shall maintain the hydroperiod and flows of existing site conditions to the extent necessary to protect the characteristic uses of the wetland.
- Wetlands created for mitigation cannot be used for stormwater treatment.
- Constructed wetlands must be built on a non-wetland site and managed for stormwater treatment.
- Treatment BMPs shall not be built within a natural vegetated buffer except for necessary approved conveyance systems.
- An adopted and implemented basin plan may be used to tailor BMPs to a specific basin.

Minimum Requirement #7 - Water Quality Sensitive Areas

- If a local government determines that the Minimum Requirements do not provide adequate protection of sensitive areas, more stringent controls shall be required to protect water quality.
- Treatment BMPs shall not be built within a natural vegetated buffer except for necessary approved conveyance systems.
- An adopted and implemented basin plan may be used to tailor BMPs to a specific basin.

Minimum Requirement #8 - Off-Site Analysis and Mitigation

- All development projects shall conduct an analysis of off-site water quality impacts resulting from the project and shall mitigate those impacts. The analysis shall extend a minimum of ¼ mile downstream and shall evaluate and mitigate for existing or potential impacts including but not limited to excessive sedimentation, streambank erosion, discharges to ground water contributing or recharge zones, violations of water quality standards and spills or discharges of priority pollutants.

Minimum Requirement #9 - Basin Planning

Note: This MR may be different because the intent of this one is to give local governments the flexibility to use basin plans to modify the other MR's. In other words, don't be surprised if it includes a list of adopted and implemented basin plans, for example.

- Adopted and implemented basin plans can be used to modify the MR's provided that the level of protection for surface or ground water achieved by the basin plan will equal or exceed that which would be achieved by the MR's otherwise.
- Basin plans shall evaluate and include as necessary retrofitting of BMPs for existing development and/or redevelopment.

Minimum Requirement #10 - Operation and Maintenance

- An O&M schedule shall be provided for all proposed facilities and BMPs and the party(ies) responsible for O&M shall be identified.

Minimum Requirement #11 - Financial Liability

- Performance bonding or other appropriate financial instruments shall be required for all projects to ensure compliance with these standards.

R0073245

Redevelopment Requirements

A. Where redevelopment of ≥ 5,000 ft2 occurs:

Minimum Requirements #1 - #11 apply to the redeveloped site

Source Control BMPs shall apply to the entire site

A stormwater site plan shall be prepared

B. Where one of the following conditions apply, a schedule for implementing the Minimum Requirements to the maximum extent practicable is required for the entire site:

1. Sites > 1 acre with ≥ 50% impervious surface

2. Sites discharging to waters with documented WQ problems. Subject to local priorities, this includes waterbodies that:

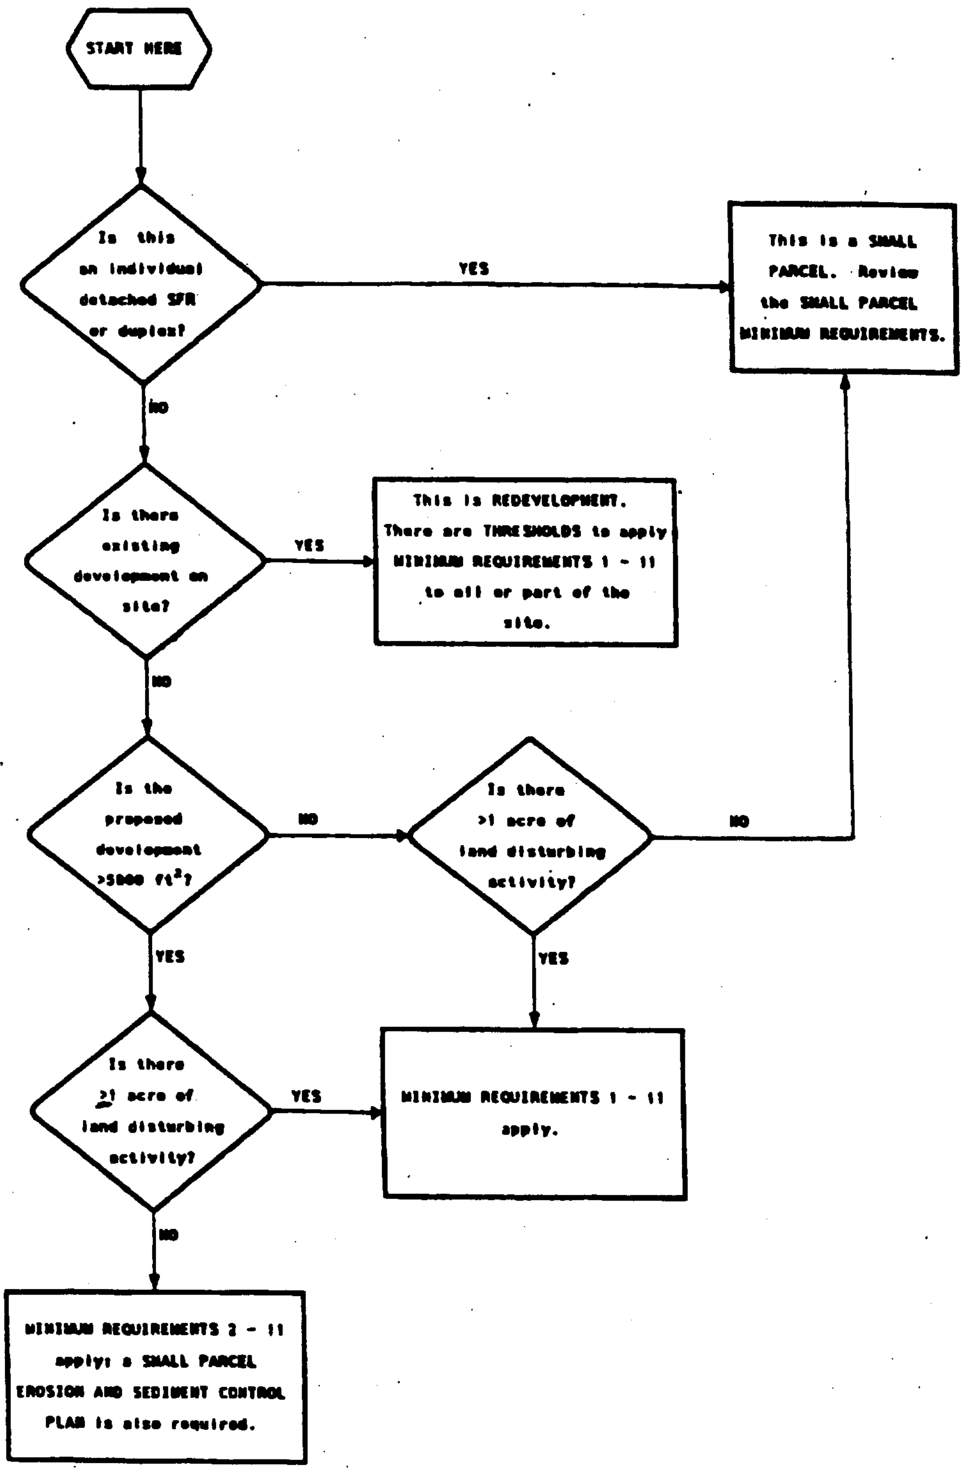
    (i) Are listed in reports required under Section 305(b) of the Clean Water Act, and designated as not supporting beneficial uses

    (ii) Listed under Section 304(l)(1)(A)(I), 304(l)(1)(A)(ii), or 304(l)(1)(B) of the Clean Water Act as not expected to meet water quality standards or goals

    (iii) Listed in Washington State's Nonpoint Source Assessment required under Section 319(a) of the Clean Water Act that, without additional action to control nonpoint sources of pollution cannot reasonably be expected to attain or maintain water quality standards.

3. Sites where the need for additional stormwater control measures have been identified through a basin plan, the watershed ranking process under Ch. 400-12 WAC, or through Growth Management Act planning.

Figure I-2.1 Flowchart Demonstrating Minimum Requirements



R0073247

Figure I-4.3 Summary of Steps for BMP Selection Process

PRELIMINARY STEP: Review Chapter I-2 prior to starting the BMP selection process.

STEP 1: Determine Stormwater Control Scenario from Table I-4.2

STEP 1A: Determine if Oil/Water Separator BMPs are Required based on Land Use Type

STEP 1B: Determine if Nutrient Control is Required *in addition* to Treatment of Conventional Pollutants

STEP 1C: Determine if Streambank Erosion Control is Required

STEP 1D: Determine Final Stormwater Control Scenario from Table I-4.2

STEP 2: Select Source Control BMPs

STEP 2A: Select Source Control BMPs based on Land Use Type

STEP 2B: Select Source Control BMPs for Nutrient Control, if required, as determined from Step 1B

STEP 2C: Prepare Final Source Control BMP List

STEP 3: Select Runoff Treatment and Streambank Erosion Control BMPs

STEP 3A: Select type of Oil/Water Separator, if required, as determined in Step 1A

STEP 3B: Determine initial order of preference of runoff treatment BMPs from Table I-4.4

STEP 3C: Determine initial order of preference of streambank erosion control BMPs from Table I-4.5

STEP 3D: Screen BMPs based on Comparative Stormwater Benefits and Restrictions using Table I-4.6

STEP 3E: Screen Runoff Treatment and Streambank Erosion Control BMPs based on Other Physical Factors

STEP 3F: Prepare Modified BMP List

STEP 3G: Prepare Final BMP List

STEP 4: Complete Stormwater Site Plan

STEP 4A: Complete Permanent Stormwater Quality Control Plan

STEP 4B: Review other Stormwater Site Plan requirements

STEP 4C: Complete Stormwater Site Plan

STEP 5: Submit Final Stormwater Site Plan to the Plan Approval Authority

How to Get Printed Copies of the Stormwater Manual

The manual, which is close to 700 pages, is now divided into five volumes. Three volumes are now available for review, the remaining two volumes will be done by the end of September, 1999.

To order printed copies of the first three available volumes of the stormwater manual, send check or money order for $25.50 (delivery in the state of Washington) or $26.50 (delivery outside the state of Washington) payable to "Department of Printing" at the following address:

Department of Printing
P.O. Box 798
Olympia, WA 98507-0798

Make sure you include your name, address (no P.O. Boxes), phone number, and the name of the publication (Stormwater Manual, Volumes I, II an IV). Allow about two weeks for delivery.

How to Find the Stormwater Manual on the Internet

The first three volumes of the Stormwater Manual are also available on Ecology's Home Page. The internet address for Water Quality Program publications is:

http://www.wa.gov/ecology/biblio/wq.html

Contact Information

If you have any questions on the proposed schedule or public review process, please e-mail Tony Barrett at tbar461@ecy.wa.gov or call him at (360) 407-6467. If you have technical questions or comments, you can contact the technical leads directly. The technical leads for each volume are:

Volume I - Minimum Technical Requirements
Ed O'Brien at eobr@ecy.wa.gov, phone (360) 4076438
Volume II - Construction Stormwater Pollution Prevention
Stew Messman at smes461@ecy.wa.gov, phone (425) 649-7070 and
Lisa Austin at lzin461@ecy.wa.gov, phone (425) 649-7276
Volume III - Hydrologic Analysis
Foroozan Labib at flab461@ecy.wa.gov, phone (360) 407-6439
Volume IV - Source Control BMPs
Stan Ciuba at sciu461@ecy.wa.gov, phone (360) 407-6435
Volume V - Runoff Treatment BMPs
Stan Ciuba and Lisa Austin (see contact information above)

Ecology is an equal opportunity agency. If you have special accommodation needs, please call Donna Lynch at (360) 407-7529 (Voice) or (306) 407-6006 (TDD). E-mail may be sent to dlyn461@ecy.wa.gov

Objective of the Manual

The objective of this manual is to provide guidance on the measures necessary to control the quantity and quality of stormwater produced by new development and redevelopment, such that they comply with water quality standards and protect beneficial uses of the receiving waters.

Development and Geographic Scope of This Manual

The Ecology stormwater manual was originally developed for the Puget Sound Basin in response to a directive of the Puget Sound Water Quality Management Plan. The technical manual was intended to provide technical guidance and to define minimum requirements for implementing local stormwater management programs.

The original 1992 manual was prepared by Ecology staff, with significant contributions from advisory committee members from local government public works and planning officials, representatives from other state agencies, and other affected parties including industry and tribes. This update was prepared in much the same manner. There were five separate advisory committees, with over 70 members representing a broad range of expertise and interests. Their insights and practical knowledge gained from years of experience in the field have been particularly valuable.

What is Driving the Revisions to the Manual?

There are several drivers behind the revisions to the manual. First, the manual was written in 1990-1991, drawing from research done in the 1980's and from existing manuals prepared by King County and by communities in other states. Even as the manual was published, deficiencies and shortcomings were evident. In addition, lessons learned from applying the manual and information from current research all point out additional deficiencies and errors in the manual. Second, funding has been provided under the Puget Sound Plan for the past two biennia to update the manual. Third, actual and proposed listing under the Endangered Species Act (ESA) call for significant changes in the way we manage urban runoff. Updating the technical manual to include new information and standards that are more protective will likely be an essential element in managing urban runoff under the ESA.

With this update of the manual, Ecology is seeking to broaden the applicability of the manual to the entire state. In that effort, we have found that the concepts developed originally for the Puget Sound Basin are applicable throughout western Washington. In addition, most of the minimum requirements and the BMPs are equally applicable in eastern Washington. It will probably be necessary to make adjustments in the minimum requirements for flow control and treatment, in some BMP design criteria, and in specifying which BMPs are applicable in some eastern Washington environments.

Organization of This Manual

The manual is organized into five volumes. The volumes will be published as separate documents to make it easier for the user to find needed information and to make it easier to publish future revisions. However, most users will find it necessary to have a complete set of all five volumes. We have tried to strike a balance between bouncing the user back and forth between volumes and unnecessary replication of material.

Unfinished Business (The Text Boxes – a Call for Action)

Although we are inviting comments and recommendations on the manual as a whole, there are some specific issues or questions where we want public comment, information or assistance. We have elected to use "Text Boxes" to highlight these issues. To comment, contact technical leads listed earlier.

The Process and Schedule for Completing the Revisions

Ecology will conduct public workshops, from early October to about mid-November, at both eastside and westside locations. We anticipate separate workshops on Volume I (Minimum Requirements and overall policy issues), Volume II (Construction Stormwater Pollution Prevention), and Volumes III – IV (Hydrologic Analysis, Source Control BMPs, and Runoff Treatment BMPs).

The comment period on the Public Review Draft will end December 15, 1999 and we anticipate publishing a Final Draft by mid-February 2000. We will conduct public meetings on the Final Draft during March and expect to publish a revised manual by the end of April 2000.

CHAPTER 1 - Introduction

1.1 Effects of Urbanization

1.1.1 Background Conditions

Prior to the Euro-American settlement, western Washington primarily was forested in alder, maple, fir, hemlock and cedar. The area's bountiful rainfall supported the forest and the many creeks, springs, ponds, lakes and wetlands. The forest system provided protection by intercepting rainfall in the canopy, reducing the possibility of erosion and the deposition of sediment in waterways. The trees and other vegetative cover evapotranspirated at least 40% of the rainfall. The forest duff layer absorbed large amounts of runoff releasing it slowly to the streams through shallow ground water flow. Forest ecosystems in eastern Washington provided similar hydrologic functions though not always to the same extent. The shrub-steppe and grasslands of eastern Washington also had their own natural hydrologic rhythms.

1.1.2 Hydrologic Changes

As settlement occurs and the population grows, trees are logged and land is cleared for the addition of impervious surfaces such as rooftops, roads, parking lots, and sidewalks. Maintained landscapes that have much higher runoff characteristics typically replace the natural vegetation. The natural soil structure is also lost due to grading and compaction during construction. Roads are cut through slopes and low spots are filled. Drainage patterns are irrevocably altered. All of this results in drastic changes in the natural hydrology, including:

- Increased peak surface runoff volumetric flow rates;
- Increased volume of surface runoff;
- Decreased time for runoff to reach a natural receiving water;
- Reduced ground water recharge;
- Increased frequency and duration of high stream flows and reduced stream flows during dry weather;
- Greater stream velocities; and
- Increased frequency and duration of wetlands inundation and reduced water elevations during the dry season.

R0073261

As a consequence of these hydrology changes, stream channels are eroded by high flows and can lose summertime base flows. Increased flooding occurs. Habitat is degraded and receiving water species composition is altered as explained below.

Figure 1.1 (Booth and Jackson, 1997)[1] illustrates the relationship between the level of development in a basin, the changes in the recurrence of high stream flows, and the resultant streambank instability and channel erosion.

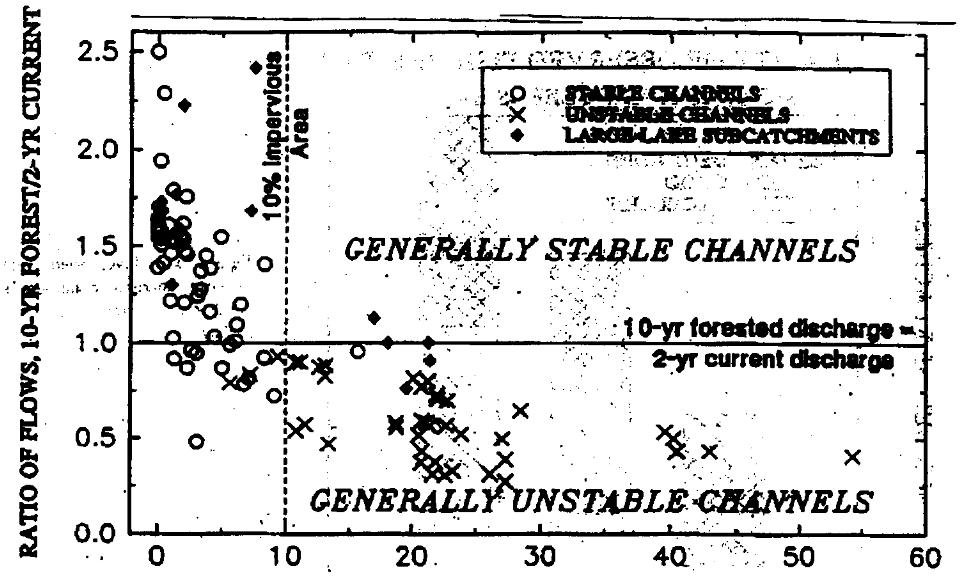

Figure 1.1: Channel Stability and Land Use:
Hylebos, East Lake Sammamish, Issaquah Basins

1.1.3 Water Quality Changes

Urbanization also causes an increase in the types and quantities of pollutants in surface and ground waters. Runoff from urban areas has been shown to contain many different types of pollutants, depending on the nature of the activities in those areas. Table 1.1 from an Analysis of Oregon Urban Runoff Water Quality Monitoring Data Collected From 1990 to 1996 (1997)[2] shows mean concentrations for a limited number of pollutants from different land uses.

The runoff from roads and highways is contaminated with pollutants from our vehicles. Oil and grease, polynuclear aromatic hydrocarbons (PAH's), lead, zinc, copper, cadmium, as well as sediments (soil particles) and road salts are typical pollutants in road runoff. Runoff from industrial areas typically contains even more types of heavy metals, sediments, and a broad range of man-made organic pollutants, including phthalates, PAH's, and other petroleum hydrocarbons. Residential areas contribute the same road-based pollutants as well as herbicides, pesticides, nutrients (from

fertilizers), bacteria and viruses (from animal waste) to runoff. All of these contaminants can seriously impair beneficial uses of receiving waters.

Regardless of the eventual land use conversion, the sediment load produced by a construction site can turn the receiving waters turbid and be deposited over the natural sediments of the receiving water.

The pollutants added by urbanization can be dissolved in the water column or can be attached to particulates that settle in streambeds, lakes, wetlands, or marine estuaries. A number of urban bays in Puget Sound have contaminated sediments due to pollutants associated with particulates in stormwater runoff.

Urbanization also tends to cause an increase in water temperature. Heated stormwater from impervious surfaces and exposed treatment and detention ponds discharges to streams with less riparian vegetation for shade.

Table 1.1: Land Uses Mean Concentrations for Selected Pollutants[2]

Land Use	TSS mg/l	Total Cu mg/l	Total Zn mg/l	Dissolved Cu mg/l	Total P mg/l
In-pipe Indus.	194	0.053	0.629	0.009	0.633

Transportation	169	0.035	0.236	0.008	0.376
Commercial	92	0.032	0.168	0.009	0.391
Residential	64	0.014	0.108	0.006	0.365
Open	58	0.004	0.025	0.004	0.166

R0073263

1.1.4 Biological Changes

The hydrologic and water quality changes result in changes to the biological systems that were supported by the natural hydrologic system. In particular, aquatic life is greatly affected by urbanization. Habitats are drastically altered when a stream changes its physical configuration and substrate due to increased flows. Natural riffles, pools, gravel bars and other areas are altered or destroyed. These and other alterations produce a habitat structure that is very different from the one in which the resident aquatic life evolved. For example, spawning areas, particularly those of salmonids, are lost. Fine sediments imbed stream gravels and suffocate salmon redds. The complex food web is destroyed and is replaced by a biological system that can tolerate the changes. However, that biological community is typically not as complex, is less desirable, and is unstable due to the ongoing rapid changes in the new hydrologic regime.

Significant and detectable changes in the biological community of Puget Sound lowland streams begins early in the urbanization process. May et al (1997)[3] reported changes in the 5-10% total impervious area range of a watershed. Figure 1.2 from May et al (1997) shows the relationship observed between the Benthic Index of Biotic Integrity (B-IBI) developed by Kleindl (1995)[4] and Karr (1991)[5], and the extent of watershed urbanization as estimated by the percentage of total impervious area (% TIA). Also shown in the figure is the correlation between the abundance ratio of juvenile coho salmon to cutthroat trout (Lucchetti and Fuerstenberg 1993)[6] and the extent of urbanization.

The biological communities in wetlands are also severely impacted and altered by the hydrological changes. Relatively small changes in the natural water elevation fluctuations can cause dramatic shifts in vegetative and animal species composition.

If the hydrological changes don't knock out a species, the toxic pollutants in the water column such as pesticides, soaps, and metals can have immediate and long-term lethal impacts. Toxic pollutants in sediments can yield similar impacts with the lesions and cancers in bottom fish of urban bays serving as a prime example.

R0073264

A rise in water temperature can have direct lethal effects. It reduces the maximum available dissolved oxygen and may cause algae blooms that further reduce the amount of dissolved oxygen in the water.

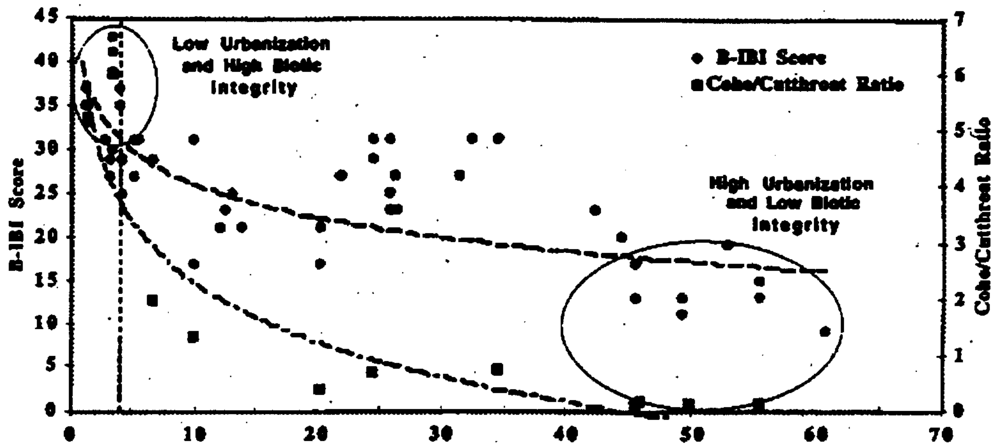

Figure 1.2: Relationship Between Basin Development and Biotic Integrity in Puget Sound Lowland Streams

1.1.5 The Role of Land Use and Our Lifestyles

The engineered stormwater conveyance, treatment, and detention systems advocated by this and other stormwater manuals can reduce the impacts of development to water quality and hydrology. But they cannot replicate the natural hydrologic functions of the natural watershed that existed before development, nor can they remove sufficient pollutants to replicate the water quality of pre-development conditions. Ecology understands that despite the application of appropriate Best Management Practices identified in this manual, we will continue to degrade our urban and suburban receiving waters and continue to lose some beneficial uses due to development. This is because land development, as we practice it today, is incompatible with the achievement of sustainable ecosystems. Unless we adopt development methods that cause significantly less disruption of the hydrologic cycle, we will inevitably degrade and lose more beneficial uses of our waters as we develop more areas.

In recent years, researchers (May et al, 1997)[3] and regulators (e.g., Issaquah Creek Basin and Nonpoint Action Plan, 1996)[7] have speculated on the amount of natural land cover and soils that would have to be maintained in a watershed in order to retain sufficient hydrologic conditions to prevent stream channel degradation and maintain base flows. There is some agreement that preserving a high percentage (50%? 65%?) of the land cover

R0073265

and soils in an undisturbed state is necessary to preserve hydrology.

It is not clear what other combinations of measures are also necessary to preserve beneficial uses. Clearly, we must improve our stormwater detention, treatment, and source control technologies. This manual is the Department of Ecology's latest effort to apply updated knowledge in these areas. We must also improve the operation and maintenance of our engineered systems so that they function as well as possible. Changing public attitudes toward chemicals use, preferred housing, and transportation modes are also necessary.

A dramatic reduction is necessary in the amount of impervious surfaces and artificially landscaped areas we create to accommodate our preferred housing, play, and work environments, and most significantly, our transportation choices. It is estimated that 65% of the impervious surfaces are created to provide "car habitat." Therefore to make appreciable progress in reducing impervious surfaces in a watershed, we must reduce the density of our road systems, alter our road construction standards, reduce surface parking, and rely more on transportation systems that do not require such extensive impervious surfaces (rail, bicycles, walking).

In short, we must implement drastic changes in where and how we develop land and how we live and move across the land if we are to achieve the goals we set for ourselves in the federal Clean Water Act - to preserve, maintain, and restore the beneficial uses of our nation's waters.

1.2 Objective

The objective of this manual is to control the quantity and quality of stormwater produced by new development and redevelopment such that they comply with water quality standards and protect beneficial uses of the receiving waters. Application of appropriate minimum requirements and BMP's identified in this manual are necessary but sometimes insufficient measures to achieve those goals.

To accomplish the objective, the manual establishes minimum requirements for projects of all sizes and provides guidance concerning how to prepare and implement stormwater site plans. These plans are required for new development and redevelopment on both large and small parcels, and must meet the applicable minimum requirements contained in Chapter 2. These requirements are, in turn, satisfied by the application of

BMPs from Volumes II through V. Projects that follow this approach will apply reasonable, technology-based BMPs to reduce the adverse impacts of stormwater.

It is important to understand that compliance with this manual does not ensure compliance with water quality standards. State and local permitting authorities with jurisdiction can require more stringent measures that are deemed necessary to meet locally established goals, state water quality standards, or other established natural resource or drainage objectives.

The manual can also be helpful in identifying options for retrofitting BMPs to existing development. Retrofitting stormwater BMPs into existing developed areas will be necessary in many cases to meet federal Clean Water Act and state Water Pollution Control Act (Chapter 90.48 RCW) requirements.

Ecology does not have guidance specifically for retrofit situations (not including redevelopment situations). We encourage application of BMPs from this manual when it is feasible to do so. However, there are typically site constraints that make the application infeasible.

Application to Retrofit Situations

Ecology is inviting comment on how and under what circumstances to modify these BMPs for retrofit situations.

Ecology is also inviting comment on the use of BMPs not included in the manual for retrofit situations.

1.3 Development and Geographic Scope of This Manual

The Ecology stormwater manual was originally developed in response to a directive of the Puget Sound Water Quality Management Plan (Plan).[8] The Puget Sound Water Quality Authority (since replaced by the Puget Sound Water Quality Action Team, PSWQAT) recognized the need for overall guidance for stormwater quality improvement. It incorporated requirements in its Plan to implement a cohesive, integrated stormwater management approach through the development and implementation of programs by local jurisdictions, and the development of rules, permits, and guidance by Ecology.

One of the plan's stormwater elements (SW-3.1) requires Ecology to develop a stormwater technical manual for use by local jurisdictions. The Plan specifies aspects that the manual is to include.

With this update of the manual, Ecology is seeking to broaden the applicability of the manual to the entire state. In that effort, we have found that the concepts developed originally for the Puget Sound Basin are applicable throughout western Washington. In addition, most of the concepts, minimum requirements and BMPs are equally applicable in eastern Washington. Adjustment in the minimum requirements for flow control and treatment, adjustment of some BMP design criteria, and specification of the types of BMPs applicable in some eastern Washington environments seem appropriate.

1.4 Development of Best Management Practices to Improve Water Quality

1.4.1 Best Management Practices (BMPs)

The primary method by which the manual controls the adverse impacts of development and redevelopment is through the application of Best Management Practices

Best Management Practices are defined as schedules of activities, prohibitions of practices, maintenance procedures, and structural and/or managerial practices, that when used singly or in combination, prevent or reduce the release of pollutants to waters of Washington State. The types of BMPs are source control, runoff treatment, and flow control.

The primary purpose of using BMPs is to protect beneficial uses of water resources through the reduction of pollutant loads and concentrations, and through reduction of discharges (volumetric flow rates) causing stream channel erosion. If it is found that, after the implementation of BMPs advocated in this manual, beneficial uses are still threatened or impaired, then additional controls may be required.

1.4.2 Source Control BMPs

Stormwater management programs should keep in mind that it is generally more cost effective to **prevent** impacts using source control than using runoff treatment to remove pollutants. However, since source controls cannot prevent all impacts, some combination of measures will always be needed.

R0073268

Source control BMPs, as the term implies, aim to **prevent** pollution, or other adverse effects of stormwater, from occurring. Ecology further classifies source control BMPs as operational or structural. Examples of source control BMPs include methods as various as using mulches and covers on disturbed soil, putting roofs over outside storage areas, berming areas to prevent stormwater run-on and pollutant runoff.

1.4.3 Treatment BMPs

Runoff treatment BMPs include facilities that remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, and soil adsorption. Runoff treatment BMPs can accomplish significant levels of pollutant load reductions if properly designed and maintained.

1.4.4 Flow Control BMPs

Flow control BMPs typically control the rate, frequency, and flow duration of stormwater surface runoff releases. The need to provide flow control BMPs depends on whether a development site discharges to a stream system or wetland, either directly or indirectly. Stream channel erosion control can be accomplished by BMPs that detain runoff flows and also by those which physically stabilize eroding streambanks. Both types of measures may be necessary in urban watersheds. Only the former is covered in this manual.

Construction of a detention pond is the most common means of meeting flow control requirements. The concept of detention is to collect runoff from a developed area and release it at a slower rate than it enters the collection system. The reduced release rate requires temporary storage of the excess amounts in a pond with release occurring over a few hours or days. The volume of storage needed is dependent on 1) the size of the drainage area; 2) the extent of disturbance of the natural vegetation, topography, and soils and creation of effective impervious surfaces (surfaces that drain to a stormwater collection system); and 3) how rapidly the water is allowed to leave the detention pond, i.e., the target release rates.

The 1992 Ecology manual focused primarily on controlling the peak flow release rates for recurrence intervals of concern – the 2, 10, and 100-year rates. This level of control did not adequately address the increased duration at which those high flows occur because of the increased volume of water from the developed condition as compared to the pre-developed conditions. To protect stream channels from increased erosion, it is necessary to control the durations over which a stream channel experiences geomorphically significant flows such that the energy imparted to the stream channel does not increase significantly. Geomorphically significant flows are those that are capable of moving sediments. This target will translate into lower release rates and significantly larger detention ponds than the previous Ecology standard. The size of such a facility can be reduced by changing the extent to which a site is disturbed.

In regard to wetlands, it is necessary to not alter the natural hydroperiod . This means control of flows from a development such that the wetland is within certain elevations at different times of the year. If the amount of surface water runoff draining to a wetland is increased because of land conversion from forested to impervious areas, it may be necessary to bypass some water around the wetland in the wet season. If however, the wetland was fed by local ground water elevations during the dry season, the impervious surface additions and the bypassing practice may cause variations from the dry season elevations. Estimations of what should be done to maintain the natural hydroperiod requires the use of a continuous runoff model. It remains to be seen whether the continuous runoff models we have available are sufficiently accurate to determine successful flow management strategies. And even if the modeling approaches are sufficient, it will be a challenge to simulate pre-development hydrology once you have significant development around and draining to or through a wetland.

1.5 Organization of This Manual

The manual is organized into five volumes

Volume I provides an introduction and overview, establishes thresholds for determining whether to apply small or large parcel minimum requirements, establishes the minimum requirements for large and small parcels, and provides guidance on preparation of a stormwater site plan. A glossary is included at the back of Volume I.

Volume II covers stormwater pollution prevention at construction sites with a primary focus on erosion and sediment control. The volume provides an overview of erosion and sedimentation, summarizes various regulatory requirements, describes how to prepare a Construction Stormwater Pollution Prevention Plan, and details the standards and specifications for BMPs.

Volume III covers hydrologic analysis methods for estimating pre- and post-developed runoff quantities and flow rates, and details of detention facility design, construction, and maintenance. It provides general information in regard to infiltration and constructed wetlands with references to Volume V for further details. It provides reference to the use of natural wetlands for stormwater. We have deleted the chapter on conveyance design, and encourage the use of other references.

Volume IV addresses control of runoff pollution produced by urban land uses with a primary emphasis on source control BMPs. Source control BMPs for specific types of activities are described in detail. Extensive appendices provide guidance on BMPs applicable to business types and helpful information concerning other related regulatory requirements and recycling, disposal, and treatment options for waste materials.

Volume V provides the details of treatment BMP design, construction, and maintenance. It is organized by treatment BMP types and details how to select BMPs according to the requirements and the needs of the site.

1.6 Users of This Manual

The users of this manual will be engineers, planners, environmental scientists, plan reviewers, and inspectors from local government and private industry. Local government officials may adopt and apply the requirements of this manual directly or adopt and apply the requirements of an equivalent manual. Local government staff will use this manual, or their own manual, as a reference for reviewing stormwater site plans, checking BMP designs, and for providing technical advice in general. Private industry will use the manual for information on how to develop and implement stormwater site plans, and as a reference for technical specifications of BMPS.

Where permits, such as the Baseline General Permit for Industrial Activities, references BMPs in this manual, affected industries shall use the manual for specifics concerning how to comply with their permits.

1.7 How to Use This Manual

Development project proponents will want to take the following steps:

- Read Chapter 2 in Volume I to determine the minimum requirements that apply to the project;
- Use Chapter 4 of Volume I to help select permanent BMPs for the project;
- Reference Volumes III through V for BMP design criteria;
- Use Chapter 3 of Volume I to help develop your stormwater site plan; and
- Use Volume II to plan your construction activities, including:
  - check your regulatory responsibilities in chapter 2;
  - use chapter 3 to develop your Construction Stormwater Pollution Prevention Plan; and
  - use chapter 4 to select and specify BMPs.

Businesses which need to comply with their industrial stormwater permit or a local requirement to apply source control BMPs should reference Volume IV.

1.8 Regulatory Status of the Manual

This manual has been developed by Ecology to represent the latest developments in technology-based management of urban stormwater. The manual itself has no independent regulatory authority. Its requirements and BMPs only become required through:

- ordinances and rules established by local governments; and,
- permits and other authorizations issued by local, state, and federal authorities.

1.9 Relationship of this Manual to Federal, State, and Local Regulatory Requirements

The Ecology manual is one cog in the efforts to manage and reduce the impacts of urban stormwater discharges. This section will explain the relationship of the manual to each of the various programs, permits, and planning efforts described below.

1.9.1 The Puget Sound Water Quality Management Plan

The Puget Sound Water Quality Management Plan (The Plan) requires all cities and counties in the Puget Sound Basin to implement stormwater management programs. Element SW-1.1 states that those programs are to include:

Ordinances for all new development and redevelopment which address control of off-site water quality and quantity effects; the use of source control BMPs; the effective treatment of the water quality design storm; the use of infiltration where appropriate; the protection of stream channels, fish and shellfish habitat, and wetlands; erosion and sediment control at construction project, and local enforcement of these stormwater controls.

Element SW-1.3 states that:

> "In conjunction with the runoff control ordinances for new development and redevelopment, each jurisdiction shall adopt a stormwater management manual containing best management practices. A local government may adopt the manual prepared by Ecology under element SW-3 or prepare its own manual as long as it has substantially equivalent technical standards to those in Ecology's manual. Ecology shall review alternative manuals of local governments for substantial consistency with the Plan and Ecology's manual and guidance."

Element SW-2.4 of the Plan requires that:

> "Each urban stormwater program shall seek to control the quality and quantity of runoff from public facilities and industrial, commercial and residential areas, including streets and roads, consistent with manuals and guidance provided by Ecology…"

Element SW-3.1 requires Ecology to:

> "…maintain a technical manual that implements the requirements in elements SW-1 and SW-2 for use by local jurisdictions in stormwater planning."

Ecology publishes this manual to fulfill its responsibilities under the Plan. Cities and counties are to adopt ordinances and manuals that are substantially equivalent. Ecology published guidance ("Guidance for Local Governments When Submitting Manuals and Associated Ordinances for Equivalency Review," 3/94, Publication #94-45) that listed the following criteria that Ecology uses to determine equivalency:

1. The Minimum Requirements *(in Chapter 2 of Volume I)* for new development and redevelopment now in the model ordinance *(also published by Ecology)* and the technical manual or their equivalents must be included in the ordinance adopted by the local government. More stringent requirements may be used, and/or the Minimum Requirements may be tailored to local circumstances through the use of basin plans.
2. The thresholds for and definitions of new development, redevelopment, land disturbing activities, and existing conditions should provide equivalent protection of receiving waters or equivalent levels of pollution treatment as those provided by Ecology's criteria.
3. The substantially equivalent manual must include BMP selection and site planning processes that have outcomes that provide equivalent or greater protection to those in Ecology's technical manual.
4. BMPs equivalent to those contained in Volumes II through IV *(corresponding to proposed Volumes II through V of this update)* of Ecology's manual must be included in the local government's version of the manual.
5. An exceptions or variance process similar in content to Section I-2.16 *(Section 2.8 of Volume I in this update)*, Exceptions, must be included.

Manual Equivalency Criteria

As part of this manual update, Ecology will update the equivalency criteria. Ecology invites comments on this section.

The text in Chapter 2 of Volume 1 that is in **bold print** are those concepts that Ecology will require local governments to incorporate or to have equivalent concepts that provide an equal or greater level of protection or treatment.

1.9.2 Phase I NPDES and State Waste Discharge Stormwater Permits for Municipalities

Ecology has issued joint NPDES and State Waste Discharge permits to regulate the discharges of stormwater from the municipal separate storm sewer systems operated by the following cities and counties:

Clark County, King County, Pierce County,

Snohomish County, Seattle, and Tacoma.

The Washington Department of Transportation is also a Phase I municipal stormwater permittee for its stormwater discharges within the jurisdictions of the above cities and counties.

As a condition (Special Condition S7.b.8.a.) of the permits issued in July, 1995, these entities are required to implement stormwater programs that must include:

> "... ordinances (except WSDOT's program), minimum requirements and best management practices (BMPs) equivalent to those found in Volumes I-IV of Ecology's *Stormwater Management Manual for the Puget Sound Basin* (1992 edition, and as amended by its replacement)...."

These entities have until the end of the permit terms, July, 2000 to comply with this requirement.

Ecology will reissue the Phase I permits in July, 2000. At that time we will add whatever additional municipalities are required by federal law to have an NPDES Phase I municipal stormwater permit. We also intend to continue to retain the above special condition with a reference to the year 2000 edition of the Ecology stormwater manual. Ecology may also add a deadline or deadlines within the term of the permit for compliance with the condition.

1.9.3 Phase II NPDES and State Waste Discharge Stormwater Permits for Municipalities

The U.S. Environmental Protection Agency (EPA) intends to promulgate its Phase II stormwater regulations in October, 1999. Those rules will identify additional municipalities as subject to NPDES municipal stormwater permitting requirements. An initial estimate is that 76 municipalities will be subject to the requirements, and 13 additional municipalities may be subject to the requirements depending upon an analysis that Ecology must perform. Unless the dates change in the final rule, the Phase II permits must be issued by November 2002. The Phase II communities must submit their stormwater programs to comply with permit requirements by January 2003.

The proposed regulations specify minimum requirements for the stormwater programs developed to comply the Phase II permits.

One of those requirements is the adoption of a program for "post-construction stormwater management in new development and redevelopment." Another is a program for "construction site stormwater runoff control."

To at least partially fulfill these requirements, Ecology intends to require the Phase II municipalities to adopt ordinances, minimum requirements, and BMPs equivalent to those in this updated manual. Essentially, this would be the same permit condition as required of the Phase I municipalities. However, a different schedule for compliance may be necessary for some municipalities. Municipalities within the Puget Sound Basin should have already completed these tasks as required by the Puget Sound Water Quality Management Plan, and as encouraged by the State's strategy for salmon recovery.

1.9.4 Municipalities Not Subject to the Puget Sound Water Quality Management Plan nor NPDES Stormwater Permits for Municipalities

Municipalities not subject to the Puget Sound Plan nor NPDES stormwater permits for municipalities are encouraged to adopt stormwater programs at least equivalent to the Puget Sound Basic Stormwater Program. This would include adoption of ordinances, minimum requirements, and BMPs equivalent to those in Ecology's manual. Any municipalities in areas where urban stormwater has been identified as a limiting factor to salmon recovery are expected to have an equivalent stormwater manual as part of a Comprehensive Stormwater Program as defined by the Puget Sound Water Quality Management Plan.

1.9.5 The NPDES and State Waste Discharge Baseline General Permit for Stormwater Discharges Associated With Industrial Activities (a.k.a., industrial stormwater permit)

Businesses subject to the Baseline General Permit for Stormwater Discharges Associated With Industrial Activities have to prepare and implement a Stormwater Pollution Prevention Plan in accordance with the terms of that permit. The permit issued in November 1995 requires a description and implementation of generic "operational BMPs" (the same category of BMPs referred to as operational source control BMPs in this manual), and "source control BMPs" (the same category of BMPs referred to as "structural source control" BMPs in this manual) from Volume IV of the 1992 Puget Sound Stormwater Manual. Additionally, application of erosion and sediment control BMPs, flow control BMPs and treatment BMPs from the 1992 manual and other published guidance is required if necessary to address an erosion, flow, or pollution problem.

The existing industrial stormwater permit expires in November 2000. Ecology intends to redraft the permit conditions and reissue the permit by that date. As a condition of the reissued permit, Ecology anticipates that it will require industrial stormwater permittees to implement the BMPs in this updated stormwater manual. Ecology will consider retaining the statement in the existing permit that allows businesses to implement alternative BMPs as long as they can demonstrate that it will result in equal or better quality of stormwater discharge.

1.9.6 The NPDES and State Waste Discharge General Permit for Stormwater Discharges Associated With Construction Activity (a.k.a., construction stormwater permit)

Projects covered by the construction stormwater permit must select BMPs from Volume II of this manual if the date of the BMP selection process for the project is 120 days or more after the issue date of the manual.

Construction sites that will disturb five acres or more and will have a discharge of stormwater from the project site to a surface water must apply for Ecology's construction stormwater permit. The permit requires application of stabilization and structural practices to reduce the potential for erosion and the discharge of sediments from the site. The stabilization and structural practices cited in the permit are very similar to the 15 minimum requirements for sedimentation and erosion control in Volume I of the 1992 Puget Sound stormwater manual. The permit also requires construction sites within the Puget Sound basin to select BMPs from Volume II of **the most recent version of the Ecology stormwater manual that has been available at least 120 days prior to the BMP selection.** Sites outside the basin are required to select BMPs from the manual, from the Erosion and Sediment Control Handbook, by Goldman et al, or to select other appropriate BMPs. The permit also states that where Ecology has determined the local government requirements for construction sites to be at least as stringent as Ecology's, Ecology will accept compliance with the local requirements.

The construction stormwater permit issued in November 1995 expires in November 2000. Ecology intends to reissue a new permit by the latter date. We anticipate that the reissued permit will require compliance with the construction stormwater pollution prevention elements cited in Large Parcel Minimum Requirement #1, and listed in Chapter 3 of Volume II. We also anticipate that the permit will require selection of BMPs from Volume II of this manual, and that it will allow use of BMPs from local government manuals where they have been determined to be equivalent.

The proposed EPA Phase II stormwater regulations would require construction sites of 1 acre and larger to apply for an NPDES stormwater permit. If that regulation is adopted as proposed, Ecology will likely require all such sites to apply for coverage under its reissued construction stormwater permit.

1.9.7 The Endangered Species Act: Section 4(d) Rules, Section 7 Consultations, Section 10 Habitat Conservation Plans

With the listing of multiple species of salmon as threatened or endangered across much of Washington State, and the probability of more listings in the future, implementation of the requirements of the Endangered Species Act will have a dramatic effect on urban stormwater management. The manner in which that will occur is still evolving.

Under Section 4(d) of the statute, the federal government issues regulations to provide for the conservation of the species. A 4(d) rule may require new development and redevelopment to comply with specific requirements. It remains to be seen whether the federal government will cite the requirements of this manual in a 4(d) rule.

Under Section 7 of the statute, all federal agencies must insure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of any endangered or threatened species (or a species proposed for listing), nor result in the destruction or adverse modification of designated critical habitat. The responsibility for determining whether jeopardy is likely to occur rests with the "action" agency. If an action "may affect" a listed species, the "action" agency must consult with the National Marine Fisheries Service (NMFS), or the U.S. Fish and Wildlife Service (F &WS) depending on the species involved, to determine whether jeopardy is likely to occur. Where NMFS or F&WS believes that jeopardy would result, it must specify reasonable and prudent alternatives to the action that would avoid jeopardy if any such alternatives are available. If the "action" agency rejects these, the action cannot proceed. This manual may play a role in these jeopardy decisions and the alternatives cited to avoid jeopardy.

Under Section 10 of the ESA, through voluntary agreements with the federal government that provide protections to an endangered species, a non-federal applicant may commit an "incidental take" of individuals of that species as long as it is incidental to an otherwise lawful activity (such as developing land or building a road). This new provision of the ESA is designed to resolve conflicts between development pressures and endangered species protection. A "Habitat Conservation Plan" (HCP) is an example of this type of agreement. Under an HCP, the applicant's plan must:

- outline the impact that will likely result from the taking;
- list steps the applicant will take to minimize and mitigate such impacts, and funding available to implement such steps; and
- include alternative actions the applicant considered and reasons alternative acts are not being used.

The federal government may grant a permit if it finds that the taking will be incidental; the applicant will minimize and mitigate impacts of taking; and the applicant will ensure that adequate funding for the conservation plan will be provided. This manual may play a key role in any proposed Habitat Conservation Plans.

1.9.8 Section 401 Water Quality Certifications

For projects that require a fill or dredge permit under Section 404 of the Clean Water Act, Ecology must certify to the permitting agency, the U.S. Army Corps of Engineers, that the proposed project will not violate water quality standards. In order to make such a determination, Ecology may do a more specific review of the potential impacts of a stormwater discharge from the construction phase of the project and from the completed project. As a result of that review, Ecology may condition its certification to require:

- application of the minimum requirements and BMPs in this manual; or
- application of more stringent requirements.

1.9.9 Hydraulic Project Applications (HPAs)

Under Chapter 75.20 RCW, the Hydraulics Act, the Washington State Department of Fish and Wildlife has the authority to require actions of projects whose stormwater discharges would change the natural flow or bed of state waters. The implementing mechanism is

the issuance of an Hydraulics Project Approval (HPA) permit. In exercising this authority, Fish and Wildlife may require:

- compliance with the provisions of this manual; or
- application of more stringent requirements that they determine are necessary to meet their statutory obligations to protect fish and wildlife.

1.9.10 Aquatic Lands Use Authorizations

The Department of Natural Resources (DNR), as the steward of public aquatic lands, may require a stormwater outfall to have a valid use authorization, and to avoid or mitigate resource impacts. Through its use authorizations, which are issued under authority of Chapter 79.90 through 96, and in accordance with Chapter 332-30 WAC, DNR may require:

- compliance with the provisions of this manual; or
- application of more stringent requirements that they determine are necessary to meet their statutory obligations to protect the quality of the state's aquatic lands.

1.9.11 Requirements Identified through Watershed/Basin Planning or Total Maximum Daily Loads (TMDL's, a.k.a., Water Clean-up Plans)

A number of the requirements of this manual can be superseded by the adoption of ordinances and rules to implement the recommendations of watershed plans or basin plans. Local governments may initiate their own watershed or basin planning processes to identify more stringent or alternative requirements. They may also choose to develop a watershed plan in accordance with the Watershed Management Act (ESHB 2514) that includes the optional elements of water quality and habitat. They may also choose to develop a basin plan in accordance with Chapter 400-12 WAC. As long as the actions or requirements identified in those plans and implemented through local or state ordinances or rules comply with the intent of applicable state and federal statutes (e.g., The federal Clean Water Act and the Endangered Species Act), they can supersede the requirements in this manual. The decisions concerning whether such locally derived requirements comply with the intent of federal and state statutes rest with the regulatory agencies responsible for implementing those statutes.

The requirements of this manual can also be superseded through the adoption of actions and requirements identified in a Total Maximum Daily Load that is approved by the EPA.

1.9.12 Other Local Government Requirements

Local governments have the option of applying more stringent requirements than those in this manual. They are not required to base those more stringent requirements on a watershed/basin plan or their obligations under a TMDL. Project proponents should always check with the local governmental agency with jurisdiction to determine the stormwater requirements that apply to their project.

CHAPTER 2 - Minimum Requirements For All New Development and Re-Development

2.1 Introduction

This manual, now expanded to be applicable on a statewide basis, was originally developed to comply the 1991 Puget Sound Water Quality Management Plan. That plan (as amended) requires all counties and cities within the Puget Sound drainage basin to adopt stormwater programs which include minimum requirements for new development and redevelopment set by the Plan and in guidance developed by Ecology. The programs are to include ordinances that address:

> *"... at a minimum: (1) the control of off-site water quality and quantity effects; (2) the use of best management practices for source control and treatment; (3) the effective treatment, using best management practices, of the storm size and frequency (design storm) as specified in the manual for proposed development; (4) the use of infiltration, with appropriate precautions, as the first consideration in stormwater management; (5) the protection of stream channels, fish, shellfish habitat, other aquatic habitat, and wetlands; (6) erosion and sedimentation control for new construction and redevelopment projects; and (7) local enforcement of these stormwater controls."*

Ecology considers the above description to be generic to proper stormwater management in any region within the State of Washington. There are judgements that must be made concerning appropriate technical standards for each region of the state based on differences in hydrology, soils, and underlying geology. For this edition of the manual, Ecology has identified flow control standards and water quality treatment design storms as the only requirements that justify different standards for eastern and western Washington. Ecology has also identified different Best Management Practices (BMPs) that will aid eastern Washington development sites to achieve the intent of the minimum requirements.

R0073281

There are several sets of requirements for proposed new development and redevelopment that are applied depending on the type and size of the proposed development. In general, small sites are required to control erosion and sedimentation from construction activities and to apply simpler approaches to treatment and flow control of stormwater runoff from the developed site. Controlling flows from small sites is important because the cumulative effect of uncontrolled flows from many small sites can be as damaging as those from a single large site.

Large sites must provide erosion and sedimentation control during construction, permanent control of stormwater runoff from the developed site through selection of appropriate BMPs, and other measures to reduce and control the onsite and offsite impacts of the project. Sites being redeveloped must generally meet the same minimum requirements as new development for the portion of the site being redeveloped. In addition, if the redevelopment meets certain cost thresholds, updated stormwater management for the entire site must be provided. There may also be situations in which additional controls are required for sites, regardless of type or size, as a result of basin plans or special water quality concerns.

Development sites are to demonstrate compliance with these requirements through the preparation of Stormwater Site Plans (SSP). The plans are described in detail in Chapter I-3. Two major components of these plans are a Construction Stormwater Pollution Prevention Plan (SWPPP) and a Permanent Stormwater Quality Control (PSQC) Plan. The Construction SWPPP shall identify how the project intends to control pollution generated during the construction phase only, primarily erosion and sediment. The PSQC shall identify how the project intends to provide permanent BMPs for the control of pollution from stormwater runoff after construction has been completed. Small sites must submit these plans for review by the local government only if they add or replace 5,000 square feet or more of impervious surface.

A flow chart demonstrating how to determine which set of requirements applies to a particular project is shown in Figure 2.2.

Throughout this Chapter, guidance to meet the requirements of the Puget Sound Water Quality Management Plan is written in bold and supplemental guidelines that serve as advice and other materials are <u>not</u> in bold.

R0073282

2.2 Definitions

A full listing and definition of stormwater-related words and phrases that are used in this manual is given in the glossary. A few of the key definitions are listed here for ease in understanding the requirements that follow.

Land disturbing activity Any activity that results in a change in the existing soil cover (both vegetative and nonvegetative) and/or the existing soil topography. Land disturbing activities include, but are not limited to demolition, construction, clearing, grading, filling and excavation.

New development Land disturbing activities, including Class IV -general forest practices that are conversions from timber land to other uses; structural development, including construction or installation of a building or other structure; creation of impervious surfaces; subdivision, short subdivision and binding site plans, as defined and applied in Chapter 58.17 RCW. All other forest practices and commercial agriculture are not considered new development.

Impervious surface A hard surface area that either prevents or retards the entry of water into the soil mantle as under natural conditions prior to development. A hard surface area which causes water to run off the surface in greater quantities or at an increased rate of flow from the flow present under natural conditions prior to development. Common impervious surfaces include, but are not limited to, roof tops, walkways, patios, driveways, parking lots or storage areas, concrete or asphalt paving, gravel roads, packed earthen materials, and oiled, macadam or other surfaces which similarly impede the natural infiltration of stormwater. Open, uncovered retention/detention facilities shall not be considered as impervious surfaces.

Pollution-generating impervious surface (PGIS) Those impervious surfaces considered to be a significant source of pollutants in stormwater runoff. Such surfaces include those which are subject to: vehicular use; industrial activities; or storage of erodible or leachable materials, wastes, or chemicals, and which receive direct rainfall or the run-on or blow-in of rainfall. Erodible or leachable materials, wastes, or chemicals are those substances which, when exposed to rainfall, measurably alter the physical or chemical characteristics of the rainfall runoff. Examples include erodible soils, uncovered process wastes, manure, fertilizers, oily substances, ashes, kiln dust, and garbage dumpster leakage. Metal roofs are also considered to be PGIS unless they are treated to prevent leaching.

R0073283

A surface, whether paved or not, shall be considered subject to vehicular use if it is regularly used by motor vehicles. The following are considered regularly-used surfaces: roads, unvegetated road shoulders, bike lanes within the traveled lane of a roadway, driveways, parking lots, unfenced firelanes, diesel equipment storage yards, and airport runways.

The following are not considered regularly-used surfaces: road shoulders primarily used for emergency parking, paved bicycle pathways, bicycle lanes adjacent to unpaved or paved road shoulders primarily used for emergency parking, fenced firelanes, and infrequently used maintenance access roads.

Pollution-generating pervious surfaces (PGPS) Any non-impervious surface subject to use of pesticides and fertilizers or loss of soil.

Project site That portion of a property or properties subject to proposed project improvements including those required by this manual.

Redevelopment On an already developed site, the creation or addition of impervious surfaces; the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; land disturbing activities associated with structural or impervious redevelopment; and any change in use that has the potential to release new pollutants from the site. New pollutants means a pollutant that was not discharged at that location immediately prior to the change in use, as well as a pollutant that was discharged in less quantities immediately prior to the change in use.

Replaced impervious surface For structures, the removal and replacement of any exterior surfaces or foundation. For other impervious surfaces, the removal down to bare soil or base course and replacement, excluding impervious surfaces removed for the sole purpose of installing underground utilities.

Site The legal boundaries of a parcel or parcels of land that is (are) subject to new or redevelopment.

Small Parcel A site with less than one acre of land disturbing activity, AND ξ is a single family residential site, or a small subdivision project, that adds or replaces less than 10,000 square feet of impervious surface; or

ξ is another type of development project that adds less than 5,000 square feet of impervious surface.

Source control BMP

A BMP that is intended to prevent pollutants from entering stormwater. This manual separates source control BMPs into two types. *Structural Source Control BMPs* are physical, structural, or mechanical devices that are intended to prevent pollutants from entering stormwater. *Operational BMPs* are schedules of activities, prohibition of practices, and other managerial practices to prevent or reduce pollutants from entering stormwater. See Volume IV for details.

Threshold Discharge Area

An onsite area draining to a single natural discharge location or multiple natural discharge locations that combine within one-quarter mile downstream (as determined by the shortest flowpath). The examples in Figure 2.1 below illustrate this definition.

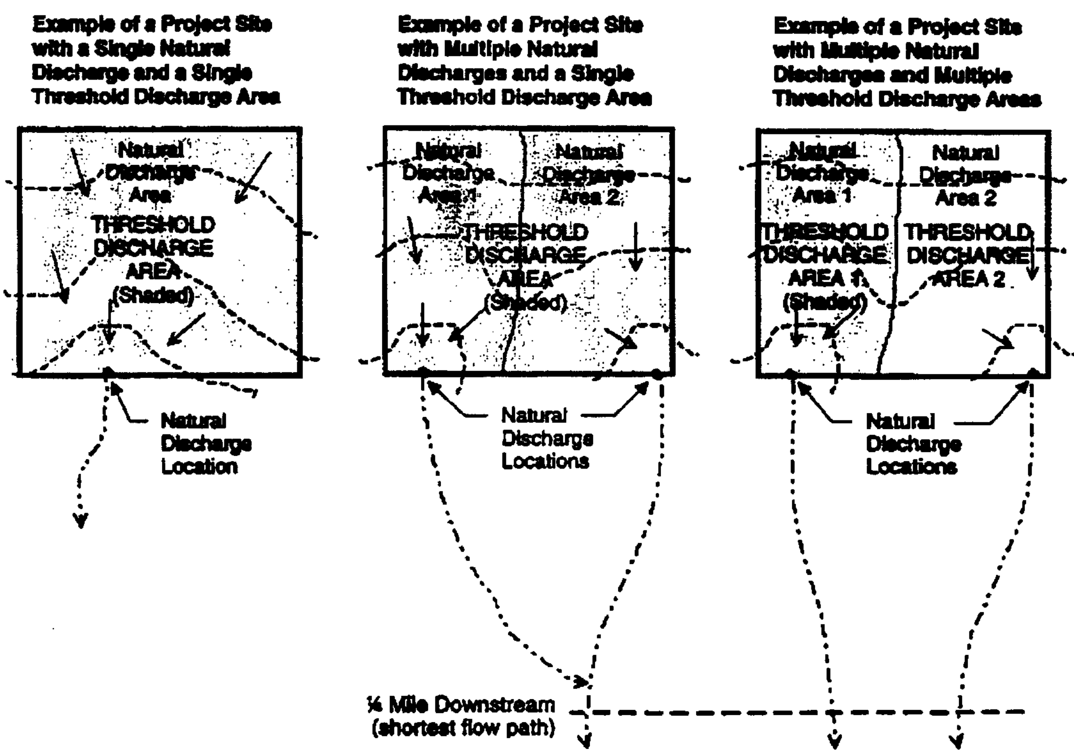

Figure 2.1. Threshold Discharge Areas

2.3 Exemptions

Commercial agriculture, and forest practices regulated under Title 222 WAC, except for Class IV General forest practices that are conversions from timber land to other uses, are exempt from the provisions of the minimum requirements. All other new development is subject to the minimum requirements.

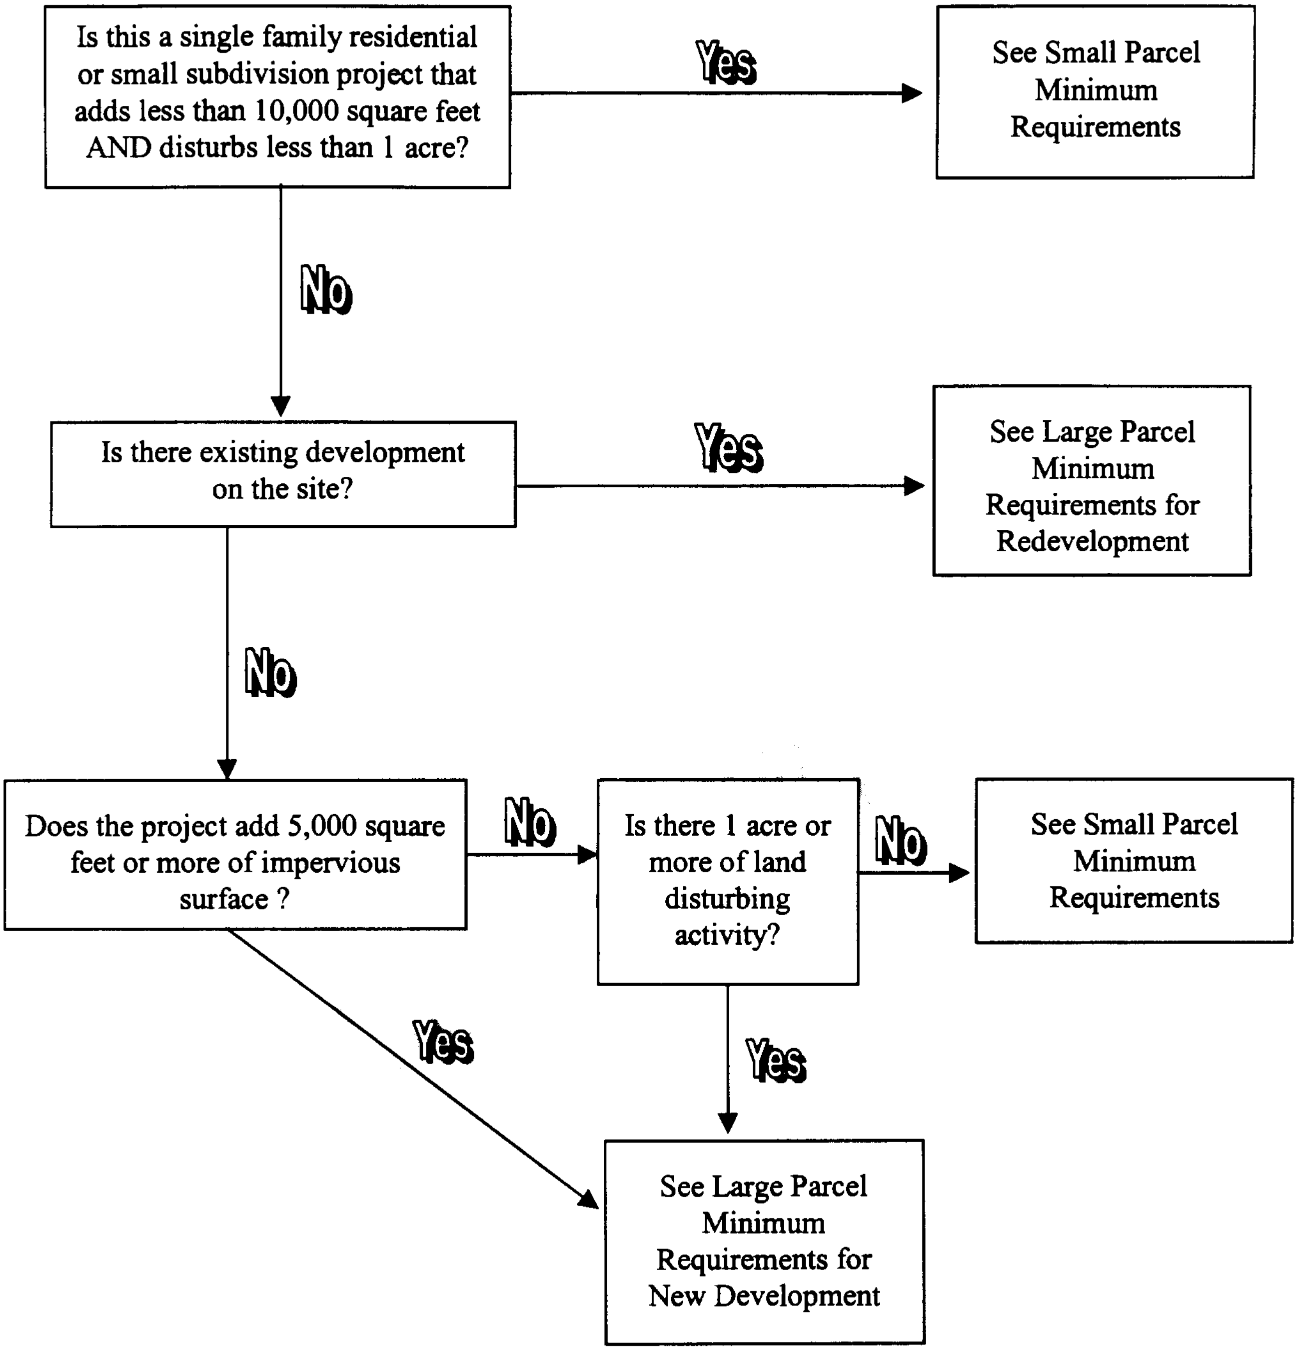

Figure 2.2: Flow Chart for Determining Applicable Requirements

R0073287

2.4 Small Parcel Requirements

A project site of a single family residence, or a small subdivision, that meets the small parcel definition is required to comply with the applicable provisions of Large Parcel Minimum Requirement #1 – Construction Stormwater Pollution Prevention (Construction SWPP) and to apply Small Site Requirements for water quality treatment and flow control. Other types of development projects that meet the definition must comply with the applicable provisions of Large Parcel Minimum Requirement #1 – Construction SWPP, Large Parcel Minimum Requirement #3 – Source Control, and apply Small Site Requirements for water quality treatment and flow control.

Small Parcels that add or replace 5,000 square feet or more of impervious surface must prepare a stormwater site plan for local government review.

Small Site Flow Control and Treatment

Ecology intends to propose small site flow control and treatment BMPs for addition to the appropriate Volumes III and V of this manual.

2.5 Large Parcel Thresholds

2.5.1 New Development

All new development, other than small parcels, that includes the creation or addition of 5,000 square feet, or greater, of new impervious surface area, and/or land disturbing activity of one acre or greater, shall comply with Large Parcel Minimum Requirements #1 through #9 and prepare a Stormwater Site Plan.

Supplemental Guidelines:

Basin planning is encouraged and may be used to tailor certain of the Large Parcel Minimum Requirements to a specific basin (see Large Parcel Minimum Requirement #8).

2.5.2 Redevelopment

All redevelopment projects in which the total of *new plus replaced* impervious surfaces is 5,000 square feet or more must comply with Large Parcel Minimum Requirements #1 and #3 for the project site.

Redevelopment projects that add 5,000 square feet or more of *new* impervious surface must comply with all the Large

Parcel Minimum Requirements for the new impervious surfaces. If the runoff quantity from the new surfaces is not separated from runoff from other surfaces prior to treatment or flow control, the stormwater facilities must be sized for the entire flow. Alternatively, the local government may allow the Large Parcel Minimum Requirements to be met for an equivalent (flow and pollution characteristics) area within the same site.

All redevelopment projects in which the total of new plus replaced impervious surfaces is 5,000 square feet or more, and whose valuation of proposed improvements – including interior improvements - exceeds 50% of the assessed value of the existing site improvements shall comply with all the Large Parcel Minimum Requirements for the entire site.

Local governments may exempt redevelopment projects from compliance with Large Parcel Minimum Requirements #4, #5, and/or #6 if they have adopted a plan that fulfills those requirements in regional facilities that will discharge to the same receiving water, AND if they have an implementation plan and a schedule for construction of those facilities. Redevelopment projects for public roads may be exempted from meeting Large Parcel Minimum Requirements #4, #5, and/or #6 for the entire site (i.e., the exemption does not extend to new surfaces that add impervious area) if there is an adopted Capital Improvement Program for retrofitting existing road surfaces.

Application of the Exemptions

Ecology is interested in advice on the application of the exemptions listed above. Should exemptions be granted for redevelopment projects if the local government has a plan and a schedule for future construction of regional facilities, or should the exemption only apply if the regional facilities have been constructed?

Also, who determines the adequacy of plans and schedules for regional facilities or of Capital Improvement Programs? Currently, there isn't a review entity identified to ensure the quality and legal adequacy of those plans, nor if they are properly implemented and on schedule.

***Supplemental Guidelines*:** Local governments can establish criteria for allowing redevelopment projects to pay a fee in lieu of constructing water quality or flow control facilities on a redeveloped site. At a minimum, the fee should be the equivalent of an engineering estimate of the cost of meeting all applicable stormwater requirements for the project. For purposes of cost estimation, the local government may allow the applicant to presume the site does not have unusual physical constraints that would escalate stormwater costs. The local government must use such funds for the implementation of stormwater control projects that would have similar benefits to the same receiving water as if the project had constructed its required improvements. Expenditure of such funds is subject to other state statutory requirements.

Underground utility projects that replace the ground surface with in-kind material or materials with similar runoff characteristics should not be subject to redevelopment requirements.

Local governments are also encouraged to review all road projects for changes in elevations or drainage flowpath that could cause flooding, upland or stream erosion, or changes to discharges to wetlands.

2.6 Large Parcel Minimum Requirements

2.6.1 Minimum Requirement #1: Construction Stormwater Pollution Prevention (SWPP)

All new development and redevelopment shall comply with Construction SWPP Elements #1 through #12 below, and shall develop and implement a Construction Stormwater Pollution Prevention Plan (SWPPP). Each of the following twelve required elements must be included in the Construction SWPPP unless exemptions are justified in the narrative.

The following Construction Stormwater Pollution Prevention (SWPP) elements shall be met:

Element #1: Mark Clearing Limits

- **Prior to beginning earth disturbing activities, including clearing and grading, all clearing limits, easements, setbacks, sensitive areas and their buffers, trees, and drainage courses should be clearly marked to prevent damage and offsite impacts.**

Element #2: Establish Construction Access

- **Construction vehicle access and exit shall be limited to one route if possible.**
- **Access points shall be stabilized with quarry spall or crushed rock to minimize the tracking of sediment onto public roads.**
- **Wheel wash or tire baths should be located on-site.**

- **If sediment is transported onto a road surface, the roads shall be cleaned thoroughly at the end of each day. Sediment shall be removed from roads by shoveling or sweeping and be transported to a controlled sediment disposal area. Street washing will be allowed only after sediment is removed in this manner.**
- **Street wash wastewater shall be controlled by pumping back on-site, or otherwise be prevented from discharging into systems tributary to state surface waters without prior and adequate treatment.**

Element #3: Detain Flows

- **Properties and waterways downstream from development sites shall be protected from erosion due to increases in the volume, velocity, and peak flow rate of stormwater runoff from the project site, as required by local plan approval authority.**
- **Downstream analysis is necessary if changes in offsite flows could impair or alter conveyance systems, streambanks, bed sediment or aquatic habitat. See Volume 1, Minimum Requirement #8, for downstream analysis requirements.**
- **Stormwater detention facilities shall be constructed as one of the first steps in grading. Detention facilities shall be functional before other land disturbing activities take place.**

R0073291

Flow Control for Sediment Ponds

We would like to receive comment on whether the flow control achieved (as estimated by the analysis below) by the flow control release structure specified for sediment ponds in Chapter 4 is adequate for construction sites which are by their nature, temporary. Also, should flow control release structures be required for sediment traps?

The flow release structure detailed in Volume II, Chapter 4 for sediment ponds and traps will not achieve the same level of flow control as required by Minimum Requirement # 5 of Volume I. The flow control specified by Minimum Requirement # 5 is intended to protect stream channels from accelerated erosion due to increases in the duration and frequency of high stream flows.

Using a continuous runoff simulation model (King County Runoff Time Series) King County staff did a brief evaluation of the level of control achieved by the release structure specified in Chapter 4. The analysis assumed a typical sediment retention facility sized using the 2-year developed flow for a 10-acre urban residential subdivision (4 acres effective impervious area and 6 acres of grass on till soils). The performance of the facility was evaluated assuming the construction site was fully disturbed, but with no improvements (modeled as 10 acres of grass on till soils). The analysis concluded that pre-developed peak flows were at least matched up to a 5-year event. Flow durations were controlled to pre-developed rates for peak flows ranging between 70% of the 2-year and roughly a 15-year event.

Element #4: Install Sediment Controls

- **Prior to leaving a construction site, stormwater runoff shall pass through a sediment pond, sediment trap, or other appropriate sediment removal BMP.**
- **Sediment ponds and traps, vegetated buffer strips, sediment barriers or filters, dikes, and other BMPs intended to trap sediment on-site shall be constructed as one of the first steps in grading. These BMPs shall be functional before other land disturbing activities take place.**
- **Earthen structures such as dams, dikes, and diversions shall be seeded and mulched according to the timing indicated in Element #5.**

Element #5: Stabilize Soils

- **All exposed and unworked soils shall be stabilized by application of effective BMPs, which protect the soil from the erosive forces of raindrop impact and flowing water.**

R0073292

- **From October 1 through April 30, no soils shall remain exposed and unworked for more than 2 days. From May 1 to September 30, no soils shall remain exposed and unworked for more than 7 days. This condition applies to all soils on site, whether at final grade or not.**
- **Applicable practices include, but are not limited to, sod and other established vegetative cover, mulching, plastic covering, and the early application of gravel base on areas to be paved.**
- **Soil stabilization measures selected should be appropriate for the time of year, site conditions, estimated duration of use, and potential water quality impacts that stabilization agents may have on downstream waters.**
- **Soil stockpiles must be stabilized and protected with sediment trapping measures.**
- **Work on linear construction sites and activities, including right-of-way and easement clearing, roadway development, pipelines, and trenching for utilities, shall not exceed the capability of the individual contractor for his portion of the project to install the bedding materials, roadbeds, structures, pipelines, and/or utilities, and to re-stabilize the disturbed soils, meeting the timing conditions specified above in Element #5.**

Element #6: Protect Slopes

- **Cut and fill slopes shall be designed and constructed in a manner that will minimize erosion.**
- **Consider soil type and its potential for erosion.**
- **Reduce slope runoff velocities by reducing continuous length of slope with terracing and diversions, reduce slope steepness, and roughen slope surface.**
- **Divert upslope drainage and run-on waters from off-site with interceptors at top of slope. Off-site stormwater should be handled separately from stormwater generated on the site. Diversion of off-site stormwater around the site may be a viable option.**
- **Contain downslope collected flows in pipes, slope drains, or protected channels.**

R0073293

- Provide drainage to remove ground water intersecting the slope surface.
- Excavated material shall be placed on the uphill side of trenches, consistent with safety and space considerations.
- Flow retention barriers shall be placed at regular intervals within trenches, which are cut down a slope.
- Stabilize soils on slopes, as specified in Element #5.

Element #7: Protect Drain Inlets

- All storm drain inlets made operable during construction shall be protected so that stormwater runoff shall not enter the conveyance system without first being filtered or treated to remove sediment.
- All approach roads shall be kept clean, and all sediment and street wash water shall not be allowed to enter storm drains without prior and adequate treatment.
- Suggested BMPs

  BMP 220: Storm Drain Inlet Protection

Element #8: Stabilize Channels and Outlets

- All temporary on-site conveyance channels shall be designed, constructed and stabilized to prevent erosion from the expected velocity of flow from a 2 year, 24-hour frequency storm for the developed condition.
- Stabilization, including armoring material, adequate to prevent erosion of outlets, adjacent streambanks, slopes and downstream reaches shall be provided at the outlets of all conveyance systems.

Element #9: Control Pollutants

- All pollutants, including waste materials and demolition debris, that occur on-site during construction shall be handled and disposed of in a manner that does not cause contamination of stormwater.
- Cover, containment, and protection from vandalism shall be provided for all chemicals, liquid products, petroleum products, and wastes present on the site.

- Maintenance and repair of heavy equipment and vehicles involving oil changes, hydraulic system drain down, solvent and de-greasing cleaning operations, fuel tank drain down and removal, and other activities which may result in discharge or spillage of pollutants to the ground or into stormwater runoff must be conducted under cover and on impervious surfaces. These surfaces shall be cleaned immediately following any discharge or spill incident.

- Wheel wash, or tire bath wastewater, shall not be discharged to the storm drain, or the on-site stormwater treatment system.

- Application of agricultural chemicals, including fertilizers and pesticides, shall be conducted in a manner and at application rates that will not result in loss of chemical to stormwater runoff. Manufacturers' recommendations shall be followed for application rates and procedures.

- Management of pH-modifying sources shall prevent contamination of runoff and stormwater collected on the site. These sources include, but are not limited to, bulk cement, cement kiln dust, fly ash, new concrete washing and curing waters, waste streams generated from concrete grinding and sawing, exposed aggregate processes, and concrete pumping and mixer washout waters.

Element #10: Control De-Watering

- All foundation, vault, and trench de-watering water, which has similar characteristics to stormwater runoff at the site, shall be discharged into a controlled conveyance system, prior to discharge to a sediment trap or sediment pond. Channels must be stabilized, as specified in Element #8.

- Clean, non-turbid de-watering water, such as well-point ground water, can be discharged to systems tributary to state surface waters, as specified in Element #8, provided the de-watering flow is less than 20 percent of the receiving water flow. These clean waters should not be routed through sediment traps or sediment ponds with stormwater.

- Highly turbid or otherwise contaminated dewatering water, such as from construction equipment

operation, clamshell digging, concrete tremie pour, or work inside a cofferdam, shall be handled separately from stormwater at the site.

- **Other disposal options, depending on site constraints, may include: 1) sanitary sewer discharge with local sewer district approval, 2) overland infiltration, 3) transport off-site in vehicle, such as a vacuum flush truck, for legal disposal in a manner that does not pollute state waters.**

Element #11: Maintain BMPs

- **All temporary and permanent erosion and sediment control BMPs shall be maintained and repaired as needed to assure continued performance of their intended function. All maintenance and repair shall be conducted in accordance with BMPs.**
- **All temporary erosion and sediment control BMPs shall be removed within 30 days after final site stabilization is achieved or after the temporary BMPs are no longer needed. Trapped sediment shall be removed or stabilized on site. Disturbed soil areas resulting from removal of BMPs or vegetation shall be permanently stabilized.**

Element #12: Manage The Project

- **Phasing of construction**
- **Seasonal work**
- **Employee training**
- **Pre-construction conference**
- **Coordination with utilities and other contractors**
- **Sub-contractor oversight**
- **Linear site special considerations**
- **Monitoring / reporting**
- **Keeping Construction SWPPP up to date**

Managing the Project

Ecology intends to add more detail to Element #12. We encourage comments concerning the completeness of the above list of sub-elements, and concerning the appropriate text for each of the sub-elements.

Objective: To control erosion and prevent sediment and other pollutants from leaving the site during the construction phase of a project.

Supplemental Guidelines: If a Construction SWPPP is found to be inadequate (with respect to erosion and sediment control requirements), then the Plan Approval Authority[1] within the Local Government should require that other BMPs be implemented, as appropriate.

2.6.2 Minimum Requirement #2: Preservation of Natural Drainage Systems

Natural drainage patterns shall be maintained, and discharges from the site shall occur at the natural location, to the maximum extent practicable. The manner by which runoff is discharged from the project site must not cause a significant adverse impact to downgradient receiving waters.

Objective: To preserve and utilize natural drainage systems to the fullest extent because of the multiple stormwater benefits these systems provide.

Supplemental Guidelines: Creating new discharge points can create significant stream channel erosion problems as the receiving water body typically must adjust to the new flows. Diversions can cause greater impacts than would otherwise occur by discharging runoff at the natural location. Where no conveyance system exists at the adjacent downstream property line and the discharge was previously unconcentrated flow or significantly lower concentrated flow, then measures must be taken to prevent downstream impacts. Local governments are encouraged to broaden this requirement to include protection against adverse impacts to downgradient properties and drainage systems. Drainage easements from downstream property owners may be needed and should be obtained prior to approval of engineering plans.

2.6.3 Minimum Requirement #3: Source Control Of Pollution

All known, available and reasonable source control BMPs shall be applied to all projects. Source control BMPs shall be selected, designed, and maintained according to this manual.

An adopted and implemented basin plan (Minimum Requirement #8) or a Total Maximum Daily Load (TMDL, also known as a Water Clean-up Plan) may be used to develop more stringent source control requirements that are tailored to a specific basin.

---

[1]The Plan Approval Authority is defined as that department within a local government that has been delegated authority to approve erosion and sediment control plans.

Objective:

The intention of source control BMPs is to prevent stormwater from coming in contact with pollutants. They are a cost effective means of reducing pollutants in stormwater, and, therefore, should be a first consideration in all projects.

Supplemental Guidelines:

A list of many source control BMPs is provided in the BMP selection chapter of this volume. Source Control BMPs include Operational BMPs and Structural Source Control BMPs. See Volume IV for design details of these BMPs. For construction sites, see Volume II, Chapter 4.

2.6.4 Minimum Requirement #4: Runoff Treatment

Thresholds

The following require construction of stormwater treatment BMPs that are sized to treat runoff from the water quality design storm:

- **Single family or multi-family residential or subdivision projects in which the total of new plus replaced pollution-generating impervious surfaces (PGIS) is 10,000 square feet or more in a threshold discharge area of the project, or**
- **Other development projects in which the total of new plus replaced PGIS is 5,000 square feet or more in a threshold discharge area of the project, or**
- **Projects in which the total of new plus modified pollution-generating pervious surfaces (PGPS) is one acre or more in a threshold discharge area, and from which there is a surface discharge in a natural or man-made conveyance system from the site. Modified PGPS means any existing PGPS that is re-graded or re-contoured by the proposed project.**

Standard Requirement

Treatment BMPs shall be sized to treat runoff from the water quality design storm, defined as the 24-hour rainfall amount with a 6-month return frequency. Approved single event hydrograph methods identified in Volume III shall be used to identify runoff volumes and peak flow rates for design purposes. Alternative methods can be used if they identify volumes and flow rates that are at least equivalent.

That portion of any development project in which the above PGIS or PGPS thresholds are not exceeded in a threshold discharge area shall apply Small Site Requirements for water quality treatment.

R0073298

Table 2.1. Treatment Requirements for PGIS by Threshold Discharge Area

	SFR or MFR < 10,000 sf PGIS	SFR or MFR, ≥ 10,000 sf PGIS	Other type of development <5,000 sf PGIS	Other type of development, ≥ 5,000 sf
Large Site Treatment BMPs		✔		✔
Small Site Treatment BMPs	✔		✔	

PGIS = pollution-generating impervious surfaces
SFR = single family residence
MFR = multiple family residence
sf = square feet

Performance Criteria

A discussion on performance criteria will be included in Volume V.

R0073299

Water Quality Design Storm Event

Ecology encourages discussion of options for establishing a water quality design storm event. The options currently under consideration include the following. These are discussed in more detail in Appendix B:

1) An estimation of a 6-month, 24-hour rainfall amount.

2) Selected percentages of the 2-year, 24-hour rainfall amount, as an estimate of the 6-month, 24-hour rainfall amount.

3) Using 24-hour rainfall data, selection of a precipitation amount for which the cumulative sum of rainfall amounts of that size and smaller account for a certain percentage (e.g., 90%) of the total rainfall inches.

4) Using 24-hour rainfall data, establish a rainfall amount for the knee of the curve for a graph of increasing 24-hour rainfall amounts (y-axis) versus cumulative number of rainfall events (x-axis).

5) Use a multiple of the mean annual storm.

6) Use of continuous runoff modeling to establish: a) a runoff flow rate that is exceeded only X % of the time using the appropriate time increment for a BMP sized based on a peak flow rate, and b) a 24-hour runoff amount that is exceeded only X% of the time for BMP's based on runoff volume.

A more detailed description of each of these options and the rainfall amounts they represent for various locations around the state are found in Appendix 2 to this chapter.

Additional Requirements

Direct discharge of untreated stormwater from pollution-generating impervious surfaces to ground water is prohibited, except for that achieved by infiltration or dispersion of runoff as allowed under the Small Site Requirements. All treatment BMPs shall be selected, designed, and maintained according to a local government manual deemed equivalent to this manual.

An adopted and implemented basin plan (Minimum Requirement #8), or a Total Maximum Daily Load (TMDL, also known as a Water Clean-up Plan) may be used to develop more stringent runoff treatment requirements that are tailored to a specific basin.

Treatment BMPs applied consistent with this manual are presumed to meet the requirement of state law to provide all

known available and reasonable methods of treatment (RCW 90.52.040, RCW 90.48.010). This technology-based treatment requirement does not excuse any discharge from the obligation to apply whatever technology is necessary to comply with state water quality standards, Chapter 173-201A WAC, state ground water quality standards, Chapter 173-200 WAC, and state sediment management standards, Chapter 173-204 WAC. Additional treatment to meet those standards may be required by federal, state, or local governments.

Objective: The purpose of runoff treatment is to reduce pollutant loads and concentrations in stormwater runoff using physical, biological, and chemical removal mechanisms. When site conditions are appropriate infiltration can potentially be the most effective BMP for runoff treatment.

***Supplemental Guidelines*:** See Volume V. The water quality design storm is intended to capture and effectively treat about 90-93% of the annual runoff in western and eastern Washington, and about 80-85% of the annual runoff in Central Washington (an area east of the Cascade crest and west of the Columbia River).

Infiltration can provide both treatment of stormwater, through the ability of certain soils to remove pollutants, and volume control of stormwater, by decreasing the amount of water that runs off to surface water. Infiltration can be very effective at treating stormwater runoff but soil conditions must be appropriate to achieve effective treatment while not impacting ground water resources. Methods currently in use such as direct discharge into dry wells do not achieve adequate water quality treatment and are therefore not permitted.

2.6.5 Minimum Requirement #5: Flow Control for Discharges to Streams

__Applicability__
The requirement below applies only to situations where stormwater runoff is discharged directly or indirectly to a stream, and must be met __in addition__ to meeting the requirements in Minimum Requirement #4, Runoff Treatment BMPs.

__Thresholds__
The following require construction of detention ponds with discharge orifices that are sized to meet the applicable standard requirement for western or eastern Washington:

- **Any projects in which the total of new plus replaced impervious surfaces is 10,000 square feet or more in a threshold discharge area of the project, or**

- **Projects in which the total of land disturbing activity is one acre or more in a threshold discharge area, and from which there is a surface discharge in a natural or man-made conveyance system from the site.**

That portion of any development project in which the above thresholds are not exceeded in a threshold discharge area shall apply Small Site Requirements for flow control.

<u>Western Washington Standard Requirement:</u>
Applies to the geographic areas designated as regions 3 and 4 in NOAA Atlas #2 (Miller et al, 1973)[9].

Stormwater discharges to streams shall match developed discharge durations to predeveloped durations for the range of predeveloped discharge rates from 50% of the 2-year peak flow up to the full 50-year peak flow. In addition, the developed peak discharge rates shall not exceed the pre-developed peak discharge rates for 2- and 10-year return periods. The applicant shall use best available information to determine whether to assume that the pre-developed condition was forested or pasture.

<u>Western Washington Alternative Requirement</u>
An alternative requirement may be established through application of watershed-scale hydrological modeling and supporting field observations. Possible reasons for an alternative flow control requirement include:

1) **Establishment of a stream –specific threshold of significant bedload movement other than the assumed 50% of the 2-year peak flow;**

2) **Zoning and Land Clearing Ordinance restrictions that, in combination with an alternative flow control standard, maintain or reduce the naturally occurring erosive forces on the stream channel; or**

3) **A duration control standard is not necessary for protection, maintenance, or restoration of designated beneficial uses or Clean Water Act compliance.**

<u>Additional Requirement</u>
As the first priority, flow control BMPs shall utilize infiltration to the fullest extent practicable if site conditions

are appropriate and ground water quality is protected. Flow Control BMPs shall be selected, designed, and maintained according to a local government manual deemed equivalent to this manual.

> ### Flow Control Exemption
>
> Ecology is considering an exemption from the flow control requirement for projects that discharge directly to major receiving waters and that are within a certain flowpath distance of those receiving waters. We encourage suggestions for a definition for major receiving waters and of a flowpath distance as well as other conditions for applying such an exemption.

> ### Submerged and Intertidal Bedlands
>
> Ecology has received comments concerning the physical impacts of stormwater discharges to lakes and marine intertidal and subtidal areas. The comments are primarily in regard to the erosive effects of the discharges. Ecology is interested in hearing suggestions regarding the wording of a generic minimum requirement to discharge flows in a manner that does not cause significant impacts to submerged and intertidal bedlands.

***Objective*:** To prevent increases in stream channel erosion rates or stream channel instability by maintaining existing erosion rates. The standard intends to maintain the total amount of time that a receiving stream exceeds an erosion-causing threshold. That threshold is assumed to be 50% of the 2-year peak flow. Maintaining existing erosion rates within streams is vital to protect fish habitat and production.

***Supplemental Guidelines*:** Reduction of flows through infiltration decreases stream channel erosion and helps to maintain base flow throughout the summer months. However, infiltration should only be used where ground water quality is not threatened by such discharges

Interim Guideline: Local governments have a choice to make concerning a flow control standard to use until a flow duration standard is adopted and a continuous rainfall/runoff model is available for use. They can continue to use the peak flow standard of the 1992 Puget Sound manual, or use a peak flow standard that approximates the results that the proposed flow duration standard would achieve. By adjusting the target peak flow standard, restricting use of variables in the SBUH hydrologic analysis, and applying a volume correction factor, you can estimate the orifice sizes and detention volumes that the proposed flow duration standard would indicate. The following example is a result of adjusting the SBUH approach to obtain similar results as the output from the King County Runoff Time Series (An application of the Hydrologic Simulation Program – Fortran) with the proposed flow duration standard as the target.

Adjusted target peak flow standard:
Limit the peak rate of runoff from individual development sites to 50 percent of the pre-developed condition 2-year, 24-hour design storm. Limit the peak rate from the 10-year, 24-hour design storm to the pre-developed condition peak rate from the 2-year, 24-hour design storm. Limit the peak rate from the 100-year, 24-hour design storm to the pre-developed condition peak rate from the 10-year, 24 hour design storm.

Restricted variable assumptions:
The flow path length assumed for sheet flow runoff in the pre-developed condition calculations must not be less than 300 feet.

The Manning's effective roughness coefficient for pre-developed forested conditions should be 0.80. For pasture conditions, the coefficient should be 0.15.

In the table of curve numbers in Volume III, Chapter 1 of the 1999 manual, the curve numbers for pre-developed forest and pasture conditions must be selected from the "fair" category.

Volume correction factor:
In addition to the above, the pond volume correction factor identified in Volume III, Chapter I should be used where the pre-developed condition is modeled as pasture.

<u>Eastern Washington Standard Requirement</u>:
Applies to geographic areas designated as regions 1 and 2 in NOAA Atlas 2 (Miller et al, 1973)[10].

Stormwater discharges to streams shall control streambank erosion by limiting the peak rate of runoff from individual development sites to 50 percent of the pre-developed condition 2-year, 24-hour design storm while maintaining the pre-developed condition peak runoff rate for the 10-year, 24-hour and 100-year, 24-hour design storms. As the first priority, flow control BMP's shall utilize infiltration to the fullest extent practicable, if site condtions are appropriate and ground water quality is protected. Flow control BMP's shall be selected, designed, and maintained according to a

local government manual that is deemed equivalent to this manual.

Eastern Washington Alternative Requirement:
An alternative requirement may be established through application of watershed-scale hydrological modeling and supporting field observations. Possible reasons for an alternative flow control requirement include:

1) **Establishment of a stream –specific threshold of significant bedload movement other than the assumed 50% of the 2-year peak flow;**

2) **Zoning and Land Clearing Ordinance restrictions that, in combination with an alternative flow control standard, maintain or reduce the naturally occurring erosive forces on the stream channel; or**

3) **A duration control standard is necessary for protection, maintenance, or restoration of designated beneficial uses or Clean Water Act compliance.**

Objective: To prevent increases in stream channel erosion rates or stream channel instability by maintaining existing erosion rates. The standard intends to maintain the total amount of time that a receiving stream exceeds an erosion-causing threshold. That threshold is assumed to be 50% of the 2-year peak flow. Maintaining existing erosion rates within streams is vital to protect fish habitat and production. Because of the different precipitation patterns prevalent in eastern Washington, use of a continuous runoff model to support a flow duration standard may not be necessary. Ecology has insufficient information to propose a flow duration standard for most of eastern Washington

Rainfall Regions

Figure 2.3 Rainfall Regions for Washington State from NOAA Atlas #2 to be added

R0073305

2.6.6 Minimum Requirement #6: Wetlands Protection

The requirements below apply only to situations where stormwater discharges directly or indirectly through a conveyance system into a wetland, and must be met in addition to meeting the requirements in Minimum Standard #4, Runoff Treatment BMPs.

Thresholds

The thresholds identified in Minimum Requirement #4 – Runoff Treatment, and Minimum Requirement #5 – Flow Control for Discharges to Streams shall also be applied for discharges to wetlands.

Standard Requirement

Discharges to wetlands shall maintain the hydrologic conditions, hydrophytic vegetation, and substrate characteristics necessary to support existing and designated uses.

The publication, "Wetlands and Urbanization, Implications for the Future", the final report of the Puget Sound Wetland and Stormwater Management Research Program, 1997, shall be used as guidance for discharges to natural and constructed wetlands.

Additional Requirements

The standard requirement does not excuse any discharge from the obligation to apply whatever technology is necessary to comply with state water quality standards, Chapter 173-201A WAC, or state ground water standards, Chapter 173-200 WAC. Additional treatment requirements to meet those standards may be required by federal, state, or local governments.

An adopted and implemented basin plan (Minimum Requirement #8), or a Total Maximum Daily Load (TMDL, also known as a Water Clean-up Plan) may be used to develop requirements for wetlands that are tailored to a specific basin.

Objective:

To ensure that wetlands receive the same level of protection as any other waters of the state. Wetlands are extremely important natural resources which provide multiple stormwater benefits, including ground water recharge, flood control, and stream channel erosion protection. They are easily impacted by development unless careful planning and management are conducted. Wetlands can be severely degraded by stormwater discharges from urban development due to pollutants in the runoff and also due to disruption of natural hydrologic functioning of the wetland system. Changes in water levels and the frequency and duration of inundations are of particular concern.

Supplemental Guidelines:

See Volume V for a summary of the "Wetlands and Stormwater Management Guidelines: Managing Wetland Hydroperiod While Managing Stormwater" (draft, 1999). These management guidelines are considered the best available science to assist in meeting the state water quality standards. The guidelines were developed in part, and include, the findings of the Puget Sound Wetlands and Stormwater Management Research Program.[10]

While it is always necessary to pre-treat stormwater prior to discharge to a wetland, there are limited circumstances where wetlands may be used for additional treatment and detention of stormwater. These situations are considered in the guidelines as well.

2.6.7 Minimum Requirement #7: Off Site Analysis and Mitigation

All development projects shall submit an offsite analysis report that assesses the potential off-site water quality, erosion, and drainage impacts associated with the project and that proposes appropriate mitigation of those impacts. An initial qualitative analysis shall extend downstream for the entire flow path from the project site to the receiving water or up to 1 mile, whichever is less. If a receiving water is within one-quarter mile, the analysis shall extend within the receiving water to one-quarter mile from the project site. The analysis shall extend one-quarter mile beyond any improvements proposed as mitigation. The analysis must extend upstream to a point where any backwater effects created by the project cease. Upon review of the qualitative analysis, the local administrator may require that a quantitative analysis be performed.

The existing or potential impacts to be evaluated and mitigated shall include:

- **Upland erosion impacts**
- **stream channel erosion**
- **loss of stream channel base flow**
- **Violations of surface water quality standards as identified in a Basin Plan or a TMDL (Water Clean-up Plan); or violations of ground water standards in a wellhead protection area.**

Local governments are encouraged to expand the offsite analysis to include an assessment of the existing and potential impacts due to flooding and conveyance capacity.

Objective: To identify and evaluate offsite water quality, erosion and drainage impacts that may be caused or aggravated by a proposed project, and to determine measures for preventing impacts and for not aggravating existing impacts. Aggravated shall mean increasing the frequency of occurrence and/or severity of a problem.

Supplemental Guidelines:

Guidance for performing an initial qualitative analysis, a subsequent quantitative analysis, and for developing mitigation options is being developed. Ecology intends to include those in the next draft of the manual.

2.6.8 Minimum Requirement #8: Basin/Watershed Planning

Adopted and implemented watershed-based basin plans may be used to require equivalent or more stringent minimum requirements for source control, treatment, and wetlands protection, and alternative requirements for flow control. Basin/Watershed plans shall evaluate and include, as necessary, retrofitting of urban stormwater BMPs for existing development and/or redevelopment in order to achieve watershed-wide pollutant reduction and flow control goals that are consistent with requirements of the federal Clean Water Act. Standards developed from basin plans shall not modify any of the above minimum requirements until the basin plan is formally adopted and implemented by the local governments within the basin, and approved or concurred with by the Department of Ecology.

Objective: To promote watershed-based planning as a means to develop and implement comprehensive water quality protection measures. Primary objectives of basin planning are to reduce pollutant loads and hydrologic impacts to surface and ground waters in order to protect beneficial uses.

Supplemental Guidelines: While Minimum Requirements #3 through #6 establish general standards for individual sites, they do not evaluate the overall pollution impacts and protection opportunities which could exist at the watershed level. In order for a basin plan to serve as a means of modifying the minimum requirements it must be formally adopted by all jurisdictions that have responsibilities under the basin plan, and ordinances or regulations called for by the plan must be in effect. This is what is meant by an adopted and implemented basin plan.

Basin planning provides a mechanism by which the on-site standards can be evaluated and refined based on an analysis of an entire watershed. Basin plans are especially well-suited to develop control strategies to address impacts from future development and to correct specific problems whose sources are known or suspected. Basin plans can be effective at addressing both long-term cumulative impacts of pollutant loads and short-term acute impacts of pollutant concentrations, as well as hydrologic impacts to streams, wetlands, and ground water resources.

Examples of how Basin Planning can alter the minimum requirements of this manual is given in Appendix A.

2.6.9 Minimum Requirement #9: Operation and Maintenance

An operation and maintenance schedule that is consistent with the local government standards shall be provided for all proposed stormwater facilities and BMPs, and the party (or parties) responsible for maintenance and operation shall be identified.

Objective: To ensure that stormwater control facilities are adequately maintained and operated properly.

***Supplemental Guidelines*:** Inadequate maintenance is likely the leading cause of failure for stormwater control facilities. The description of each BMP in Volumes II, III, and V includes a section on maintenance. The Guidance Manual also includes a section on developing an operation and maintenance program and a model operation and maintenance ordinance.

2.7 Optional Guidance #1: Financial Liability

Performance bonding or other appropriate financial guarantees shall be required for all projects to ensure construction of drainage facilities in compliance with these standards. In addition, a project applicant shall post a two year financial guarantee of the satisfactory performance and maintenance of any drainage facilities that are scheduled to be assumed by the local government for operation and maintenance.

***Objective*:** To ensure that development projects have adequate financial resources to fully implement stormwater management plan requirements and that liability is not unduly incurred upon local governments.

Supplemental Guidelines: The type of financial instrument required is less important than ensuring that there are adequate funds available in the event that non-compliance occurs.

2.8 Exceptions

Exceptions to the Small Parcel Requirements and Large Parcel Minimum Requirements #1 through #9 may be granted prior to permit approval and construction. An exception may be granted following a public hearing, provided that a written finding of fact is prepared, that addresses the following:

- **The exception provides equivalent environmental protection and is in the overriding public interest; and that the objectives of safety, function, environmental protection and facility maintenance, based upon sound engineering, are fully met; AND**
- **There are special physical circumstances or conditions affecting the property such that the strict application of these provisions would deprive the applicant of all reasonable use of the parcel of land in question, and every effort to find creative ways to meet the intent of the Minimum Requirements has been made; AND**
- **That the granting of the exception will not be detrimental to the public health and welfare, nor injurious to other properties in the vicinity and/or downstream, and to the quality of waters of the state; AND**
- **The exception is the least possible exception that could be granted to comply with the intent of the Minimum Requirements.**

Public Hearing Alternatives

The above exception provision includes a requirement to hold a public hearing on the proposed exception. Ecology is interested in suggestions of an alternative to a public hearing which would give local governments more flexibility and less onerous administrative procedures in granting an exception while still protecting the interests of, and alerting interested and potentially impacted parties to the exception under consideration.

Supplemental Guidelines:

Ecology encourages the Plan Approval Authority to impose additional or more stringent criteria as appropriate for their area. Additionally, criteria which may be inappropriate or too restrictive for an area may be modified through basin planning (Minimum Requirement #8). Modification of any of the minimum requirements which are deemed inappropriate for the site may be done by granting an exception.

The exception procedure is an important element of the plan review and enforcement programs. It is intended to maintain a necessary flexible working relationship between local officials and applicants. Plan Approval Authorities should consider these requests judiciously, keeping in mind both the need of the applicant to maximize cost-effectiveness and the need to protect off-site properties and resources from damage.

R0073312

CHAPTER 3 - Preparation of Stormwater Site Plans

3.1 Introduction

The purpose of this chapter is to provide summarized guidelines on how Construction Stormwater Pollution Prevention Plan Plan (Construction SWPPP) and Permanent Stormwater Quality Control (PSQC) Plans, the plans that make up a Stormwater Site Plan (SSP) can be prepared. The thresholds and Minimum Requirements for these plans are described in detail in Chapter 2

The goal of this chapter is to provide a framework for uniformity in plan preparation. Such uniformity will promote predictability throughout the region and help secure prompt governmental review and approval. Properly drafted engineering plans and supporting documents will also facilitate the operation and maintenance of the proposed system long after its review and approval.

Please note that this chapter describes <u>how</u> to prepare a Stormwater Site Plan - the specific BMPs and design methods and standards to be used are contained in Volumes II-V. Construction SWPPPs are covered in detail in Chapter 3 of Volume II. Guidelines for selecting BMPs are given in Chapter 3 of this Volume. Note also that all plans, except small parcel plans, shall be stamped a professional engineer licensed in the State of Washington. All land boundary surveys used, and any legal descriptions prepared, except those for small parcels, must be stamped by a professional land surveyor licensed in the State of Washington.

Chapter 3 of Volume I

The text for this chapter was not completed in time for this preliminary draft of the manual. Ecology will discuss its intent for this chapter in public meetings to discuss this preliminary draft. Public comments and criticisms of this chapter in the existing manual would be helpful.

After receiving public comment, Ecology will develop this chapter with the assistance of an advisory committee for Volume 1. A draft will be included in the second draft of the manual that is scheduled for release early in 2000.

R0073313

R0073314

CHAPTER 4 - BMP Selection Process For Permanent Stormwater Quality Control Plans

Chapter 4 of Volume I

We are considering combining Chapter III and IV of Volume I of the 1992 manual and moving the details of the BMP selection process to the appropriate volume in the current manual.

R0073315

APPENDIX A - Guidance for Altering the Minimum Requirements Through Basin Planning

Basin Planning Applied to Source Control

(Minimum Requirement #3)

Basin plans can identify potential sources of pollution and develop strategies to eliminate or control these sources to the fullest extent possible. A basin plan can include the following source control strategies:

1. Detection and correction of illicit discharges to storm sewer systems, including the use of dry weather sampling and dye-tracing techniques;

2. Identification of existing businesses, industries, utilities, and other activities which may store materials susceptible to spillage or leakage of pollutants into the storm sewer system;

3. Elimination or control of pollutant sources identified in (2);

4. Identification and control of future businesses, industries, utilities, and other activities which may store materials susceptible to spillage or leakage of pollutants into the storm sewer system; and

5. Training and public education

Basin Planning Applied to Runoff Treatment

(Minimum Requirement #4)

Basin plans can develop more stringent runoff treatment requirements and performance standards to reduce pollutant concentrations or loads based on an evaluation of the beneficial uses to be protected within or downstream of a watershed. Consideration must be given to the antidegradation provisions of the Clean Water Act and implementing state water quality standards. The evaluation should include an analysis of existing and future conditions. Additional levels of control beyond Minimum Requirement #4 may be justified in order to control the impacts of future development. Requirements/performance

R0073317

standards can be developed based on an evaluation of pollutant loads and modeling of receiving water conditions.

Runoff treatment requirements/performance standards developed from a basin plan should apply to individual development sites. Regional treatment BMPs can be considered an acceptable substitute for on-site treatment BMPs if they can meet the identified treatment requirements/performance standards. A limitation to the use of regional treatment systems is that the conveyances used to transport the stormwater to the BMP must not include waters of the state that have (or had as of November, 1975) beneficial uses other than drainage.

Basin plans shall evaluate retrofitting opportunities, such as installation of extended detention outlets for existing stormwater detention facilities.

Basin Planning Applied to Flow Control

(Minimum Requirement #5)

Basin planning is well-suited to control stream channel erosion for both existing and future conditions. Flow control standards developed from a basin plan may include a combination of on-site, regional, and stream protection/rehabilitation measures. On-site standards shall be the primary mechanism to protect streams from the impacts of future conditions. Regional flow control BMPs are to used primarily to correct existing stream erosion problems. Stream protection/rehabilitation measures may be applied where stream channel erosion problems currently exist which will not be corrected by on-site or regional BMPs. However, caution is urged in the application of such measures. If the causes of the stream channel erosion problems still exist, repairs to the physical expression of those problems will be short-lived.

Basin Planning Applied to Wetlands and other Sensitive Areas

(Minimum Requirement #6)

Basin planning can be used to develop additional protection standards for wetlands and other sensitive areas, such as landslide hazard areas, wellhead protection areas, and ground water quality management areas. . These standards can include source control, runoff treatment, flow control, and stage levels, and frequency and duration of inundations.

APPENDIX B - Water Quality Treatment Design Storm Options

Ecology encourages discussion of options for establishing a water quality design storm event. The options currently under consideration include:

1. **An estimation of a 6-month, 24-hour rainfall amount.**

   This is the current water quality design storm in the Stormwater Management Manual for the Puget Sound Basin. It was originally chosen when developing the Puget Sound manual based upon a judgement of when the incremental costs of additional treatment capacity exceed the incremental benefits. In particular, the cost of providing the increased detention volume for a wet pond was not seen as cost-effective when compared with the incremental amount of annual stormwater volume that would be effectively treated. Rainfall data from Sea-Tac was used in the original analysis.

   There are at least two ways to estimate the rainfall amount of a 6-month, 24-hour storm. One way is to analyze the 24-hour rainfall records for each rainfall station. The more extensive your record, the more confidence you may have in your estimate. The rainfall amount which has a probability of being equaled or exceeded twice a year is the 6-month, 24-hour storm. The 6-month, 24-hour rainfall amounts shown for 58 stations in Table B.1 have been estimated by analyzing the daily rain gauge data obtained from CD-ROM Hydrodata, USGS Daily and Peak Values, published by Hydrosphere Data Products, Inc.[11]

   The way in which the 6-month, 24-hour estimates in table 2 are calculated is as follows. A data set containing the annual maxima series for 24-hour durations for rainfall stations throughout the state was used.to determine the 2-year, 24-hour return frequency in the first column of Table B.2. The data set was collected by Dr. Schaefer of the Washington Dept. of Ecology and is more fully described in "Regional Analyses of Precipitation Annual Maxima in Washington State,"[12] Then an algorithm was applied to convert the series to a partial duration series. Dr. Schaefer describes the conversion as follows: "A return period of 1.16 years (annual exceedance probability of 0.862) in the annual maxima data series is equivalent to a 6-month return period in the partial duration data series. The 6-month values were computed using at-site 24-hour station mean values, regional coefficients of variation (Cv) and L-skewness (tau3), and a frequency factor (K) of –0.94 which corresponds to a return period of 1.16 years. This K value of –0.94 yields 6-month estimates that are correct within 3% +/- for various Kappa distribution parameter sets for climates from arid to rainforest in Washington State." (The reader is referred to references #13 and #14.) Note that the 2-year storm values in Table B.2 differ slightly from those in Table B.1 because they are a different data set and have undergone additional statistical analysis.

A disadavantage to using a 6-month, 24-hour storm as the design storm is that we do not have isopluvials identifying 6-month, 24-hour storms statewide. We would have to produce such a map, or develop a method to estimate the volume for projects at sites not listed in a reference table of 6-month, 24-hour storms. One method to do that is listed as the second option below.

2. **72% of the 2-year, 24-hour rainfall amount for areas in western Washington and in Ferry, Stevens, Pend Oreille, Spokane, Whitman, Garfield, Walla, Walla, Columbia, and Asotin Counties of eastern Washington. Other areas of eastern Washington shall use 65% of the 2-year, 24-hour rainfall amount.**

Based upon an analysis of the rainfall record of 58 stations across the state, the 6-month, and 2-year, 24-hour rainfall amounts were calculated and compared. Those results are shown in Table B.1. Based on those results, there seemed to be a justification for establishing two different percentages for ease in estimating 6-month, 24-hour rainfall amounts across the state.

The arithmetic average of the ratio of the 6-month to the 2-year totals for 35 stations in western Washington (expressed as a percentage) was 71%. With the exception of a few stations, the percentages vary within a range of 67% to 76%. Using only four stations for the mountainous northeastern area and the far eastern areas of the state , the computed ratios were 71% to 73% with an average of 72%. A ratio of 72% is suggested for both of these areas.

Using 16 stations for an area generally described as eastern Cascades and the Columbia Basin, the ratios varied from 61.6% to 68.4% with an average of 65%.

An advantage of this approach is that updated statewide isopluvial maps for the 2-year, 24-hour design storm are expected to be available soon. By interpolation, the 2-year rainfall amount for a project site can be easily identified. Application of the percentage assigned to that area yields the estimate of the 6-month, 24-hour rainfall amount. Citing a particular percentage of the 2-year, 24-hour rainfall amount (or a 6-month, 24-hour event) means that different areas of the state will be effectively sizing treatment facilities for the runoff from storms of vastly different sizes. However, those size differences are based upon actual differences in rainfall among the sites.

Also, as mentioned above in Option 1, the original basis for 6-month, 24-hour rainfall amount was a comparison of costs to benefits based upon how much annual runoff would be effectively treated. (The assumption in these comparisons is that storm sizes crudely track relative runoff quantities). The 6-month, 24-hour storm and smaller storms constituted about 91% of the total rainfall of record at SEA-TAC. Because the % of the 24-hour rainfall volumes that the 6-month, 24-hour storm and smaller 24-hour rainfall amounts represent changes across the state (See Table B.1, column entitled, "6 month, % Rainfall Volume") the cost analysis isn't exactly the same for other areas. However, for the 58 stations computed, the 6-month storm and smaller storms represent from 93% to 82% of the total rainfall volume. Therefore, for most areas of the state, the relative cost to % of runoff effectively treated is lower than was assumed in the original analysis.

3) **Using 24-hour rainfall data, identification of a precipitation amount for which the cumulative sum of rainfall amounts of that size and smaller account for a certain percentage of the total rainfall inches.**

For example, we could choose to size a treatment BMP to effectively treat the runoff from all the 24-hour precipitation amounts that made up 90% of the total rainfall. To do that, you order all the recorded 24-hour precipitation amounts by increasing size, and sum the total precipitation as you move up the list from smaller to larger 24-hour amounts. The last 24-hour total that you have to include to bring your cumulative total to approximately 90% of the total historical rainfall amount is your water quality design storm. The rainfall amount from this storm would be used as input to your runoff calculations to estimate total runoff volume for sizing volume-sensitive BMP's, and as input to your hyetograph/hydrograph analysis to determine the estimated peak flow rates for sizing water quality treatment BMPs. Note that for BMP's designed based on runoff volumes,

R0073321

we can estimate that 24-hour rainfall amounts of lesser amount will meet the detention time design criteria. However, for treatment BMP's whose design is based on volumetric runoff rates or velocity, i.e., cubic feet per second or feet per second, we do not know how frequently, nor how much of the actual runoff occurs at flow rates below the design flow rate. This is because the design flow rate is based upon an idealized hyetograph.

The relative sizes of water quality design storms defiined in this manner are shown in Table B.1 for 90% and 95% of the total rainfall inches for 58 rainfall stations. Note that a different set of rainfall data was used in this table than in Table B.2. Also the data was managed differently. However, based upon a close correlation of computed 2-year, 24-hour return frequency storms, we would expect insignificant differences in the percentages if computed for the other data set.

The water quality design storm identified in this approach would vary across the state. Assuming a 90% goal, rainfall amounts vary from 0.54 inches at Moses Lake to 3.18 inches at Cushman Dam. Runoff amounts from these storms will also vary depending upon natural soil conditions, vegetative cover, and the % effective imperviousness of a site. Maryland has recently adopted a statewide standard of capturing and treating 90% of the annual runoff volume. Rainfall in Maryland does not vary to the extent it does in Washington.

To implement this approach, Ecology would have to publish the water quality design storm for as many rainfall stations as possible. Then we would have to identify an adjustment factor to use for the project site. The factor could be based on a ratio of 2-year, 24-hour rain amounts between the nearest or most appropriate rainfall station and the project site, or upon a ratio of mean annual precipitation for the same two sites. The 2-year, 24-hour amount or the mean annual precipitation for the project site would have to be based upon interpolation of isopluvials.

An example estimation would be as follows: 1) calculate the 2-year, 24-hour or the mean annual precipitation for a site by interpolating between the two nearest isopluvials. 2) calculate ratios of the mean annual rainfall amounts or 2-year, 24-hour amounts for the site to the nearest or most appropriate gauge for which a 90% value is published; 2) multiply the 90% rainfall amount for the gauge by the ratio.

4. **Using 24-hour rainfall data, establish the knee of the curve for a graph of increasing 24-hour rainfall amounts (y-axis) versus cumulative rainfall depth (x-axis).**

Please refer to Figures B.1 and B.2. Figure B.1 shows examples of graphing the record of 24-hour rainfall amounts versus the cumulative percent of rainfall depth for the record. So each point on the curve shows the percent of rainfall depth that is represented by the corresponding 24-hour amount and lesser amounts. Figure B.2 depicts how the knee of the curve was determined for four rain gauge sites. Note that the graphs in Figures B.1 and B.2 have the same units for the x- and y-axes, but the scales are different. The curves start out fairly straight with a gentle rise, and then begin to rise sharply for the largest rainfall amounts. In order to perform the knee of the curve analysis, two tangent lines, or asymptotes were drawn, one through the horizontal portion of the curve and the other through the rising part of the curve. The two tangent lines were then bisected and the point where the bisect line intersected the curve was considered to be the knee of the curve. The rainfall depth and percent of total rainfall represented by the knee of the curve can then be determined.

The tangent lines were drawn by choosing points that included as much of the flat horizontal portion of the curve as possible and as many points as possible to represent the sharply rising portion of the curve. Then a best-fit approach on the points was used to generate the tangent lines. Only a portion of the curves are shown in Figure B.2.

The intent of this analysis is to relate the size of the storm (and by direct relationship, treatment cost) to the percent of total runoff (by assuming runoff tracks approximately with rainfall amount) that would receive treatment within the design parameters for the selected BMP (benefit).

The results of using this approach for a number of rainfall stations are shown in Table B.2. For most stations, the rainfall amounts are substantially greater than the amounts identified in options #1 or #2 above, or the amount identified in option #3 assuming a 90% total rainfall criterion.

5. **Use a multiple of the mean annual storm.**

   The mean annual storm is defined as the total annual average precipitation amount divided by the average annual number of precipitation events. Mean annual storm values for various sites were computed based on data in The National Precipitation Databook, 1992[15], and are displayed in Table B.2.

   Other areas of the country have identified multiples of the mean annual storm as the basis for sizing water quality treatment BMPs. King Co. recently adopted a multiplier of 3x the runoff of the mean annual storm as the design basis for the volume of their "basic wetpond." The factor of three was arrived at as an estimate of the volume needed to achieve the County's design goal of 80% removal of total suspended solids.

   For BMPs sized based on volumetric flow rate or velocity, a characteristic hyetograph would be used in combination with the selected multiple of the mean annual storm to compute the peak flow rate for the time increment of interest.

6. **Use continuous runoff modeling to establish: a runoff flow rate that is exceeded only X % of the time using the appropriate time increment for a BMP sized based on a peak flow rate, and a runoff amount that is exceeded only X% of the time for BMP's based on runoff volume.**

   Using continuous runoff models allows you to obtain estimates of the probability of exceedence for flow rates and runoff volumes for the available rainfall record. This approach has probably the best statistical basis for deciding upon what your goal should be for technology-based water quality treatment volumes and flow rates. In weighing the cost reasonableness of selecting any particular percentage, we could compare the flow rates and volumes to those for which we have conducted cost analyses in the past, i.e., the current standards. The only method by which we could pursue this approach within the alloted timeframe for reissuance of this manual is to use results from King Co.'s application of HSPF, i.e., KCRTS .

Table B.1. Rainfall Amounts and Comparisons for Selected USGS Stations as Published by Hydrosphere Data Products, Inc.

Station Name	6 Month Storm Inches	6 Month % Rainfall Volume	2 Year Storm Inches	6 Month/ 2 year %	90% Rainfall Inches	95% Rainfall Inches	Mean Annual Precip.Inches

GLOSSARY AND NOTATIONS

The following terms are provided for reference and use with this manual. They shall be superseded by any other definitions for these terms adopted by ordinance unless they are defined in a Washington State WAC or RCW or are used and defined as part of the Minimum Requirements for all new development and redevelopment.

AASHTO classification The official classification of soil materials and soil aggregate mixtures for highway construction, used by the American Association of State Highway and Transportation Officials.

Absorption The penetration of a substance into or through another, such as the dissolving of a soluble gas in a liquid.

Adjacent steep slope A slope with a gradient of 15 percent or steeper within five hundred feet of the site.

Adsorption The adhesion of a substance to the surface of a solid or liquid; often used to extract pollutants by causing them to be attached to such adsorbents as activated carbon or silica gel. Hydrophobic, or water-repulsing adsorbents, are used to extract oil from waterways when oil spills occur. Heavy metals such as zinc and lead often adsorb onto sediment particles.

Aeration The process of being supplied or impregnated with air. In waste treatment, the process used to foster biological and chemical purification. In soils, the process by which air in the soil is replenished by air from the atmosphere. In a well aerated soil, the soil air is similar in composition to the atmosphere above the soil. Poorly aerated soils usually contain a much higher percentage of carbon dioxide and a correspondingly lower percentage of oxygen.

Aerobic Living or active only in the presence of free (dissolved or molecular) oxygen.

Aerobic bacteria Bacteria that require the presence of free oxygen for their metabolic processes.

Aggressive plant species Opportunistic species of inferior biological value that tend to out-compete more desirable forms and become dominant; applied to native species in this manual.

Algae Primitive plants, many microscopic, containing chlorophyll and forming the base of the food chain in aquatic environments. Some species may create a nuisance when environmental conditions are suitable for prolific growth.

R0073335

Algal bloom	Proliferation of living algae on the surface of lakes, streams or ponds; often stimulated by phosphate over-enrichment. Algal blooms reduce the oxygen available to other aquatic organisms.
American Public Works Association or APWA	The adopted edition of the Washington State Chapter of the American Public Works Association.
Anadromous	Fishes ascending rivers from the sea for breeding.
Anaerobic	Living or active in the absence of oxygen.
Anaerobic bacteria	Bacteria that do not require the presence of free or dissolved oxygen for metabolism.
Annual flood	The highest peak discharge on average which can be expected in any given year.
Antecedent moisture conditions	The degree of wetness of a watershed or within the soil at the beginning of a storm.
Anti-seep collar	A device constructed around a pipe or other conduit and placed through a dam, levee, or dike for the purpose of reducing seepage losses and piping failures.
Anti-vortex device	A facility placed at the entrance to a pipe conduit structure such as a drop inlet spillway or hood inlet spillway to prevent air from entering the structure when the pipe is flowing full.
Applicant	The person who has applied for a development permit or approval.
Approved manual	Means a stormwater management manual approved by Ecology.
Appurtenances	Machinery, appliances, or auxiliary structures attached to a main structure, but not considered an integral part thereof, for the purpose of enabling it to function.
Aquifer	A geologic stratum containing ground water that can be withdrawn and used for human purposes.
As-built drawings	Engineering plans which have been revised to reflect all changes to the plans which occurred during construction.
As-graded	The extent of surface conditions on completion of grading.
BSBL	See Building set back line.
Background	A description of pollutant levels arising from natural sources, and not because of man's immediate activities.
Backwater	Water upstream from an obstruction which is deeper than it would normally be without the obstruction.

R0073336

Bankfull discharge A flow condition where streamflow completely fills the stream channel up to the top of the bank. In undisturbed watersheds, the discharge conditions occurs on average every 1.5 to 2 years and controls the shape and form of natural channels.

Base flood A flood having a one percent chance of being equaled or exceeded in any given year. This is also referred to as the 100-year flood.

Base flood elevation The water surface elevation of the base flood. It shall be referenced to the National Geodetic Vertical Datum of 1929 (NGVD).

Baseline sample A sample collected during dry-weather flow (i.e., it does not consist of runoff from a specific precipitation event).

Basin plan A plan and all implementing regulations and procedures including but not limited to land use management adopted by ordinance for managing surface and stormwater quality and quantity management facilities and features within individual subbasins.

Bearing capacity The maximum load that a material can support before failing.

Bedrock The more or less solid rock in place either on or beneath the surface of the earth. It may be soft, medium, or hard and have a smooth or irregular surface.

Bench A relatively level step excavated into earth material on which fill is to be placed.

Berm A constructed barrier of compacted earth, rock or gravel.

Best management practice (BMP) The schedules of activities, prohibitions of practices, maintenance procedures, and structural and/or managerial practices, that when used singly or in combination, prevent or reduce the release of pollutants to waters of Washington State.

Biochemical oxygen demand (BOD) An indirect measure of the concentration of biologically degradable materials present in organic wastes. The amount of free oxygen utilized by aerobic organisms when allowed to attack the organic material in an aerobically maintained environment at a specified temperature (20θC) for a specific time period (5 days), and thus stated as BOD_5. It is expressed in milligrams of oxygen utilized per liter of liquid waste volume (mg/l) or in milligrams of oxygen per kilogram of waste solution (mg/kg = ppm = parts per million parts). Also called biological oxygen demand.

Biodegradable Capable of being readily broken down by biological means, especially by bacterial action. Degradation can be rapid or may take many years depending upon such factors as available oxygen and moisture.

R0073337

Bioengineering Restoration or reinforcement of slopes and stream banks with living plant materials.

Biofilter A designed, vegetated treatment facility where the more or less simultaneous processes of filtration, infiltration, adsorption and biological uptake of pollutants in stormwater takes place when runoff flows over and through . Vegetation growing in these facilities acts as both a physical filter which causes gravity settling of particulates by regulating velocity of flow, and also as a biological sink when direct uptake of dissolved pollutants occurs. The former mechanism is probably the most important in western Washington where the period of major runoff coincides with the period of lowest biological activity.

Biofiltration The process of reducing pollutant concentrations in water by filtering the polluted water through biological materials.

Biological control A method of controlling pest organisms by means of introduced or naturally occurring predatory organisms, sterilization, the use of inhibiting hormones, or other means, rather than by mechanical or chemical means.

Biological magnification The increasing concentration of a substance along succeeding steps in a food chain. Also called biomagnification.

Bollard A post (may or may not be removable) used to prevent vehicular access.

Bond A surety bond, cash deposit or escrow account, assignment of savings, irrevocable letter of credit or other means acceptable to or required by the manager to guarantee that work is completed in compliance with the project's drainage plan and in compliance with all local government requirements.

Borrow area A source of earth fill material used in the construction of embankments or other earth fill structures.

Buffer The zone contiguous with a sensitive area that is required for the continued maintenance, function, and structural stability of the sensitive area. The critical functions of a riparian buffer (those associated with an aquatic system) include shading, input of organic debris and coarse sediments, uptake of nutrients, stabilization of banks, interception of fine sediments, overflow during high water events, protection from disturbance by humans and domestic animals, maintenance of wildlife habitat, and room for variation of aquatic system boundaries over time due to hydrologic or climatic effects. The critical functions of terrestrial buffers include protection of slope stability, attenuation of surface water flows from stormwater runoff and precipitation, and erosion control.

R0073338

Building setback line (BSBL)	A line measured parallel to a property, easement, drainage facility or buffer boundary, that delineates the area (defined by the distance of separation) where buildings, or other obstructions are prohibited (including decks, patios, outbuildings, or overhangs beyond 18 inches). Wooden or chain link fences and landscaping are allowable within a building setback line. In this manual the minimum building setback line shall be 5 feet.
CIP	See Capital Improvement Project.
Capital Improvement Project or Program (CIP)	A project prioritized and scheduled as a part of an overall construction program or, the actual construction program.
Catchbasin	A chamber or well, usually built at the curb line of a street, for the admission of surface water to a sewer or subdrain, having at its base a sediment sump designed to retain grit and detritus below the point of overflow.
Catchline	The point where a severe slope intercepts a different, more gentle slope.
Catchment	Surface drainage area.
Channel	A feature that conveys surface water and is open to the air.
Channel, constructed	Channels or ditches constructed (or reconstructed natural channels) to convey surface water.
Channel, natural	Streams, creeks, or swales that convey surface/ground water and have existed long enough to establish a stable route and/or biological community.
Channel stabilization	Erosion prevention and stabilization of velocity distribution in a channel using vegetation, jetties, drops, revetments, and/or other measures.
Channel storage	Water temporarily stored in channels while enroute to an outlet.
Channelization	Alteration of a stream channel by widening, deepening, straightening, cleaning, or paving certain areas to change flow characteristics.
Check dam	Small dam constructed in a gully or other small watercourse to decrease the streamflow velocity, minimize channel scour, and promote deposition of sediment.
Chemical oxygen demand (COD)	A measure of the amount of oxygen required to oxidize organic and oxidizable inorganic compounds in water. The COD test, like the BOD test, is used to determine the degree of pollution in water.

R0073339

Civil engineer A professional engineer licensed in the State of Washington in Civil Engineering who is experienced and knowledgeable in the practice of soils engineering.

Civil engineering The application of the knowledge of the forces of nature, principles of mechanics and the properties of materials to the evaluation, design and construction of civil works for the beneficial uses of mankind.

Clay lens A naturally occurring, localized area of clay which acts as an impermeable layer to runoff infiltration.

Clearing The destruction and removal of vegetation by manual, mechanical, or chemical methods.

Closed depression An area which is lowlying and either has no, or such a limited, surface water outlet that during storm events the area acts as a retention basin.

Cohesion The capacity of a soil to resist shearing stress, exclusive of functional resistance.

Coliform bacteria Microorganisms common in the intestinal tracts of man and other warm-blooded animals; all the aerobic and facultative anaerobic, gram-negative, nonspore-forming, rod-shaped bacteria which ferment lactose with gas formation within 48 hours at 35θC. Used as an indicator of bacterial pollution.

Commercial agriculture Those activities conducted on lands defined in RCW 84.34.020(2), and activities involved in the production of crops or livestock for wholesale trade. An activity ceases to be considered commercial agriculture when the area on which it is conducted is proposed for conversion to a nonagricultural use or has lain idle for more than five (5) years, unless the idle land is registered in a federal or state soils conservation program, or unless the activity is maintenance of irrigation ditches, laterals, canals, or drainage ditches related to an existing and ongoing agricultural activity.

Compaction Densification of a fill by mechanical means.

Compensatory storage New excavated storage volume equivalent to the flood storage capacity eliminated by filling or grading within the flood fringe. Equivalent shall mean that the storage removed shall be replaced by equal volume between corresponding one foot contour intervals that are hydraulically connected to the floodway through their entire depth.

Compost Organic residue or a mixture of organic residues and soil, that has undergone biological decomposition until it has become relatively stable humus.

R0073340

Composting A controlled process of degrading organic matter by microorganisms. Present day composting is the aerobic, thermophilic decomposing of organic waste to relatively stable humus. Humus with no more than 25 percent dead or living organisms is stable enough not to reheat or cause odor or fly problems. It can undergo further, slower decay.

Comprehensive planning Planning that takes into account all aspects of water, air, and land resources and their uses and limits.

Conservation district A public organization created under state enabling law as a special-purpose district to develop and carry out a program of soil, water, and related resource conservation, use, and development within its boundaries, usually a subdivision of state government with a local governing body and always with limited authority. Often called a soil conservation district or a soil and water conservation district.

Constructed wetland Those wetlands intentionally created on sites that are not wetlands for the primary purpose of wastewater or stormwater treatment and managed as such. Constructed wetlands are normally considered as part of the stormwater collection and treatment system.

Contour An imaginary line on the surface of the earth connecting points of the same elevation.

Conveyance A mechanism for transporting water from one point to another, including pipes, ditches, and channels.

Conveyance system The drainage facilities, both natural and man-made, which collect, contain, and provide for the flow of surface and stormwater from the highest points on the land down to a receiving water. The natural elements of the conveyance system include swales and small drainage courses, streams, rivers, lakes, and wetlands. The human-made elements of the conveyance system include gutters, ditches, pipes, channels, and most retention/detention facilities.

Cover crop A close-growing crop grown primarily for the purpose of protecting and improving soil between periods of permanent vegetation.

Created wetland Means those wetlands intentionally created from nonwetland sites to produce or replace natural wetland habitat (e.g., compensatory mitigation projects).

Critical Areas At a minimum, areas which include wetlands, areas with a critical recharging effect on aquifers used for potable water, fish and wildlife habitat conservation areas, frequently flooded areas, geologically hazardous areas, including unstable slopes, and associated areas and ecosystems.

R0073341

Critical depth	The depth which minimizes the specific energy of flow (E).
Critical Drainage Area	An area with such severe flooding, drainage and/or erosion/sedimentation conditions that the area has been formally adopted as a Critical Drainage Area by rule under the procedures specified in an ordinance.
Critical flow	Flow at the critical depth and velocity.
Critical reach	The point in a receiving stream below a discharge point at which the lowest dissolved oxygen level is reached and stream recovery begins.
Culvert	Pipe or concrete box structure which drains open channels, swales or ditches under a roadway or embankment. Typically with no catchbasins or manholes along its length.
Cut	Portion of land surface or area from which earth has been removed or will be removed by excavating; the depth below original ground surface to excavated surface.
Cut-and-fill	Process of earth moving by excavating part of an area and using the excavated material for adjacent embankments or fill areas.
DNS	See Determination of nonsignificance.
Dead storage	The volume available in a depression in the ground below any conveyance system, or surface drainage pathway, or outlet invert elevation that could allow the discharge of surface and stormwater runoff.
Dedication of land	Refers to setting aside a portion of a property for a specific use or function.
Degradation	(Biological or chemical) The breakdown of complex organic or other chemical compounds into simpler substances, usually less harmful than the original compound, as with the degradation of a persistent pesticide. (Geological) Wearing down by erosion. (Water) The lowering of the water quality of a watercourse by an increase in the pollutant loading.
Degraded (disturbed) wetland (community)	A wetland (community) in which the vegetation, soils, and/or hydrology have been adversely altered, resulting in lost or reduced functions and values; generally, implies topographic isolation; hydrologic alterations such as hydroperiod alteration (increased or decreased quantity of water), diking, channelization, and/or outlet modification; soils alterations such as presence of fill, soil removal, and/or compaction; accumulation of toxicants in the biotic or abiotic components of the wetland; and/or low plant species richness with dominance by invasive weedy species.
Denitrification	The biochemical reduction of nitrates or nitrites in the soil or organic deposits to ammonia or free nitrogen.

Depression storage	The amount of precipitation that is trapped in depressions on the surface of the ground.
Design engineer	The professional civil engineer licensed in the State of Washington who prepares the analysis, design, and engineering plans for an applicant's permit or approval submittal.
Design storm	A prescribed hyetograph and total precipitation amount (for a specific duration recurrence frequency) used to estimate runoff for a hypothetical storm of interest or concern for the purposes of analyzing existing drainage, designing new drainage facilities or assessing other impacts of a proposed project on the flow of surface water. (A hyetograph is a graph of percentages of total precipitation for a series of time steps representing the total time during which the precipitation occurs.)
Detention	The release of stormwater runoff from the site at a slower rate than it is collected by the stormwater facility system, the difference being held in temporary storage.
Detention facility	An above or below ground facility, such as a pond or tank, that temporarily stores stormwater runoff and subsequently releases it at a slower rate than it is collected by the drainage facility system. There is little or no infiltration of stored stormwater.
Detention time	The theoretical time required to displace the contents of a stormwater treatment facility at a given rate of discharge (volume divided by rate of discharge).
Determination of Nonsignificance (DNS)	The written decision by the responsible official of the lead agency that a proposal is not likely to have a significant adverse environmental impact, and therefore an EIS is not required.
Development	Means new development, redevelopment, or both. See definitions for each.
Discharge	Outflow; the flow of a stream, canal, or aquifer. One may also speak of the discharge of a canal or stream into a lake, river, or ocean. (Hydraulics) Rate of flow, specifically fluid flow; a volume of fluid passing a point per unit of time, commonly expressed as cubic feet per second, cubic meters per second, gallons per minute, gallons per day, or millions of gallons per day.
Dispersed discharge	Release of surface and stormwater runoff from a drainage facility system such that the flow spreads over a wide area and is located so as not to allow flow to concentrate anywhere upstream of a drainage channel with erodible underlying granular soils.
Ditch	A long narrow excavation dug in the earth for drainage with its top width less than 10 feet at design flow.

R0073343

Divide, Drainage The boundary between one drainage basin and another.

Drain A buried pipe or other conduit (closed drain). A ditch (open drain) for carrying off surplus surface water or ground water.

(To) Drain To provide channels, such as open ditches or closed drains, so that excess water can be removed by surface flow or by internal flow. To lose water (from the soil) by percolation.

Drainage Refers to the collection, conveyance, containment, and/or discharge of surface and stormwater runoff.

Drainage basin A geographic and hydrologic subunit of a watershed.

Drainage channel A drainage pathway with a well-defined bed and banks indicating frequent conveyance of surface and stormwater runoff.

Drainage course A pathway for watershed drainage characterized by wet soil vegetation; often intermittent in flow.

Drainage easement A legal encumbrance that is placed against a property's title to reserve specified privileges for the users and beneficiaries of the drainage facilities contained within the boundaries of the easement.

Drainage pathway The route that surface and stormwater runoff, leaving any part of the site, follows downslope.

Drainage review An evaluation by Plan Approving Authority staff of a proposed project's compliance with the drainage requirements in this manual or its technical equivalent.

Drainage, Soil As a natural condition of the soil, soil drainage refers to the frequency and duration of periods when the soil is free of saturation; for example, in well-drained soils the water is removed readily but not rapidly; in poorly drained soils the root zone is waterlogged for long periods unless artificially drained, and the roots of ordinary crop plants cannot get enough oxygen; in excessively drained soils the water is removed so completely that most crop plants suffer from lack of water. Strictly speaking, excessively drained soils are a result of excessive runoff due to steep slopes or low available water-holding capacity due to small amounts of silt and clay in the soil material. The following classes are used to express soil drainage:

- Well drained - Excess water drains away rapidly and no mottling occurs within 36 inches of the surface.
- Moderately well drained - Water is removed from the soil somewhat slowly, resulting in small but significant periods of wetness. Mottling occurs between 18 and 36 inches.

Drainage, Soil (continued)

- Somewhat poorly drained - Water is removed from the soil slowly enough to keep it wet for significant periods but not all of the time. Mottling occurs between 8 and 18 inches.

- Poorly drained - Water is removed so slowly that the soil is wet for a large part of the time. Mottling occurs between 0 and 8 inches.
- Very poorly drained - Water is removed so slowly that the water table remains at or near the surface for the greater part of the time. There may also be periods of surface ponding. The soil has a black to gray surface layer with mottles up to the surface.

Drawdown — Lowering of the water surface (in open channel flow), water table or piezometric surface (in ground water flow) resulting from a withdrawal of water.

Drop-inlet spillway — Overall structure in which the water drops through a vertical riser connected to a discharge conduit.

Drop spillway — Overall structure in which the water drops over a vertical wall onto an apron at a lower elevation.

Drop structure — A structure for dropping water to a lower level and dissipating its surplus energy; a fall. A drop may be vertical or inclined.

Dry weather flow — The combination of sanitary sewage, and industrial and commercial wastes normally found in sanitary or storm sewers during the dry weather season of the year. Also that flow in streams during the dry season.

EIS — See Environmental Impact Statement.

ESC — Erosion and Sediment Control (Plan).

Earth material — any rock, natural soil or fill and/or any combination thereof.

Easement — The legal right to use a parcel of land for a particular purpose. It does not include fee ownership, but may restrict the owners use of the land.

Embankment — A structure of earth, gravel, or similar material raised to form a pond bank or foundation for a road.

Emergent plants — Aquatic plants that are rooted in the sediment but whose leaves are at or above the water surface. These wetland plants often have high habitat value for wildlife and waterfowl, and can aid in pollutant uptake.

Emergency spillway — A vegetated earth channel used to safely convey flood discharges in excess of the capacity of the principal spillway.

R0073345

Energy dissipator — Any means by which the total energy of flowing water is reduced. In stormwater design, they are usually mechanisms that reduce velocity prior to, or at, discharge from an outfall in order to prevent erosion. They include rock splash pads, drop manholes, concrete stilling basins or baffles, and check dams.

Energy gradient — The slope of the specific energy line (i.e., the sum of the potential and velocity heads.)

Engineering geologist — A geologist experienced and knowledgeable in engineering geology.

Engineering geology — The application of geologic knowledge and principles in the investigation and evaluation of naturally occurring rock and soil for use in the design of civil works.

Engineering plan — A plan prepared and stamped by a professional civil engineer. An engineering plan contains a Technical Information Report and Site Improvement Plans which are described in detail in Chapter I-3.

Enhancement — To raise value, desirability, or attractiveness of an environment associated with surface water.

Environmental Impact Statement (EIS) — A document that discusses the likely significant adverse impacts of a proposal, ways to lessen the impacts, and alternatives to the proposal. They are required by the national and state environmental policy acts when projects are determined to have significant environmental impact.

Erodible granular soils — Soil materials that are easily eroded and transported by running water, typically fine or medium grained sand with minor gravel, silt, or clay content. Such soils are commonly described as Everett or Indianola series soil types in the SCS classification. Also included are any soils showing examples of existing severe stream channel incision as indicated by unvegetated streambanks standing over two feet high above the base of the channel.

Erosion — The wearing away of the land surface by running water, wind, ice, or other geological agents, including such processes as gravitational creep. Also, detachment and movement of soil or rock fragments by water, wind, ice, or gravity. The following terms are used to describe different types of water erosion:

- Accelerated erosion - Erosion much more rapid than normal or geologic erosion, primarily as a result of the influence of the activities of man or, in some cases, of the animals or natural catastrophes that expose bare surfaces (e.g., fires).
- Geological erosion - The normal or natural erosion caused by geological processes acting over long geologic periods and resulting in the wearing away of mountains, the building up of floodplains, coastal plains, etc. Synonymous with natural erosion.

Erosion (continued)

- Gully erosion - The erosion process whereby water accumulates in narrow channels and, over short periods, removes the soil from this narrow area to considerable depths, ranging from 1 to 2 feet to as much as 75 to 100 feet.
- Natural erosion - Wearing away of the earth's surface by water, ice, or other natural agents under natural environmental conditions of climate, vegetation, etc., undisturbed by man. Synonymous with geological erosion.
- Normal erosion - The gradual erosion of land used by man which does not greatly exceed natural erosion. See Natural erosion.
- Rill erosion - An erosion process in which numerous small channels only several inches deep are formed; occurs mainly on recently disturbed and exposed soils. See Rill.
- Sheet erosion - The removal of a fairly uniform layer of soil from the land surface by runoff.
- Splash erosion - The spattering of small soil particles caused by the impact of raindrops on wet soils. The loosened and spattered particles may or may not be subsequently removed by surface runoff.

Erosion classes (soil survey)

A grouping of erosion conditions based on the degree of erosion or on characteristic patterns. Applied to accelerated erosion, not to normal, natural, or geological erosion. Four erosion classes are recognized for water erosion and three for wind erosion.

Erosion/sedimentation control

Any temporary or permanent measures taken to reduce erosion; control siltation and sedimentation; and ensure that sediment-laden water does not leave the site.

Erosion and sediment control facility

A type of drainage facility designed to hold water for a period of time to allow sediment contained in the surface and stormwater runoff directed to the facility to settle out so as to improve the quality of the runoff.

Escarpment

A steep face or a ridge of high land.

Estuarine wetland

Generally, an eelgrass bed; salt marsh; or rocky, sandflat, or mudflat intertidal area where fresh and salt water mix. (Specifically, a tidal wetland with salinity greater than 0.5 parts per thousand, usually semi-enclosed by land but with partially obstructed or sporadic access to the open ocean).

Estuary

An area where fresh water meets salt water, or where the tide meets the river current (e.g., bays, mouths of rivers, salt marshes and lagoons). Estuaries serve as nurseries and spawning and feeding grounds for large groups of marine life and provide shelter and food for birds and wildlife.

R0073347

Eutrophication — Refers to the process where nutrient over-enrichment of water leads to excessive growth of aquatic plants, especially algae.

Evapotranspiration — The collective term for the processes of evaporation and plant transpiration by which water is returned to the atmosphere.

Excavation — The mechanical removal of earth material.

Exfiltration — The downward movement of runoff through the bottom of an infiltration BMP into the soil layer or the downward movement of water through soil.

Existing site conditions means

(a) For developed sites with stormwater facilities that have been constructed to meet the standards in the Minimum Requirements of this manual, existing site conditions shall mean the existing conditions on the site.

(b) For developed sites that do not have stormwater facilities that meet the Minimum Requirements, existing site conditions shall mean the conditions that existed prior to the development of the project site. If in question, the existing site conditions shall be documented by aerial photograph records, or other appropriate means.

(c) (c) For undeveloped sites existing site conditions shall mean the existing conditions on the site.

Experimental best management practice (BMP) — A BMP that has not been tested and evaluated by the Department of Ecology in collaboration with local governments and technical experts.

FIRM — See Flood Insurance Rate Map.

Fertilizer — Any material or mixture used to supply one or more of the essential plant nutrient elements.

Fill — A deposit of earth material placed by artificial means.

Filter fabric — A woven or nonwoven, water-permeable material generally made of synthetic products such as polypropylene and used in stormwater management and erosion and sediment control applications to trap sediment or prevent the clogging of aggregates by fine soil particles.

Filter fabric fence — A temporary sediment barrier consisting of a filter fabric stretched across and attached to supporting posts and entrenched. The filter fence is constructed of stakes and synthetic filter fabric with a rigid wire fence backing where necessary for support.

Filter strip — A strip of vegetation used to retard or collect sediment for the protection of diversions, drainage basins, or other structures. Often used in conjunction with a level spreader to keep flow from becoming channelized in the filter strip.

R0073348

Flocculation	The process by which suspended colloidal or very fine particles are assembled into larger masses or floccules which eventually settle out of suspension. This process occurs naturally but can also be caused through the use of such chemicals as alum.
Flood	An overflow or inundation that comes from a river or any other source, including (but no limited to) streams, tides, wave action, storm drains or excess rainfall. Any relatively high stream flow overtopping the natural or artificial banks in any reach of a stream.
Flood control	Methods or facilities for reducing flood flows and the extent of flooding.
Flood control project	A structural system installed to protect land and improvements from floods by the construction of dikes, river embankments, channels, or dams.
Flood frequency	The frequency with which the flood of interest may be expected to occur at a site in any average interval of years. Frequency analysis defines the "n-year flood" as being the flood that will, over a long period of time, be equaled or exceeded on the average once every "n" years.
Flood fringe	That portion of the floodplain outside of the floodway which is covered by floodwaters during the base flood; it is generally associated with standing water rather than rapidly flowing water.
Flood Hazard Areas	Those areas subject to inundation by the base flood. Includes, but is not limited to streams, lakes, wetlands, and closed depressions.
Flood Insurance Rate Map (FIRM)	The official map on which the Federal Insurance Administration has delineated many areas of flood hazard, floodway, and the risk premium zones.
Flood Insurance Study	The official report provided by the Federal Insurance Administration that includes flood profiles and the FIRM.
Flood peak	The highest value of the stage or discharge attained by a flood; thus, peak stage or peak discharge.
Floodplain	The total area subject to inundation by the base flood including the flood fringe and floodway.
Flood-proofing	Adaptations that ensure a structure is substantially impermeable to the passage of water below the flood protection elevation that resists hydrostatic and hydrodynamic loads and effects of buoyancy.
Flood protection elevation	The base flood elevation or higher as defined by the local government.

R0073349

Flood protection facility — Any levee, berm, wall, enclosure, raise bank, revetment, constructed bank stabilization or armoring, that is commonly recognized by the community as providing significant protection to a property from inundation by flood waters.

Flood routing — An analytical technique used to compute the effects of system storage dynamics on the shape and movement of flow represented by a hydrograph.

Flood stage — The stage at which overflow of the natural banks of a stream begins.

Floodway — The channel of the river or stream and those portions of the adjoining floodplains which are reasonably required to carry and discharge the base flood flow. The portions of the adjoining floodplains which are considered to be "reasonably required" is defined by flood hazard regulations.

Forebay — An easily maintained, extra storage area provided near an inlet of a BMP to trap incoming sediments before they accumulate in a pond or wetland BMP.

Forest practice — Any activity conducted on or directly pertaining to forest land and relating to growing, harvesting, or processing timber, including but not limited to:

a. Road and trail construction.
b. Harvesting, final and intermediate.
c. Precommercial thinning.
d. Reforestation.
e. Fertilization.
f. Prevention and suppression of diseases and insects.
g. Salvage of trees.
h. Brush control.

Forested communities (wetlands) — In general terms, communities (wetlands) characterized by woody vegetation that is greater than or equal to 6 meters in height; in this manual the term applies to such communities (wetlands) that represent a significant amount of tree cover consisting of species that offer wildlife habitat and other values and advance the performance of wetland functions overall.

Freeboard — The vertical distance between the design water surface elevation and the elevation of the barrier which contains the water.

Frequently flooded areas — the 100-year floodplain designations of the Federal Emergency Management Agency and the National Flood Insurance Program or as defined by the local government.

R0073350

Frost-heave — The upward movement of soil surface due to the expansion of water stored between particles in the first few feet of the soil profile as it freezes. May cause surface fracturing of asphalt or concrete.

Frequency of storm (design storm frequency) — The anticipated period in years that will elapse, based on average probability of storms in the design region, before a storm of a given intensity and/or total volume will recur; thus a 10-year storm can be expected to occur on the average once every 10 years. Sewers designed to handle flows which occur under such storm conditions would be expected to be surcharged by any storms of greater amount or intensity.

Functions — The ecological (physical, chemical, and biological) processes or attributes of a wetland without regard for their importance to society (see also values). Wetland functions include food chain support, provision of ecosystem diversity and fish and wildlife habitat, floodflow alteration, ground water recharge and discharge, water quality improvement, and soil stabilization.

Gabion — A rectangular or cylindrical wire mesh cage (a chicken wire basket) filled with rock and used as a protecting agent, revetment, etc., against erosion. Soft gabions, often used in streambank stabilization, are made of geotextiles filled with dirt, in between which cuttings are placed.

Gage or gauge — Device for registering precipitation, water level, discharge, velocity, pressure, temperature, etc. Also, a measure of the thickness of metal; e.g., diameter of wire, wall thickness of steel pipe.

Gaging station — A selected section of a stream channel equipped with a gage, recorder, or other facilities for determining stream discharge.

Geologist — A person who has earned a degree in geology from an accredited college or university or who has equivalent educational training and has at least five years of experience as a practicing geologist or four years of experience and at least two years post-graduate study, research or teaching. The practical experience shall include at least three years work in applied geology and landslide evaluation, in close association with qualified practicing geologists or geotechnical professional/civil engineers.

Geologically hazardous areas — Areas that because of their susceptibility to erosion, sliding, earthquake or other geological events, are not suited to the siting of commercial, residential or industrial development consistent with public health or safety concerns.

Geometrics — The mathematical relationships between points, lines, angles and surfaces used to measure and identify areas of land.

Geotechnical professional civil engineer — A practicing, geotechnical/civil engineer licensed as a professional Civil Engineer with the State of Washington who has at least four years of professional employment as a geotechnical engineer in responsible charge, including experience with landslide evaluation.

Grade — The slope of a road, channel, or natural ground. The finished surface of a canal bed, roadbed, top of embankment, or bottom of excavation; any surface prepared for the support of construction such as paving or the laying of a conduit.

(To) Grade — To finish the surface of a canal bed, roadbed, top of embankment or bottom of excavation.

Gradient terrace — An earth embankment or a ridge-and-channel constructed with suitable spacing and an acceptable grade to reduce erosion damage by intercepting surface runoff and conducting it to a stable outlet at a stable nonerosive velocity.

Grassed waterway — A natural or constructed waterway, usually broad and shallow, covered with erosion-resistant grasses, used to conduct surface water from an area at a reduced flow rate. See also biofilter.

Ground water — Water in a saturated zone or stratum beneath the land surface or a surface water body.

Ground water recharge — Inflow to a ground water reservoir.

Ground water table — The free surface of the ground water, that surface subject to atmospheric pressure under the ground, generally rising and falling with the season, the rate of withdrawal, the rate of restoration, and other conditions. It is seldom static.

(the) Guidance Manual — "The Stormwater Program Guidance Manual for the Puget Sound Basin," a companion manual to this technical manual which contains program implementation guidance for local governments. Examples of the guidance contained are model ordinances, public education information, and guidance on setting up a stormwater utility.

Gully — A channel caused by the concentrated flow of surface and stormwater runoff over unprotected erodible land.

Habitat — The specific area or environment in which a particular type of plant or animal lives. An organism's habitat must provide all of the basic requirements for life and should be protected from harmful contaminants.

Hardpan — A cemented or compacted and often clay-like layer of soil that is impenetrable by roots.

R0073352

Harmful pollutant A substance that has adverse effects to an organism including immediate death, chronic poisoning, impaired reproduction, cancer or other effects.

Head (Hydraulics) The height of water above any plain of reference. The energy, either kinetic or potential, possessed by each unit weight of a liquid, expressed as the vertical height through which a unit weight would have to fall to release the average energy possessed. Used in various compound terms such as pressure head, velocity head, and head loss.

Head loss Energy loss due to friction, eddies, changes in velocity, or direction of flow.

Heavy metals Metals of high specific gravity, present in municipal and industrial wastes, that pose long-term environmental hazards. Such metals include cadmium, chromium, cobalt, copper, lead, mercury, nickel, and zinc.

Humus Organic matter in or on a soil, composed of partly or fully decomposed bits of plant tissue or from animal manure.

Hydraulic gradient Slope of the potential head relative to a fixed datum.

Hydrodynamics Means the dynamic energy, force, or motion of fluids as affected by the physical forces acting upon those fluids.

Hydrograph A graph of runoff rate, inflow rate or discharge rate, past a specific point over time.

Hydrologic cycle The circuit of water movement from the atmosphere to the earth and return to the atmosphere through various stages or processes as precipitation, interception, runoff, infiltration, percolation, storage, evaporation, and transpiration.

Hydrologic Soil Groups A soil characteristic classification system defined by the U.S. Soil Conservation Service in which a soil may be categorized into one of four soil groups (A, B, C, or D) based upon infiltration rate and other properties.

Hydrology The science of the behavior of water in the atmosphere, on the surface of the earth, and underground.

Hydroperiod A seasonal occurrence of flooding and/or soil saturation; it encompasses depth, frequency, duration, and seasonal pattern of inundation.

Hyetograph A graph of percentages of total precipitation for a series of time steps representing the total time in which precipitation occurs.

Illicit discharge All non-stormwater discharges to stormwater drainage systems that cause or contribute to a violation of state water quality, sediment quality or ground water quality standards, including but not limited to sanitary sewer connections, industrial process water, interior floor drains, car washing and greywater systems.

Impact basin A device used to dissipate the energy of flowing water. Generally constructed of concrete in the form of a partially depressed or partially submerged vessel, it may utilize baffles to dissipate velocities.

Impervious A surface which cannot be easily penetrated. For instance, rain does not readily penetrate paved surfaces.

Impervious surface A hard surface area which either prevents or retards the entry of water into the soil mantle as under natural conditions prior to development. A hard surface area which causes water to run off the surface in greater quantities or at an increased rate of flow from the flow present under natural conditions prior to development. Common impervious surfaces include, but are not limited to, roof tops, walkways, patios, driveways, parking lots or storage areas, concrete or asphalt paving, gravel roads, packed earthen materials, and oiled, macadam or other surfaces which similarly impede the natural infiltration of stormwater. Open, uncovered retention/detention facilities shall not be considered as impervious surfaces.

Impoundment A natural or man-made containment for surface water.

Improvement Streets (with or without curbs or gutters), sidewalks, crosswalks, parking lots, water mains, sanitary and storm sewers, drainage facilities, street trees and other appropriate items.

Industrial activities Material handling, transportation, or storage; manufacturing; maintenance; treatment; or disposal. Areas with industrial activities include plant yards, access roads and rail lines used by carriers of raw materials, manufactured products, waste material, or by-products; material handling sites; refuse sites; sites used for the application or disposal of process waste waters; sites used for the storage and maintenance material handling equipment sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to stormwater.

Infiltration Means the downward movement of water from the surface to the subsoil.

R0073354

Infiltration facility (or system)	A drainage facility designed to use the hydrologic process of surface and stormwater runoff soaking into the ground, commonly referred to as a percolation, to dispose of surface and stormwater runoff.
Ingress/egress	The points of access to and from a property.
Inlet	A form of connection between surface of the ground and a drain or sewer for the admission of surface and stormwater runoff.
Insecticide	A substance, usually chemical, that is used to kill insects.
Interception (Hydraulics)	The process by which precipitation is caught and held by foliage, twigs, and branches of trees, shrubs, and other vegetation. Often used for "interception loss" or the amount of water evaporated from the precipitation intercepted.
Interflow	That portion of rainfall that infiltrates into the soil and moves laterally through the upper soil horizons until intercepted by a stream channel or until it returns to the surface for example, in a wetland, spring or seep.
Intermittent stream	A stream or portion of a stream that flows only in direct response to precipitation. It receives little or no water from springs and no long-continued supply from melting snow or other sources. It is dry for a large part of the year, ordinarily more than three months.
Invasive weedy plant species	Opportunistic species of inferior biological value that tend to out-compete more desirable forms and become dominant; applied to non-native species in this manual.
Invert	The lowest point on the inside of a sewer or other conduit.
Invert elevation	The vertical elevation of a pipe or orifice in a pond which defines the water level.
Isopluvial map	A map with lines representing constant depth of total precipitation for a given return frequency.
Lag time	The interval between the center of mass of the storm precipitation and the peak flow of the resultant runoff.
Lake	An area permanently inundated by water in excess of two meters deep and greater than 20 acres in size as measured at the ordinary high water marks.
Land disturbing activity	Any activity that results in a change in the existing soil cover (both vegetative and nonvegetative) and/or the existing soil topography. Land disturbing activities include, but are not limited to demolition, construction, clearing, grading, filling and excavation.

R0073355

Landslide	Episodic downslope movement of a mass of soil or rock that includes but is not limited to rockfalls, slumps, mudflows, and earthflows. For the purpose of these rules, snow avalanches are considered to be a special case of landsliding.
Landslide Hazard Areas	Those areas subject to a severe risk of landslide.
Large Parcel Erosion and Sediment Control Plan" or "LPESC Plan"	A plan to implement BMPs to control pollution generated during land disturbing activity. Guidance for preparing a Large Parcel ESC Plan is contained in Chapter II-4. *[Note: Ecology will be adding a sample Large Parcel ESC Plan to the Guidance Manual.]*
Leachate	Liquid that has percolated through soil and contains substances in solution or suspension.
Leaching	Removal of the more soluble materials from the soil by percolating waters.
Legume	A member of the legume or pulse family, Leguminosae, one of the most important and widely distributed plant families. The fruit is a "legume" or pod. Includes many valuable food and forage species, such as peas, beans, clovers, alfalfas, sweet clovers, and vetches. Practically all legumes are nitrogen-fixing plants.
Level spreader	A temporary ESC device used to spread out stormwater runoff uniformly over the ground surface as sheet flow (i.e., not through channels). The purpose of level spreaders are to prevent concentrated, erosive flows from occurring, and to enhance infiltration.
Local government	Any county, city, or town having its own incorporated government for local affairs.
Low flow channel	An incised or paved channel from inlet to outlet in a dry basin which is designed to carry low runoff flows and/or baseflow, directly to the outlet without detention.
Lowest floor	The lowest enclosed area (including basement) of a structure. An area used solely for parking of vehicles, building access, or storage, in an area other than a basement area, is not considered a building's lowest floor, provided that the enclosed area meets all of the structural requirements of the flood hazard standards.
MDNS	A Mitigated Determination of Nonsignificance (See DNS and Mitigation).

R0073356

Manning's equation (Hydraulics)

An equation used to predict the velocity of water flow in an open channel or pipelines:

$$V = \frac{1.486R^{2/3}S^{1/2}}{n}$$

where:

V is the mean velocity of flow in feet per second

R is the hydraulic radius in feet

S is the slope of the energy gradient or, for assumed uniform flow, the slope of the channel in feet per foot; and

n is Manning's roughness coefficient or retardance factor of the channel lining.

Mass wasting

The movement of large volumes of earth material downslope.

Master Drainage Plan

A comprehensive drainage control plan intended to prevent significant adverse impacts to the natural and manmade drainage system, both on and off-site.

Mean annual water level fluctuation

Derived as follows--

(1) Measure the maximum water level (e.g., with a crest stage gage, Reinelt and Horner 1990) and the existing water level at the time of the site visit (e.g., with a staff gage) on at least eight occasions spread through a year.

(2) Take the difference of the maximum and existing water level on each occasion and divide by the number of occasions.

Mean depth (Hydraulics)

Average depth; cross-sectional area of a stream or channel divided by its surface or top width.

Mean velocity

The average velocity of a stream flowing in a channel or conduit at a given cross-section or in a given reach. It is equal to the discharge divided by the cross-sectional area of the reach.

Measuring weir

A shaped notch through which water flows are measured. Common shapes are rectangular, trapezoidal, and triangular.

Mechanical analysis

The analytical procedure by which soil particles are separated to determine the particle size distribution.

Mechanical practices

Soil and water conservation practices that primarily change the surface of the land or that store, convey, regulate, or dispose of runoff water without excessive erosion.

R0073357

Metals — Elements, such as mercury, lead, nickel, zinc and cadmium, that are of environmental concern because they do not degrade over time. Although many are necessary nutrients, they are sometimes magnified in the food chain, and they can be toxic to life in high enough concentrations. They are also referred to as heavy metals.

Mitigation — Means, in the following order of preference:

(a) Avoiding the impact altogether by not taking a certain action or part of an action;

(b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation, by using appropriate technology, or by taking affirmative steps to avoid or reduce impacts;

(c) Rectifying the impact by repairing, rehabilitating or restoring the affected environment;

(d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; and

(e) Compensation for the impact by replacing, enhancing, or providing substitute resources or environments.

Modification, Modified (wetland) — A wetland whose physical, hydrological, or water quality characteristics have been purposefully altered for a management purpose, such as by dredging, filling, forebay construction, and inlet or outlet control.

Monitor — To systematically and repeatedly measure something in order to track changes.

Monitoring — The collection of data by various methods for the purposes of understanding natural systems and features, evaluating the impacts of development proposals on such systems, and assessing the performance of mitigation measures imposed as conditions of development.

NGPE — See Native Growth Protection Easement.

NGVD — National Geodetic Vertical Datum (see Base flood elevation).

NPDES — The National Pollutant Discharge Elimination System as established by the Federal Clean Water Act.

National Pollutant Discharge Elimination System (NPDES) — The part of the federal Clean Water Act, which requires point source dischargers to obtain permits. These permits are referred to as NPDES permits and, in Washington State, are administered by the Washington State Department of Ecology.

Native Growth Protection Easement (NGPE)
An easement granted for the protection of native vegetation within a sensitive area or its associated buffer. The NGPE shall be recorded on the appropriate documents of title and filed with the County Records Division.

Natural location
Means the location of those channels, swales, and other non-manmade conveyance systems as defined by the first documented topographic contours existing for the subject property, either from maps or photographs, or such other means as appropriate.

New development
Land disturbing activities, including Class IV -general forest practices that are conversions from timber land to other uses; structural development, including construction or installation of a building or other structure; creation of impervious surfaces; subdivision, short subdivision and binding site plans, as defined and applied in Chapter58.17 RCW. All other forest practices and commercial agriculture are not considered new development.

Nitrate (NO_3)
A form of nitrogen which is an essential nutrient to plants. It can cause algal blooms in water if all other nutrients are present in sufficient quantities. It is a product of bacterial oxidation of other forms of nitrogen, from the atmosphere during electrical storms and from fertilizer manufacturing.

Nitrification
The biochemical oxidation process by which ammonia is changed first to nitrites and then to nitrates by bacterial action, consuming oxygen in the water.

Nitrogen, Available
Usually ammonium, nitrite, and nitrate ions, and certain simple amines available for plant growth. A small fraction of organic or total nitrogen in the soil is available at any time.

Nonpoint source pollution
Pollution that enters a water body from diffuse origins on the watershed and does not result from discernible, confined, or discrete conveyances.

Normal depth
The depth of uniform flow. This is a unique depth of flow for any combination of channel characteristics and flow conditions. Normal depth is calculated using Manning's Equation.

Nutrients
Essential chemicals needed by plants or animals for growth. Excessive amounts of nutrients can lead to degradation of water quality and algal blooms. Some nutrients can be toxic at high concentrations.

Off-site
Any area lying upstream of the site that drains onto the site and any area lying downstream of the site to which the site drains.

Off-system storage Facilities for holding or retaining excess flows over and above the carrying capacity of the stormwater conveyance system, in chambers, tanks, lagoons, ponds, or other basins that are not a part of the subsurface sewer system.

On-site The entire property that includes the proposed development.

OperationalBMPs Schedules of activities, prohibition of practices, and other managerial practices to prevent or reduce pollutants from entering stormwater. Operational BMPs are a type of Source Control BMP.

Ordinary High Water Mark The term ordinary high water mark means the line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank; shelving; changes in the character of soil destruction on terrestrial vegetation, or the presence of litter and debris; or other appropriate means that consider the characteristics of the surrounding area.

The ordinary high water mark will be found by examining the bed and banks of a stream and ascertaining where the presence and action of waters are so common and usual, and so long maintained in all ordinary years, as to mark upon the soil a character distinct from that of the abutting upland, in respect to vegetation. In any area where the ordinary high water mark cannot be found, the line of mean high water shall substitute. In any area where neither can be found, the channel bank shall be substituted. In braided channels and alluvial fans, the ordinary high water mark or substitute shall be measured so as to include the entire stream feature.

Orifice An opening with closed perimeter, usually sharp-edged, and of regular form in a plate, wall, or partition through which water may flow, generally used for the purpose of measurement or control of water.

Outlet Point of water disposal from a stream, river, lake, tidewater, or artificial drain.

Outlet channel A waterway constructed or altered primarily to carry water from man-made structures, such as terraces, tile lines, and diversions.

Overflow A pipeline or conduit device, together with an outlet pipe, that provides for the discharge of portions of combined sewer flows into receiving waters or other points of disposal, after a regular device has allowed the portion of the flow which can be handled by interceptor sewer lines and pumping and treatment facilities to be carried by and to such water pollution control structures.

Overflow rate Detention basin release rate divided by the surface area of the basin. It can be thought of as an average flow rate through the basin.

Overtopping To flow over the limits of a containment or conveyance element.

Peak discharge — The maximum instantaneous rate of flow during a storm, usually in reference to a specific design storm event.

Peak-shaving — Controlling post-development peak discharge rates to pre-development levels by providing temporary detention in a BMP.

Percolation — The movement of water through soil.

Percolation rate — The rate, usually expressed as a velocity, at which water moves through saturated granular material.

Permanent Stormwater Quality Control (PSQC) Plan — A plan which includes permanent BMPs for the control of pollution from stormwater runoff after construction and/or land disturbing activity has been completed. For small sites, this requirement is met by implementing a Small Parcel Erosion and Sediment Control Plan. Guidance on preparing a PSQC Plan is contained in Chapter I-3 and Chapter I-4. *[Note: Ecology will add a sample Large Parcel ESC Plan to the Guidance Manual.]*

Permeability rate — The rate at which water will move through a saturated soil. Permeability rates are classified as follows:

a. Very slow - Less than 0.06 inches per hour.
b. Slow - 0.06 to 0.20 inches per hour.
c. Moderately slow - 0.20 to 0.63 inches per hour.
d. Moderate - 0.63 to 2.0 inches per hour.
e. Moderately rapid - 2.0 to 6.3 inches per hour.
f. Rapid - 6.3 to 20.0 inches per hour.
g. Very rapid - More than 20.0 inches per hour.

Permeable soils — Soil materials with a sufficiently rapid infiltration rate so as to greatly reduce or eliminate surface and stormwater runoff. These soils are generally classified as SCS hydrologic soil types A and B.

Person — Any individual, partnership, corporation, association, organization, cooperative, public or municipal corporation, agency of the state, or local government unit, however designated.

Perviousness — Related to the size and continuity of void spaces in soils; related to a soil's infiltration rate.

Pesticide — A general term used to describe any substance - usually chemical - used to destroy or control organisms; includes herbicides, insecticides, algicides, fungicides, and others. Many of these substances are manufactured and are not naturally found in the environment. Others, such as pyrethrum, are natural toxins which are extracted from plants and animals.

pH A measure of the alkalinity or acidity of a substance which is conducted by measuring the concentration of hydrogen ions in the substance. A pH of 7.0 indicates neutral water. A 6.5 reading is slightly acid.

Physiographic Characteristics of the natural physical environment (including hills).

Planned unit development (PUD) A special classification authorized in some zoning ordinances, where a unit of land under control of a single developer may be used for a variety of uses and densities, subject to review and approval by the local governing body. The locations of the zones are usually decided on a case-by-case basis.

Plat A map or representation of a subdivision showing the division of a tract or parcel of land into lots, blocks, streets, or other divisions and dedications.

Plunge pool A device used to dissipate the energy of flowing water that may be constructed or made by the action of flowing. These facilities may be protected by various lining materials.

Point discharge The release of collected and/or concentrated surface and stormwater runoff from a pipe, culvert, or channel.

Pollution Contamination or other alteration of the physical, chemical, or biological properties, of waters of the state, including change in temperature, taste, color, turbidity, or odor of the waters, or such discharge of any liquid, gaseous, solid, radioactive or other substance into any waters of the state as will or is likely to create a nuisance or render such waters harmful, detrimental or injurious to the public health, safety or welfare, or to domestic, commercial, industrial, agricultural, recreational, or other legitimate beneficial uses, or to livestock, wild animals, birds, fish or other aquatic life.

Pollution-generating impervious surface(PGIS) Those impervious surfaces considered to be a significant source of pollutants in stormwater runoff. Such surfaces include those which are subject to: vehicular use; industrial activities; or storage of erodible or leachable materials, wastes, or chemicals, and which receive direct rainfall or the run-on or blow-in of rainfall. Metal roofs are also considered to be PGIS unless they are treated to prevent leaching.

A surface, whether paved or not, shall be considered subject to vehicular use if it is regularly used by motor vehicles. The following are considered regularly-used surfaces: roads, unvegetated road shoulders, bike lanes within the traveled lane of a roadway, driveways, parking lots, unfenced firelanes, diesel equipment storage yards, and airport runways.

Pollution-generating impervious surface(PGIS) (continued)	The following are not considered regularly-used surfaces: road shoulders primarily used for emergency parking, paved bicycle pathways, bicycle lanes adjacent to unpaved or paved road shoulders primarily used for emergency parking, fenced firelanes, and infrequently used maintenance access roads.
Pollution-generating pervious surface	Any non-impervious surface subject to use of pesticides and fertilizers or loss of soil. Modified PGPS means any existing PGPS that is re-graded or re-contoured by the proposed project.
Prediction	For the purposes of this document an expected outcome based on the results of hydrologic modelling and/or the judgment of a trained professional civil engineer or geologist.
Pretreatment	The removal of material such as gross solids, grit, grease, and scum from flows prior to physical, biological, or physical treatment processes to improve treatability. Pretreatment may include screening, grit removal, stormwater, and oil separators.
Priority peat systems	Unique, irreplaceable fens that can exhibit water pH in a wide range from highly acidic to alkaline, including fens typified by Sphagnum species, <u>Ledum groenlandicum</u> (Labrador tea), <u>Drosera rotundifolia</u> (sundew), and <u>Vaccinium oxycoccos</u> (bog cranberry); marl fens; estuarine peat deposits; and other moss peat systems with relatively diverse, undisturbed flora and fauna. Bog is the common name for peat systems having the Sphagnum association described, but this term applies strictly only to systems that receive water income from precipitation exclusively.
Professional civil engineer	A person registered with the state of Washington as a professional engineer in civil engineering.
Project	The proposed action of a permit application or an approval which requires a drainage review.
Project site	That portion of a property or properties subject to proposed project improvements including those required by this manual.
Puget Sound basin	Puget Sound south of Admiralty Inlet (including Hood Canal and Saratoga Passage); the waters north to the Canadian border, including portions of the Strait of Georgia; the Strait of Juan de Fuca south of the Canadian border; and all the lands draining into these waters as mapped in Water Resources Inventory Areas numbers 1 through 19, set forth in WAC 173-500-040.
R/D	See Retention/detention facility.

Rare, threatened, or endangered species — Plant or animal species that are regional relatively uncommon, are nearing endangered status, or whose existence is in immediate jeopardy and is usually restricted to highly specific habitats. Threatened and endangered species are officially listed by federal and state authorities, whereas rare species are unofficial species of concern that fit the above definitions.

Rational method — A means of computing storm drainage flow rates (Q) by use of the formula Q = CIA, where C is a coefficient describing the physical drainage area, I is the rainfall intensity and A is the area. This method is no longer used in the technical manual.

Reach — A length of channel with uniform characteristics.

Receiving waters — Bodies of water or surface water systems receiving water from upstream manmade (or natural) streams.

Recharge — The flow to ground water from the infiltration of surface and stormwater runoff.

Redevelopment — On an already developed site, the creation or addition of impervious surfaces, structural development including construction, installation or expansion of a building or other structure, and/or replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities associated with structural or impervious redevelopment.

Regional — An action (here, for stormwater management purposes) that involves more than one discrete property.

Regional detention facility — A stormwater quantity control structure designed to correct existing excess surface water runoff problems of a basin or subbasin. The area downstream has been previously identified as having existing or predicted significant and regional flooding and/or erosion problems.

This term is also used when a detention facility is used to detain stormwater runoff from a number of different businesses, developments or areas within a catchment. The use of regional detention facilities may be more efficient than on-site stormwater treatment although the preferred option is to include some on-site stormwater treatment through the use of grassy swales etc. even when regional detention facilities are used.

Release rate — The computed peak rate of surface and stormwater runoff for a particular design storm event and drainage area conditions.

Replaced impervious surface — For structures, the removal and replacement of any exterior surfaces or foundation. For other impervious surfaces, the removal down to bare soil or base course and replacement, excluding impervious surfaces removed for the sole purpose of installing underground utilities.

Residential density	The number of persons per unit of residential land area. Net density includes only occupied land. Gross density includes unoccupied portions of residential areas, such as roads and open space.
Restoration	Actions performed to reestablish wetland functional characteristics and processes that have been lost by alterations, activities, or catastrophic events in an area that no longer meets the definition of a wetland.
Retention	The process of collecting and holding surface and stormwater runoff with no surface outflow.
Retention/detention facility (R/D)	A type of drainage facility designed either to hold water for a considerable length of time and then release it by evaporation, plant transpiration, and/or infiltration into the ground; or to hold surface and stormwater runoff for a short period of time and then release it to the surface and stormwater management system.
Retrofitting	The renovation of an existing structure or facility to meet changed conditions or to improve performance.
Return interval	A statistical term for the average time of expected interval that an event of some kind will equal or exceed given conditions (e.g., a stormwater flow that occurs every 2 years).
Rhizome	A modified plant stem that grows horizontally underground.
Riffles	Fast sections of a stream where shallow water races over stones and gravel. Riffles usually support a wider variety of bottom organisms than other stream sections.
Rill	A small intermittent watercourse with steep sides, usually only a few inches deep. Often rills are caused by an increase in surface water flow when soil is cleared of vegetation.
Riprap	A facing layer or protective mound of stones placed to prevent erosion or sloughing of a structure or embankment due to flow of surface and stormwater runoff.
Riparian	Pertaining to the banks of streams, wetlands, lakes or tidewater.
Riser	A vertical pipe extending from the bottom of a pond BMP that is used to control the discharge rate from a BMP for a specified design storm.
Rodenticide	A substance used to destroy rodents.
Runoff	Water originating from rainfall and other precipitation that is found in drainage facilities, rivers, streams, springs, seeps, ponds, lakes and wetlands as well as shallow ground water.
SCS	Soil Conservation Service, U.S. Department of Agriculture.

SCS Method — A hydrologic analysis based on the Curve Number method (National Engineering Handbook - Section 4: Hydrology, August 2971).

SEPA — See State Environmental Policy Act.

Salmonid — A member of the fish family Salmonidae. Chinook, coho, chum, sockeye and pink salmon; cutthroat, brook, brown, rainbow and steelhead trout; Dolly Varden, kokanee and char are examples of salmonid species.

Saturation point — In soils, the point at which a soil or an aquifer will no longer absorb any amount of water without losing an equal amount.

Scour — Erosion of channel banks due to excessive velocity of the flow of surface and stormwater runoff.

Sediment — Fragmented material that originates from weathering and erosion of rocks or unconsolidated deposits, and is transported by, suspended in, or deposited by water.

Sedimentation — The depositing or formation of sediment.

Sensitive emergent vegetation communities — Assemblages of erect, rooted, herbaceous vegetation, excluding mosses and lichens, at least some of whose members have relatively narrow ranges of environmental requirements, such as hydroperiod, nutrition, temperature, and light. Examples include fen species such as sundew and, as well as a number of species of Carex (sedges).

Sensitive life stages — Stages during which organisms have limited mobility or alternatives in securing the necessities of life, especially including reproduction, rearing, and migration periods.

Sensitive scrub-shrub vegetation communities — Assemblages of woody vegetation less than 6 meters in height, at least some of whose members have relatively narrow ranges of environmental requirements, such as hydroperiod, nutrition, temperature, and light. Examples include fen species such as Labrador tea, bog laurel, and cranberry.

Settleable solids — Those suspended solids in stormwater that separate by settling when the stormwater is held in a quiescent condition for a specified time.

Sheet erosion — The relatively uniform removal of soil from an area without the development of conspicuous water channels.

Sheetflow — Runoff which flows over the ground surface as a thin, even layer, not concentrated in a channel.

Shoreline development — The proposed project as regulated by the Shoreline Management Act. Usually the construction over water or within a shoreline zone (generally 200 feet landward of the water) of structures such as buildings, piers, bulkheads, and breakwaters, including environmental alterations such as dredging and filling, or any project which interferes with public navigational rights on the surface waters.

Short circuiting — The passage of runoff through a BMP in less than the design treatment time.

Siltation — The process by which a river, lake, or other water body becomes clogged with sediment. Silt can clog gravel beds and prevent successful salmon spawning.

Site — A property which is subject to development.

Slope — Degree of deviation of a surface from the horizontal; measured as a numerical ratio, percent, or in degrees. Expressed as a ratio, the first number is the horizontal distance (run) and the second is the vertical distance (rise), as 2:1. A 2:1 slope is a 50 percent slope. Expressed in degrees, the slope is the angle from the horizontal plane, with a 90° slope being vertical (maximum) and 45° being a 1:1 or 100 percent slope.

Sloughing — The sliding of overlying material. It is the same effect as caving, but it usually occurs when the bank or an underlying stratum is saturated or scoured.

Small Parcel — Single family residential and small subdivision projects that add less than 10,000 ft2 of impervious surface and disturb less than 1 acre. Other types of development projects that add less than 5,000 ft2 of impervious surface and disturb less than 1 acre.

Soil — The unconsolidated mineral and organic material on the immediate surface of the earth that serves as a natural medium for the growth of land plants.

Soil group, hydrologic — A classification of soils by the Soil Conservation Service into four runoff potential groups. The groups range from A soils, which are very permeable and produce little or no runoff, to D soils, which are not very permeable and produce much more runoff.

Soil horizon — A layer of soil, approximately parallel to the surface, that has distinct characteristics produced by soil-forming factors.

Soil profile — A vertical section of the soil from the surface through all horizons, including C horizons.

Soil structure — The relation of particles or groups of particles which impart to the whole soil a characteristic manner of breaking; some types are crumb structure, block structure, platy structure, and columnar structure.

Soil permeability — The ease with which gases, liquids, or plant roots penetrate or pass through a layer of soil.

Soil stabilization — The use of measures such as rock lining, vegetation or other engineering structures to prevent the movement of soil when loads are applied to the soil.

Sorption — The physical or chemical binding of pollutants to sediment or organic particles.

Source control BMP — A BMP that is intended to prevent pollutants from entering stormwater. A few examples of source control BMPs are erosion control practices, maintenance of stormwater facilities, constructing roofs over storage and working areas, and directing wash water and similar discharges to the sanitary sewer or a dead end sump.

Specific energy — The total energy within any system with respect to the channel bottom, equal to the potential head plus velocity and pressure heads.

Spillway — A passage such as a paved apron or channel for surplus water over or around a dam or similar obstruction. An open or closed channel, or both, used to convey excess water from a reservoir. It may contain gates, either manually or automatically controlled, to regulate the discharge of excess water.

State Environmental Policy Act (SEPA) — The Washington State law intended to minimize environmental damage. SEPA requires that state agencies and local governments consider environmental factors when making decisions on activities, such as development proposals over a certain size and comprehensive plans. As part of this process, environmental documents are prepared and opportunities for public comment are provided.

Steep slope — Slopes of 40 percent gradient or steeper.

Storm drains — The enclosed conduits that transport surface and stormwater runoff toward points of discharge (sometimes called storm sewers).

Storm drain system — Refers to the system of gutters, pipes, streams, or ditches used to carry surface and stormwater from surrounding lands to streams, lakes, or Puget Sound.

Storm frequency — The time interval between major storms of predetermined intensity and volumes of runoff for which storm sewers and other structures are designed and constructed to handle hydraulically without surcharging and backflooding, e.g., a 2-year, 10-year or 100-year storm.

Storm sewer — A sewer that carries stormwater and surface water, street wash and other wash waters or drainage, but excludes sewage and industrial wastes. Also called a storm drain.

Stormwater — That portion of precipitation that does not naturally percolate into the ground or evaporate, but flows via overland flow, interflow, channels or pipes into a defined surface water channel, or a constructed infiltration facility.

Stormwater drainage system — constructed and natural features which function together as a system to collect, convey, channel, hold, inhibit, retain, detain, infiltrate, divert, treat or filter stormwater.

Stormwater facility — A constructed component of a stormwater drainage system, designed or constructed to perform a particular function, or multiple functions. Stormwater facilities include, but are not limited to, pipes, swales, ditches, culverts, street gutters, detention basins, retention basins, constructed wetlands, infiltration devices, catchbasins, oil/water separators, sediment basins and modular pavement.

Stormwater Management Manual for the Puget Sound Basin or "Manual" — this manual as prepared by Ecology that contains BMPs to prevent, control or treat pollution in stormwater [or a technically equivalent Manual approved by Ecology].

Stormwater Program — Either the Basic Stormwater Program or the Comprehensive Stormwater Program as appropriate to the context of the reference. See the "Stormwater Program Guidance Manual for the Puget Sound Basin" for a complete description of the requirements of each program.

Stormwater Site Plan — a plan which includes an Erosion and Sediment Control (ESC) Plan and/or a Permanent Stormwater Quality Control Plan (PSQC). For small sites, this plan is the equivalent of a Small Parcel Erosion and Sediment Control Plan. Guidance on preparing a Stormwater Site Plan is contained in Chapter I-3.

Stream gaging — The quantitative determination of stream flow using gages, current meters, weirs, or other measuring instruments at selected locations. See Gaging station.

Streambanks — The usual boundaries, not the flood boundaries, of a stream channel. Right and left banks are named facing downstream.

Stream classification The following stream classification which applies to all streams.

1. Type 1 streams are all streams inventoried as Shorelines of the State under Chapter 90.58 RCW.
2. Type 2 streams are all streams smaller than Type 1 streams that flow year around during years of normal rainfall, or are used by salmonids.
3. Type 3 streams are streams that are intermittent or ephemeral during years of normal rainfall and are not used by salmonids.

Streams Those areas where surface waters flow sufficiently to produce a defined channel or bed. A defined channel or bed is indicated by hydraulically sorted sediments or the removal of vegetative litter or loosely rooted vegetation by the action of moving water. The channel or bed need not contain water year-round. This definition is not meant to include irrigation ditches, canals, stormwater runoff devices or other entirely artificial watercourses unless they are used to convey Type 1 and 2 streams naturally occurring prior to construction. Those topographic features that resemble streams but have no defined channels (i.e. swales) shall be considered streams when hydrologic and hydraulic analyses done pursuant to a development proposal predict formation of a defined channel after development.

Structure A catchbasin or manhole in reference to a storm drainage system.

Structural Source Control BMPs Physical, structural, or mechanical devices that are intended to prevent pollutants from entering stormwater.

Stub-out A short length of pipe provided for future connection to a storm drainage system.

Subbasin A drainage area which drains to a water course or waterbody named and noted on common maps and which is contained within a basin.

Subcatchment A subdivision of a drainage basin (generally determined by topography and pipe network configuration).

Subcritical flow Flow at depths greater than the critical depth.

Sub-division retention/detention facility A retention/detention facility which is both (1) located within or associated with a short or formal plat sub-division containing only single family or duplex residential structures located on individual lots; and 2) which is required to handle excess runoff generated by development of an area of which two-thirds or more is designated for single family or duplex residential structures located on individual lots.

Subdrain A pervious backfilled trench containing stone or a pipe for intercepting ground water or seepage.

Subgrade — A layer of stone or soil used as the underlying base for a BMP.

Subsoil — The B horizons of soils with distinct profiles. In soils with weak profile development, the subsoil can be defined as the soil below the plowed soil (or its equivalent of surface soil), in which roots normally grow. Although a common term, it cannot be defined accurately. It has been carried over from early days when "soil" was conceived only as the plowed soil and that under it as the "subsoil."

Substrate — The natural soil base underlying a BMP.

Supercritical flow — Flow at depths less than the critical depth.

Surcharge — The flow condition occurring in closed conduits when the hydraulic grade line is above the crown of the sewer.

Surface and stormwater — Water originating from rainfall and other precipitation that is found in drainage facilities, rivers, streams, springs, seeps, ponds, lakes, and wetlands as well as shallow ground water.

Surface and stormwater management system — Drainage facilities and any other natural features which collect, store, control, treat and/or convey surface and stormwater.

Suspended solids — Organic or inorganic particles that are suspended in and carried by the water. The term includes sand, mud, and clay particles (and associated pollutants) as well as solids in stormwater.

Swale — A shallow drainage conveyance with relatively gentle side slopes, generally with flow depths less than one foot.

Terrace — An embankment or combination of an embankment and channel across a slope to control erosion by diverting or storing surface runoff instead of permitting it to flow uninterrupted down the slope.

Threshold Discharge Area — An onsite area draining to a single natural discharge location or multiple natural discharge locations that combine within one-quarter mile downstream (as determined by the shortest flowpath). The examples below illustrate this definition. The purpose of this definition is to clarify how the thresholds of this manual are applied to project sites with multiple discharge points.

Drawings of three different situations depicting the relationship of project sites, natural discharge locations, and threshold discharge areas.

Tile, Drain — Pipe made of burned clay, concrete, or similar material, in short lengths, usually laid with open joints to collect and carry excess water from the soil.

Tile drainage — Land drainage by means of a series of tile lines laid at a specified depth and grade.

Time of concentration — The time period necessary for surface runoff to reach the outlet of a subbasin from the hydraulically most remote point in the tributary drainage area.

Toe of slope — A point or line of slope in an excavation or cut where the lower surface changes to horizontal or meets the exiting ground slope.

Top of slope — A point or line on the upper surface of a slope where it changes to horizontal or meets the original surface.

Topography — General term to include characteristics of the ground surface such as plains, hills, mountains; degree of relief, steepness of slopes, and other physiographic features.

Total dissolved solids — The dissolved salt loading in surface and subsurface waters.

Total solids — The solids in water, sewage, or other liquids, including the dissolved, filterable, and nonfilterable solids. The residue left when the moisture is evaporated and the remainder is dried at a specified temperature, usually 130°C.

Toxic — Poisonous, carcinogenic, or otherwise directly harmful to life.

Tract — A legally created parcel of property designated for special nonresidential and noncommercial uses.

Trash rack — A structural device used to prevent debris from entering a spillway or other hydraulic structure.

Travel time — The estimated time for surface water to flow between two points of interest.

Treatment BMP — A BMP that is intended to remove pollutants from stormwater. A few examples of treatment BMPs are detention ponds, oil/water separators, biofiltration swales and constructed wetlands.

Turbidity — Dispersion or scattering of light in a liquid, caused by suspended solids and other factors; commonly used as a measure of suspended solids in a liquid.

Underdrain — Plastic pipes with holes drilled through the top, installed on the bottom of an infiltration BMP which are used to collect and remove excess runoff.

Undisturbed buffer	A zone where development activity shall not occur, including logging, and/or the construction of utility trenches, roads, and/or surface and stormwater facilities.
Undisturbed low gradient uplands	Forested land, sufficiently large and flat to infiltrate surface and storm runoff without allowing the concentration of water on the surface of the ground.
Unstable slopes	Those sloping areas of land which have in the past exhibited, are currently exhibiting, or will likely in the future exhibit, mass movement of earth.
Unusual biological community types	Assemblages of interacting organisms that are relatively uncommon regionally.
Urbanized area	Areas designated and identified by the U.S. Bureau of Census according to the following criteria: an incorporated place and densely settled surrounding area that together have a maximum population of 50,000.
USEPA	The United States Environmental Protection Agency.
Values	Wetland processes or attributes that are valuable or beneficial to society (also see Functions). Wetland values include support of commercial and sport fish and wildlife species, protection of life and property from flooding, recreation, education, and aesthetic enhancement of human communities.
Vegetation	All organic plant life growing on the surface of the earth.
Water body	Surface waters including rivers, streams, lakes, marine waters, estuaries, and wetlands.
Water quality	A term used to describe the chemical, physical, and biological characteristics off water, usually in respect to its suitability for a particular purpose.
Water quality BMP	A BMP specifically designed for pollutant removal.
Water quality design storm	The 6-month 24-hour design storm.
Water quality standards	Minimum requirements of purity of water for various uses; for example, water for agricultural use in irrigation systems should not exceed specific levels of sodium bicarbonate, pH, total dissolved salts, etc. In Washington, the Department of Ecology sets water quality standards.
Water quality swale	An open vegetated drainage channel intended to optimize water quality treatment of surface and stormwater runoff by following the specific design criteria described in the manual.

Watershed — A geographic region within which water drains into a particular river, stream, or body of water as identified and numbered by the State of Washington Water Resource Inventory Areas (WRIAs) as defined in Chapter 173-500 WAC.

Water table — The upper surface or top of the saturated portion of the soil or bedrock layer, indicates the uppermost extent of ground water.

Weir — Device for measuring or regulating the flow of water.

Weir notch — The opening in a weir for the passage of water.

Wetlands — Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas. This includes wetlands created, restored or enhanced as part of a mitigation procedure. This does not include constructed wetlands or the following surface waters of the state intentionally constructed from sites that are not wetlands: Irrigation and drainage ditches, grass-lined swales, canals, agricultural detention facilities, farm ponds, and landscape amenities.

Wetland edge — Delineation of the wetland edge shall be based on the U.S. Army Corps of Engineers Wetlands Delineation Manual, Technical Report Y-87-1, U.S. Army Engineers Waterways Experiment Station, Vicksburg, Miss. (1987)

Wetponds and wetvaults — Drainage facilities for water quality treatment that contain permanent pools of water that are filled during the initial runoff from a storm event. They are designed to optimize water quality by providing retention time in order to settle out particles of fine sediment to which pollutants such as heavy metals absorb, and to allow biologic activity to occur that metabolizes nutrients and organic pollutants.

Zoning ordinance — An ordinance based on the police power of government to protect the public health, safety, and general welfare. It may regulate the type of use and intensity of development of land and structures to the extent necessary for a public purpose. Requirements may vary among various geographically defined areas called zones. Regulations generally cover such items as height and bulk of buildings, density of dwelling units, off-street parking, control of signs, and use of land for residential, commercial, industrial, or agricultural purposes. A zoning ordinance is one of the major methods for implementation of a comprehensive plan.

Notations

This list of notations is provided only as a guide to some of the notations used in this report. The exact definition and units are listed when the symbol is used. Since the same symbol can be used for different design methods, the exact definition should be obtained directly from the appropriate section of the report.

A	=	drainage area (mi^2), also full cross-sectional area of culvert barrel (ft^2)
A_b	=	top surface area of basin (ft^2), also area of pond bottom (ft^2)
A_d	=	drainage area
A_p	=	surface area of porous asphalt pavement (ft^2)
A_s	=	surface area of swale (ft^2), also average surface area for detention BMP
A_t	=	total area (acres)
C	=	estimated runoff coefficient
CN	=	SCS runoff curve number
ΔCN	=	change in curve number
D	=	interior height of culvert barrel (ft)
D_{50}	=	median stone diameter (riprap)
d	=	average permanent pool depth of a detention BMP
d_b	=	basin depth (ft)
d_c	=	critical depth (ft)
d_p	=	depth of porous asphalt paving stone subbase (ft)
d_s	=	depth of swale check dam (ft)
dt	=	time interval in minutes
d_x	=	a mixture of riprap sizes where the percent of stone by weight is $<x$ (the specified diameter)
E	=	designated fraction of particulates to be removed by a BMP
f	=	final infiltration rate of soil (in/hr)

f_d = infiltration rate including a safety factor of two

g = acceleration due to gravity, 32.2 ft/sec^2

H = stage height (ft) or water depth above pond bottom, also $H = H_f + H_e + H_{ex}$; head on orifice

H_c = specific head at critical depth ($d_c + V_c^2/2g$) (ft)

H_d = design depth of pond

H_e = entrance head loss (ft) = $K_e(V^2/2g)$

H_{ex} = exit head loss (ft) = $V^2/2g$

H_f = Friction loss (ft) = $V^2n^2L/2.22R^{1.35}$ Note: if (H_f + TW - LS) <D, adjust H_f such that (H_f + TW - LS) = D. This will keep the analysis simple and still yield reasonable results (erring on the conservative side)

HW = headwater depth above inlet invert (ft)

h_b = distance from the hydraulic grade line at the 2-year flow on the outflow pipe to the overflow elevation

I = inflow at time 1 and time 2

I(t) = instantaneous hydrograph, in cfs (SBUH hydrograph method)

i = hydraulic gradient (ft/ft)

K_e = entrance loss coefficient

k = time of concentration velocity factor (feet/second)

k_c = time of concentration velocity factor; channel flow

k_s = time of concentration velocity factor; shallow flow

L = distance of flow across a given segment, also length of culvert (ft), also width of emergency overflow weir

MB_{el} = mean tributary basin elevation above sea level (ft)

M_s = potential average snowmelt during storms (in)

m = number of flow segments

N_s = number of check dams along total length of swale

n	=	Manning's "n"
n_s	=	sheet flow; Manning's effective roughness coefficient
O	=	outflow at time 1 and time 2
P	=	rainfall depth (inches)
P_R	=	the total precipitation at a site for the 24-hour design storm event for the given return frequency (R)
Q	=	flow or discharge (cfs), also runoff depth from overlying area of dry well (ft), also orifice area
Q_a	=	after development depth of runoff (inches)
Q_b	=	before development depth of runoff (inches)
Q_c	=	depth of runoff from contributing area (ft)
Q_d	=	runoff depth in inches over a given area
Q_o	=	average release rate from detention BMP
Q_s	=	depth of runoff controlled by vegetated swale (inches)
Q_t	=	release rate for orifice
Q_{total}	=	total flow at maximum head
$Q(t)$	=	the routed flow of the runoff hydrograph (SBUH method)
$Q_{10\%}$	=	the flow that is not exceeded more than 10% of the time during the months of adult (salmonid) migration
ΔQ	=	change in runoff depth (inches)
Δq	=	change in peak discharge (cfs)
R	=	hydraulic radius (ft) in Manning's equation
$R(t)$	=	the total runoff depth at time increment dt, in inches; also known as precipitation excess
S	=	storage at time 1 and time 2, also culvert barrel slope (ft/ft)
$S(H)$	=	storage (ft^3) at stage height (H)
S_d	=	the largest volume from an initial pond sizing

s_f	=	friction slope = $n^2V^2/2.21R^{4/3}$
s_o	=	slope of flow path (ft/ft), also bottom slope
T	=	width of swale or vegetated filter strip
T_c	=	time of concentration (hrs)
T_t	=	travel time of overland flow across separate flow path segments
$T_{1,2,n}$	=	the consecutive flow paths of different land cover categories having significant differences in flow path slope
TW	=	tailwater depth above invert of culvert outlet (ft) Note: if TW < $(D + d_c)/2$, set TW = $(D + d_c)/2$.
t_d	=	design detention time of a BMP
Δt	=	time interval; time 2 - time 1
V	=	average velocity across the land cover (ft/sec), also barrel velocity (fps), also mean velocity
V_c	=	flow velocity at critical depth (fps)
V_{max}	=	maximum allowed velocity of runoff in a biofilter
V_{pp}	=	permanent pool volume
V_r	=	void ratio
V_{sed}	=	settling velocity of the deign soil particle
W_{50}	=	the median stone size (riprap)
w	=	settling velocity of target particle
y	=	depth of flow
y_n	=	normal flow depth
Z	=	basin side slope ratio (h:v)
Z^1,Z^2	=	side slope ratio of swale cross section (h:v)
α	=	energy coefficient which corrects for the non-uniform distribution of velocity over the channel cross-section

Re: Petition for Review Concerning the Los Angeles County SUSMP
(SWRCB Files A-1280, A-1280(a) and A-1280(b))

Dear Ms. Jennings:

The purpose of this letter is to provide comments on the Petition for Review which was submitted to the State Board challenging the SUSMP which was adopted on January 26, 2000 by the Los Angeles Regional Board for new developments in Los Angeles County. We supported the adoption of the SUSMP in a letter to the Regional Board dated January 13, 2000, and we also provided testimony in the support of the SUSMP at the January 26, 2000 adoption hearing. We have reviewed the arguments in the Petition for Review and we continue to believe that the Regional Board acted properly in adopting the SUSMP. Our comments on the specific issues raised in the Petition for Review are enclosed.

Should you have any questions regarding this matter, please call me at (415) 744-1860, or Eugene Bromley of the CWA Standards and Permits Office at (415) 744-1906.

Sincerely,

Alexis Strauss
Director, Water Division

cc: Xavier Swamikannu, Los Angeles Regional Board

ENCLOSURE - Region 9 Comments on the Petition for Review Concerning the Los Angeles County SUSMP

1) Compliance with California Water Code Section 13360

The Petitioners have argued that the SUSMP violates Section 13360 of the California Water Code which prohibits the Regional Board from specifying the "design, location, type of construction, or particular manner" in which compliance with a permit is to be achieved. The Petitioners note that the SUSMP specifies a "design" storm for which treatment or mitigation must be provided and contend that this violates Section 13360. EPA disagrees with this argument. Although the SUSMP specifies a particular storm for which treatment or mitigation must be provided, the exact nature of the mitigation is not specified in the SUSMP.

The SUSMP is a technology-based effluent limitation which is the same category of effluent limitation as secondary treatment effluent limitations for POTWs, or similar numeric effluent limitations for industrial sources. Technology-based effluent limitations most commonly specify a pollutant concentration which must be achieved. To ensure compliance with Section 13360, these effluent limitations do not specify the manner in which compliance is to be achieved. Although the SUSMP specifies a numeric "design" storm, the SUSMP also provides flexibility in selecting and implementing different control technologies similar to that which is provided to a POTW or industrial facility in designing for compliance with their effluent limitations.

The effect of having the "design" storm in the SUSMP is simply to select for treatment or mitigation that fraction of the total storm water discharges which are generated by the first 0.75" of rainfall. For a POTW, mitigation (sufficient to comply with numeric effluent limitations) must be provided for 100% of the wastewater which is discharged rather than just a portion as in the case of the SUSMP. In neither case is the exact nature of the treatment or mitigation specified. Therefore, we believe that the SUSMP is consistent with Section 13360.

The SUSMP might seem more familiar to the Petitioners if numeric effluent limitations were specified for the runoff generated by the design storm. Even this would be consistent with Section 13360 since only the effluent limitation would be specified and not the manner of compliance.

2) Appropriateness of the Numeric Standards in Meeting MEP

Despite the arguments raised by the Petitioners, we believe that the numeric standards for post-construction controls in the SUSMP are fully consistent with the requirement in the Clean Water Act to reduce pollutants to the maximum extent practicable (MEP). Region 9's January 13, 2000 letter to the Regional Board noted that NPDES regulations at 40 CFR 122.26(d)(2)(iv)(A)(2) require that MS4 permittees include requirements for post-construction storm water controls in their storm water management programs. EPA's guidance manual for Part 2 MS4 permit applications (EPA 833-B-92-002) specifically encourages "design criteria and performance standards" for post-construction control measures for storm water discharges.

Design criteria are appropriate to ensure an adequate and enforceable level of control over the pollutants in the discharges.

Region 9 also pointed out in its letter of January 13, 2000 that requirements similar to the Regional Board's SUSMP already exist in other areas such as the State of Florida, the Puget Sound area in Washington, Prince George's County in Maryland and selected cities such as Phoenix, AZ. The experiences in these other areas show that the SUSMP requirements can be achieved without an excessive burden on developers. We believe these experiences show that the SUSMP is consistent with the requirement to reduce pollutants in storm water runoff to the MEP level.

A Petitioner also argued that a recent decision by the Ninth Circuit (Defenders of Wildlife v. Browner 191 F.3d 1159, 1166-67 (9th Cir. 1999)) indicates that numeric standards are not required by the Clean Water Act for MS4 permits. However, this case involved numeric water quality-based effluent limitations rather than technology-based effluent limitations. The SUSMP is a technology-based effluent limitation based on the MEP requirements of the Clean Water Act. As such, the Ninth Circuit case does not support the Petitioner on this matter. Moreover, the Court found that the Regional Board could include numeric water quality-based effluent limitations at its discretion.

3) Compliance with the California Administrative Procedure Act, CEQA, and the Unfunded Mandate Provisions of the California Constitution

The Petitioners have argued that since the SUSMP is allegedly not a Federal requirement, it violates the California Administrative Procedure Act, CEQA, and also the unfunded mandate provisions of the California Constitution. We disagree that the SUSMP is not a Federal requirement. The SUSMP is simply the Regional Board's best judgment as to what it is required to do in order to comply with Federal NPDES regulations at 40 CFR 122.26(d)(2)(iv)(A)(2). As noted above under item #2, EPA's guidance manual for Part 2 MS4 permit applications specifically encourages design criteria in complying with the regulations.

4) Cost-Effectiveness of the SUSMP

The Petitioners have objected that the Regional Board has not adequately addressed the issue of whether the SUSMP is cost-effective. They note that the Los Angeles County MS4 permit includes cost-effectiveness as one of the factors to be considered in developing SUSMP requirements. However, the Regional Board has conducted certain cost analyses which are discussed in the Regional Board's Response to the Petition and which support the SUSMP. Further, EPA's final Phase II storm water regulations included a cost/benefit analysis for the regulations, including the six minimum measures which would be required to be implemented by the MS4s covered by the regulations. Post-construction storm water controls similar to those which would be required by the Regional Board's SUSMP are one of the six minimum measures required by the Phase II regulations. EPA's analysis shows that the six minimum measures are cost-effective. In addition, this analysis concludes that the inclusion of post-construction controls in new developments (such as required by the SUSMP) is the most cost-effective of all approaches to storm water quality management. EPA believes that the Regional Board's analyses, buttressed by EPA's analysis for the Phase II regulations, adequately addresses the Petitioners' concerns regarding the cost-effectiveness of the SUSMP.

We would also point out that a number of TMDLs, such as the trash TMDL which was distributed for comment on March 17, 2000, are currently under development in the Los Angeles area. By itself, the SUSMP may not ensure that the pollutant loading reductions called for by the TMDLs are attained, but we would expect that the SUSMP would be an important contributor to the needed reductions. By implementing the SUSMP (and doing so as expeditiously as possible), the SUSMP should ultimately ease the costs and burdens of complying with the TMDLs.

As another indicator of EPA's belief in the value of including appropriate controls in the design of new developments, EPA's Office of Science and Technology is in the process of developing effluent limitations guidelines for construction site discharges. These regulations are expected to address runoff during the construction phase as well as post-construction discharges. However, the guidelines are still being developed and the specific requirements remain to be seen. The guidelines will not even be proposed until 2002, and we believe the Regional Board acted appropriately to adopt its SUSMP now to expedite the water quality benefits from the controls.

Petitioners have also expressed concern regarding whether meaningful pollutant reductions could be expected from the SUSMP. Performance data for the types of controls contemplated by the SUSMP can be found in any of a number of BMP manuals, including the California Storm Water Best Management Practices Handbooks. EPA and ASCE have also just recently established a national database of BMP effectiveness information. The data indicate that BMP effectiveness will vary substantially depending on the particular BMP and the pollutant involved. However, the data indicate that overall, the SUSMP should result in meaningful pollutant loading reductions in the discharges.

5) Regional Board Procedures in Reviewing and Approving the SUSMP

The Petitioners argued that the Regional Board failed to follow the procedures in Part 2.I.G of the Los Angeles County MS4 permit in reviewing the SUSMP. However, we would point out that SUSMP which was originally submitted in July, 1999 was the subject of workshops on August 10, 1999 and September 9, 1999, and numerous meetings with interested parties prior to the final adoption hearing on January 26, 2000.

Although the Regional Board may not have followed exactly the procedures in the MS4 permit, EPA believes the Regional Board's procedures have afforded commenters ample time and opportunity to express their views on issues surrounding the SUSMP. Therefore, EPA believes that the Regional Board has acted reasonably and in accord with the intent of the permit.

We would also point out that the permit requires that individual permittees submit their own programs consistent with the SUSMP no later than July 31, 1999, a deadline which has past. As we have noted previously, we believe it is important to expedite the SUSMP to realize its benefits as soon as possible in order to address existing water quality impairments.

6) Ground Water Concerns

The Petitioners have argued that compliance with the SUSMP may adversely affect ground water resources. However, in response to this issue, we would point out that the SUSMP includes waiver provisions in section 11 which address this concern.

Mr. Xavier Swamikannu
Stormwater Program
Water Quality Control Board
320 W. 4th Street, Suite 200
Los Angeles, California 90013

Dear Ms. Jennings and Mr. Swamikannu:

This letter is sent in response to the email that I received from Mr. Swamikannu on May 19 requesting information about the State of Florida's stormwater treatment requirements. Where appropriate I also have included information that may be helpful about stormwater treatment programs in other states. This information was collected and published in the books *Institutional Aspects of Urban Runoff Programs: A Guide for Program Development* and *Implementation and Operation, Maintenance, and Management of Stormwater Management Systems*. I also have enclosed a paper that I use in teaching stormwater classes that I think will be helpful.

You specifically requested a response to the following questions:

1. **Why did your state elect to have requirements on new development and redevelopment?**

Studies conducted in the mid to late 1970s as part of the Section 208 Areawide Water Quality Management Program demonstrated that stormwater was a significant source of water pollution, especially from urban development. These studies also demonstrated that it was much easier and cheaper to prevent stormwater pollution using BMPs than to restore degrade water bodies and retrofit already developed areas. Accordingly, given the rapid urban growth Florida was experiencing in the late 1970s and the project growth in the 1980s, the Department of Environmental Protection determined that stormwater was a pollution source that needed treating. Consequently, the Environmental Regulation Commission adopted an interim stormwater rule requiring treatment in 1979 until further studies could be done on BMP effectiveness. On February 1, 1982, the final state stormwater rule was adopted requiring all new development and redevelopment activities to treat their runoff.

Today, six states in the country (Florida, Maryland, Delaware, Virginia, South Carolina, and Massachusetts) have adopted laws or rules that require the treatment of runoff from new developments. In addition, there are numerous regional (i.e., Puget Sound) and local governments that have implemented requirements for stormwater treatment.

2. **Does your state have design standards and performance standards for treatment control BMPs for new development/ redevelopment?**

Under the Federal Clean Water Act, water pollution control programs can be either water quality effluent based or technology based. Every stormwater treatment program in the United States is a technology based program. The key components of a technology based program are a performance standard (desired level of stormwater treatment) and design criteria for BMPs that assure they will provide that level of treatment. To develop design criteria, a number of analyses must be conducted including rainfall characteristics (annual volume, number of storms, interevent time, etc), runoff characteristics (i.e., stormwater volume, pollutant loadings, drainage area), whether BMPs are on-line or off-line, and BMP effectiveness.

Like all stormwater treatment programs in the United States, Florida's performance standard for stormwater treatment is to reduce the average annual loading of TSS by 80% (note that this is postdevelopment loading, so even with treatment, pollutant loads almost always increase). We adopted design criteria for various stormwater treatment BMPs (ie, retention, wet detention, detention with filtration) in our first rule. These criteria have been revised periodically as we gained additional information to assure that they meet the desired level of treatment. I have included a copy of Rule 40C-42 from the St. Johns River Water Management District which is the most current of our state stormwater rules with respect to design criteria. Also please remember that, during construction, erosion and sediment control BMPs must be used to retain sediment on site.

3. **Do you have thresholds for new development and or redevelopment (impervious area; size etc) for requirements to apply.**

The threshold varies depending on the stormwater/environmental resource permitting rule. Florida's stormwater program is cooperatively implemented by DEP and our regional water management districts. Therefore, we have five sets of rules in the state. The typical threshold is the creation of 4000 square feet of impervious area.

4. **What development categories do the requirements apply to [i.e. commercial; parking lots; residential etc]?**

Our rule applies to all urban development (and many agricultural activities as well).

5. **How long have such requirements been in place. Are they statewide or region specific?**

As previously stated, the statewide stormwater rule was first adopted in 1979 with a revised comprehensive rule in place on February 1, 1982. Florida's stormwater program is cooperatively implemented by DEP and our regional water management districts. Therefore, we have five sets of rules in the state. The WMD rules combine stormwater quantity, stormwater quality, and wetlands protection into a single permit called an environmental resource permit.

6. **Have the design standards and performance standards unduly burdened cities and builders with unsupportable costs? Has compliance been difficult? Has change been for the better or have you seen none. Any noticeable improvements in water quality?**

Complying with Florida's stormwater rule is a way of life that does not impose unduly burdens on local governments or the private sector. It also has provided many jobs for the engineering profession. The only part of compliance that is difficult is assuring long term operation and maintenance of the stormwater BMPs. They need to be inspected at least annually. Unfortunately, the public sector will never have enough inspectors which is why Delaware and Florida have implemented training and certification programs for inspectors. We have no doubts that the implementation of Florida's stormwater treatment program has greatly reduced the effects of growth in Florida on water quality and is a major reason why the state has so few truly impaired waters. We also have seen improvements in water quality as a result of retrofitting older stormwater drainage systems.

7. **Typically, what is your estimate of the range in additional cost (in percent of project cost) that the requirements have imposed on builders.**

This question is very site specific since the major cost is the land cost and that varies with every site. We estimate that complying with our stormwater rules requires about 5-10 percent of the land area of a development, although much of this is related to flood protection.

8. **How have municipalities ensured that the post construction BMPs O & M has been provided and/or BMPs are properly maintained.**

As part of our permitting process, the developer must identify the responsible maintenance entity. Typically, this is a homeowner or property owners association for residential development or the property owner for commercial development. The DEP and WMDs require recertification that the stormwater system is functioning on a regular basis (every 1 to 2 years). Additionally, since stormwater systems are part of the local infrastructure, many local governments conduct inspections annually and several have implemented stormwater operating permit systems that require annual inspections. Some of the 100+ local stormwater utilities in the state provide credits for functioning onsite stormwater systems providing an economic incentive to land owners to maintain their stormwater systems.

9. What are the policy goals that the standards are intended to achieve [reverse impairment; hold the line etc.]

Florida statutes and rules establishes the goals for the state's stormwater management program. These include:

- Effective stormwater management for existing and new systems to protect, preserve and restore the functions of natural systems and the beneficial uses of waters;
- Preventing stormwater problems from new land use changes and restoring degraded water bodies by reducing the pollution contributions from older stormwater systems;
- Preserving freshwater resources by encouraging stormwater infiltration and reuse;
- Trying to assure that the stormwater peak discharge rate, volume and pollutant loading are no greater after a site is developed than before; and
- Eliminating the discharge of inadequately managed stormwater into waters and to minimize other adverse impacts on natural systems, property and the health, safety and welfare caused by improperly managed stormwater.

9. Also discuss standards and requirements in other states that you are familiar with because of you special role and expertise.

As previously stated, nearly all of the stormwater treatment programs in the United States are similar. All of the above information for 32 stormwater programs around the country are summarized in books *Institutional Aspects of Urban Runoff Programs: A Guide for Program Development.*

I hope that this information is helpful. It is truly unfortunate that the development industry is still denying that urban runoff is a major source of degradation of our aquatic ecosystems. However, don't be discouraged. When we first adopted our rule, we went through 29 official rule drafts and over 100 TAC meetings before the final rule was adopted. Given the knowledge about stormwater pollution and the effects of urbanization on aquatic ecosystems, it should be much easier to fight any challenges that arise. Please let me know if I can be of further assistance.

Sincerely,

Eric H. Livingston

Best Management Practices for Urban Stormwater Management

Eric H. Livingston
Bureau of Watershed Management
FDEP
Tallahassee, Florida

Introduction

Before discussing stormwater practices, stormwater management program considerations will be briefly reviewed. ***Successful stormwater management requires more than simply the use of runoff control techniques. It also requires a strong institutional foundation.*** A key component of this foundation is establishing effective mechanisms to assure that stormwater systems not only are designed and constructed correctly, but that they also are inspected, maintained and operated properly.

2.1 Stormwater Program Components

This section briefly discusses the many components of a successful stormwater management program. No single framework for a stormwater management program can be recommended. Flexibility is needed to establish or refine programs, based on an area's existing legal authorities and institutional framework.

Experience has shown that no single entity can do everything. ***Program implementation typically will be shared by a partnership involving all appropriate levels of government, together with the public sector and all citizens. Cooperation and coordination among all of the partners involved in program implementation are cornerstones of successful programs.*** It is especially important that the roles of each partner involved in program implementation be clearly stated. This will help to avoid duplication and distribute program activities to the entity most suited for the role. This is especially true for assuring the long term performance of stormwater management practices.

Experience also has shown that successful stormwater management programs share several common building blocks (WMI, 1997). These involve the program's institutional framework, its technical foundations, and the many activities that are undertaken by the stormwater program.

2.2. Stormwater Program Evolution to Address Existing Development

Stormwater quality management programs typically must be phased in. They usually must be integrated with existing "drainage" programs to provide coordinated management of stormwater quantity and quality. ***Initial program efforts are aimed at***

preventing and mitigating stormwater problems from new development, both during and after construction. Generally, these programs rely upon on-site planning and BMP implementation. Once all aspects, including inspections and operation/maintenance, of this new development program are running smoothly, the program can be expanded to correct stormwater problems caused by existing development and land uses (retrofitting). Section 2.3 discusses important components of programs aimed at stormwater from new development.

Establishing a program to retrofit existing stormwater systems, however, presents many technical, institutional, and financial dilemmas. In many instances, the unavailability or high cost of land in urban areas makes the use of conventional BMPs infeasible. State laws and institutional arrangements promote piecemeal, crisis-solving approaches aimed at managing stormwater within political boundaries — yet stormwater follows watershed boundaries. Finally, retrofitting usually is prohibitively expensive. With many local governments already short of funds, the need for innovative, dedicated stormwater funding sources, such as stormwater utility fees, cannot be overemphasized.

Solving existing stormwater problems will require comprehensive, coordinated, creative approaches and technology. Essential elements of a comprehensive, long-term effort to reduce pollutant loadings from existing land uses and older stormwater systems include:

A. Watershed Management

A watershed approach which integrates land use planning with the development of stormwater infrastructure is essential. After all, ***it is the intensification of land use and the increase in impervious surfaces within a watershed that creates the stormwater and water resources management problems***. Consequently, a "watershed management team" effort is necessary which involves state, regional and local governments, together with the private sector and all citizens within a watershed. Section 403.0891, Florida Statutes, and Section 62-40.432, F.A.C. (State Water Policy) create the legal institutional framework for Florida's Stormwater Management Program. This framework includes a watershed approach which relies upon the SWIM Program and the Local Government Growth Management Program. Implementation involves FDEP, the WMDs, local governments, and the private sector. To further promote watershed management in Florida, the DEP recently created a Bureau of Watershed Management that will be responsible for implementing the new rotating basin approach to water management. The bureau consists of five sections that are responsible for nearly all aspects of watershed management. The sections and their administrators include: Watershed Monitoring and Data Management (Ellen McCarron), Watershed Assessment (Jan Mandrup-Poulsen), Watershed Planning & Coordination (Fred Calder), Nonpoint Source Management and Water Quality Standards (Greg Knecht), and Ground Water Protection (Jim McNeal). Implementation of the watershed approach will be especially important given the new focus on Total Maximum Daily Loads and the implementation of the Florida Watershed Restoration Act of 1999.

B. Treatment Requirements for Older Systems (Retrofitting)

Numerous problems inherent to a highly urbanized area make it nearly impossible to apply the same stormwater design and performance standards that are applied to new developments. Instead, a "watershed loading" concept should be considered. This "big picture" approach considers the beneficial uses of the receiving waters, assesses the loadings from all pollution sources, and establishes the maximum loadings of pollutants that can be assimilated by those waters. A key element is setting a "stormwater pollutant load reduction goal" for existing untreated stormwater discharges. An ecologically based goal should be established, such as increasing the area of sea grasses or restoring habitat for desired aquatic species. It is important that the ecologically-based goal is understood by the public and determined with broad community participation. Stormwater PLRGs are required by State Water Policy and they are being established as part of the SWIM plans for the SWIM priority water bodies. Additionally, TMDLs will be established for the state's impaired waters over the next 13 years.

Success in meeting the load reduction goal will depend not only on the treatment benefits from retrofitting projects, but also by assuring that the on-site systems serving new development are constructed, operated, and maintained properly. Even with BMPs, post-development stormwater pollution loadings are still greater than pre-development levels. Minimizing stormwater pollutant loadings from new developments is essential in assuring the success of stormwater retrofitting programs. Otherwise, the desired watershed pollutant loadings will be exceeded and the community's desired ecological goals will not be achieved.

C. Selective Targeting

The extremely high cost of retrofitting older urban stormwater systems makes it essential to carefully evaluate pollutant reduction goals, allocation strategies, and BMP implementation. ***States should establish a priority watershed program which leads to development and implementation of watershed management plans***. Implementation of these long term (15-30 years) plans will be designed to protect or restore the beneficial uses of priority, targeted water bodies. In Florida, our priority watersheds are those established by the SWIM Program.

Within priority watersheds, sub-basins can be targeted based on pollution sources, flooding, and water quality problems. Regional and local stormwater master plans are an essential component of the watershed plan. In these local plans, existing stormwater systems can be targeted for modification to assure that citizens receive the greatest benefit (pollutant load reduction, flood protection) for the dollar. The upgrading of older systems also needs to be coordinated with other planned infrastructure improvements, such as road widenings, and with park, recreation, and urban redevelopment projects .

D. Alternative Controls

Nonstructural BMPs and source controls need to be used extensively to reduce stormwater pollution from already developed areas. For example, street sweepers remove lots of litter, debris, and sediments from paved surfaces even if they can't collect the smaller particles (<60 microns) which contain high concentrations of metals and other pollutants. Prohibiting and eliminating the discharge of wastewaters other than stormwater into storm sewers and other conveyances can also greatly reduce pollutant loadings. These types of controls are especially appropriate in downtown business districts, where other BMPs usually are infeasible, and in certain industrial situations.

Education programs for the public and for stormwater management professionals also are vital. Citizens, businesses, and practitioners need to understand how their everyday activities contribute to stormwater pollution. For example, citizens should not discard leaves, grass clippings, used motor oil or other material into swales or storm sewers. Yet ***many people believe that storm "sewers" go to the wastewater treatment plant and not to the nearest water body.*** Getting youth and citizen groups involved in storm sewer stenciling projects (Dump No Wastes, Drains to Lake) is an excellent way of reducing dumping of potential pollutants into these conveyances. Equally important are comprehensive training and certification programs for those in the private and public sectors who design, review, construct, inspect, operate, or maintain stormwater management systems.

E. Funding

Even just to solve existing flooding problems, the national cost of improving stormwater infrastructure is gigantic. Yet, local governments already are struggling financially. ***Traditional revenue sources such as property taxes cannot be relied upon to pay for stormwater management.*** Alternative funding sources are needed.

An excellent example is the stormwater utility - a dedicated source of revenue with fees based on a site's contribution to the stormwater problem. Section 403.0893, F.S., authorizes Florida's local governments to implement stormwater utilities and over 100 have been established in the state. Additionally, the State Revolving Fund provides loan interest loans for stormwater treatment projects.

F. Innovative BMPs

The infeasibility of using traditional BMPs to reduce stormwater pollutant loads in urban areas requires creative and innovative BMPs. ***Regional stormwater systems, which manage stormwater from several developments or an entire drainage basin, offer many advantages over the piecemeal approach that relies upon small, individual on-site systems.*** Regional systems can use natural processes, such as extended detention and constructed wetlands, or mechanical processes, such as alum injection, to reduce stormwater pollutants. They provide economies of scale in construction, operation and maintenance. Regional systems are especially useful in managing stormwater from existing land uses. They need to be a central part of any retrofitting program. They can also be used to provide stormwater management for new development, but this requires excellent planning and an expenditure of funds by the local government or a developer to build the regional system and then get repaid by those who use it. Regional systems are most successful when a watershed approach is used that fully integrates land use, stormwater management, wetlands protection, parks, and recreation/open space.

Innovative practices which are not land intensive are urgently needed. Injecting chemical coagulating agents into storm sewers to enhance flocculation and sedimentation of stormwater pollutants is an example. This often may be a better BMP where land for traditional detention basins is unavailable or expensive. Several alum injection systems have been installed in urban areas in Florida to help restore receiving lakes. Concerns over potential aluminum toxicity, however, must still be addressed before this innovative BMP can be fully endorsed.

2.3. Stormwater BMPs and New Development

This section will briefly discuss some key issues of using BMPs to reduce the stormwater impacts associated with new development. These issues include the stormwater program's goals, the setting of performance standards, and the establishment of design criteria for specific BMPs.

2.3.1. Program Goals

The goals of a stormwater management program must be clearly established up front. Until recently, this was a relatively easy task since programs typically were established only to control stormwater peak discharge rates. This is why stormwater management frequently is referred to as "drainage" -- the traditional focus is on draining runoff away from developed property as quickly as possible.

<u>A. Stormwater Quantity Goals</u>

Today, even the goals of stormwater quantity management are changing and broadening. Control of stormwater volume, not just peak discharge rate, is being required in closed basins and for discharges to estuaries. Peak discharge rate control also is evolving - from control of a single frequency storm to multiple frequency storms. ***It is becoming common to control the peak discharge from a 1 or 2-year storm to minimize the erosion of stream channels, in addition to controlling the peak discharges for 10-, 25- and/or 100-year storms for flood control.*** Some stormwater management entities such as the Suwannee River Water Management District and the Florida Department of Transportation are requiring control of the "critical storm". This storm creates the biggest difference between pre-development and post-development peak discharge rate and/or volume.

B. Stormwater Quality Goals

The increasing awareness of stormwater quality problems by citizens and elected officials, along with Federal Clean Water Act requirements, is stimulating state and local governments to broaden the objectives of their stormwater programs. ***Today, stormwater management program goals include consideration of stormwater quantity, stormwater quality, erosion prevention and sediment control, aesthetic values, stormwater reuse, and even open space and recreational benefits.***

Stormwater quality programs need to be implemented within the framework of the federal Clean Water Act. It establishes two types of regulatory approaches to control pollutant discharges. ***Technology-based effluent limitations*** reflect the best controls available, considering their technical and economic achievability. ***Water quality-based effluent limitations*** reflect the water quality standards and allowable pollutant loadings set up by permit (U.S. EPA, 1994).

With respect to stormwater discharges, the latter approach possibly can be developed and implemented through a comprehensive monitoring approach. This not only involves traditional water chemistry monitoring, but also needs to includes sediment chemistry, and an assessment of physical habitat, stream bank erosion, biological community structure, and possibly even whole-effluent toxicity. These techniques are more appropriate than water column chemistry in assessing cumulative, intermittent stormwater impacts.

However, implementing a water quality-based effluent limit permit program for stormwater discharges is nearly impossible because of staffing and technical limitations. The many land use changes occurring in this country create tens of thousands of new stormwater discharges each year. Site-specific analyses to establish water quality-based effluent limitations for so many new discharges simply can't be done. Additionally, there is a sparsity of data on stormwater toxicity and ecological impacts. Therefore, **nearly all stormwater quality permitting programs are technology-based.**

In 1987, the EPA issued guidance on the development of technology-based stormwater programs and the role of water quality criteria. The guidance recognizes that **Best Management Practices (BMPs)** are the primary mechanism for achieving water quality standards. **BMPs are control techniques used for a given set of site conditions to achieve stormwater quality and quantity enhancement at a minimum cost** (Wanielista and Yousef, 1986). The guidance also recommends that state programs should include the following iterative process:

1. Design of BMPs based on site-specific conditions, technical, institutional and economic feasibility, and the water quality standards of the receiving waters.
2. Monitoring to ensure that practices are correctly designed and applied.
3. Monitoring to determine the effectiveness of BMPs in meeting water quality standards and the appropriateness of water quality criteria in reasonably assuring

protection of beneficial uses.

4. Adjustment of BMPs when water quality standards are not being protected to a designed level, or evaluation and possible adjustment of water quality standards.

The ultimate water quality goal of stormwater management programs is to protect or restore the beneficial uses of the receiving waters through the proper installation and operation of program-approved BMPs. If beneficial uses are not maintained or restored, additional BMPs need to be implemented and/or the design criteria for current BMPs should be modified to improve their performance.

2.3.2. Program Performance Standards

Whether for BMPs serving new development or for retrofitting, a performance standard must be established so that specific BMP design criteria can be developed. ***The performance standard establishes a technology-based effluent limitation for stormwater treatment systems.***

<u>A. Stormwater Management Goals</u>

Ideally, the basic goal for stormwater systems serving new development is to assure that the post-development peak discharge rate, volume, timing and pollutant load does not exceed pre-development levels. However, this goal usually is unattainable because our current BMPs, either alone or in combination, can not achieve this level of treatment and/or volume control, and because of the limitations imposed by variations in site conditions. This necessitates the establishment of performance standards that can be achieved through the implementation of BMPs.

<u>B. Stormwater Treatment Performance Standards</u>

The stormwater treatment programs in Florida, Delaware, and Maryland have established similar performance standards for stormwater systems serving new development. ***They require stormwater systems to achieve at least an 80% reduction in the annual average post-development pollutant loading of Total Suspended Solids (TSS) discharged to fishable/swimmable waters.*** This performance standard corresponds to secondary treatment levels, thereby helping to create greater equity between intermittent stormwater discharges and the treatment requirements for traditional point sources such as domestic and industrial wastewater discharges. Florida's program also sets a 95% removal level for stormwater discharges to sensitive waters such as potable supply waters, shellfish harvesting waters, and Outstanding Florida Waters. Florida's minimum stormwater treatment performance standards are set forth in State Water Policy, Section 62-40.431(4),F.A.C.

2.3.3. BMP Design Criteria Factors

Once the performance standard is established, design criteria then need to be set for each of the various BMPs that are going to be used for stormwater management.

This section will briefly review some of the factors that must be considered when setting BMP design criteria. The primary factors influencing BMP removal efficiency include rainfall characteristics; the volume of stormwater that is detained, infiltrated, or reused ("treatment volume"); the time needed to recover the treatment volume; the processes used to capture, filter, or assimilate stormwater pollutants; whether the system is on-line or off-line; and site conditions. By analyzing the factors below, an average annual pollutant removal efficiency can be calculated based on the annual mass of pollutants introduced and the annual mass removed.

A. Rainfall Characteristics

An analysis of long-term rainfall records needs to be undertaken to determine the statistical distribution of various rainfall characteristics such as storm intensity and duration, precipitation volume, number of storms, time between storms, etc. ***Unlike flood control, which focuses on large, infrequent storms, effective stormwater treatment generally relies on capturing and treating runoff from small, frequent events that carry the majority of pollutants***. For example, in Florida, nearly 90% of a year's storm events produce one inch of rainfall or less, and 75% of the total annual volume of rain falls in storms of one inch or less (Wanielista, 1977). Also, the average time between storms is an important consideration in designing stormwater management practices (Wanielista et. al., 1991).

B. "First Flush" Phenomenon

"First flush" describes the washing action that runoff may have on accumulated pollutants in the watershed. In the early stages of runoff, the land surfaces, especially impervious surfaces like streets and parking areas, are flushed clean by the stormwater. This can result in higher concentrations of some stormwater pollutants, especially particulates, during the early part of the storm (Miller, 1985). However, ***the occurrence of "first flush" depends on many factors, including the pollutant, conveyance system, drainage area, percent imperviousness, rainfall patterns, and location***. For example, in the Pacific northwest, which has frequent, long duration, low volume storms, first flush is much less pronounced. Where a target pollutant is associated with the first flush phenomenon, only this early fraction of the total storm runoff volume must be captured and treated to reach the desired treatment level.

C. Land Use Pollutant Loadings

Stormwater pollutant sources, concentration peaks, and decay functions vary from site to site. Accordingly, ***the typical stormwater pollutant loading from any particular type of land use can vary greatly***. Runoff from residential lands have lower concentrations and loadings of most pollutants when compared to stormwater from commercial land uses or highways. Runoff from streets and parking lots will have higher concentrations of heavy metals and other petroleum associated pollutants. Consequently, setting design criteria for stormwater BMPs must include evaluation of factors such as land use, the pollutants on site, and the characteristics of the drainage basin, such as the soil type, amount of imperviousness, type of stormwater conveyance system, and the length and time of travel.

D. On-line vs. off-line BMPs

On-line BMPs capture all of the runoff from a design storm, temporarily storing it before discharge. They primarily provide flood control benefits, with water quality benefits secondary. However, some on-line BMPs, such as wet detention systems, can do an excellent job of achieving both objectives.

Off-line BMPs divert the runoff "treatment volume" for treatment and isolate it from the remaining fraction of runoff, which must still be managed for flood control. This helps to improve treatment efficiency, reduce BMP maintenance, and make maintenance easier.

E. BMP Efficiency and Cost Data

During the past 15 years, many investigations of BMP effectiveness have been performed. Typical information generated often includes the pollutant removal effectiveness of various BMPs, and the costs of BMP construction and operation. A review of Florida BMP investigations (Wanielista and Shannon, 1977) revealed that ***the cost of treatment increases exponentially beyond "secondary treatment" (i.e., removal of 80% of the annual load)***. Therefore, higher levels of treatment are required in Florida only for stormwater discharges to the state's most sensitive water bodies.

F. Site evaluation

The soil types, slopes, geology, water table and other features of a site will greatly influence which BMPs will be most effective. Sandy soils imply using infiltration practices while natural low areas and high water tables offer opportunities for wet detention ponds or constructed wetlands.

3. STORMWATER POLLUTANTS AND REDUCTION MECHANISMS

The key to properly specifying, designing, and operating treatment practices is an awareness of the pollutants in stormwater and an understanding of the biological, chemical, and physical mechanisms that can be used to prevent them from proceeding into receiving waters. Table 2-1 lists the principal mechanisms that have potential to capture, hold, and transform the various classes of pollutants in urban runoff. The most common stormwater pollutants and amelioration mechanisms are summarized below:

1. **Sediment** is solid material that originates mostly from disintegrated rocks, eroded soil, or accumulated organic materials deposited on the land surface. The quantity, characteristics, and causes of the sediment are influenced by many factors including slope, slope length, soil characteristics, and land use, and traffic volume. Sediment

particles vary greatly in size and density. ***The settleability of a particular sediment particle depends directly on it's size and density.*** Sediment size and density must be determined to know which BMPs are most appropriate to remove the particles and to build into the stormwater management system appropriate mechanisms to promote the settling of these particles. Some soils, because of their silty, colloidal nature, can almost never be settled once they get into suspension. These soils may require the use of coagulating agents, such as alum or ferric compounds, to remove them from the water. ***Of course, the most effective control method for sedimentation is erosion control--prevent the production of sediment as much as possible.***

2. **Oxygen-demanding substances** include numerous organic materials that are decomposed by microorganisms thereby creating a need for oxygen. Consequently, a stormwater system such as a detention pond must include mechanisms to maintain high oxygen levels and prevent the formation of anaerobic conditions. Oxygenation mechanisms can be natural (such as shallow depths, sufficient length and width to induce wind mixing, and orientation to maximize the opportunities for wind mixing) or mechanical (such as aerators).

3. **Heavy metals** in highway runoff originate from the operation of motor vehicles, atmospheric deposition, and the degradation of highway materials. The most abundant heavy metals in stormwater are lead, zinc and copper, which together account for about 90 percent of the dissolved heavy metals and 90-98 percent of the total metal concentrations (Harper, 1985). ***Except for copper, zinc, and cadmium, the majority of metals are present in particulate form.*** Consequently, very good removal efficiencies (60-95%) can be obtained in properly designed stormwater management practices.

To maximize heavy metal removal in detention designs, designers should provide physical configurations which encourage a gradual reduction in flow velocity to promote particle sedimentation; maximize the flow length from inlets to the discharge point; prevent short circuiting of flows and hydraulically dead zones; and include suitable aquatic plants to promote uptake and removal of dissolved metal species. ***To keep metals bound to sediment, it is important that the sediment pH be kept near 7 and that the sediments be aerobic***. A decrease in pH and, to lesser extent, a reduction in redox potential, will cause metals to become soluble and release from the sediment (Harper, 1985). For this reason, it is important to monitor the accumulation of sediment and decaying organic matter within detention ponds since this can result in lowered pH and possible anaerobic conditions. Failure to properly remove sediments could cause release of accumulated metals into the underlying ground water or into surface waters.

4. **Nutrients**, such as nitrogen and phosphorus, are common constituents of stormwater. They stimulate the growth of algae and other aquatic plants, and contribute to oxygen depletion as these plants decompose. Excessive nutrients accelerate the natural process of eutrophication in lakes and streams. ***Nutrients in stormwater may be either dissolved or particulate, with particulate forms slightly dominating (about 60%)***. Consequently, a stormwater management system,

especially a wet detention system, must incorporate provisions for settling to remove particulate forms of nutrients and include nutrient assimilation for dissolved forms. A littoral zone planted with suitable aquatic plants should be concentrated near the discharge point to provide nutrient assimilation. Biofiltration, swale conveyance, sediment sumps, or a perimeter swale and berm system can be used to reduce particulate nutrients.

5. **Increased temperature of stormwater** occurs because urban lands, especially impervious surfaces, are heated on warm days. Runoff stored in BMPs, especially shallow ponds, is also heated by the sun between storms. Proper selection of BMPs is the best way to minimize adverse thermal impacts from stormwater BMP discharges. Galli (1991) ranks the potential of BMPs to raise receiving water temperatures, from least to most serious, as: infiltration basins < extended detention wetlands < extended dry detention ponds < wet detention ponds. Other methods to lessen thermal impacts include using trees to help shade BMPs, especially pilot channels and outfall channels for extended dry detention ponds. The use of exposed riprap or concrete surfaces for these channels also can be mnimized. BMPs also can be oriented to take advantage of prevailing winds, promoting water circulation and cooling.

6. **Increased stormwater volume** associated with the increased imperviousness which accompanies urbanization is now being recognized as a major cause of water body degradation. The increased volume of runoff causes channels and streams to flow at bank full levels more frequently resulting in streambank and bed erosion, and loss of habitat. Additionally, the discharge of greater volumes of runoff to estuaries has led to decreases in their salinity and shifts in biological communities. Reducing stormwater volume is not easy. Nonstructural BMPs to minimize imperviousness and reduce directly connected impervious area are the most effective. Structural BMPs which help to reduce stormwater volume include infiltration systems, many biofiltration systems, and wet detention stormwater reuse systems.

Although not specifically listed in Table 2-1, **treatment time is an important factor in the functioning of all mechanisms**. The effectiveness of settling a solid particle is directly related to the time provided to complete sedimentation at the characteristic settling velocity of the particle. Time is also a crucial variable in determining the degree to which chemical and biological mechanisms operate. Chemical reactions and biologically mediated processes all proceed at characteristic rates, which must be implicitly recognized to obtain their benefits in treatment. For all of these reasons, water residence time is the most basic variable for applying treatment practice technology effectively.

An alternative way of looking at the information presented in Table 2-1 is to group features that promote certain specific pollutant control objectives. The following list extracts those features for the most common objectives:

Features That Help Achieve All Objectives

- Increasing hydraulic residence time
- Low turbulence
- Fine, dense herbaceous plants
- Medium-fine texture soil

Features That Help Achieve Specific Objectives

- Phosphorus control:
    - High soil exchangeable aluminum and/or iron content
    - Addition of precipitating agents

- Nitrogen control:
    - Alternating aerobic and anaerobic conditions
    - Low levels of toxicants
    - Circumneutral pH (around 7)

- Metals control:
    - High soil organic content
    - High soil cation exchange capacity
    - Circumneutral pH
    - Organics control:
    - Aerobic conditions
    - High light
    - High soil organic content
    - Low levels of toxicants
    - Circumneutral pH

The degree of control that the treatment system designer and operator can exert to influence the operation of these various features differs. Fortunately, at least three of the four features that promote all favorable mechanisms (possibly excluding the soil) are under a high degree of control. The additional features that promote the more specific objectives require more intervention (e.g., developing some desired soil condition).

4. STORMWATER MANAGEMENT PRACTICES (BMPs)

The stormwater management tool box contains many tools that can help prevent or correct stormwater problems. The broadening objectives of stormwater management is leading to the development of new tools and the refinement of some of our existing tools. The goals of a stormwater program usually will play a major role in deciding which tools will be selected and used.

Generally, the ***stormwater tool box can be separated into two main drawers: nonstructural controls and structural controls.*** Generally, nonstructural controls are those that can help to prevent stormwater problems, while structural controls are used to mitigate stormwater problems. Until recently, most stormwater programs, because of their focus on flood control, have relied upon structural controls.

Nonstructural controls often are somewhat difficult to implement. Several of them require consideration and control of changes in property (i.e., growth management, land use planning, zoning) - often very controversial topics. ***Nonstructural controls also include "source controls", which are used to limit the types and amounts of potential pollutants that get into runoff.*** Many source controls involve modifying or controlling certain aspects of human behavior such as the use of fertilizers, pesticides or household cleaners. Doing so may be very difficult or highly controversial. However, source controls can be very effective, especially in highly urbanized areas, and less costly than structural controls. ***The dilemma for stormwater managers is the effectiveness of nonstructural controls is not well understood yet***.

With respect to structural controls, broadening of stormwater management goals often requires reconsideration of the usual BMP design, less emphasis and use of certain practices, changes in preferred alternatives, and greater emphasis on regular maintenance. For example:

- To improve pollutant removal, detention pond design typically must be changed to increase residence time, maximize length of flow through the pond, and include shallow littoral zones planted with appropriate native wetland plants to help remove dissolved nutrients and metals.

- Less emphasis is placed on use of dry detention, which is used widely for flood control. However, dry detention systems provide very low pollutant removal benefits because of very short detention times, bottom discharge controls, and paved channels.

- In many locations, local codes require the use of street curbs and gutters with storm sewers to eliminate ponding of runoff, even for short periods of time. To promote infiltration, thereby decreasing runoff volume and improving pollutant removal, many localities are eliminating this requirement and promoting the use of roadside vegetated swales, especially in low or medium density residential areas.

- ***There is increasing emphasis on the "BMP treatment train" concept, wherein several types of stormwater controls are used together and integrated into a comprehensive stormwater management system***. This is especially true where wet detention ponds are the primary control but are being promoted as a visual and recreational amenity on a project. To help prevent the wet pond from turning into an algae-covered eyesore, swales can be used for conveyance instead of storm sewers, and vegetated littoral zones are added to assimilate nutrients. Increasingly, the use of small, off-line depressional storage areas is being integrated into site plans, usually as part of the site's required open space and landscaping. These can not only reduce pollutants but decrease the overall size and cost of downstream stormwater system components.

In Florida, the primary BMPs used for treating stormwater from new developments include:

Retention (infiltration)
- Basins
- Trenches
- Swales

Detention with filtration
Wet detention
Wetlands treatment

For each of the above BMPs, specific design criteria have been established which are presumed to assure that the BMP acheives the minimum level of treatment specified in State Water Policy. FDEP and the WMDs periodically review the latest scientific data on BMP performance and revise the design criteria as needed to assure that BMPs are performing optimally.

4.1. BMP Selection

Effective operation and minimum maintenance of a stormwater system begins with selection of the most appropriate BMP(s) for the site. Factors which need to be evaluated include:

A. Watershed Area

Infiltration, biofiltration, and filter BMPs generally are more suitable for smaller areas. Pond BMPs typically require a larger drainage area to assure proper operation.

B. Area Required

Adequate area must be available at the site. Many BMPs are land intensive but some can be installed underground, although this increases maintenance difficulties and costs.

C. Stormwater pollutants

Most BMPs are more effective at removing particulate related pollutants. Some BMPs, primarily those with vegetative components, can also reduce dissolved constituents.

D. High Sediment Loading

Many BMPs are highly susceptible to clogging. Pretreatment (BMP Treatment Train) helps to increase effectiveness, reduce maintenance, and extend the life of BMPs.

E. Soil type

Soil permeability has a profound influence on BMP effectiveness, especially for infiltration practices. Also, silty and clayey soils that get into stormwater are much harder to settle than sandy ones.

F. Slope

Steep slopes can restrict the use of several BMPs, especially when water ponding or flow velocity may cause instability or erosion.

G. Water Table Elevation

A crucial factor in the design of all BMPs is water table elevation. Incorrectly estimating the seasonal high water table so it is too close to the bottom can cause BMP failure, decrease effectiveness, and increase maintenance. This is especially true for infiltration or dry detention systems. Wet ponds need high water tables to maintain their permanent pools.

H. Bedrock or Hardpan

Restrictive soil layers or rock can impede downward infiltration of runoff or make excavation for ponds impossible or expensive.

I. Karst Geology

Fractured limerock geology provides channels for stormwater pollutants to migrate into the ground water. Excavation or the hydraulic head of stored runoff may create sinkholes in the bottom of BMPs creating a direct discharge to ground water.

J. Proximity to Foundations, Septic Tanks, and Wells

BMPs should not be located close to building foundations, septic tanks, or drinking wells. Seepage problems or ground water pollution can result, especially from infiltration practices.

K. Receiving Water

If the stormwater discharge will be to an estuary or other saline habitat, BMPs which reduce stormwater volume need to be considerd first. If the discharge is to a water body which supports a cold water fishery or biological community, the potential thermal impacts must be considered in the selectionof the most appropriate stormwater BMPs.

L. Water Availability

Water may be needed during the dry season to keep grass or other vegetation alive and continuing to function as a filtering media.

M. Side Effects and Ancillary Benefits

Potential for mosquito breeding or ground water contamination need to be considered, as do opportunities for wildlife use and passive recreation.

N. Public Acceptance

No stormwater system will be maintained if the property owner does not like or approve of its design or the types of BMP used.

ST. JOHNS RIVER WATER MANAGEMENT DISTRICT

CHAPTER 40C-42, F.A.C.

ENVIRONMENTAL RESOURCE PERMITS: REGULATION OF STORMWATER MANAGEMENT SYSTEMS

Revised
October 3, 1995

R0073405

CHAPTER 40C-42

ENVIRONMENTAL RESOURCE PERMITS: REGULATION OF STORMWATER MANAGEMENT SYSTEMS

40C-42.011 Scope.

(1) This chapter governs stormwater management systems which are designed and constructed or implemented to control discharges necessitated by rainfall events. These systems may incorporate methods to collect, convey, store, absorb, inhibit, treat, use or reuse water to prevent or reduce flooding, overdrainage, environmental degradation and pollution, or otherwise affect the quality and quantity of discharges. Standard general and individual environmental resource stormwater permits are required under this chapter for construction, operation, maintenance, alteration, removal, or abandonment of systems that are not permitted under provisions of chapters 40C-4, 40C-40, or 40C-400, F.A.C. Permits issued under this chapter must be consistent with the objectives of the District and not cause harm to the water resource.

R0073406

(2) A permit under this chapter will be required only for certain stormwater management systems as defined herein. This provision shall not affect the District's authority to require appropriate corrective action whenever any system causes or contributes to violations of state water quality standards.

(3) Stormwater discharges to groundwaters shall be regulated under the provisions of section 62-28.700, F.A.C., and other applicable rules of the Department of Environmental Protection .

Specific Authority 373.044, 373.113, 373.171, 373.418 FS. Law Implemented 373.416, 403.812, 403.814 FS. History--New 4-1-86. Amended 9-25-91, 10-3-95.

40C-42.021 Definitions.

(1) "Appropriate Registered Professional" or "Registered Professional" means, for purposes of this rule, a professional registered in Florida with the necessary expertise in the fields of hydrology, drainage, flood control, erosion and sediment control, and stormwater pollution control to design and certify stormwater management systems. Examples of registered professionals may include professional engineers licensed under chapter 471, F.S., professional landscape architects licensed under chapter 481, F.S., and professional geologists licensed under chapter 492, F.S., who have the referenced skills.

(2) "As-Built Drawings" means plans certified by an appropriate registered professional or registered surveyor which accurately represents the constructed condition of a system.

(3) "Completion of Construction" means the time at which the stormwater management system is first placed into operation, when the project passes final building inspection or when the project receives a certificate of occupancy, whichever occurs first.

(4) "Construction" means any activity including land clearing, earth moving, or the erection of structures which will result in the creation of a stormwater management system.

(5) "Control Device" or "Bleed-down Device" means that element of a discharge structure which allows the gradual release of water under controlled conditions.

(6) "Control Elevation" means the lowest elevation at which water can be released through the control device.

(7) "Detention with Filtration" or "Filtration" means the selective removal of pollutants from stormwater by the collection and temporary storage of stormwater and the subsequent gradual release of the stormwater into surface waters in the state through at least 2 feet of suitable fine textured granular media such as porous soil, uniformly graded sand, or other natural or artificial fine aggregate, which may be used in conjunction with filter fabric and/or perforated pipe.

(8) "Detention" or "To Detain" means the collection and temporary storage of stormwater with subsequent gradual release of the stormwater.

(9) "Direct Discharge" means, for purposes of this chapter, a point or nonpoint discharge which enters Class I, Class II, or Outstanding Florida Waters, or Class III waters which are approved, conditionally approved, restricted, or conditionally restricted for shellfish harvesting without an adequate opportunity for mixing and dilution to prevent significant degradation. Examples of direct discharge include the following:

(a) discharge without entering any other water body or conveyance prior to release to the Class I, Class II, Outstanding Florida Waters, or Class III waters which are approved, conditionally approved, restricted, or conditionally restricted for shellfish harvesting;

(b) discharge into an intermittent watercourse which is a tributary of a Class I, Class II, Outstanding Florida Water, or Class III waters which are approved, conditionally approved, restricted, or conditionally restricted for shellfish harvesting; and

(c) discharge into a perennial watercourse which is a tributary of a Class I, Class II, Outstanding Florida Water, or Class III waters which are approved, conditionally approved, restricted, or conditionally restricted for shellfish harvesting when there is not an adequate opportunity for mixing and dilution to prevent significant degradation.

(10) "Dry detention" means a system designed to collect and temporarily store stormwater in a normally dry basin with subsequent gradual release of the stormwater.

(11) "Effective Grain Size" means the diameter of filter sand or other aggregate that corresponds to the 10 percentile finer by dry weight on the grain size distribution curve.

(12) "Intermittent Watercourse" means a stream or waterway that flows only at certain times of the year, flows in direct response to rainfall, and is normally an influent stream except when the ground water table rises above the normal wet season level.

(13) "Littoral zone" means, in reference to stormwater management systems, that portion of a wet detention pond which is designed to contain rooted aquatic plants.

(14) "Off-line" means the storage of a specified portion of the stormwater in such a manner so that subsequent runoff in excess of the specified volume of stormwater does not flow into the area storing the initial stormwater.

(15) "Operational Maintenance" means any activity or repair required to keep a stormwater management system functioning as permitted and designed.

(16) "Operate" or "Operation" means to cause or to allow a stormwater management system to function.

(17) "Perennial Watercourse" means a stream or waterway which is not an intermittent watercourse.

(18) "Permanent Pool" means that portion of a wet detention pond, which normally holds water (e.g., between the normal water level and the pond bottom) excluding any water volume claimed as wet detention treatment volume pursuant to paragraph 40C-42.026(4)(a), F.A.C.

(19) "Pollution" means the presence in waters of the state of any substances, contaminants, or manmade or man-induced impairment of waters or alteration of the chemical, physical, biological, or radiological integrity of water in quantities or at levels which are or may be potentially harmful or injurious to human health or welfare, animal or plant life, or property or which unreasonably interfere with the enjoyment of life or property, including outdoor recreation unless authorized by applicable law.

(20) "Registered Surveyor" means a registered professional land surveyor licensed in the state of Florida under chapter 472, F.S.

(21) "Reconstruction" means rebuilding or construction in an area upon which construction has previously occurred.

(22) "Retention" means a system designed to prevent the discharge of a given volume of stormwater runoff into surface waters in the state by complete on-site storage. Examples may

include excavated or natural depression storage areas, pervious pavement with subgrade, or above ground storage areas.

(23) "Seasonal high ground water table elevation" means the highest level of the saturated zone in the soil in a year with normal rainfall.

(24) "Semi-impervious" means land surfaces which partially restrict the penetration of water; included as examples are porous concrete and asphalt pavements, limerock, and certain compacted soils.

(25) "Sensitive Karst Areas" means those areas of the District delineated in chapters 40C-4 and 40C-41, F.A.C., in which the Floridan aquifer is near the land surface.

(26) "Stormwater" means the flow of water which results from, and which occurs immediately following, a rainfall event.

(27) "Stormwater Discharge Facility" means a stormwater management system which discharges stormwater into surface waters of the State.

(28) "Stormwater Management System" means a system which is designed and constructed or implemented to control discharges which are necessitated by rainfall events, incorporating methods to collect, convey, store, absorb, inhibit, treat, use or reuse water to prevent or reduce flooding, overdrainage, environmental degradation, and water pollution or otherwise affect the quality and quantity of the discharges.

(29) "Swale" means a manmade trench which:

(a) Has a top width to depth ratio of the cross-section equal to or greater than 6:1, or side slopes equal to or greater than 3 feet horizontal to 1 foot vertical; and,

(b) Contains contiguous areas of standing or flowing water only following a rainfall event; and,

(c) Is planted with or has stabilized vegetation suitable for soil stabilization, stormwater treatment, and nutrient uptake; and,

(d) Is designed to take into account the soil erodibility, soil percolation, slope, slope length, and drainage area so as to prevent erosion and reduce pollutant concentration of any discharge.

(30) "Underdrain" means a drainage system installed beneath a stormwater holding area to improve the infiltration and percolation characteristics of the natural soil when permeability is restricted due to periodic high water table conditions or the presence of layers of fine textured soil below the bottom of the holding area. These systems usually consist of a system of interconnected below-ground conduits such as perforated pipe, which simultaneously limit the water table elevation and intercept, collect, and convey stormwater which has percolated through the soil.

(31) "Underground Exfiltration Trench" or "Exfiltration Trench" means a below-ground system consisting of a conduit such as perforated pipe surrounded by natural or artificial aggregate which is utilized to percolate stormwater into the ground.

(32) "Uniformity Coefficient" means the number representing the degree of homogeneity in the distribution of particle sizes of filter sand or other granular material. The coefficient is calculated by determining the D^{60}/D^{10} ratio where D^{10} and D^{60} refer to the particle diameter corresponding to the 10 and 60 percentile of the material which is finer by dry weight.

(33) "Waters" are as defined in subsection 373.019(8), F.S.

(34) "Wet Detention" means the collection and temporary storage of stormwater in a permanently wet impoundment in such a manner as to provide for treatment through physical, chemical, and biological processes with subsequent gradual release of the stormwater.

(35) "Wetlands Stormwater Management System" means a stormwater management system which incorporates those wetland described in subsection 40C-42.0265(2), F.A.C., into the stormwater management system to provide stormwater treatment.

Specific Authority 373.044, 373.113, 373.171, 373.418 FS. Law Implemented 373.413, 373.416 FS. History--New 4-1-86. Amended 9-25-91, 3-21-93, 4-11-94, 10-3-95

40C-42.022 Permits Required.

(1) A permit is required under this chapter for construction (including operation and maintenance) of a stormwater management system which serves a project that exceeds any of the following thresholds:

(a) Construction of 4,000 square feet or more of impervious or semi-impervious surface area subject to vehicular traffic. This area includes roads, parking lots, driveways, and loading zones;

(b) Construction of 5000 square feet or more of building area or other impervious area not subject to vehicular traffic; or

(c) Construction of 5 acres or more of recreational area. Recreation areas include but are not limited to golf courses, tennis courts, putting greens, driving ranges, or ball fields.

(2) A permit is required under this chapter for alteration, removal, reconstruction, or abandonment of existing stormwater management systems which serve a project which may be expected to result in any of the following:

(a) Increase pollutant loadings (including sediment) in stormwater runoff from the project,

(b) Increase in peak discharge rate,

(c) Decrease in onsite or instream detention storage,

(d) Replacement of roadside swales with curb and gutter,

(e) Construction of 4,000 square feet or more of impervious or semi-impervious surface area subject to vehicular traffic. This area includes roads, parking lots, driveways, and loading zones;

(f) Construction of 5,000 square feet or more of building area or other impervious area not subject to vehicular traffic; or

(g) Construction of 5 acres or more of recreational area. Recreation areas include but not limited to golf courses, tennis courts, putting greens, driving ranges, or ball fields.

(3) These thresholds include all cumulative activity which occurs on or after September 25, 1991.

(4) For purposes of this section, the calculation of the amount of impervious surface shall not include water bodies.

(5) Applications received by the District for which a permit has not been issued prior to the rule revisions effective April 11, 1994, and which do not require a permit pursuant to sections (1) or (2), above, may be withdrawn by the applicant.

(6) Permits issued by the District for systems which no longer require a permit pursuant to sections (1) or (2), above, may either be abandoned or relinquished by the permittee subject to the following:

(a) Local governments may have concurrent jurisdiction with the District over a stormwater system. The permittee is not relieved by this rule of the responsibility to comply with any other applicable rules or ordinances which may govern such system.

(b) The permittee provides reasonable assurance that there will not be a violation of state water quality standards as set forth in chapter 62-302 and 62-550, F.A.C.;

(c) The permittee provides reasonable assurance that adjacent or nearby properties not owned or controlled by the applicant will not be adversely affected by drainage or flooding; and

(d) The permittee must apply to the District for and receive written authorization from the District prior to abandonment of the system.

Specific Authority 373.044, 373.113, 373.171, FS. Law Implemented 373.413, 373.416 FS. History--New 9-15-91. Amended 4-11-94, 11-22-94.

40C-42.0225 Exemptions From Permitting for Stormwater Management Systems. The following types of stormwater management systems are exempt from the notice and permit requirements of this chapter:

(1) Systems designed to accommodate only one single family dwelling unit, duplex, triplex, or quadruplex, provided the single unit, duplex, triplex or quadruplex is not part of a larger common plan of development or sale.

(2) Systems which are designed to serve single family residential projects, including duplexes, triplexes and quadruplexes, of less than 10 acres total land area and which have less than 2 acres impervious surface and if the systems:

(a) Comply with all regulations or ordinances applicable to stormwater management adopted by a city or county;

(b) Are not part of a larger common plan of development or sale; and

(c) Discharge into a stormwater management system exempted or permitted by the District under this chapter which has sufficient capacity and treatment capability as specified in this chapter and is owned, maintained, or operated by a city, county, special district with drainage responsibility, or water management district; however, this exemption does not authorize discharge to a system without the system owner's prior written consent.

(3) Systems that qualify for a noticed general permit pursuant to chapter 40C-400, F.A.C. and which comply with the requirements of such noticed general permit.

Specific Authority 373.044, 373.113, 373.171, 373.413 FS. Law Implemented 373.413, 373.416, 403.812 FS. History--New 9-25-91. Amended 3-21-93, 10-3-95.

40C-42.023 Requirements for Issuance.

(1) To receive a general or individual permit under this chapter the applicant must provide reasonable assurance based on plans, test results and other information, that the stormwater management system:

(a) will not result in discharges from the system to surface and ground water of the state that cause or contribute to violations of state water quality standards as set forth in chapters 62-3, 62-4, 62-302 and 62-550, F.A.C., including any antidegradation provisions of sections 62-4.242(1)(a) and (b), 62-4.242(2) and (3), and 62-302.300, F.A.C., and any special standards for Outstanding Florida Waters and Outstanding National Resource Waters set forth in sections 62-4.242(2) and (3), F.A.C.;

(b) will not adversely affect drainage and flood protection on adjacent or nearby properties not owned or controlled by the applicant;

(c) will be capable of being effectively operated and maintained pursuant to the requirements of this chapter; and

(d) meets any applicable basin criteria contained in chapter 40C-41, F.A.C.

(2)(a) A showing by the applicant that the stormwater management system complies with the applicable criteria in sections 40C-42.024, 40C-42.025, 40C-42.026, and 40C-42.0265, F.A.C., shall create a presumption that the applicant has provided reasonable assurance that the proposed activity meets the requirements in paragraphs (a), above.

(b) A showing by the applicant that the stormwater management system complies with the criteria of subsections 40C-42.025(8) and (9), F.A.C., shall create a presumption that the applicant has provided reasonable assurance that the proposed activity meets the requirements in paragraph (b), above.

(c) A showing by the applicant that the stormwater management system complies with the applicable criteria of sections 40C-42.027, 40C-42.028, and 40C-42.029, F.A.C., shall create a presumption that the applicant has provided reasonable assurance that the proposed activity meets the requirements in paragraph (c), above.

Specific Authority 373.044, 373.113, 373.171, 373.418 FS. Law Implemented 373.413, 373.416 FS. History--New 9-25-91. Amended 3-21-93, 10-3-95.

40C-42.024 Standard General and Individual Permits.

(1) Any person proposing to construct, alter, operate, maintain, remove, or abandon a stormwater management system, which requires a permit pursuant to sections 40C-42.022, F.A.C., except those exempted pursuant to section 40C-42.0225, F.A.C., or noted in section 40C-42.061, F.A.C, shall apply to the District for a standard general or individual environmental resource stormwater permit, prior to the commencement of construction, alteration, removal, operation, maintenance, or abandonment of the stormwater management system. No construction, alteration, removal, operation, maintenance, or abandonment of a stormwater management system shall be undertaken without a valid standard general or individual environmental resource stormwater permit as required pursuant to this section.

(2) The following types of stormwater management systems qualify for a standard general environmental resource stormwater permit and shall be processed according to the administrative procedures set forth in chapter 40C-40, F.A.C.:

(a) Systems which discharge into a stormwater management system which is permitted pursuant to paragraph 40C-42.024(2)(b), (c), or (d), F.A.C., or subsection 40C-42.024(3), F.A.C., or which was previously approved pursuant to a noticed exemption under section 17-25.030 where the appropriate treatment criteria specified in this chapter and applied to the permitted or exempt system are not exceeded by the discharge; however, this does not authorize discharge to the permitted or exempt system without the system owner's prior written consent.

(b) Systems which meet the applicable design and performance standards of section 40C-42.025, F.A.C., and which comply with any one or more of the following:

1. Retention systems which meet the criteria of subsection 40C-42.026(1), F.A.C.;
2. Underdrain systems which meet the criteria of subsection 40C-42.026(2), F.A.C.;
3. Underground exfiltration trench systems which meet the criteria of subsection 40C-42.026(3), F.A.C.;
4. Wet detention systems which meet the criteria of subsection 40C-42.026(4), F.A.C.; or
5. Swale systems which meet the criteria in subsections 40C- 42.021(30) and 40C-42.026(5), F.A.C.
6. Dry detention systems within project areas less than 5 acres in size, and which serve draiage area less than 5 acres in size, and which meet the criteria of subsection 40C-42.026(6), F.A.C.

(c) Modification or reconstruction by a city, county, state agency, federal agency, or special district with drainage responsibility, of an existing stormwater management system which is not intended to increase the original design capacity, and which will not increase pollution loading, or change points of discharge in a manner that would adversely affect the designated uses of waters in the state.

(d) Paving of existing public dirt roads by a public entity if all of the following conditions are met:

1. The road will not serve new development.
2. Additional traffic lanes are not added to the road;
3. The traffic load is not expected to significantly increase;
4. The drainage system serving the road is not significantly altered;
5. Erosion and sediment controls are utilized to prevent turbidity during construction;
6. The project does not involve dredging or filling in wetlands or other surface waters, other than in ditches that were excavated through uplands ;
7. Permanent vegetative cover is established on both sides of the pavement within the road right of way; and
8. Swale blocks, or other means, are utilized to retain runoff and promote infiltration in areas with soil having good infiltration (i.e., SCS hydrologic soil groups "A" and "B").

(3) The following types of stormwater management systems will be processed as an individual permit according to the administrative procedures set forth in chapter 40C-4, F.A.C.:

(a) Wetlands stormwater management systems which are designed pursuant to the criteria in sections 40C-42.025 and 40C-42.0265, F.A.C.;

(b) Systems which propose to satisfy the standards of subsection 40C-42.023(1), F.A.C., by employing an alternative treatment methodology or device other than those described in subsection (2) or paragraph (3)(a), above. An affirmative showing by the applicant that the system design will provide treatment equivalent to retention systems described in paragraph (2)(b)1., above, will create a presumption in favor of satisfying the standards in paragraphs 40C-42.023(1)(a), F.A.C. In addition, systems which have a direct discharge to Class I, Class II, Outstanding Florida Waters, or Class III waters which are approved, conditionally approved, restricted, or conditionally restricted for shellfish harvesting shall provide an additional level of treatment (i.e., additional treatment volume and off-line treatment) pursuant to section 40C-42.026, F.A.C., or an alternative demonstrated by the applicant to be equivalent.

(c) Systems which do not meet the applicable criteria of sections 40C-42.025, 40C-42.026, or 40C-42.0265, F.A.C. An affirmative showing by the applicant based on plans, test results, calculations, or other information that an alternative design is appropriate for the specific site conditions will create a presumption in favor of satisfying the applicable standards in subsection 40C-42.023(1), F.A.C.

(4) In otherwise determining whether reasonable assurance has been provided for paragraphs (3)(b) and (c), above, the District shall, where appropriate, consider:

(a) Whether best management practices are proposed, such as those described in "Stormwater Management Manual (October, 1981)," "The Florida Development Manual: A Guide to Sound Land and Water Management (June, 1988)," or best management practices described in manuals adopted by the Environmental Regulation Commission pursuant to section 62-25.050, F.A.C., or other appropriate best management practices (the manuals listed above by name are adopted and made a part of this rule by reference. Copies of these documents may be inspected at all District offices);

(b) The public interest served by the system;

(c) The probable efficacy and costs of alternative controls; and

(d) Whether reasonable provisions have been made for the operation and maintenance of the proposed system.

(5) The standard general or individual environmental resource stormwater permit which is granted will include a specified period for which the permit will be valid. Such period, unless the permit is modified or revoked, is generally:

(a) five years for permits to construct, alter, or remove a system; and

(b) permanent for permits to operate, maintain, or abandon a system.

(6) Procedures governing transfers, permit revocation, permit modifications, and extensions are found in chapters 40C-1 and 40C-4, F.A.C., and apply to permits obtained pursuant to this chapter. Procedures governing converting construction to operation permits and transferring the system to the operation and maintenance entity are found in section 40C-42.027, F.A.C., below.
Specific Authority 373.044, 373.113, 373.118, 373.171, 373.418 FS. Law Implemented 373.413, 373.416, 403.813 FS. History--New 9-25-91. Amended 3-21-93, 4-11-94, 10-3-95.

40C-42.025 Design and Performance Criteria for Stormwater Management Systems. The following criteria shall apply to stormwater management systems unless otherwise noted:

(1) Erosion and sediment control best management practices shall be used as necessary during construction to retain sediment on-site. These management practices shall be designed and certified by an appropriate registered professional experienced in the fields of soil conservation or sediment control according to specific site conditions and shall be shown or noted on the plans of the stormwater management system. The registered professional shall furnish the contractor with information pertaining to the construction, operation and maintenance of the erosion and sediment control practice. Sediment accumulations in the system from construction activities shall be removed to prevent loss of storage volume.

(2) Stormwater management systems which either receive stormwater from areas with greater than 50 percent impervious surface or are a potential source of oil and grease contamination in concentrations that exceed applicable water quality standards shall include a baffle, skimmer, grease trap or other mechanism suitable for preventing oil and grease from leaving the stormwater management system in concentrations that would cause or contribute to violations of applicable water quality standards in the receiving waters. For purposes of this subsection, the calculation of the amount of impervious surface shall not include water bodies.

(3) Unless applicable local regulations are more restrictive, for purposes of public safety the following requirements apply:

(a) Normally dry basins designed to impound more than two feet of water or permanently wet basins shall be fenced or otherwise restricted from public access, or shall contain side slopes that are no steeper than 4:1 (horizontal:vertical) out to depth of two feet below the control elevation; and,

(b) Control devices that are designed to contain more than a two foot depth of water within the structure under the design storm and have openings greater than one foot minimum dimension shall be restricted from public access.

(4) All stormwater basin side slopes shall be stabilized by either vegetation or other materials to minimize erosion and sedimentation of the basins.

(5) Stormwater management systems must be designed to accommodate maintenance equipment access and to facilitate regular operational maintenance (such as underdrain replacement, unclogging filters, sediment removal, mowing and vegetation control). Operational maintenance and operation easements shall be provided when necessary to facilitate equipment access.

(6) The applicant must obtain sufficient legal authorization as appropriate prior to permit issuance for stormwater management systems which propose to utilize offsite areas to satisfy the requirements in subsection 40C-42.023(1), F.A.C.

(7) Stormwater management systems (except retention and exfiltration trench systems) shall provide gravity or pumped discharge that effectively operates under one of the following tailwater conditions:

(a) Maximum stage in the receiving water resulting from the mean annual 24-hour storm. This storm depth is described in "Rainfall Analysis for Northeast Florida;" St. Johns River Water Management District Technical Publication No. SJ 88-3 (May, 1988). Lower stages may be utilized if the applicant demonstrates that flow from the project will reach the receiving water prior to the time of maximum stage in the receiving water;

(b) Mean annual high tide for tidal areas;

(c) Mean annual seasonal high water elevation. This elevation may be determined by water lines on vegetation or structures, historical data, adventitious roots or other hydrological or biological indicators, design of man-made systems, or estimated by a registered professional using standard hydrological methods based on the site and receiving water characteristics; or

(d) As an alternative, the applicant may propose any applicable criterion established by a local government, state agency, or stormwater utility with jurisdiction over the project.

(8) Stormwater management systems which require a permit pursuant to subsection 40C-42.022(1), F.A.C., and which serve new construction area with greater than 50 percent

impervious surface (excluding water bodies) must demonstrate that the post-development peak rate of discharge does not exceed the pre-development peak rate of discharge for one of the following:

(a) The mean annual 24-hour storm event. This storm depth is described in "Rainfall Analysis for Northeast Florida;" St. Johns River Water Management District Technical Publication No. SJ 88-3 (May, 1988). The criteria contained in sections 10.3.5 - 10.3.8 of the Management and Storage of Surface Waters Applicant's Handbook, (A.H.), are herein incorporated by reference;

(b) The mean annual 24-hour storm event utilizing the modified rational hydrograph method. This storm depth is described in the publication referenced in paragraph (a), above. This methodology should only be used for systems meeting the following criteria:

1. The drainage area is less than 40 acres;

2. The pre-development time of concentration for the system is less than 60 minutes; and,

3. The post-development time of concentration for the system is less than 30 minutes; or

(c) As an alternative to paragraphs (a) or (b), above, the applicant may propose a storm event, duration, and criteria specified by a local government, state agency, or stormwater utility with jurisdiction over the project.

(9) Stormwater management systems which alter existing conveyance systems must not adversely affect existing surface water conveyance capabilities. It is presumed that a system meets this criteria if one of the following are met:

(a) The existing hydraulic conveyance is maintained;

(b) The applicant demonstrates that changes in flood elevations or velocities will not adversely impact upstream or downstream off-site property;

(c) The applicant demonstrates that the criteria in 10.5.2(b), Applicant's Handbook, are met; or

(d) As an alternative, the applicant may propose to comply with applicable criteria established by a local government, state agency, or stormwater utility with jurisdiction over the project.

(10) The construction plans and supporting calculations must be signed, sealed, and dated by an appropriate registered professional as required by the relevant statutory provisions when the design of the stormwater management system requires the services of an appropriate registered professional.

(11) Stormwater management systems located within Sensitive Karst Areas must meet the requirements of subsection 40C-41.063(6), F.A.C.

Specific Authority 373.044, 373.113, 373.171, 373.418 FS. Law Implemented 373.117, 373.413, 373.416, 403.0877 FS. History--New 4-1-86. Amended 9-25-91, 3-21-93.

40C-42.026 Specific Design and Performance Criteria.

(1) Retention systems shall:

(a) Provide for one of the following:

1. Off-line retention of the first one half inch of runoff or 1.25 inches of runoff from the impervious area, whichever is greater;

2. On-line retention of an additional one half inch of runoff from the drainage area over that volume specified in subparagraph 1., above;

3. On-line retention that provides for percolation of the runoff from the three year, one-hour storm; or

4. On-line retention of the runoff from one inch of rainfall or 1.25 inches of runoff from the impervious area, whichever is greater, for systems which serve an area with less than 40 percent impervious surface and that contain only U.S. Department of Agriculture Soil Conservation Service (SCS) hydrologic group "A" soils.

(b) Provide retention in accordance with one of the following for those systems which have direct discharge to Class I, Class II, Outstanding Florida Waters, or Class III waters which are approved, conditionally approved, restricted, or conditionally restricted for shellfish harvesting:

1. At least an additional fifty percent of the applicable treatment volume specified in subparagraph 1., above. Off-line retention must be provided for at least the first one half inch of runoff or 1.25 inches of runoff from the impervious area, whichever is greater, of the total amount of runoff required to be treated;

2. On-line retention of an additional fifty percent of the treatment volume specified in subparagraph 2., above;

3. On-line retention that provides percolation of the runoff from the three-year, one-hour storm; or

4. On-line retention that provides at least an additional 50 percent of the runoff volume specified in subparagraph 40C-42.026(1)(a)4., above, for systems which serve an area with less that 40 percent impervious surface and that contain only U.S. Department of Agriculture Soil Conservation Service (SCS) hydrologic group "A" soils.

(c) Provide the capacity for the appropriate treatment volume of stormwater specified in paragraphs (a) or (b) above, within 72 hours following the storm event assuming average antecedent moisture conditions. The storage volume must be provided by a decrease of stored water caused only by percolation through soil, evaporation or evapotranspiration.

(d) Be stabilized with pervious material or permanent vegetative cover. Permanent vegetative cover must be utilized, except for pervious pavement systems, when U.S. Department of Agriculture Soil Conservation Service (SCS) hydrologic group "A" soils underlie the retention basin.

(2) Underdrain stormwater management systems shall:

(a) Provide for either of the following:

1. Off-line storage of the first one half inch of runoff or 1.25 inches of runoff from the impervious area, whichever is greater; or

2. On-line storage of an additional one half inch of runoff from the drainage area over that volume specified in subparagraph 1., above.

(b) Provide either of the following for those underdrain systems which have direct discharge to Class I, Class II, Outstanding Florida Waters, or Class III waters which are approved, restricted, or conditionally restricted for shellfish harvesting:

1. At least an additional fifty percent of the applicable treatment volume specified in subparagraph 1., above. Off-line storage must be provided for at least the first one half inch of

runoff or 1.25 inches of runoff from the impervious area, whichever is greater, of the total amount of runoff required to be treated; or

2. On-line storage of the runoff from a three-year, one-hour storm or an additional fifty percent of the treatment volume specified in subparagraph 2., above, whichever is greater.

(c) Provide the capacity for the appropriate treatment volume of stormwater specified in paragraphs (a) or (b), above, within 72 hours following a storm event. The storage volume must be provided by a decrease of stored water caused only by percolation through soil with subsequent transport through the underdrain pipes, evaporation or evapotranspiration.

(d) Provide at least two feet of indigenous soil between the bottom of the stormwater holding area and the underdrain pipe(s).

(e) Be designed with a safety factor of at least two unless the applicant affirmatively demonstrates based on plans, test results, calculations or other information that a lower safety factor is appropriate for the specific site conditions. Examples of how to apply this factor include but are not limited to reducing the design percolation rate by half or designing for the required drawdown within 36 hours instead of 72 hours.

(f) Contain areas of standing water only following a rainfall event.

(g) Be stabilized with permanent vegetative cover.

(h) Include, at a minimum, a capped and sealed inspection and cleanout ports which extend to the surface of the ground at the following locations of each drainage pipe:

1. The terminus; and

2. Every 400 feet or every bend of 45 or more degrees, whichever is less.

(i) Utilize filter fabric or other means used to prevent the soil from moving and being washed out through the underdrain pipe.

(3) Underground exfiltration trench systems shall:

(a) Provide for either of the following:

1. Off-line storage of the first one half inch of runoff or 1.25 inches of runoff from the impervious area, whichever is greater; or

2. On-line storage of an additional one half inch of runoff from the drainage area over that volume specified in subparagraph 1., above.

(b) Provide either of the following for those exfiltration trench systems which have direct discharge to Class I, Class II, Outstanding Florida Waters, or Class III waters which are approved, conditionally approved, restricted, conditionally restricted for shellfish harvesting:

1. At least an additional fifty percent of the applicable treatment volume specified in subparagraph 1., above. Off-line storage must be provided for at least the first one half inch of runoff or 1.25 inches of runoff from the impervious area, whichever is greater, of the total amount of runoff required to be treated; or

2. On-line storage of the runoff from the three-year, one-hour storm or an additional fifty percent of the treatment volume specified in subparagraph 2., above, whichever is greater.

(c) Provide the capacity for the appropriate treatment volume of stormwater specified in paragraphs (a) or (b), above, within 72 hours following a storm event assuming average antecedent moisture conditions. The storage volume must be provided by a decrease of stored water caused only by percolation into the soil.

(d) Be designed with a safety factor of at least two unless the applicant affirmatively demonstrates based on plans, test results, calculations or other information that a lower safety factor is appropriate for the specific site conditions. Examples of how to apply this factor include but are not limited to reducing the design percolation rate by half or designing for the required drawdown within 36 hours instead of 72 hours.

(e) Be designed with a twelve (12) inch minimum pipe diameter.

(f) Be designed with a three (3) foot minimum trench width.

(g) Be designed so that aggregate in the trench is enclosed in filter fabric.

(h) Provide cleanout and inspection structures which extend to the surface of the ground at the inlet and terminus of each pipe. Inlet structures should include sediment sumps.

(i) Be designed so that the invert elevation of the trench must be at least two feet above the seasonal high ground water table elevation unless the applicant demonstrates based on plans, test results, calculations or other information that a alternative design is appropriate for the specific site conditions.

(j) Be designed so that the system must have the capacity to retain the required treatment volume without considering discharges to ground or surface waters.

(4) Wet detention stormwater management systems shall:

(a) Provide a treatment volume of the greater of the following:

1. First one inch of runoff; or

2. 2.5 inches of runoff from the impervious area.

(b) Be designed so that the outfall structures shall bleed down one-half the volume of stormwater specified in paragraph (a), above, within 48 to 60 hours following a storm event, but no more than one-half of this volume will be discharged within the first 48 hours.

(c) Contain a permanent pool of water sized to provide an average residence time of at least 14 days during the wet season (June - October).

(d)1. Provide a littoral zone to be designed as follows:

a. The littoral zone shall be gently sloped (6:1 or flatter). At least 30 percent of the wet detention system surface area shall consist of a littoral zone. The percentage of littoral zone is based on the ratio of vegetated littoral zone to surface area of the pond at the control elevation.

b. The treatment volume should not cause the pond level to rise more than 18 inches above the control elevation unless the applicant affirmatively demonstrates that the littoral zone vegetation can survive at greater depths.

c. Eighty percent coverage of the littoral zone by suitable aquatic plants is required within the first twenty-four months of completion of the system or as specified by permit conditions.

d. To meet the 80% coverage requirement, planting of the littoral zone is recommended. As an alternative, portions of the littoral zone may be established by placement of wetland top soils (at least a four inch depth) containing a seed source of desirable native plants. When utilizing this alternative, the littoral zone must be stabilized by mulching or other means and at least the portion of the littoral zone within 25 feet of the inlet and outlet structures must be planted.

2. In lieu of the requirements of subparagraph 1., above, the applicant may provide either of the following:

a. At least fifty percent additional permanent pool volume over that specified in paragraph (c), above; or

b. Treatment of the stormwater pursuant to subparagraphs 40C- 42.024(2)(b)2., 3., 4., or 6., F.A.C., prior to the stormwater entering the wet detention pond.

(e) Be designed so that the mean depth of the permanent pool is between 2 and 8 feet and the maximum depth does not exceed 12 feet below the invert of the bleed down device, unless the applicant affirmatively demonstrates that alternative depths will not inhibit the physical, chemical, and biological treatment processes or cause the resuspension of pollutants into the water column due to anaerobic conditions in the water column.

(f) Be designed so the flow path through the pond has an average length to width ratio of at least 2:1. The alignment and location of inlets and outlets should be designed to maximize flow paths in the pond. If short flow paths are unavoidable, the effective flow path should be increased by adding diversion barriers such as islands, peninsulas, or baffles to the pond. Inlet structures shall be designed to dissipate the energy of water entering the pond.

(g) Be designed so that bleed down devices incorporating dimensions smaller than three inches minimum width or less than 20 degrees for "v" notches shall include a device to eliminate clogging. Examples include baffles, grates, and pipe elbows.

(h) Be designed so that bleed down structure invert elevations are at or above the estimated post-development normal ground water table elevation. If the structure is proposed to be set below this elevation, ground water inflow must be considered in the drawdown calculations, calculation of average residence time, estimated normal water level in the pond, and pollution removal efficiency of the system.

(i) Provide for permanent maintenance easements or other acceptable legal instruments to allow for access to and maintenance of the system, including the pond, littoral zone, inlets, and outlets. The easement or other acceptable instrument must cover the entire littoral zone.

(j) Be designed so that the average pond side slope measured between the control elevation and two feet below the control elevation is no steeper than 3:1 (horizontal:vertical).

(k) Wet detention systems which have direct discharge to Class I, Class II Outstanding Florida Waters, or Class III waters which are approved, conditionally approved, restricted, or conditionally restricted for shellfish harvesting shall provide either of the following in addition to the requirements in paragraphs (b), (d), and (e) - (j), above:

1. An additional fifty percent of the applicable treatment volume specified in paragraph (a), above, and an additional fifty percent of the applicable permanent pool volumes specified in paragraphs (c) or subparagraph (d)2., above; or

2. Treatment pursuant to subsections (1), (2), (3) above, or (5) below, prior to discharging into a wet detention pond designed pursuant to paragraphs (a) - (j), above.

(5) Swale systems shall:

(a) Percolate 80% of the runoff from the three year, one-hour storm.

(b) Percolate the runoff from the three-year, one-hour storm for those swale systems which have direct discharge to Class I, Class II, Outstanding Florida Waters, or Class III waters which are approved, conditionally approved, restricted, or conditionally restricted for shellfish harvesting.

(c) Provide the capacity for the given volume of stormwater pursuant to paragraphs (a) or (b), above, and contain no contiguous areas of standing or flowing water within 72 hours following the storm event referenced in paragraphs (a) and (b), above, assuming average antecedent moisture conditions. The storage volume must be provided by a decrease of stored water caused only by percolation through soil, evaporation or evapotranspiration.

(d) Meet the criteria in subsection 40C-42.021(29), F.A.C.

(6) Dry detention systems shall:

(a) Provide off-line detention of the first one inch of runoff or 2.5 inches of runoff from the impervious area, whichever is greater.

(b) Provide at least an additional fifty percent of the applicable treatment volume specified in subparagraph 1., above, for those systems which have direct discharge to Class I, Class II, Outstanding Florida Waters, or Class III waters which are approved, conditionally approved, restricted, or conditionally restricted for shellfish harvesting.

(c) Be designed so that the outfall structures shall discharge one-half the appropriate treatment volume of stormwater specified in paragraphs (a) or (b), above, between 24 to 30 hours following a storm event.

(d) Be designed so that discharge structures shall include a device to prevent the discharge of accumulated sediment, minimize exit velocities, and prevent clogging. Examples include perforated riser enclosed in a gravel jacket and perforated pipes enclosed in sand or gravel.

(e) Contain areas of standing water for no longer than 3 days following a rainfall event.

(f) Be stabilized with permanent vegetative cover.

(g) Be designed so the average flow path through the basin has a length to width ratio of at least 2:1. The alignment and location of inlets and outlets should be designed to maximize flow paths in the basin. If short flow paths are unavoidable, the effective flow path should be increased by adding diversion barriers such as baffles to the basin.

(h) Be designed so inlet structures dissipate the energy of water entering the basin.

(i) Be designed to include a maintenance schedule for removal of sediment and debris on at least a bi-monthly basis from the basin and mowing and removal of grass clippings.

(j) Be designed so the basin floor is level or uniformly sloped toward the outfall structure.

(k) Be designed so that the basin floor and control elevation is at least one foot above the seasonal high ground water table elevation. Sumps may be placed up to one foot below the control elevation.

Specific Authority 373.044, 373.113, 373.118, 373.177, 373.418 FS. Law Implemented 373.413, 373.416, 403.813 FS. History--New 9-25-91. Amended 3-21-93, 6-15-93, 4-11-94, 7-20-95.

40C-42.0265 Design and Performance Criteria for Wetlands Stormwater Management Systems.

(1) The wetlands stormwater management system design and performance criteria and other provisions relating to such systems are an initial but necessary step by the District in a field in which there exists limited knowledge. In an effort to further refine the District's wetlands stormwater management system policies, monitoring data and other pertinent information relating to the performance criteria will be collected and analyzed and periodic reports of the results of this

monitoring shall be made available to the public. The District must attempt to ensure that the wetlands stormwater management system is compatible with the ecological characteristics of the wetlands utilized for stormwater treatment and to ensure that water quality standards will not be violated by discharges from wetlands stormwater management system. To achieve these goals, specific performance criteria are set forth in this section for systems which incorporate wetlands for stormwater treatment.

(2) The only wetlands to be used for stormwater treatment are those:

(a) Which are isolated wetlands; and

(b) Which would be isolated wetlands, but for a hydrologic connection to other wetlands or surface waters via another watercourse that was excavated through uplands.

(3) Applications for wetland stormwater management systems shall be processed by the District as an individual permit application according to the administrative procedures set forth in chapter 40C-4, F.A.C.

(4) In the review of wetlands stormwater management system permit applications, the District shall consider the following:

(a) Compliance of the wetlands stormwater management system permit with the performance criteria specified in subsection 40C-42.0265(5).

(b) If the applicant is unable to show compliance with the performance criteria in subsection 40C-42.0265(5), the applicant shall qualify for a wetlands stormwater management system permit using alternative design and performance criteria if the applicant affirmatively demonstrates that the use of the wetlands is compatible with the ecological characteristics of the wetland and the applicant complies with the standards in section 40C-42.023, F.A.C.

(c) If the applicant proposes to dredge or fill in the wetlands used for stormwater treatment, the District in its review of the permit application shall evaluate the adverse effects of the dredging or filling on the treatment capability of the wetland.

(5) A showing by the applicant that the wetlands stormwater management system design complies with the performance criteria listed below shall create a presumption in favor of the issuance of the permit:

(a) The system complies with the requirements of section 40C-42.025 and subsection 40C-42.0265(2), F.A.C.

(b) The system is part of a comprehensive stormwater management system that utilizes wetlands in combination with other best management practices to provide treatment of the runoff from the greater of the following:

1. First one inch of runoff; or
2. 2.5 inches times the impervious area.

(c) Those systems which direct discharge to Class I, Class II, or Outstanding Florida Waters shall provide an additional fifty percent of the applicable treatment volume specified in paragraph (b), above.

(d) The wetlands stormwater management system must provide treatment for the runoff as specified in paragraph 40C-42.0265(5)(b) or (c), F.A.C., within the wetlands. The design features of the system shall maximize residence time of the stormwater within the wetland. The outfall structure shall be designed to bleed down one-half the volume specified in paragraph 40C-42.0265(5)(b) or (c) within the first 60 to 72 hours.

(e) Stormwater shall be discharged into the wetlands utilized so as to minimize the channelized flow of stormwater by employing methods including, but not limited to, sprinklers, overland flow or spreader swales.

(f) The use of wetlands for stormwater must meet the criteria in section 12.0, Environmental Considerations, of the Applicant's Handbook: Management and Storage of Surface Waters, adopted by reference in section 40C-4.091, F.A.C.

(6) In order to establish a reliable, scientifically valid data base upon which to evaluate the performance criteria and the performance of the wetlands stormwater management system, a monitoring program may be required. Monitoring programs shall provide the District with comparable data for different types of wetlands and drainage designs. Data to be collected shall include (unless irrelevant to the permitted system): sedimentation rate, sediment trace metal concentrations, sediment nitrogen and phosphorus concentrations, changes in the frequency, abundance and distribution of vegetation, and inflow and outflow water quality for nutrients, metals, turbidity, oils and greases, bacteria and other parameters related to the specific site conditions. Inflow and outflow water quality parameters will be monitored on such storm event occurrences as established by the District based on a site specific basis. The District shall eliminate the requirement to continue the monitoring program upon its determination that no further data is necessary to evaluate the performance criteria or ensure compliance with the performance criteria and applicable water quality standards.

Specific Authority 373.044, 373.113, 373.177, 373.418 FS. Law Implemented 373.413, 373.416 FS. History--New 9-25-91, 3-21-93, 10-3-95.

40C-42.027 Legal Operation and Maintenance Entity Requirements.

(1) The District considers the following entities to be acceptable for meeting the requirements necessary to ensure that a stormwater management system will be operated and maintained in compliance with the requirements of this Chapter and other District regulations in chapters 40C-4 or 40C-40, F.A.C.:

(a) Local governmental units including counties or municipalities, or Municipal Service Taxing Units established pursuant to section 125.01, F.S.;

(b) Active water control districts created pursuant to chapter 298, F.S., or drainage districts created by special act, or Community Development Districts created pursuant to chapter 190, F.S., or Special Assessment Districts created pursuant to chapter 170, F.S.;

(c) State or federal agencies; or

(d) Duly constituted stormwater, communication, water, sewer, electrical or other public utilities.

(2) The property owner or developer is normally not acceptable as a responsible entity when the property is intended to be subdivided. The property owner or developer shall be acceptable in any of the following circumstances:

(a) Written proof is furnished either by letter or resolution, that a governmental entity or such other acceptable entity as set forth in paragraphs (a)-(d) above, will accept the operation and maintenance of the stormwater management system at a time certain in the future;

(b) Proof of bonding or assurance of a similar nature is furnished in an amount sufficient to cover the cost of the operation and maintenance of the stormwater management system;

(c) The property is wholly owned by the permittee and ownership is intended to be retained. This would apply to a farm, corporate office or single industrial facility, for example; or

(d) The ownership of the property is retained by the permittee and is either leased or rented to third parties such as in shopping centers or mobile home parks.

(3) Profit or non-profit corporations including homeowners associations, property owners associations, condominium owners associations or master associations shall be acceptable only under certain conditions that ensure that the corporation has the financial, legal and administrative capability to provide for the long term operation and maintenance of the stormwater management system.

(4) Entity Requirements.

(a) If a multimember association such as a Homeowner, Property Owner, Condominium or Master Association is proposed, the owner or developer must submit Articles of Incorporation for the Association, and Declaration of Covenants and Restrictions, or such other organizational and operational documents which affirmatively assign authority and responsibility for the operation or maintenance of the stormwater management system.

(b) The Association shall have sufficient powers reflected in its organizational or operational documents to:

1. Operate and maintain the stormwater management system as permitted or exempted by the District;

2. Establish rules and regulations;

3. Assess members a fee for the cost of operation and maintenance of the system, and enforce collection of such assessments;

4. Contract for services (if the Association contemplates employing a maintenance company) to provide the services for operation and maintenance;

5. Exist in perpetuity. The Articles of Incorporation must provide that if the association is dissolved the stormwater management system shall be transferred to and maintained by an entity acceptable to the District as defined in this section. Transfer of maintenance responsibility shall be effectuated prior to dissolution of the association;

6. Enforce the restrictions relating to the operation and maintenance of the stormwater management system;

7. Provide that the portions of the Declarations which relate to the operation and maintenance may be enforced by the District in a proceeding at law or in equity; and

8. Require that amendments to the documents which alter the stormwater management system beyond maintenance in its original condition must receive District approval prior to taking effect.

(5) Phased Projects.

(a) If an Operation and Maintenance entity is proposed for a project which will be constructed in phases, and subsequent phases will utilize the same stormwater management systems as the initial phase or phases, the entity shall have the ability to accept responsibility for the operation and maintenance of stormwater management system for future phases of the project.

(b) If the development scheme contemplates independent operation and maintenance entities for different phases, and the stormwater management system is integrated throughout the project, the entities either separately or collectively shall have the authority and responsibility to operate and maintain the stormwater management system for the entire project. That authority shall include cross easements for stormwater management and the ability to enter and maintain the various systems, should any sub-entity fail to maintain a portion of the stormwater management system within the project.

(6) The applicant shall be an acceptable entity from the time construction begins until the stormwater management system is dedicated to and accepted by a legal entity established pursuant to this section. The applicant shall provide proof of the existence of an entity pursuant to this section or of the future acceptance of the system by an entity described in this section prior to initiating construction.

Specific Authority 373.044, 373.113, 373.171 FS. Law Implemented 403.812, 403.814 FS. History--New 4-1-86. Amended 9-25-91, 3-21-93.

40C-42.028 Operation Phase Permits.

(1) The operation phase of a stormwater management system permit which was designed by an appropriate registered professional does not become effective until all of the following criteria in this subsection and subsection (3) have occurred:

(a) Within 30 days after completion of construction of the stormwater management system, permittee shall submit a signed and sealed certification by an appropriate registered professional indicating that the system has been constructed and that the system is ready for inspection by the District.

(b) The certification prepared by a registered professional (not necessarily the project design registered professional but one who has been retained by the permittee to provide professional services during the construction phase of project completion) shall be made on form number 40C-1.181(13), As Built Certification by a Registered Professional.

(c) The registered professional shall certify that:

1. The system has been constructed substantially in accordance with approved plans and specifications, or;

2. Any deviations from the approved plans and specifications will not prevent the system from functioning in compliance with the requirements of this chapter. The registered professional shall note and explain substantial deviations from the approved plans and specifications and provide two copies of as-built drawings to the District.

(d) The certification shall be based upon on-site observation of construction (scheduled and conducted by the professional or by a project representative under his or her direct supervision) or review of as-built drawings for the purpose of determining if the work was completed in compliance with approved plans and specifications.

(e) As-built drawings shall be the permitted drawings revised to reflect any changes made during construction. Both the original and revised specifications must be clearly shown. The plans must be clearly labeled as "as-built" or "record" drawings. All surveyed dimensions and elevations required shall be certified by a registered surveyor. The following information, at a minimum, shall be verified on the as-built drawings:

1. Dimensions and elevations of all discharge structures including all weirs, slots, gates pumps, pipes, and oil and grease skimmers;

2. Locations, dimensions, and elevations of all filter, exfiltration, or underdrain systems including cleanouts, pipes, connections to control structures, and points of discharge to the receiving waters;

3. Dimensions, elevations, contours, or cross-sections of all treatment storage areas sufficient to determine stage-storage relationships of the storage area and the permanent pool depth and volume below the control elevation for normally wet systems, when appropriate;

4. Dimensions, elevations, contours, final grades, or cross-sections of the system to determine flow directions and conveyance of runoff to the treatment system;

5. Dimensions, elevations, contours, final grades, or cross-sections of all conveyance systems utilized to convey off-site runoff around the system;

6. Existing water elevation(s) and the date determined; and

7. Elevation and location of benchmark(s) for the survey.

(2) The operation phase of a stormwater management system permit which was not designed by an appropriate registered professional does not become effective until all of the criteria in this subsection, and subsection (3) below, have occurred. Within 30 days after completion of construction of the stormwater management system, permittee shall submit a certification, on form number 40C-1.181(14), As Built Certification, that the system has been constructed in accordance with the design approved by the District and shall notify the District that the system is ready for inspection.

(3) The permittee shall submit documentation to the District showing that adequate provisions have been made for the operation and maintenance of the system and for meeting any special permit conditions. Entities which qualify to operate and maintain systems for purposes of this rule are listed at section 40C-42.027, supra. Documentation must include an affirmative indication that the entity intends to or agrees to take over maintenance responsibility for the system, unless the transfer is associated with the conversion of the construction permit to its operation phase and the maintenenac entity exists as approved under the permit.

(4) The permit will be converted from a construction permit to an operation permit once the project is determined to be in compliance with the permitted plans and an appropriate entity exists for maintenance of the system. The District will transfer the permit to the maintenance entity upon request, pursuant to section 40C-4.351, F.A.C., once all conditions for converting the construction permit to an operation permit have been met.

Specific Authority 373.044, 373.113, 373.171, 373.418 FS. Law Implemented 373.413, 373.416 FS. History--New 9-25-91, 3-21-93. Amended 7-20-95.

40C-42.029 Monitoring and Operational Maintenance Requirements.

(1) The operation and maintenance entity is required to provide for periodic inspections of the stormwater management system to insure that the system is functioning as designed and permitted. The entity shall submit inspection reports to the District, certifying that the stormwater management system is operating as designed. In addition, the entity will state in the report what operational maintenance has been performed on the system. The reports shall only be required for those systems which are subject to operation phase permits pursuant to subsection 40C-42.028(1),

F.A.C., after the effective date of this rule adoption, unless indicated otherwise in a permit. The reports shall be submitted to the District as follows unless otherwise required by a permit condition:

(a) Inspection reports for retention, underdrain, wet detention, swales, and wetland stormwater management systems shall be submitted two years after the completion of construction and every two years thereafter on form number 40C-1.181(15), Registered Professional's Inspection Report, for systems designed by a registered professional. For systems not designed by a registered professional, the inspection reports shall be submitted on form number 40C-1.181(16), Statement of Inspection Report. However, reports for those systems in sensitive karst areas must be submitted pursuant to paragraph (c) below.

(b) Inspection reports for dry detention, exfiltration, and pumped systems shall be submitted one year after the completion of construction and every two years thereafter on form number 40C-1.181(15), Registered Professional's Inspection Report. A registered professional must sign and seal the report certifying the dry detention, filtration, exfiltration, or pumped system is operating as designed. However, reports for those systems in sensitive karst areas must be submitted pursuant to paragraph (c) below.

(c) Systems in sensitive karst areas must be inspected monthly for the occurrence of sinkholes and solution pipes. The inspection reports for these systems must be submitted to the District annually on form number 40C-1.181(15), Registered Professional's Inspection Report, for systems designed by a registered professional. For systems not designed by a registered professional, the inspection reports shall be submitted on form number 40C-1.181(16), Statement of Inspection Report.

(2) Permittees which operate stormwater management systems that are designed and constructed to accept stormwater from multiple parcels within the drainage area served by the system shall notify the District annually of the stormwater discharge volumes of all new parcels which have been allowed to discharge into the system in the previous year and shall certify that the maximum allowable treatment volume of stormwater has not been exceeded.

(3) The following operational maintenance activities shall be performed on all permitted systems on a regular basis or as needed:

(a) Removal of trash and debris,

(b) Inspection of inlets and outlets,

(c) Removal of sediments when the storage volume or conveyance capacity of the stormwater management system is below design levels, and

(d) Stabilization and restoration of eroded areas.

(4) Specific operational maintenance activities are required, depending on the type of permitted system, in addition to the practices listed in subsection (3), above.

(a) Retention, swale and underdrain systems shall include provisions for:

1. Mowing and removal of grass clippings, and

2. Aeration, tilling, or replacement of topsoil as needed to restore the percolation capability of the system. If tilling or replacement of the topsoil is utilized, vegetation must be established on the disturbed surfaces.

(b) Exfiltration systems shall include provisions for removal of sediment and debris from sediment sumps.

(c) Wet detention systems shall include provisions for operational maintenance of the littoral zone. Replanting shall be required if the percentage of vegetative cover falls below the permitted level. It is recommended that native vegetation be maintained in the littoral zone as part of the system's operation and maintenance plan. Undesirable species such as cattail and exotic plants should be controlled if they become a nuisance.

(d) Dry detention systems shall include provisions for mowing and removal of grass clippings

(e) Systems in sensitive karst areas shall include provisions for the repair of any sinkhole or solution pipe that develops in the system.

(5) If the system is not functioning as designed and permitted, operational maintenance must be performed immediately to restore the system. If operational maintenance measures are insufficient to enable the system to meet the design and performance standards of this chapter, the permittee must either replace the system or construct an alternative design. A permit modification must be obtained from the District prior to constructing such alternative design pursuant to section 40C-4.331, F.A.C.

Specific Authority 373.044, 373.113, 373.171, 373.418 FS. Law Implemented 373.413, 373.416 FS. History--New 9-25-91. Amended 3-21-93, 4-11-94.

40C-42.031 Exemptions for Stormwater Management Systems.

Specific Authority 373.044, 373.113, 373.171 FS. Law Implemented 403.812, 403.814 FS, History--New 4-1-86. Amended 8-11-91. Repealed 9-25-91.

40C-42.032 Limiting Conditions.

(1) The Governing Board shall impose upon any permit granted pursuant to this Chapter such reasonable conditions as are necessary to assure that construction and operation of the permitted system will not be inconsistent with the District's permitting standards set forth in section 40C-42.023, F.A.C., and will not be harmful to the water resources of the District.

(2)(a) In addition to project-specific special conditions, the following standard limiting conditions shall be attached to all permits issued pursuant to this Chapter unless waived by the Board upon a determination that the conditions are inapplicable for the work authorized by a given permit:

1. This permit for construction will expire five years from the date of issuance unless otherwise specified by a special condition of the permit.

2. Permittee must obtain a permit from the District prior to beginning construction of subsequent phases or any other work associated with this project not specifically authorized by this permit.

3. Before any offsite discharge from the stormwater management system occurs, the retention and detention storage must be excavated to rough grade prior to building construction or placement of impervious surface within the area served by those systems. Adequate measures must be taken to prevent siltation of these treatment systems and control structures during construction or siltation must be removed prior to final grading and stabilization.

4. The permittee must maintain a copy of this permit complete with all conditions, attachments, exhibits, and permit modifications, in good condition at the construction site. The

complete permit must be available for review upon request by District representatives. The permittee shall require the contractor to review the complete permit prior to commencement of the activity authorized by this permit.

5. All activities shall be implemented as set forth in the plans, specifications and performance criteria as approved by this permit. Any deviation from the permitted activity and the conditions for undertaking that activity shall be considered a violation of this permit.

6. District authorized staff, upon proper identification, must be granted permission to enter, inspect and observe the system to insure conformity with the plans and specifications approved by the permit.

7. Prior to and during construction, the permittee shall implement and maintain all erosion and sediment control measures (best management practices) required to retain sediment on-site and to prevent violations of state water quality standards. All practices must be in accordance with the guidelines and specifications in chapter 6 of the Florida Land Development Manual: A Guide to Sound Land and Water Management (Florida Department of Environmental Regulation 1988), which are hereby incroporated by reference, unless a project specific erosion and sediment control plan is approved as part of the permit, in which case the practices must be in accordance with the plan. If site specific conditions require additional measures during any phase of construction or operation to prevent erosion or control sediment, beyond those specified in the erosion and sediment control plan, the permittee shall implement additional best management practices as necessary, in accordance with the specifications in chapter 6 of the Florida Land Development Manual: A Guide to Sound Land and Water Management (Florida Department of Environmental Regulation 1988). The permittee shall correct any erosion or shoaling that causes adverse impacts to the water resources.

8. If the permitted system was designed by a registered professional, within 30 days after completion of the stormwater system, the permittee must submit to the District the following: District Form No. 40C-1.181(13) (As Built Certification By a Registered Professional), signed and sealed by an appropriate professional registered in the State of Florida, and two (2) sets of "As Built" drawings when a) required by a special condition of this permit, b) the professional uses "As Built" drawings to support the As Built Certification, or c) when the completed system substantially differs from permitted plans. This submittal will serve to notify the District staff that the system is ready for inspection and approval.

9. If the permitted system was not designed by a registered professional, within 30 days after completion of the stormwater system, the permittee must submit to the District the following: District Form No. 40C-1.181(14) (As Built Certification), signed by the permittee and two (2) sets of "As Built" drawings when required by a special condition of this permit, or when the completed system substantially differs from permitted plans. This submittal will serve to notify the District staff that the system is ready for inspection and approval.

10. Stabilization measures shall be initiated for erosion and sediment control on disturbed areas as soon as practicable in portions of the site where construction activities have temporarily or permanently ceased, but in no case more than seven (7) days after the construction activity in that portion of the site has temporarily or permanently ceased.

11. Should any other regulatory agency require changes to the permitted system, the permittee shall provide written notification to the District of the changes prior to implementation so that a determination can be made whether a permit modification is required.

12. Within thirty (30) days after sale or conveyance of the permitted stormwater management system or the real property on which the system is located, the owner in whose name the permit was granted shall notify the District of such change of ownership. Transfer of this permit shall be in accordance with the provisions of section 40C-1.612, Florida Administrative Code. All terms and conditions of this permit shall be binding upon the transferee. The permittee transferring the permit shall remain liable for any corrective actions that may be required as a result of any permit violations prior to such sale, conveyance or other transfer.

13. The stormwater management system must be completed in accordance with the permitted plans and permit conditions prior to the initiation of the permitted use of site infrastructure. The system must be completed in accordance with the permitted plans and permit conditions prior to transfer of responsibility for operation and maintenance of the stormwater management system to a local government or other responsible entity.

14. The operation phase of the permit shall not become effective until the requirements of condition No. 8 or 9 have been met, the District determines that the system complies with the permitted plans, and the entity approved by the District in accordance with section 40C-42.027, F.A.C., accepts responsibility for operation and maintenance of the system. The permit cannot be transferred to such an approved responsible operation and maintenance entity until the requirements of section 40C-42.028, F.A.C., are met, and the operation phase of the permit becomes effective. Following inspection and approval of the permitted system by the District in accordance with section 40C-42.028, F.A.C., the permittee shall request transfer of the permit to the responsible approved operation and maintenance entity, if different from the permittee. Until the permit is transferred pursuant to subsection 40C-42.028(4), F.A.C., the permittee shall be liable for compliance with the terms of the permit.

15. Prior to lot or unit sales, or upon completion of construction of the system, whichever occurs first, the District must receive the final operation and maintenance document(s) approved by the District and recorded, if the latter is appropriate. For those systems which are proposed to be maintained by county or municipal entities, final operation and maintenance documents must be received by the District when maintenance and operation of the system is accepted by the local government entity. Failure to submit the appropriate final document will result in the permittee remaining personally liable for carrying out maintenance and operation of the permitted system.

16. This permit does not eliminate the necessity to obtain any required federal, state, local and special district authorizations prior to the start of any activity approved by this permit. This permit does not convey to the permittee or create in the permittee any property right, or any interest in real property, nor does it authorize any entrance upon or activities on property which is not owned or controlled by the permittee, or convey any rights or privileges other than those specified in the permit and Chapter 40C-42, F.A.C.

17. The permittee shall hold and save the District harmless from any and all damages, claims, or liabilities which may arise by reason of the activities authorized by the permit or any use of the permitted system.

18. The permittee shall immediately notify the District in writing of any previously submitted information that is later discovered to be inaccurate.

19. Activities approved by this permit shall be conducted in a manner which do not cause violations of state water quality standards.

(b) This section shall not be construed as a limitation on the authority of the Board to impose such other limiting conditions as may be necessary in order to assure that the permitted system is consistent with the requirements for issuance listed in section 40C-42.023, F.A.C.
Specific Authority 373.044, 373.113, 373.171 FS. Law Implemented 373.409, 373.413, 373.416, 373.419, 373.423, 373.426 FS. History--New 3-21-93, 10-3-95.

40C-42.033 Implementation.

(1) This chapter shall become effective on September 25, 1991.

(2)(a) Each construction permit issued under chapter 40C-42, F.A.C., prior to the effective date of this rule shall remain valid according to its terms.

(b) Each construction permit application which is filed with the District prior to the effective date of this rule will be processed and evaluated under the rules implemented on April 1, 1986.

(c) Each construction permit application which is not filed with the District prior to September 25, 1991, will be processed and evaluated according to the rule provisions implemented on September 25, 1991.

(3) If the validity of any provisions of chapter 40C-42, F.A.C., or the application thereof to any person or circumstance is challenged pursuant to Chapter 120 or 373, F.S., or pursuant to any other basis in law, it is the intent of the Governing Board of the St. Johns River Water Management District that neither a challenge to the validity of a provision or application thereof nor the invalidation of a provision or application thereof shall affect the validity or application of other provisions of the rule which can be given effect without the challenged or invalidated provision or application and to this end the provisions of chapter 40C-42, F.A.C., are declared severable.
Specific Authority 373.044, 373.113, 373.171, 373.429 FS. Law Implemented 373.416 FS. History--New 9-25-91.

40C-42.035 Stormwater General Permits.
Specific Authority 373.044, 373.113, 373.171 FS. Law Implemented 403.812, 403.814 FS. History--New 4-1-86. Repealed 9-25-91.

40C-42.041 Individual Permit Requirements for New Stormwater Discharge Facilities.
Specific Authority 373.044, 373.113, 373.171 FS. Law Implemented 403.812, 403.814 FS. History--New 4-1-86. Repealed 9-25-91.

40C-42.061 Relationship to Other Permitting Requirements.

(1) Whenever the construction, alteration, removal, operation, maintenance, or abandonment of a stormwater management system requires that an environmental resource permit be secured pursuant to Chapters 40C-4 or 40C-40 , F.A.C., the requirements in this chapter shall be reviewed as part of those permit applications. A separate permit application under this chapter shall not be required. However, the applicant must provide the required technical information as part of those applications to demonstrate compliance with this chapter. If the applicant requests a separate environmental resource stormwater permit, the applicant must notify the District of any other District permits, exemptions, or certifications which have or will be requested for the project.

(2) When a permit is required pursuant to this chapter and an individual environmental resource permit is required pursuant to chapter 40C-4 for the same system, the time frames of chapter 40C-4 shall apply to issuance of a permit under section 40C-42.024(2), F.A.C.

(3) This rule does not apply to any stormwater discharge facility listed in (a) and (b) below, unless such facility is modified pursuant to section 40C-42.024, F.A.C.:

(a) Which was in existence on February 1, 1982; or

(b) Which was permitted, modified, or found to be exempt, under Chapter 62-25, F.A.C., by the Department of Environmental Regulation (DER) after February 1, 1982, but prior to April 1, 1986, provided the facility was constructed in accordance with the DER permit or exemption, and is functioning in accordance with the requirements of chapter 62-25, F.A.C.

(4) The operation phase permit requirements set forth in subsection 40C-42.028(1), F.A.C., shall not apply to systems permitted and found to be in compliance with all rule requirements prior to the effective date of this rule.

(5) Applications for conceptual agency review of stormwater management systems, as required by section 380.06, F.S., will be reviewed in accordance with the procedure used by the District to review conceptual approval permit applications pursuant to subsection 40C-4.041(2), F.A.C.

(6) Systems for agricultural lands will be regulated under chapter 40C-44, F.A.C.

Specific Authority 373.044, 373.113, 373.171 FS. Law Implemented 373.413, 373.416, 380.06(9) FS. History--New 4-1-86. Amended 9-25-91, 3-21-93, 4-11-94, 7-20-95, 8-3-95.

40C-42.071 Permit Processing Fee. There shall be a non-refundable permit processing fee as specified by section 40C-1.603, F.A.C., payable to the District at the time that an application for a permit is submitted.

Specific Authority 373.044, 373.113, 373.171 FS. Law Implemented 373.109, 373.113 FS. History--New 4-1-86. Amended 9-25-91.

40C-42.081 General Provisions. Nothing under this chapter shall preclude:

(1) Stormwater effects from being considered in the evaluation of other types of permits where such consideration is relevant to a determination of compliance with applicable District requirements.

(2) The legal joinder in a permitting proceeding under this chapter of any person who owns or controls an unpermitted stormwater management system or systems which comprise a significant portion of the stormwater management system.

(3) The District from taking appropriate legal action including but not limited to the requiring of a permit to prevent the impairment of a use for which a water of the state has been designated under chapter 62-3, F.A.C.

(4) The District from entering interagency or interlocal agreements to accomplish the provisions of this chapter.

Specific Authority 373.044, 373.113, 373.171 FS. Law Implemented 403.812, 403.814 FS. History--New 4-1-86. Amended 9-25-91.

40C-42.091 Publications Incorporated by Reference.

(1) The Governing Board adopts by reference Part I "Policy and Procedures", Part II, "Criteria for Evaluation", and Part III "Operation and Maintenance", of the document entitled "Applicant's Handbook: Regulation of Stormwater Management Systems, Chapter 40C-42, F.A.C.", effective 10-3-95.

(2) This document provides information regarding the stormwater management system permitting program

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

SERVING COASTAL LOS ANGELES & VENTURA COUNTIES

TRANSCRIPT OF PROCEEDINGS

Wednesday, June 30, 1999

9:05 A.M.

RICHARD H. CHAMBERS U.S. COURT OF APPEALS BUILDING
125 South Grand Avenue, Main Courtroom #3
Pasadena, California

REPORTED BY:
Lori D. Casillas,
CSR No. 9869, RPR
Our File No. 1-57224

APPEARANCES:

BOARD MEMBERS:

H. David Nahai, Chairman
Fran B. Diamond
Jack J. Coe, Ph.D., P.E.
Michael Keston
Marilyn Lyon

STAFF:

Dennis Dickerson
Deborah Smith
James KuyKendall
Robyn Goodman
Ronji Harris
Pat Guokas
J.T. Liu
Jorge Leon

P R O C E E D I N G S

* * *

MS. GOODMAN: This is a public meeting to consider Board action for the following proposed requirements; Item 9.1, City of Redondo Beach (Seaside Lagoon); Item 9.5, EXXON Company, U.S.A.; and Item 10.2, County Sanitation Districts of Los Angeles County (Puente Hills Landfill Corrective Action Program for Main Canyon).

Copies of these requirements were sent to the State Water Resources Control Board and other interested agencies, persons, and organizations. The order of presentation of testimony will be the discharger, public agencies, other interested agencies and groups. Anyone so desiring will be heard.

If you haven't filled out one of the blue cards located on the table at the back of the room, please raise your hand and we will get a card for you to fill out.

It will be appreciated if all persons appearing before the Board today will leave written copies of their testimony, if available. The Board will consider all testimony, however, in the interest of time it is requested that all repetitive and redundant statements be avoided.

The setting of time limits for the presentation of evidence is at the discretion of the Board.

Mr. Chairman, we now open the meeting.

MR. NAHAI: Could I ask everyone who is going to give testimony with respect to Items 9.1, 9.5 and 10.2 to rise, please, and repeat after me.

(Oath was given.)

MR. NAHAI: Thank you.

So the first matter is 9.1. And could we have the staff presentation?

MR. DASKER: Good morning, Mr. Chairman. My name is Dennis Dasker. I'm chief of the Watershed Regulatory Section. My business address is 320 West Fourth Street, Suite 200, Los Angeles, 90013. Also present today are Wendy Dusane and Mazhar Ali who worked on the presentation.

The City of Redondo Beach has a seaside lagoon, which is located at 200 Portifino Way in Redondo Beach. This is a man-made swimming lagoon which was constructed over 30 years ago. It is open from Memorial Day until Labor Day for public use. And it has a surface area of about 1.2 acres and contains about 1.4 million gallons of water.

The water supplied to it is from an adjacent power plant, it's the old Southern California Edison power plant, which is now the ADS LLC power plant. They tap off their cooling water discharge line and they supply about 2.3 million gallons per day of water to the Seaside Lagoon. The water is -- they add a disinfection to it, sodium hydrochloride, and a disinfectant prior to being discharged to King Harbor.

The intent requirements that we prepared limit coliforms, BOD, and reduce residual chlorine. We received telephone comments from Heal the Bay, which they commented that since the discharge from the power plant also at times includes low-volume waste, they felt that they should be excluded from being picked off and placed into the swimming lagoon. And actually we do agree with that.

They also suggested that intracaucus be used as an indicator organism in the monitoring program and that we place limitations on intracaucus.

We have prepared a change sheet which has been presented to you, which has a limitation for intracaucus; it also puts a specification in the permit that they not obtain water from the lagoon when AES is discharging, not including low-volume waste. And we also modified the monitoring program to conform to this.

So our recommendation is that the Board adopt the permit as modified by the change sheet.

MR. NAHAI: I don't have any cards from anybody else wishing to speak on this.

Do we have any questions from the Board?

MS. LYON: Were there any comments to the changes?

MR. DASKER: No, we have not, ma'am. They are agreeable to the changes.

MR. NAHAI: May we have a motion to approve?

MS. DIAMOND: I move to approve.

MS. LYON: Second.

MR. NAHAI: All in favor?

BOARD MEMBERS: Aye.

MR. NAHAI: Let's move on to Item No. 9.5.

MR. DASKER: Mr. Chairman, Board members, Dennis Dasker again. Business address is 320 West Fourth Street, Suite 200, Los Angeles, 90013. I'm the chief of the Watershed Regulatory Section. We also have Wayne Chiou and Dan Radulescu, the engineers that worked on this case.

This is EXXON Company, the Rancho Dominguez plant. This is a lubricant oil and grease manufacturing facility that indirectly discharges up to about 32,000 gallons per day of rainfall runoff which goes to Compton Creek.

The tentative order contains limitations to detect phenols, along with some other parameters. And the discharger has provided information to the Boards in comment letter that they do not have a reasonable potential to have detects in phenols in their effluent; and they also requested that those parameters be eliminated from the requirements; and also they requested that detoxicity be deleted from the effluent limitations.

We have looked into it. And we do agree that they do not have a reasonable potential for detect phenols; and we've provided you previously with a change sheet to remove those from the permit. Though we did feel that detoxicity should remain in the permit. And even though those parameters will be removed, they will still be monitored for those parameters.

The discharger also pointed out that they intermittently have approximately one gallon per day of (inaudible) and washdown water, which are also going to the discharge. So we are recommending in the change sheet that the findings be modified to identify the intermittent non-storm flow of one gallon per day of (inaudible) washdown water.

With that, the recommended tentative order be adopted as modified by the change sheet.

MR. NAHAI: Any questions?

I don't have any cards from any member of the public wishing to speak on this item.

So do we have a motion for approval?

MR. COE: I move for approval.

MR. NAHAI: Second?

MS. LYON: I second.

MR. NAHAI: All in favor?

BOARD MEMBERS: Aye.

MR. NAHAI: Motion carried.

Moving now to No. 10.2.

May we have the staff presentation?

MS. PONEK-BACHAROWSKI: Good morning, Mr. Chairman and Board members. My name is Blythe Ponek-Bacharowski and I'm an associate engineer geologist in the landfills unit on Board staff.

You'll notice that this item originally was supposed to be going consent as no written comments were received during the 30-day public comment period, with the exception of the current standards with the discharger submitted a letter to us. There was a very extensive mailing list. I just wanted you to be aware of that.

Item 10.2 is to modify the existing waste discharge requirements for the landfill to implement the discharger's proposed Corrective Action Program.

I'm going to give you a brief overview of the landfill and the state and federal regulations that govern the Corrective Action Program. And then the discharger will follow with a presentation for a Corrective Action Program.

The Puente Hills Landfill is a 1,365 acre nonhazardous solid waste landfill. It's the largest operating landfill in the western United States and at this time maybe in the world. And from 1957 to 1970 it was operated by the Pellisier Ranch as a small ranch and local dump site.

From 1970 to the present it was operated by the County Sanitation Districts of Los Angeles County. The landfill is bordered by the communities of Avocado Heights, Hacienda Heights, City of Industry and Whittier.

Here is an aerial map photo of the landfill showing the Main Canyon area, which is the subject of this Corrective Action Program. Canyon 9 and Eastern Canyons, which you see in green, are composite-lined areas of the landfill -- modern landfill and the Main Canyon is unlined.

You'll see kind of an orangy line to the north of Main Canyon; that orange line to the left is the subsurface barrier No. 3. And the larger orange line due north is subsurface barrier No. 1. These are both the subject of a Corrective Action Program.

Regional Board has had oversight on this site since 1957 through waste discharge requirements. The most current waste discharge requirements were adopted in 1990 for the Main Canyon area; 1993 were the waste discharge requirements for the Eastern Canyon expansion.

The waste discharge requirements had also been modified in 1993 by this federal Subtitle D requirements, which brought all landfills in line with the federal regulations.

The Regional Board staff approves all monitoring systems and all the programs, all the investigation work plans. They approve all containment structures, composite liners, and gas and groundwater extraction systems. Regional Board staff also approves all surface drainage systems and the closer/postclosure plans.

The Corrective Action Program is for the release of volatile organic compounds that have been detected in groundwater monitoring wells located downgradient of that older Main Canyon area, which is unlined, downgradient of the Barriers 1 and 3.

This is not unusual. We see this type of release of VOCs either from gas or leachate. Most commonly in unlined landfills. And that's, of course, the reason now that we require composite land systems.

The volatile organic concentrations range from below MCLs to about eight times MCLs. MCLs, of course, are drinking water standards.

To put this into prospective, the problems of VOC contamination from other industrial sources in the main San Gabriel basin, which of course, is the Superfund area, our whole investigation program works on that.

Those VOCs are anywhere from 100 to a 1,000 times drinking water standards. The plume extends approximately 200 feet to 350 feet from the subsurface barriers. And we feel that we have stabilized the plume at this point.

The tentative Waste Discharge Requirements before you will implement the dischargers proposed cleanup plan for these VOCs.

I would like to talk a little bit about the federal and state requirements for monitoring phases.

The first phase is Detection Monitoring Program; second is Evaluation Monitoring Program; and third is what our subject is today, the Corrective Action Program.

State and federal landfill regulations require that there be a monitoring system for groundwater, surface water and vadose zone; and that it be capable of detecting the earliest release from the landfill.

It also establishes site-specific water quality protection standards based on background water quality. The Waste Discharge Requirements for the landfill. We do have some of these water quality protection standards for EDS and sulfate, which the Board adopted in 1990.

We will present to you what we think the water quality protection standard should be for this volatile organic compound pollution that is coming from the landfill.

And Detection Monitoring Program also establishes minimum routine monitoring. These have been in place since the approval of both state and federal regulations and the Waste Discharge Requirements.

Once there has been a detection, the discharger is put into evaluation monitoring phase or program to determine the nature and extent of the release. It also has the discharger implement interim corrective action measures, including coordinated landfill gas control.

And the information derived from this Evaluation Monitoring Program helps to design a Corrective Action Program by conducting engineering feasibility studies to see what is the most appropriate remedy.

The discharger has explored some 20 plus of these technologies and have completed all these stages of the Evaluation Monitoring Program.

As part of this evaluation monitoring, I mentioned that there is Interim Corrective Action, or should be, in place. There has been Interim Corrective Action for sometime at the landfill by way of continuous groundwater extraction at the barrier system. This is why the barrier system is in place, it acts as an impedance. And once you extract the source water, you should not have any further source.

There were four additional extraction wells installed in the fall of 1996 at subsurface Barrier No. 1, which significantly improved the groundwater quality. And also, coordinated landfill gas extraction has been implemented.

The Corrective Action Program must be protective of human health and the environment; and must be capable of achieving compliance with the water quality protection standards that the Board adopts.

It also requires public participation. Of course, we have this public meeting today. But the discharger also conducted a public workshop that was held December of last year. It's interesting to know that there were no oral comments at all during that two-hour workshop, except from the discharger.

And the Corrective Action Program continues until the water quality correction standard is achieved. Once the Corrective Action Program has been in place and it has been successful, then once again you return to the detection monitoring to see if there is any further release.

The Board adopts the water quality protection standards or the cleanup goals in this matter. Current state and federal landfill regulation specify that the water quality protection standard should not exceed background concentrations, unless it's shown to be economically infeasible.

The background concentrations at this site are non-detect or essentially zero. And so our goal is to have the discharger clean up these volatile organics to background or non-detect.

As far as regulatory compliance, the discharger conducted an appropriate and relevant detection monitoring, which was capable of detecting the release of volatile organic compounds; and through that Evaluation Monitoring Program, the discharger has adequately determined the full lateral and vertical extent of the release of volatile organics.

The discharger is proposing a Corrective Action Program that uses regulatory criteria, both state and federal regulations. It is technically feasible, and we believe can achieve the water quality protection standards.

Staff's recommendations are that the

Corrective Action Program that's proposed by the discharger be implemented through the adoption of these Waste Discharge Requirements. And we also recommend that the water quality protection standards be set at essentially non-detect, we call it "Laboratory Method Detection Limits."

And that concludes my presentation. I'll be glad to answer any questions you may have.

MR. NAHAI: Any questions?

MS. LYON: I have one question.

After the water is extracted from that, then what happens to that?

MS. PONEK-BACHAROWSKI: There is two possible uses for it.

One, they have reuse requirements for dust control and irrigation on the landfill if it meets certain limits. Or because they're really close to the San Jose treatment plant and they own it, they can discharge to the sewer.

MS. LYON: Thank you.

MS. PONEK-BACHAROWSKI: Thank you.

MR. NAHAI: I have a question.

During your presentation you said the VOC cleaning is now stabilized.

And so that would lead me to conclude

that the corrective actions taken so far are having some positive effect?

MS. PONEK-BACHAROWSKI: Yes.

MR. NAHAI: When is it that -- if we approve the Corrective Action Plan today, how long will it be before the water quality controls are attained?

MS. PONEK-BACHAROWSKI: It may be a long time. And one of the requirements in the Waste Discharge Requirements is that the discharger do like a trend analysis to see if really things are going down or that we see an increase of dark compound showing that there is a breakdown of these VOCs over time. So it does take a long time.

But they will be doing quarterly monitoring to assess the success of this program. If it doesn't work or it looks like the trend is going up on the VOCs, then certainly we are going to have to revisit this whole issue may.

MR. NAHAI: Okay.

MR. COE: I have a question along those lines.

This monitoring will include a monitoring off site?

MS. PONEK-BACHAROWSKI: Yes.

MR. COE: And that's how we're going to get off this experience on this natural tenuation --

MS. PONEK-BACHAROWSKI: Yes.

MR. COE: -- which is one-third of the Corrective Action Plan?

MS. PONEK-BACHAROWSKI: Yes.

MR. COE: Do we have any experience now on how natural tenuation in that area based on bacteria or so on?

MS. PONEK-BACHAROWSKI: We know that there is some natural tenuation because, as I said, we basically have source control at the site right now. But what happens, you know, if you believe the gas laws, basically you get to a point where this low level of VOC, you get to a point where it becomes acentotic; that is, you have low levels for a very, very, very long time as this stuff is attenuated.

So I think they will be able to reach the MCL probably very soon. This zero detection may take longer.

MR. COE: I said bacteria and that may be in connection --

MS. PONEK-BACHAROWSKI: Well, bacteria is one of the ways -- there is an absorption and many other factors that go into that.

MR. COE: Have you worked with the owner of this well to find out what their feelings are?

MS. PONEK-BACHAROWSKI: No. Although, I think, from the Waste Discharge Requirement we do have a finding in there that it would take from hundreds to thousands of years given the hydraulic conductivity and the distance for any of these to reach -- if they reached even without a tenuation, it would be like a thousand years.

MR. COE: Thank you.

MS. PONEK-BACHAROWSKI: Thank you.

MR. NAHAI: Thank you.

I have four cards here. I would like to call first Mr. Thomas LeBrun. Presentation is limited to three minutes.

MR. LEBRUN: I will do my best.

Is it possible to have a slightly additional time? I believe my presentation may answer some of the questions that were posed to staff members a few minutes ago. I will try and be as brief as I can, but I'm not sure I can do it in three minutes.

MR. NAHAI: I'll give you some, but then afterwards if there are follow-up questions from the Board, then additional items can be discussed at that time.

MR. LEBRUN: Yes, I understand. I will.

My name is Thomas LeBrun. I'm a division engineer with the Sanitation Districts of Los Angeles County.

We will go quickly then to the first slide.

The work has been completed and has been accepted with this Evaluation Monitoring Program. It's been ongoing since 1994 and was approved in late '98. During that time period, we spent over $2 million trying to study the area that is in question.

We also completed a proposed Corrective Action Plan, which included enhancing some of our protective features in 1996. We completed an engineering feasibility study. We held a public hearing in which we received no testimony. We had a 30-day period for submission of written comments.

We did see one or two letters of written comments which we included in our document, along with our responses to those which have also been submitted to every interested party. And we're currently under design right now to enhance our landfill gas control. Some of those we will spend over a million dollars on this issue.

I think an important thing to note is the landfill is outside of the main San Gabriel Valley groundwater basin. This slide came from the basin plan prepared by the Regional Board. And you'll see the area in black known as Puente Hills. Our landfill is within the Puente Hills area outside the main groundwater basin. The natural groundwater quality is very poor, water is limited in quantity, and this has been established as a non-water bearing zone since the early '60s by the California Department of Water Resources.

The next slide shows a little bit more closely the Puente Hills Landfill in relation to the basin. The colors you see are existing contamination of industrial sources. We put this up only for comparison purposes. The landfill has not caused any of this contamination, as we'll get into.

Whatever plumes of VOCs we have are very close to the landfill and are nowhere near in size or as much concentration as you see that exist in the groundwater basin today. And I think Blythe showed you this slide, so I'll skip passed it. The

Main Canyon is the area in question.

This is a historic photo to explain how we got to building the corrective actions that we have.

The Main Canyon -- this is an aerial photo from 1952. There is four canyons shown in blue, which drain to the north or to the top on the slide. The water would then be collected in the San Jose Creek, which you see in blue. And that would be the surface water drainage before the landfill was put in.

Our studies show that groundwater tends to also accumulate in the canyon bottoms shown by those yellow lines going again northward.

The subsurface (inaudible) is one in three that you see which were constructed many, many years ago to cut off this hydraulic pathway from the landfill into the basin.

Under the studies that we've conducted for evaluation monitoring, this will give you an idea of the hydrogeologic studies and borings that we've done. As you can see, there are a huge number of exploratory borings that were done at Barriers 1 and 3. We've received comments in the past about potential pathways to the north leading to some production wells. And we had a lot of borings that were done there and we did groundwater sampling at many of these locations mapped for testing.

These reports were submitted to the Regional Board and were approved, and this documentation is available in public record.

The monitoring program we currently have approved and the evaluation monitoring, which will continue, shows these 16 monitoring wells which are located basically across the same area of concern. I don't know if you can see it, but there is a dashed red line that shows a historic creek bed in relation to the monitoring wells.

And the two areas of concern that we did detect are shown in this Area 1 in blue and Area 2 in the green. And I have two monitoring wells that I want to speak to right now.

One of the questions you had is: Is natural tenuation effective? At Well EMP 5, which is the most downgradient well, which is closest to the drinking water well, the VOC concentration we see range from non-detect to no higher than 0.8 parts per billion.

We think that the corrective actions that we've taken and natural tenuation have made this one -- it's the only one we see -- present at less then one part per billion to date. M 10 B, going through the Barrier 1 area, had higher levels of VOC concentrations and did install additional water extraction wells in '96. And I'll show you the documents of that.

This next presentation will show you the groundwater pathway that was determined from the work that we had done. And basically it's following the historic prechannel and going, in this case, to the west.

We did a mathematical model as part of the engineering feasibility study. And the model is shown in the box that's dashed. And the white dot is monitoring well M 10 B, you'll see it's right adjacent to the Pomona Freeway. And the zone of contamination that you saw basically exists in this area underneath the Pomona Freeway, if you will. That's the extent of it laterally and also vertically.

So as part of the modeling program, we were able to calculate the decrease in VOC concentrations at this one well, that is the well that has the highest VOC concentrations at the site. And it's not real clear, but we plotted in the green the actual decrease in VOC concentrations since 1996 when we started the extraction. You'll see it's coming down rather dramatically. It's pretty much following the curve that was predicted by the computer model. This curve does not represent what will change, if and when, we construct the enhanced landfill gas control.

So we are on a steady decrease. We have seen decreases of the dramatic concentration at this well since 1996.

MR. NAHAI: Well, how much more time do you need? It's going on seven or eight minutes now.

MR. LEBRUN: Okay. Let me just flip to the last two slides now.

Our only objection to the -- is not really an objection. We had not asked that this matter be removed from the consent agenda. We believe that the Regional Board's proposal establishing laboratory detection limits, which in this case could be five times more restrictive than drinking water standards, is unnecessarily restrictive for groundwater that will never be used for drinking; it's in a non-water bearing zone; and it's outside the basin.

We think the control systems that we

have would allow this Board to give us the concentration greater than background. And that would be our recommendation.

We think the requirement recommended by the Regional Board staff is a little restrictive. We need something that is five times more restrictive than drinking water standards.

I'll save the rest of my slides. I'm open for questions.

MR. NAHAI: When this matter was going to be included on the consent calendar, did you ask for it to be removed?

MR. LEBRUN: No, we did not. We asked that it remain on the consent calendar. We indicated that we felt that these standards that were being proposed were overly restrictive. And in our discussions with Staff we said we want the opportunity to come back at a future date when we have actual performance data from the monitoring wells that you saw on the graph.

And we think at that point we can make a more compelling case for a different and more reasonable standard of drinking level limits. So we did not request this be removed from the consent agenda. We actually agree with the discharge standards, with the one proviso that I just mentioned.

MR. NAHAI: Pending further monitoring so that we can all find out what is happening there?

MR. LEBRUN: That is correct.

MR. NAHAI: Any questions?

Thank you very much.

Next card I have is from Mr. Thomas Stetson.

MR. STETSON: Good morning. I'm Thomas Stetson. I'm senior consultant to Stetson Engineers, which is a firm that I founded back in 1997. I'm also the district engineer for the Upper San Gabriel Valley Municipal Water District, which is the agency which I'm representing here today.

MR. NAHAI: Mr. Stetson, would you please limit yourself to three minutes.

MR. STETSON: Three minutes? I'll try, sir.

First of all, I would like to know whether our letter of January the 8th has been received by the Board? We wrote a letter dated January 8th to Mr. Robert Berlein, the manager of the Upper San Gabriel Valley Municipal Water District, which we understood was submitted to the Board and the Staff.

Is that in the package? They've seen that letter?

MS. PONEK-BACHAROWSKI: We do have as part of the file that was received during this County Sanitation District workshop, of which the County Sanitation -- you know, they made comments on those. So we have that, but however, that was not a part of our public comment. But it was taken into consideration by Staff when they developed this Corrective Action WDRs.

MR. STETSON: Well, in that regard, as you know, there is the -- the basin is on the Superfund, has been since 1984. I'm also the engineer for the (inaudible) Watermaster and the San Gabriel Valley Municipal Water District. I've been studying this basin since 1959 when the downstream area of central basin sued for water rights.

Subsequent to that lawsuit, there was a lawsuit entered in 1972 that adjudicated the water rights in the basin. And that's under a nine-member Watermaster service.

We did not have water quality problems -- at least we didn't know we had them -- until December 1979 when the VOCs were discovered.

Since then, basically, there was the Superfund in 1984. And under EPA's studies, they made lots of studies, but they haven't treated cleaned up any water yet. The only water that got cleaned up in the basin was done by producers with well-head treatment. And that's probably 12 or 15 water treatment plants.

Right now we're trying to put together a plan with the Watermaster of the lead agency and the district and the water quality authority and the state Department of Health Services and the causers, the responsible parties for the pollution, to develop a large project called the "Baldwin Park Project," which would clean up the basin. It will probably cost $100 million and it's probably going to take 30 or 40 years.

In fact, there is a meeting this morning at 10:30 with all of those people discussing that, and trying to get that study started.

Now, both Blythe Ponek and Tom LeBrun showed you how bad the water is in the basin. And they said their water is no more than 8 times the MCLs. Any way you look at it, we don't want more MCLs, more contaminate, in the basin.

And our concern is with proper monitoring of the landfill and its activities to see that that doesn't happen. We agree that downstream barriers can be effective when disposing of waste in a canyon because you can monitor both sides of the barrier. And if you detect something, you can do something about it. It's much better than a landfill and a gravel pit in the middle of the basin, which they've had in the past.

My understanding is that the Staff has adopted what was alternative to a Corrective Action Report prepared by the Sanitation Districts. We objected to that. We did not recommend that as a solution in our letter. In fact, we said we wouldn't support it.

However, if that plan can be modified in one respect by adding more shallow wells to the program, we would be willing to accept that. The program now has mainly deep wells. And we've prepared a list of wells, some existing and some that would be new shallow wells, that we would like to recommend be considered as an exhibit that we present as an amendment to the Staff's recommendation. And I have that copies of that here.

We've been monitoring the operations of the landfill now for probably six or seven years. Some of the constituents of Upper San Gabriel Valley

Municipal Water District came to the Board and asked them to look into some of the reports being prepared for the District or prepared by the District and have the District engineer review those reports.

We've been doing that on an ongoing basis since about 1993. And that's why we reviewed this report by the Sanitation Districts for the Corrective Action Plan. And we write frequently a letter of report to our District and the District then passes that on to the Regional Board and the Sanitation Districts.

We've also recommended in the past that an oversight committee be formed, including water district persons, sanitation district persons, Regional Board persons, so we have some kind of a group that oversees these activities as they occur. New reports come out, review them, comment on them.

We're not trying to be critical, we're trying to cooperate with the system. And, again, the reasons we suggest and somehow we think could be done to improve their operation.

Is my time up?

MR. NAHAI: Do you have any other suggested modifications apart from what you have --

MR. STETSON: That's the only one we

have at the present time.

MR. NAHAI: Thank you very much.

MR. STETSON: Do you need copies of this?

MR. NAHAI: Yes. We would like to see copies. If you would please give them to the executive officer.

The next card I have is from Mr. Royall Brown.

MR. BROWN: Thank you.

My name is Roy Brown. I'm a past director of the Upper San Gabriel Valley Municipal Water District. In that capacity, I worked with the Hacienda Heights Improvement Association on these leakage problems for many years.

We have seen the indications of leakage beyond Barrier 1 for more than 10 years. We watched the Sanitation District and Regional Board staff accept many excuses for why this leakage was here.

Although the Waste Discharge Requirements said it should not be, we watched them drag their feet on investigations and withhold the results of those investigations during the State Board review.

We believe that the history of

uncorrected contamination from this landfill has gone on long enough. Each report that has been prepared over the past seven years has showed a growing plume of contaminated groundwater. In 1992, only one or two wells near Barrier 1 were effected. Now most of the Barrier 1 wells are impacted with effects extending off site.

In 1993 there was no mention of contamination in Barrier No. 3. A few years after its construction, contamination because noted in both shower wells and off site and Well EMP 5 and potentially in M 16 A. The reason for installation of monitoring wells is to determine a need for corrective action when leakage is detected. We do not believe natural attenuation of this long-term problem is appropriate any longer.

We support a pump-and-treat alternative with new wells installed outside the landfill. We recognize that this program may not now be easy to build given the wide-spread nature of the contamination; that is exactly the reason why the contamination should not have been ignored before it got off site.

Gas withdrawal and natural attenuation have not worked so far. The hydraulic connection between the landfill and the aquifer has been ignored long enough. It is time to protect the public with a proactive treatment plan.

We do not agree with the deletion of Well M 1680 from the monitoring program. This well has detected some VOCs that are identical to those found in other landfill monitoring wells.

It is not acceptable to dismiss these results without understanding how they got there. The formations underlying the landfill are complex. Some are quite permeable, while others are less so. All of them extend through the San Gabriel River Basin.

North of Whittier Narrows, the river basin is more than a thousand feet deep. The monitoring wells are shallow compared to that. Contaminants migrating through permeable bed rock layers do not follow straight paths. Lines on a map are easy to draw, but they must be carefully considered in light of the fact that they represent conjure rather than rigorous definition.

Contaminants could easily bypass a shallow well, like EMP-5, and show up in a deeper well some distance beyond. It does not make sense to put in off site wells to detect far-reaching landfill effects and then abandon it when those effects show up.

If anything, more monitoring should be done; landfill effects at this location would indicate, as we suspect, that the extent of contamination continues to be poorly understood.

Before you agree to further reduce public protection, I request that you require a much more scientific analysis of how these contaminants got here. Lacking that, monitoring Well M 16 A should be reinstated in the program. Thank you.

Any questions?

MR. NAHAI: Any questions of Mr. Brown?

Thank you very much.

The last card I have is from Mr. Jeff Yann.

MR. YANN: Good morning, my name is Jeff Yann. I chair the Environmental Water Quality Committee of the Hacienda Heights Improvement Association.

As an engineer, who used to work in a highly regulated industry, it is disappointing to me that concerns HHIA has been raising over the years still have not been answered by this regulatory body.

In 1995 in response to our appeal, the

Water Resources Control Board remanded the landfill Waste Discharge Requirements back to the Regional Board for further investigation.

Now, it seems we find ourselves back here today with the investigation presumably complete; many new questions raised; few answered; and apparently your Staff anxious to get this matter behind them without having to challenge their permittee.

First, we still do not have agreement on location-specific background water quality standards. A final Corrective Action Plan cannot be developed before all sources of leakage have been identified.

We've been told for the past 16 years that Barrier 1 is a nearly impenetrable dike keyed into bed rock. Now we find out this is not true. In fact, the formations underlying the east end of Barrier 1 are quite permeable. The pumps inside the barrier can now be used to pump contaminated water back into the landfill from outside.

The ERR (inaudible) when this barrier was built committed to repair it if water quality downstream ever indicated it had been breached. Now that we know water has been flowing beneath it for years, that commitment has been forgotten.

Not only that, leakage is being detected on a broad front along Barrier 1 and is now being picked up along Barrier 3, with little explanation of the cause and no proposed corrective action.

In addition, these same permeable formations penetrate completely under the underlying landfill. Worse yet, they run to the west where they're intercepted and drained by the San Gabriel River. This is spelled out in the new investigations.

As recently as 1993, we were told permeability of formations underlying the landfill were less than 10 to the minus 6. That's one millionth centimeter per second. Now we know that recent borings in these formations are showing permeability thousands of times higher.

It is inconceivable that knowing this, the Regional Board staff is content to let this situation go uninvestigated and unmonitored

These are not trivial concerns. In fact, HHIA has little to gain in coming here to tell you this, except to express our concerns that this threat exists to a major drinking water source.

As a former project engineer, I understand why the Sanitation Districts are not investigating this on their own. What I don't understand is the appearance that this regulatory body seems to believe it should spend our tax dollars defending its permittees.

I urge you before you accept the provisions of this CAP to ask your Staff to do their own review and answer conclusively to the public satisfactions these questions we have been raising.

Issues contained in HHIA's comments to the Sanitation Districts in January have not been properly addressed. We've received no response from a letter we sent to the Regional Board at that same time.

On behalf of HHIA and water users in this area, I request that you have your Staff prepare a direct and comprehensive response to our concerns. I request that you satisfy yourselves by looking at these facts to make sure water users are truly being protected before you make your determination in this case.

Taking time to develop a comprehensive solution that assures protection of groundwater supply is far better than a rush to judgment that ignores the deep-seeded problems presented by this landfill that does not have to be here next to the river.

Are there any questions?

MR. NAHAI: Any questions of Mr. Yann?

I had one question.

The monitoring program that is being proposed, when infinitely will that not detect leakages from Barrier 1 and Barrier 3?

MR. YANN: It will detect leakage from Barrier 1.

What we're concerned about is the fact that the new results have shown very high permeability for the formations that extend underneath the landfill. They've gone deeper into those formations out in front of the landfill, but those same formations extend under the landfill. They also drain following the hydraulic radient toward the San Gabriel River, which is where you would expect them to drain. There is no monitoring on those pathways.

The concern we have is no water -- there is a lot of water that goes into the landfill, very little comes out in the leachate tracking system. Where is that water going? That is the pathway that we're concerned about that is being missed by the shallow monitoring program out in front of Barrier 1.

MR. NAHAI: So your proposal, then, would be that there should be additional monitoring?

MR. YANN: Exactly.

We believe if there are contaminants going through those permeable formations, they should be found before they get into the river and corrected on sight, rather than be shown -- some of them may be showing up in monitoring Well 16 A that Royall Brown talked about. So those are the areas that we're concerned about.

MR. NAHAI: Thank you.

Are there any questions?

MS. DIAMOND: I have a question.

Do you have some suggestions that would go towards protection of the public health?

MR. YANN: Yes. I think first -- as I mentioned, there is a lot of water that has gone into the landfill. Very little has been drawn out. It may still be in the landfill. I think we need to make an inventory to find out if it's there or we need to find out if the formations are as permeable underneath the landfill as they appear to be.

Perhaps that water is migrating through these formations. In which case, we would need to analyze those travel pathways towards the river and sink borings down into the sandstone conglomerate parts of the formation to assess whether contaminants are traveling through those formations at some depth, 200 feet, 300 feet potentially beneath the landfill.

So those are the types of things I would like to see investigated.

MS. DIAMOND: Thank you.

MR. NAHAI: Thank you.

I think we would like to have some Staff response.

MS. PONEK-BACHAROWSKI: We will see if I got this all down.

We would very much like to see what Mr. Stetson has proposed in the way of shallow groundwater monitoring. The monitoring program that you have attached to the Waste Discharge Requirements is by no means a stagnate program. That's going to be changing over the years. And it can be done by the Executive Officer's signature. And the reason being is as conditions change here, we definitely are going to want to see how effective the Corrective Action Program is.

And so if there need to be more wells, there are going to be more wells installed. At this time we feel this is a very conservative starting point on the wells -- on the detection wells and the corrective action detection wells.

Mr. Brown is correct in saying that there have been more detections in wells because they've been installing wells to chase the plume. So the whole idea behind putting additional wells in is to put them where you think the plume is going and then you delineate the boundaries. So that's why there are more detections.

And as far as MW 16, that well is pretty much centered in the San Gabriel Valley. And it has the same fingerprint VOC as you see in the problem areas in the central portion of the valley not caused by landfill. Wells between the landfill and that landfill do not show the same constituents in the same concentration.

So we believe that MW 16 are wells that are picking up the main San Gabriel Valley VOCs contamination unrelated to the landfill.

It is true that higher permeable strata has been investigated at the eastern edge of Barrier 1. And that's why the additional extraction wells were put in that area. The idea is, if you extract out the groundwater behind the barrier, then there is no polluted groundwater to go anywhere. And so that was the purpose for the installation of those four wells. And I think I mentioned to you that we see a great deal of improvement in that area since those wells went in in '96 or '97.

And I want you to know that we've reviewed all comments by all parties. And I think you can see we have kind of extremes in ideas about what is going on at this landfill. And what we've tried to do is bring things to the middle and adequately address the comments, but also not be overly burdensome on the discharge, but be reasonable.

And, again, this is not a staffed program. If this needs an update or additional extraction or whatever, that's what is going to occur.

MR. COE: I have a question.

I believe Mr. Stetson recommended an advisory committee being created, as I understood it. And what is your response to that?

MS. PONEK-BACHAROWSKI: Yes. Actually that came up a few years ago. And at that time it was the Executive Officer's idea that because we have to abide by a strict set of federal and state landfill regulations, that that's what dictates the way we look at these problems and the series of events that happen.

And although an advisory committee may have some really important things to bring to that, I mean they can bring that to us also in the way of a letter. We certainly look at every single comment that's ever been received.

And I mean that's always up again if that pleases the Board, that can be looked into.

MR. COE: We're trying to improve our two-way communications. And rather than meet within the 12 individual meetings or 12 individual letters --

MS. PONEK-BACHAROWSKI: Well, although the Regional Board staff have been kind of removed from this, I believe there is a citizen's advisory group that meets on a regular basis, concerned parties, with the discharger and they meet on a regular basis also.

MR. COE: Thank you.

MR. KESTON: I just have one question.

Did you comment or could you comment on

the Sanitation Districts comment about levels of detect.

MS. PONEK-BACHAROWSKI: Again, the regulations say that the water quality protection standards shall not exceed background concentrations unless it's shown to be technically infeasible. And in order to show that basically you need more data showing that, you know, selected remedy is not going past a certain point.

And I think it's reasonable for them to ask down the line as we get more and more data and more trend analysis, that perhaps we review all the groundwater data to see what is going on here and maybe in the future bring it back to the Board.

This is what we've done with other landfills if we used the non-detect as the protection standard. As you can see, the water that's being discharged is not really being discharged in our drinking water aquifer; although, it has potential to reach it sometime down a point if it's not -- there is no source control. So I would say that we could revisits that in the future.

MR. KESTON: Is that a very costly -- are they requesting that change because it's very costly or time consuming or what is the reason?

MS. PONEK-BACHAROWSKI: It's a possibility that they are -- because of the low non-detect that they could be in corrective action forever. And that they may have to enhance the corrective action down the line if they're not achieving those non-detect limits. So it would cost them money in the long run, yes.

MR. KESTON: Thank you.

MR. NAHAI: I have a question regarding the timing issues of this thing.

When exactly is it that you think that the data from the monitoring will be sufficient to ground the decision as to whether additional monitoring is required; as to whether additional corrective action is required; whether it be appropriate to go to a feed program rather than barriers? Do you expect that in six months' time as to what the monitoring reveals? A year's time?

MS. PONEK-BACHAROWSKI: Well, you know, the regulations have not really caught up to reality because the regulations say that the discharger has to report at least semi-annually about the success of their corrective action. That's not really reality. Because if you've got four quarters of monitoring, I mean you couldn't even start with statistical analysis until you have four, six, eight quarters of monitoring. And trend analysis may take even longer than that.

So I would say in the next couple of years with eight quarters of monitoring we should certainly see something happening or should be able to tell it statistically.

Also, if it continues to follow the modeling, I mean, we can see that right away. If the levels continue to follow the curve on the modeling

Also -- well, I'll stop there.

MR. NAHAI: Would it be feasible to ask Staff to come back to the Board perhaps in six months with a report as to what it is that monitoring -- or eight months or six months as to what monitoring in two quarters. I think we're seeing some real concerns expressed here.

MS. PONEK-BACHAROWSKI: Sure.

MR. NAHAI: And I'm not sure that they're that extreme. And to let it go for another two years and gather data and then in two years we discover that perhaps our thoughts about how much leakage was happening and where this was hydrologically connected to or in error, that would put us back two years. I don't think we should have to wait that long.

MS. PONEK-BACHAROWSKI: The time lag will be caused by the installation of additional gas extraction wells, which is going to take some time. And the discharger will be, as part of the WDRs, will be giving us an implementation schedule.

So it's going to take a little while to get these extraction wells or gas extraction wells built and online. So that's one of the biggest time delays right there.

Also, the idea of putting extraction systems out under the 60 Freeway, I mean we have civil engineers here that can tell you that's probably not a very good idea since we have substantive subtypes every time that you start extracting large amounts of groundwater under a structure.

MR. NAHAI: I'm not talking about the extraction wells. I'm talking about reporting back to the Board as to the results of the monitoring.

MS. PONEK-BACHAROWSKI: We certainly can do that, of course. We receive those reports quarterly.

MR. NAHAI: Okay. So that in two quarters we will hear back from you on this issue?

MS. PONEK-BACHAROWSKI: Yes, sir.

MR. NAHAI: Thank you.

Any other questions?

I think that concludes that item. Our agenda calls for the Board to take a break at 10:15. We can take that break now.

MR. LEON: Are you going to vote on the item?

MR. NAHAI: Do we need to include reporting back to the Board on the item?

MR. LEON: Part of the motion, direction to Staff.

MR. NAHAI: Okay. Then that will be the approval of the motion as recommended by Staff with the amendment that Staff report back to the Board in six months' time as to the results of the monitoring obtained between now and six months from now.

MR. KESTON: Could the reporting back be reporting by the director executive officer instead of at a public hearing? The truth is normal monthly reporting technique, I think that might be more effective; and then if we see an issue, we can then schedule it rather than having it as a public hearing.

MR. NAHAI: That's fine.

MS. DIAMOND: Could I also ask that the reports that we get respond to the comments that were made today, particularly about the modifications that were suggested; and whether, in fact, it makes sense to abandon some deep wells or delete any wells so that we have a response to those comments that were made today which I also think were educational and not terribly, extreme.

MR. KUYKENDALL: Mr. Chairman, members of the Board, if we could have that report back after two quarters of reports are submitted and it can be analyzed by Staff; so it won't be within six months. Technically we receive two quarterly reports and can they be analyzed?

MR. NAHAI: And how much time to be analyzed?

MR. KUYKENDALL: We're talking roughly a month for the second report, so we're talking about a month after the submittal of the second quarterly report.

MR. KESTON: If that's a motion, then I'll second it.

MR. NAHAI: All in favor?

BOARD MEMBERS: Aye.

MR. NAHAI: It's a good thing we have a lawyer as the chairman here to keep all my motions in line and stuff like that. I apologize.

MS. LYON: I do think we should take a break because Staff and our audience would appreciate that.

MR. NAHAI: You probably think I should take a break.

We will see you in about 10 minutes.

(Brief recess.)

MR. NAHAI: Can we come to order, please.

Okay. We're going to move to Item No. 11, which is the consideration of a Municipal Storm Water Permit for the City of Long Beach and a consideration of a proposed settlement agreement.

I would like the executive assistant to read the statement.

MS. HARRIS: This is a public hearing to receive evidence and consider Board action on the following items: Consideration of a Municipal Storm Water Permit for the City of Long Beach; and 11.2, Consideration of a Proposed Settlement Agreement.

Copies of these items were sent to the

dischargers, the Environmental Protection Agency, the State Water Resources Control Board, and other interested agencies, persons and organizations.

The order of presentation of testimony at this hearing will be Board Staff, the dischargers, public agencies, and other interested agencies and groups. Anyone so desiring, will be heard.

If you have not filled out one of the blue cards located on the table at the back of the room, please raise your hand and we will get a card to you to fill out.

It will be appreciated if all persons appearing before the Board today will leave written copies of testimony if available. The Board will consider all testimony; however, in the interest of time, it is requested that all repetitive and redundant statements be avoided.

The setting of time limits for the presentation of evidence is at the discretion of the Board.

Mr. Chairman, will you now open the hearing and administer the oath.

MR. NAHAI: I shall.

Would all those who are going to give testimony with respect to this item rise and repeat after me.

(Oath was given.)

MR. NAHAI: May we have the Staff presentation?

MR. DICKERSON: Mr. Chairman, Members of the Board, the next item City of Long Beach Municipal NPDES Stormwater Permit, represents the culmination of a long period of discussions between Regional Board staff, the City of Long Beach, the County of Los Angeles, USEPA, and representatives from several public interest organizations. What is before you is a proposed permit that addresses the stormwater pollution in the City of Long Beach. As you can see it is a comprehensive permit that addresses an array of issues in what is hopefully a succinct and clear fashion.

Its format may very well serve as the foundation for subsequent stormwater permits to be presented for Board consideration. This permit is, of course, a departure from the existing stormwater permit with the County of Los Angeles. It essentially removes the City of Long Beach from coverage under that permit and provides Long Beach with a stand alone permit. How we got to where we are today requires a few words of clarification.

The County stormwater permit was adopted by this Board in July of 1996. While I and some of you do not participate in that permit hearing, by most accounts it could not be described as warm and fuzzy. Unfortunately, the process embraced by Board staff to seek consensus on the permit's content failed to achieve consensus from all participants, most significantly, the City of Long Beach.

Following the Board's adoption of the permit, the City of Long Beach exercised its appeal rights to the State Board and to Superior Court. Currently, there is a case pending, City of Long Beach versus Los Angeles Regional Water Quality Control Board, which challenges many aspects of the Board's adoption of the County stormwater permit.

Shortly after joining the Board as Executive Officer, I recognized that the ill will generated by the adoption of the County permit was shared by others and represented a source of misunderstanding and resentment. In response, I made it one of my key priorities to do everything that I reasonably could to change that perception and to successfully resolve the pending Long Beach litigation in a way that would be fair, equitable, and would result in a step forward in addressing stormwater pollution.

That process started with my gaining a clear understanding of the permit itself and reaching out to various local government entities and interest groups to listen firsthand to their concerns. It continued through the adoption of model programs under the County permit and to building a foundation of trust with the City of Long Beach. Over the many months that have transpired since, I have had the opportunity to build a strong relationship that I believe is one of friendship and mutual respect with the City staff who are charged with implementation of the stormwater program.

The permit before you today is the outcome of an intensive effort that began in earnest late last year. There have been many drafts of permit language, representatives of the major environmental groups were consulted early on and they actively participated or had the opportunity to help draft the language that you have before you.

While not every issue is resolved to everyone's complete satisfaction, the permit does represent a very credible and comprehensive permit that clearly places the City of Long Beach among the forefront of cities addressing this challenging problem. They've reached out to other cities to learn from their experience and they have engaged in an open and honest dialogue on what we're trying to achieve. It has been one of the most demanding, yet fulfilling experiences in my career.

So today we have a permit for your consideration. Assuming it is adopted today, what happens to the pending litigation? We've worked with the City to draft a settlement agreement which I'm requesting your authorization to execute.

This elegantly simple agreement has this essential provision: It calls upon the City of Long Beach to immediately move to dismiss the pending litigation once two events occur. First, that the Long Beach Stormwater Management Plan is approved by the Executive Officer pursuant to the existing County Permit. This has been done. Second, that the Regional Board and USEPA adopt the permit. I believe that we have a representative from USEPA here who will offer comments to the effect that USEPA endorses this permit and intends to act on this matter expeditiously.

With those two actions, the litigation can be resolved and both we and the City can move forward to implementation. I should note that the City retains their rights of appeal of the draft permit now before you, once it's approved. However, I fully expect that the outcome of today's hearing and Board action will render that provision unnecessary and I know that the representatives from the City share that sentiment with me.

Xavier Swamikannu will shortly be walking you through the permit and some issues that have been raised since we issued the tentative draft permit. Xavier's involvement in this process has been exemplary and essential. Quite frankly, it simply could not have been done without his dedication and efforts and I have the greatest admiration for his knowledge of the County permit and his willingness to get this job done.

Thank you very much, Xavier. I appreciate it.

In addition, our Counsel Jorge Leon played a critical role in getting to this point as did our Assistant Attorney General Marilyn Levin. My sincere thanks to each of you.

From the City, Ray Holland, Director of Public Works and Ed Putz, City Engineer, have been in every respect men of fairness and dignity. They were open to a bridge to resolution and we've shared many hours together to achieve that result. I consider gaining their professional friendship one of the best outcomes of this process.

Barbara Munoz had the difficult and overwhelming task of developing a stormwater management plan for the City of Long Beach. That document served as the critical element that allowed this process to move forward. She did the yeoman's work and deserves no small amount of recognition for her contribution.

Finally, this permit will be implemented principally by Rose Collins and Tom Leary, who greatly helped in the stretch to wrap-up this permit. The final version of this permit that is before you was the product of a marathon meeting -- and a very long meeting indeed -- between Rose and Xavier to take a document with all the essentials and to make it presentable. Thanks must also go to Mark Gold, Steve Fleischli, Jacqueline Lambricts, Terri Grant, and many others who all devoted no small amount of time to this project.

With all that being said, I can recommend a permit to you for your approval, with a number of technical revisions that are in the change sheet before you. These changes should resolve many, if not most, of the comments that we received.

Dr. Xavier Swamikannu will now brief you on the elements of the permit and he'll be followed by the City of Long Beach and others who wish to comment.

Finally, I would request that the Board waive its normal 3-minute rule to allow additional time to ensure that the comments that we receive today are well documented for the record.

Thank you.

MR. NAHAI: Mr. Dickerson, could I have an additional copy of that change sheet, please, if you have one.

MR. DICKERSON: Yes.

MR. SWAMIKANNU: Mr. Chairman, Members of the Board, my name is Xavier Swamikannu. I'm an engineer on Board staff.

First, I'm going to describe the permit structure, the things that are in it.

The first section is the finding section. The findings basically lays a basis for issuance of the permit. It talks about the history of permitting in the Los Angeles region. And it directs you to the appropriate state and federal laws that implement the permit.

The second section is a section on receiving water limitations. And the receiving water limitations we basically say that some are discharge and must comply with water quality standards. Water quality standards were established to protect beneficial uses.

In addition we have a prohibition on some discharge causing nuisance. We also have statewide language that has been recently adopted by the state Board that lays in a process in case you have exceedance of water quality standards. It basically goes past -- the city goes through a series of process to update the BMPs in order to resolve any exceedance that they find.

The next section is a section on discharge prohibitions. Dischargers permitted under the NPDES. Dischargers that are exclusively authorized in the permit. There is also a process laid out for the executive officer to consider any use for the discharger to be authorized under this permit if they do not cause problems.

We have a section stormwater management. And I'll go through briefly in my next Icon the components of that.

We have special provisions. Special provisions are provisions specific to the City of Long Beach. And these are generally random targets that we've agreed on, for example, training or planning in the next six months. Those kinds of provisions.

We also have a section standard provisions. Standard provisions are provisions that go into all NPDES permits.

We have appendices. And in the appendices is the outline of the Long Beach Watermaster program as well as the Long Beach monitoring program. It also includes a few drainage maps that depict drainage in the city.

Stormwater management. Basically this component of the permit requires that the city implement best management practices approved by this Board under previous permits since 1990. They're explicitly called out in the permit.

It also requires the city to possess legal authority to prohibit or control pollutants to the storm drain. The city has told us that they have adequate legal authority at this time. It is a separate ordinance. They have also expressed a willingness to consolidate all those codes into a single ordinance at a future time after considering the need for such consolidation.

The city is required to implement a Stormwater Management Program. And I'll briefly go over it, but the details I shall leave to the city to discuss.

The city is required to implement a monitoring program basically to assess the amount of pollution that is coming out of the stormwater to study impacts and to study the effectiveness of BMPs that are being implemented.

The city is required to conduct reporting on the program to us and evaluate progress on implementation.

There was also a subsection on budget specifically allocated to the stormwater program and they're trying to provide us with an annual update of the budget.

Next I shall briefly go over the federal regulations that require us to approve the Stormwater Management Program.

Under the regulations the city is required to reduce pollutants from residential and commercial areas. They must find these elements in development plan, development construction sections, as well as public information participation.

The city is also required to control illicit connections and illegal dumping in the discharge permit and that comes out of federal regulations as well

The city is required to control pollutants from municipal and industrial facilities. You'll find this comment on the public agency activities, as well as public education where they're required to visit Phase 1 industrial facilities and other facilities.

The city is required to control pollutants from construction sites. And you'll find these requirements under development planning and construction. I should make note that the regulations are 40 CFR 122.26.

Now, Long Beach Stormwater Management Program, public agency activities; these are activities associated with the municipality. They're required to implement BMPs on their facilities in their planning programs and such. The city will provide an elaboration.

Development planning, development construction. This section is a primarily private program, primarily construction. And they're required to implement -- approve local plans for controlling stormwater pollution on sites 1 acre or more, but less than 5.

The city is also required to eliminate illicit connections and illicit discharges to the storm drain system.

The public education and public information component, this is an outreach to the general public, but it also includes city employees as well as business.

Next, briefly I'll go over each of the sections. I want to highlight certain things that are different from the L.A. permit that we entered into in 1976.

Under public agency activities, the city is required to clean up catch-basins that are 40 percent or more full between October 1 and April 30. So during that period, they're required to clean out catch-basins that reach that capacity.

Next the city is required to landscape areas with 25 percent of vegetation. When they are required to do landscaping, they'll landscape with xeriscape vegetation, which is dry vegetation.

Next, street saw-cutting and paving will be prohibited when it rains when the rain fall is more than a quarter of an inch. You don't want that activity going on because there is a lot of pollutants associated with asphalt.

Under development planning, the city will train its planning department employees under requirements no later than six months and will conduct an annual refresher course thereafter.

The city has also required specific BMPs for automotive repair, service stations, restaurants and hillside projects. This is different from the county-wide program where we require a separate plan because the BMPs have been designated. Since the BMPs have been designated, we have removed the requirement for a local plan. And I think that's an evolutionary step.

Under public education information, the city has stated that it will achieve a certain new number of impressions on the public via multi-media. Again, this is a measure of the outreach message. And the number that they've agreed to is 1.5 million.

The city will also conduct walk-through of businesses visited to provide consultation on recommended BMPs if invited by the facility operator.

The city will conduct a separate study to survey private parking lots with 10 or more spaces to evaluate trash and other pollutants generated and will send recommendations to the Board on any action necessary.

The city will implement a monitoring program. This is the first time any city is implementing a monitoring program separate from the county-wide program.

The city will determine mass-emissions, the amount of pollutants coming out at Dominguez Gap, which is to the Los Angeles River, Bouton Creek and Alamitos Bay, these additional two sites are fully within the city, so they're lead contributors.

In addition they have agreed to monitor Los Cerritos Channel beginning year 02. And the city is the largest contributor to the watershed. But there are other cities. They will mass-emissions at the out-fall. And when we consider future permits for other cities, we would bring them to allocate their contributions, or at least to understand their contributions.

The city has agreed to evaluate stormwater toxicity to see if it has an impact. And if it has an impact, there is a protocol in there to follow-up, identify the cause of toxicity, and then to identify sources as well.

The city will also evaluate effectiveness of dry-weather flow diversion at one of the locations, Alamitos Bay. And they want to demonstrate that that's a good BMP.

We received comments from municipalities, including the City of Azusa, Claremont, Diamond Bar and the City of L.A.

We received comments from environmental groups, The Natural Resources Defense Council; a letter cosigned with American Oceans Camping; and Friends of the Los Angeles River; and we also received comments from Heal the Bay.

We received comments from the Petroleum Association. We had an issue with one of the provision requirements that I'll discuss on the main issues.

First general comment was the period for comment. This comment came from cities as well as the environmental group was insufficient. By law, we're required to provide 30 days' notice. Given the fact that we had code deadlines before us, we did the best we could. But in the future, we should consider giving people more time, more time is always better.

On the Long Beach Stormwater Management Program, there was comment that it was not circulated; what we have in the permit is simply the outline of it. In our public notice that was published in the Los Angeles Times on May 28, it mentioned the availability of these documents. These documents are in four volumes and so it's impractical to circulate them. There was a number provided in the public notice. And the city or the Natural Resources Defense Council could have contacted us to review the documents.

In addition a civil issue was raised before the state Board and petition in 1996 when a stormwater permit was issued to Santa Clara Valley and the state Board simply dismissed -- did not recognize that the circulation was essential; did not comment on it, but the document says under California Code of Regulations that where an issue is not commented on a decision, then the issue is considered dismissed.

So in my opinion there was not a substantial issue of law or process that was applicable according to the state Board.

The next issue, one city and perhaps a few more will consider what a strict applicability to other cities of the requirements of this permit. This is a format. We have a general format for future stormwater permits.

The cities were concerned about the fact that they had no opportunity for discussion or negotiation. What we're offering today is we're offering a change in the finding that caused concern. And the finding basically says -- it's in the change sheet -- and it says the Regional Board will ensure that Stormwater Management Programs within the County of Los Angeles that bring to the City of Long Beach complement requirements of the offer.

So any future permits that are issued we will not issue permits that contradict or make the City of Long Beach violate this order, as opposed to imposing the same requirements on them.

That, to me, is a substantial change from the City's point of view.

The next issue, this is an issue that came up very close to the final days of negotiation. And it has to do with the requirement of development planning, new development. And the environment community generally wanted a requirement in there that at least some measure for new development.

And they proposed infiltration and/or treatment of runoff from new development projects. These are three of the options at the time. One is

100 percent treatment of stormwater runoff from the property, from the new development. The second standard is the one that's being proposed by the county, which hasn't come to that. It's in the draft document. It talks about treatment of the first six-tenths of an inch of storm runoff. And treatment means infiltration, buffers in any form. They're not basically specifying the following treatment. All they're saying is the first six-tenths of an inch undergo some type of infiltration or treatment.

The County of Los Angeles, under a settlement agreement with the Natural Resources Defense Council for the unincorporated area of Los Angeles County, have agreed to the treatment of the first three-quarters of an inch of storm runoff.

The Staff issue on this point is simply that we haven't had time to look at these numbers. Obviously monitoring them is good. From the technical documents that I've seen, anywhere between .04 of an inch to an inch treats first flush, which is the lower pollution that comes off, perhaps 80, 85 percent. But we haven't had the opportunity to analyze the effectiveness or the cost effectiveness associated with these different numbers.

And I believe that we will have that

opportunity when the standard mitigation plans come to the executive office of our approval. And I will request that we consider it at that point other than hold up the permit now.

The next issue, this is an issue that was brought to us by the Western States Petroleum Association. There is a requirement that on new gas stations and new service stations that the discharge from hazardous maintenance storage areas, repair maintenance areas be prohibited. The dischargers now may be prohibited. The tentative also includes fueling areas.

And it was brought to our attention that that's probably irrespective. What you have generally VOCs, prohibition may not be necessary. It was also brought to our attention that through a consensus process, the state stormwater task force, which is a coalition of municipalities, had come to some agreements on BMPs for these kinds of activities.

And so we have recognized that and our recommendation is the fact that we take fueling areas out of the prohibition and allow BMPs to be applied in accordance with this stormwater task force.

The next issue, main issue has to do

with the monitoring program. As I mentioned, this is the first time a city is monitoring for stormwater under a permit. One of the comments submitted expressed concerns that some of the major shared watersheds, like the Los Angeles River or San Gabriel River, there is going to be no monitoring until the year 03; when the city has expressed an interest in being part of the group effort.

Similarly, the comment was also mentioned that there is no protocol to identify sources and perform evaluations of BMPs, whether they're working or not.

Something that has come to our attention recently, there is an influx in Southern California from all the municipal county programs to enter into an agreement to ensure consistency as well as regional issues like protocol for testing; protocol for salmonella contaminants and such.

And the City of Long Beach has expressed an interest to be part of that. That effort is being put together by a Southern California Coastal Water Resource Project, Regional Board's executive officer is commissioner on that organization, which is sort of an independent research organization of regulators as well as the

Sanitation Districts.

And it's my opinion that any resources that the city permits will be well commended to do it on a Regional basis as opposed to the City of Long Beach.

Next we will go to recommendation. We have a change sheet before you. And they're separated into substantive changes, substantive to the commenters and non-substantive changes. I'll just briefly go over the substantive changes. I've addressed some of them already and I've touch on a couple of non-substantive changes that came to my attention today.

The first substantive change we discussed that there is a finding that we say that the Board will ensure that the programs in areas within the County of Los Angeles will complement the requirements of this order.

The next change, it was also brought to our attention that there is no default date in the permit. In some cases, we've provided that something be done by a certain date. So the changes that are -- we go to an implement date -- a default date of six months from the permit option. And we've discussed that with the city and they've agreed to that.

The next substantive change is the one to do with the fueling areas at gas stations, and I've discussed that.

I'll also briefly mention the next one on public information parking spaces, the tentative requirements of minimum of 100,000 per year of the general public. We've changed that to 1.5 million. We've talked to the city and they've agreed, took that higher number.

On the non-substantive changes in the permit, monitoring at one of the channels, Los Cerritos Channels, not the only one. The requirement in the permit was beginning in the year 03. We are now moving that ahead to year 02. And this is something that the city has said that it's agreeable to.

In addition, one more non-substantive change. I have a definition for ecological sensitive areas. And that's probably the last page under definitions, it's the last definition.

And I had recommended an addition based on comments received that we add any ecological area designated. My understanding, perhaps that's opening a can of worms, just too broad. And we would rather leave it as is in the tentative.

If at some future point there is an appropriate agency that's identified with the ecological areas, we can just define it through the executive officer's authority to include that entity.

So with that, my recommendation is that the Board adopt the permit with the changes that are proposed in the change sheet as well as what I've voiced before you today.

Thank you.

Any questions?

MR. KESTON: Mr. Chairman, yes, I have two questions if I could.

Some of your comments today talked about standard urban stormwater mitigation plans for the L.A. County permit. And I think you mentioned that the county -- whatever you ever call them -- something, SUSMPs are not yet approved and will be heard before this Board in a short period of time, so you want to defer whether it's four-tenths, six-tenths, seven-tenths, or whatever, until they're heard.

Could you just tell us when that will be heard? Do you have any feeling for that?

MR. DICKERSON: Mr. Chairman, Xavier

and I really haven't talked specifically about scheduling that, but it's my understanding it will be coming to our office very shortly. And given the timing of having it before the Board, we want to have it, of course, before the Board here in Los Angeles County, not in Camarillo.

Earlier this morning and just thinking about the issue, the thought crossed my mind as to whether or not we should even have a special meeting. Because I suspect that that particular item may have quite a bit of interest associated with it. And we may even need a good portion of the day on that one item.

So I think that's a possibility. So I would like to discuss that with the Board.

MR. KESTON: So you're talking about 60 or 90 days or something in that time period?

MR. DICKERSON: Oh, I would expect either late August or early September.

MR. KESTON: So that's 60 days or so?

MR. DICKERSON: Right.

MR. KESTON: Okay. That was my first question.

My second question, as you read the change originally proposed, on the last page of the change sheet pertaining to environmentally sensitive areas, you define them as a special biological significance by the state Board Resources Control Board, and certainly that's an agency that we believe sets special biological areas by the California Research Agency, and certainly we don't have a problem and the County of Los Angeles. And since we're dealing in the County of L.A., that's appropriate too.

And I think your comment was these words, "or any other ecological area designated by any other government body," you would like deleted?

MR. SWAMIKANNU: Yes. The tentative has it without.

MR. KESTON: Without it? Okay.

MR. SWAMIKANNU: Yes.

MR. KESTON: Because obviously "any other government body," could include a school board, a mosquito abatement board, groups that have no jurisdiction and no interest and no responsibility to that.

MR. SWAMIKANNU: There is a possibility that that can be interpreted that way.

MR. DICKERSON: And we may have some comments on those items as to the justification, which may offer some clarification. Right now the language as included in the change sheet just seems to be a bit broad, but we're open to hearing more clarification on that.

MR. KESTON: Personally, I think it should identify those agents that have responsibility and are identified; and that if anyone comes up in the future, you can add them, but certainly not to make it so broad that anything becomes an agency. I think the way it was in the original permit sounds fine to me.

MR. COE: I have a comment or two.

I think it's apparent that a lot of work has gone into this. It's also apparent that it's been sort of a rushed effort. The Regional Board members received a four-page change sheet this morning when we arrived here. And I would like to ask Jorge Leon a legal question.

As I understand it, the rush is tied in with the litigation and a deadline apparently set by the judge. What is the situation? And could it be changed by some kind of extension by the judge to avoid this appearance being perceived for true here that we really would like a month or two more, and then have it come back in either August or a special meeting to finalize it.

Could you tell me about that?

MR. LEON: Sure. As you know we have been basically in litigation with the City of Long Beach since the issuance of the permit; they appealed to the state Board; the state Board dismissed; and the City of Long Beach appealed to the court. And there have been various legal maneuvering and wranglings over discovery. And just usual kinds of litigation activities ongoing between the filing of the litigation and now.

There was at least one request that was granted by the judge to move the previously set hearing date in the litigation. And the current litigation start date is, I believe, it's July 12. Is it July 12 or the 16th? The judge in his order granting the extension basically said very firmly, very sternly, there will be no further extensions. And we've taken that statement very seriously.

And so we worked with the judge's admonition that no further extensions would be granted, to move this permit along. And as Xavier, I think, indicated; sure, it would have been great to get additional time, but it does appear to me that adequate notice was provided to the public.

Certainly minimum legal notice was provided to the public and all documents have been available to the public.

We've been moved too far a fetched, just an attempt to explain why we're here today and not two months in the future.

MR. COE: If all parties of the litigation come before the judge and both agree to it, there is no advisary --

MR. LEON: Normally that's what our belief would have been as well, but we were basically in conference with the city's attorneys -- and you can ask them as well when the City of Long Beach comes up -- but we pretty much agreed that we would not be able to get the concurrence of the judge even if we requested it together.

Normally we would have expected that, yes, but we didn't believe we would get it in this case.

MR. COE: Even though the plaintiff withdrew?

MR. LEON: Well, a withdrawal is completely different. The petitioner was not in the position to withdraw the litigation. They were only in the position to request an extension.

MR. COE: Okay. Thank you.

MR. LEON: Thank you.

MR. COE: I would like to ask Xavier, looking over these changes quickly, it doesn't seem to me -- and I may be incorrect -- you haven't taken care of the comments -- the two main comments by Heal the Bay on the development planning and the monitoring of permits.

Is that true or do you think you've taken care of it?

MR. SWAMIKANNU: I've taken care of the monitoring issue that Heal the Bay has raised. And probably there are better alternatives in terms of keeping in line the efforts of conducting monitoring sooner than later. They agree that monitoring for monitoring sake is useless.

And my opinion is there is a regional effort which has just begun and they probably weren't aware of it. And Long Beach has agreed to participate in that effort. That will be a better use of their resources.

MR. COE: And the monitoring changes in the change sheet --

MR. SWAMIKANNU: Oh, the monitoring changes is something that was brought to my attention here this morning. And so my recommendation is that we move up the monitoring of the Los Angeles channel to year 02.

MR. COE: Okay. That's change sheet No. 2?

MS. DIAMOND: Did you say the year 02?

MR. DICKERSON: That was actually approached by Heal the Bay and the city this morning.

MR. COE: I'm going to ask Heal the Bay if the changes take care of their problems.

MR. SWAMIKANNU: And I'll be happy to respond to them.

MR. COE: How about the development program?

MR. DICKERSON: If I could just comment with regard to the fact that this is an issue that is going to be coming to us shortly, it's the time frame that we talked about earlier. We did not resolve Heal the Bay's concern with regard to this permit. However, this permit contains language that in essence says that once that language is adopted for everyone else, the City of Long Beach will conform to those provisions.

And so I do expect that when those come to us and before the Board, it will be a very interesting discussion.

MR. COE: Dennis, do you feel that this new information that's coming in on those two things, and others, that the permit permits by reference to submit to the executive officer who will approve this or something like that, that those things can be accommodated and the permit can be more satisfactory to more people?

MR. DICKERSON: I'm not quite sure I'm following you.

MR. COE: The new information that's coming in --

MR. DICKERSON: Right.

MR. COE: -- you just said that you're waiting on this development plan.

Does the permit very easily accommodate without coming back before this Board and having hearing changes in the permit that --

MR. DICKERSON: Oh, that, bringing that matter to the Board is actually something that's not going to be specific to Long Beach. It's more reflective with the county permit. So we're not going to be reopening the Long Beach permit. And we're not going to be reopening the county permit.

The permit right now -- as Xavier

pointed out -- the county permit, allows the executive officer to approve those what we call SUSMPs, Standard Urban Stormwater Management Plans. And at a meeting -- several meetings ago we made a commitment to actually bring that to the Board in response to some of the questions that were raised. And so that is the genosis of that particular commitment.

MR. COE: What is approved in the county permit will also apply in the Long Beach permit?

MR. DICKERSON: Yes.

MR. COE: Thank you.

MR. NAHAI: Any questions?

I had a couple.

First, with respect to this issue of new development -- I hate to revisit it again, but you kind of just lost me.

I understood that with respect to that issue what is going to happen is that hopefully today we would set a deadline for that to come back to us, be it September or whatever is a reasonable time, we would actually try to decide on that today. And that when that happened, it in effect if not reopening this, we would be supplementing it.

Because it seems to me on the one hand you're saying that Long Beach is not going to be completely taken out of the county permit regime. And yet the new development matters that you were talking about, you were saying would pertain to the countywide permit from which Long Beach is being expressly excluded under this permit. And so it is a legal comment that Jorge can sort out for us.

In other words, I think what I'm saying the issue of new development and the regulation of stormwater runoff is a critical issue. And we need to make a decision today. That's not going to be before us today. And if we're going to adopt this permit without those critical aspects, then we need to know exactly when they will brought before us. And we need to know that they will be brought before us in a legal form that will in effect supplement this, so then there won't be any question as to the effectiveness of those provisions once they find out.

MR. LEON: Mr. Dickerson, I think, wants to make a couple comments after finding a point in the permit. But I agree with you that the concern is valid. And I see it as a process that will supplement the petition -- I'm sorry -- permit because otherwise you would have a gap.

MR. COE: That was really one of my questions.

MR. DICKERSON: On page 16 of 33, paragraph 6 (a), the language is that SUSMPs will incorporate the following requirements: A. Provision associated with SUSMPs adopted by the Regional Board.

And so that is the reference by which when future action adopting actual provisions of SUSMPs, Long Beach is obligated to conform to that.

MR. LEON: Did you want to make perhaps a statement -- make a modification that makes that absolutely clear? And from your question I also hear a request for a statement with respect to timing about when that will be brought back.

MR. NAHAI: Yes.

MR. LEON: Dennis, do you know when that will be brought back?

MR. DICKERSON: Would September 15 at the latest be acceptable?

MR. COE: What date is that?

MR. DICKERSON: September 15th. So we would bring that to you at some point before that.

MR. NAHAI: Okay. That will be hopefully when we get to it and a motion is made, this will be one of the issues that will be -- you know, I anticipate as we go through this process that there are going to be many other modifications. And someone should be noting them so when we get to our motion --

MR. DICKERSON: I'll so designate myself.

MR. NAHAI: I have a couple of other questions.

First, I would like to compliment you, and the Regional Board staff and Heal the Bay and Friends of the Los Angeles River and everyone else that spent so much time; of course, the City of Long Beach in bringing this to this place. I know it was a difficult process and a time-consuming one.

MR. SWAMIKANNU: Happy to have a happy ending.

MR. NAHAI: Well, having said that -- who talked about a happy ending?

Whenever I'm in court and the judge says nice things to me, that's when I begin to get happy. But here are the couple of questions that I have.

First, with respect to the timing issue. I appreciate the fact that a time limit has been put in here because there just wasn't one before. On the other hand, the timing that's been put in now is a general one, six months for implementation where no other time has been specified.

But as we go through the permit, there are provisions and requirements which don't lend themselves to a six-month time frame. And I wanted to ask you about a couple of things if you have this in front of you, because I see that they're not specifically, you know, addressed.

For instance, in Part 1(c) on page 6 of 33, "The permit shall be part of part 1 and 2 in the permit in timely implementation of controlling measures, et cetera," is that supposed to fall under a six-month deadline? And what does is contemplate in there?

MR. SWAMIKANNU: The six-month deadline is for implementation of the Stormwater Management Program, which is their program to achieve. But it doesn't give them a six-month waiver on compliance.

MR. NAHAI: But this is my question, Xavier, because if you take a look at the change language, it says "Implementation of the requirements of the permit and the LBS WMD," so that's where my confusion arose from.

For instance, we've got things here like -- I don't know -- in page 11 (b)(1), "The permittee shall participate with the County of Los Angeles, the City of Los Angeles, et cetera."

Do they have six months to do that or is that something that should become effective immediately?

MR. SWAMIKANNU: That should be effective immediately. Because they're part of the countywide program, they will continue to participate. And that's laid out in the Long Beach Stormwater Management Program. I realize that that confusion can arise based on the change that I recommended.

MR. NAHAI: Okay. Well, we need -- just another example -- and all I can do here is give examples -- and then we can go through it paragraph by paragraph. But on page 18 paragraph 4, "The permittee shall not issue a grading permit for developments that would disturb areas of five acres or greater," that's not a six-month time frame. That should become effective immediately.

So what do we need to do? If we take your six-month deadline and we make that applicable only to the stormwater plan, then that leaves all of these other provisions without a deadline.

I mean, I'm happy to be a pain and go through each paragraph that I've marked here if that's the thing to do.

MR. DICKERSON: Perhaps what would be best is -- and it's clear that we're going to probably have to break for lunch, then reconvene in order to close out all the public comment -- over lunch, Xavier, I'm sure, can go through that and identify any items that need to be clarified in that manner.

Will that be okay?

MR. SWAMIKANNU: Yeah.

MR. KESTON: Is it possible if we don't break for lunch, we can get through this and be done by 1 o'clock?

MR. DICKERSON: I doubt that very much.

MR. KESTON: We don't have to make this until 5 o'clock today; right? I mean, it's not a requirement that we do that? I would surely like to see if we could really move this along and make things happen here earlier.

MR. NAHAI: I would like to do it as quickly as possible, but if you think that we've agreed to give 10 minutes to the discharger on this and five minutes to each of the commenters and we've got eleven cards here and not even allowing for questions --

MR. KESTON: I mean everybody takes five minutes? I mean usually we have two minutes of speaking.

MR. NAHAI: But Mr. Dickerson suggested and requested that given the fact that this permit, you know, may well be the model permit for other cities, it deserves -- it really deserves all of the areas of scrutiny that we can give it. And we have a responsibility to do that.

MR. DICKERSON: We can certainly have a shorter lunch, if that would help.

MR. NAHAI: Well, shall we take lunch now and then come back and hear from the discharger?

MR. DICKERSON: That makes sense.

MR. NAHAI: Okay. So we break for lunch until 12:30, say? Let's do that then.

(Lunch recess.)

MR. NAHAI: Let's come to order then.

And we're continuing Item No. 11.

And we've heard from Staff and now we're going to hear from the representative of the discharger. And we've agreed that we will provide 10 minutes to the City of Long Beach and thereafter five minutes to each person.

MR. HOLLAND: Thank you, Mr. Chair, Members of the Board. I'm Raymond T. Holland. You can call me Ray. I'm the director of Public Works. I've been with the city for over 15 years in that capacity. And I'm honored to be here to talk to you today. And I'm here on behalf of the city council. And I would like to thank the Water Quality Control Board for working so diligently with us over the past several months in creating the proposed permit presented for adoption today.

I especially would like to thank Dennis Dickerson, Xavier Swamikannu and staff, for their dedication and technical expertise in working with the environmental groups, other public agencies and our city staff to produce a document that not only meets, but exceeds the intent, technical aspects and legal requirements of the Clean Water Act.

I would like to say -- and it's not in my written notes here -- that I want to say about Dennis and Xavier that in my over 30 years of experience in public administration, I've never worked with more consummate professionals than the two of them. That's from the depths of my heart. They're honorable men of integrity, good will, and it's been a privilege to work with them. And I count it as a blessing to consider them as friends and I want to continue that friendship.

I would also like to thank the environmental groups and the scientific research community for their participation during this process.

And on our presentation over here you see the names and so forth, you might want to follow the presentation to my right, your left.

Thanks are also extended to the public agencies, such as EPA Region IX and the Los Angeles County Department of Public Works for their assistance in the development.

The content and quality of this proposed permit has been greatly enhanced by the concerned parties, and I would like to say "linking our arms." We've linked our arms, the environmental community on one side, your staff on the other side and us in between. We've been working together over the past several months to create a document which is designed to protect and preserve our valuable water resources.

It is important to adopt this proposed permit not only for the City of Long Beach, but for the region.

The City of Long Beach is committed to protecting and preserving the quality of its waters and beaches. As you may know, Long Beach recently received an A plus rating in the Heal the Bay's "Beach Report Card." Clean, uncontaminated waters and beaches are vital to the quality of life for our residents. Safe waters and clean beaches provide many recreational opportunities and are important parts of Long Beach's appeal to tourists and to our economic prosperity. Adoption of this proposed permit provides for protection and preservation of our valuable water resources.

Long Beach has worked cooperatively with all concerned parties to develop a permit that serves to protect and preserve our waterbodies and beaches. When adopted, it can provide framework for other cities in the region to follow, not only for their particular city, but also for a cooperative cost-efficient watershed approach.

Adoption of this proposed permit in 1999 instead of 2001 allows a two-year "jump start" towards achieving water quality standards. It includes items such as implementation of TMDL's, monitoring for quality water in the City of Long Beach and incorporation of specific elements in planning, development and construction, just to name a few. All of these items are designed to reduce pollutant runoff and improve water quality.

Adoption of this proposed permit allows us to fully implement a comprehensive program to expand upon and integrate all components of the permit concurrently with the approved Long Beach Stormwater Management Program, into our environmentally based programs in a cost-efficient manner.

Let's take a look at some of our programs.

The Long Beach SWMP approved May the 27, consists of the following elements:

Program management, which outlines the areas of responsibility for each department within the city structure for implementation.

Geographic characteristics describes the storm drain system, channels, and waterways.

Development planning and construction provides for stormwater quality guidance for developers.

Illicit connections and illicit discharges is designed to eliminate illegal connections and discharges into the storm drain system.

Education and public information programs for heightened awareness of stormwater runoff and its potential effects on our waterways.

And annual reporting for benchmarking, trend analysis and setting future stormwater quality goals.

This plan is the foundation of our Stormwater Management Programs and provides a method of implementation and integration of the clean water elements with existing programs for maximum efficiency and cost effectiveness.

Let's look at how our Long Beach SWMP integrates with current environmental programs associated with the stormwater management.

The city has many proactive stormwater quality related programs that can be expanded and used to integrate the elements of the Long Beach SWMP concurrently with the implementation of the proposed permit.

Some examples of these programs are street sweeping; automated trash collection;

Southeast Resource Recovery Facility, that's our waste energy facility; pump station cleaning, 45 percent of the city's stormwater runoff drains to pump stations allowing us a unique opportunity to remove debris prior to outfall into our waterways.

We have programs for catch basin cleaning; catch basin stenciling; litter receptacles on streets, in parks and on beaches; and a beach raking program, takes the debris and rakes it up before it gets into the water.

Beach clean up after storms. And I would like you to look at that picture. I hope you can see it. That's the kind of stuff that comes down the rivers onto our front door. And I've shown many of these kinds of pictures to Dennis and that's why we're concerned about clean water. We want this region to do something about what comes down and gets on our beaches.

We have recycling programs. Extensive. I think we're a leader in that field. Oil collection program. Again, we're a leader in that area. This is a curbside collection of oil for our residents so that they don't get dumped into the storm drains.

We have special refuse collection programs. Again, we're trying to get the citizens to not put their trash out in the street or someplace where it will blow into the street. We provide that. We have litter abatement and property maintenance ordinances, and we enforce those. We have household hazardous waste collection programs. I think you know about those.

We have what we call our "Traveling Recycling Education Center." This is a very elaborate trailer with up-to-date kinds of devices that we take out to the schools and we educate them on environmental programs, including stormwater education.

We have what is called "Protect Our Watery World" programs for children. This program is a hands-on interactive children's education class on the negative effects of trash and pollutants on marine life and our oceans.

We have the City of Long Beach Nature Center, which conducts various and environmentally-based classes, including education on the protection of our waters and appreciation of aquatic life. We have composting and vermiposting programs; water conservation programs; reclaimed water programs.

If you look at the green shaded area,

our areas where we irrigate with reclaimed water. We have Adopt a Beach program; we have Beach Clean Up Days. And we participate in countywide events of all sorts that are environmentally oriented, particularly water quality oriented.

Ash can/litter can ordinance. Long Beach has established an ordinance which requires the placement of ash cans and litter cans in appropriate places, such as you see here in front of restaurants, fast food establishments and markets to prevent litter and cigarette butts from ending up in our streets and on our beaches.

I hope you all have visited our Aquarium of the Pacific, there is a picture of it there. We have many cooperative programs with the aquarium folks to educate children and adults about water pollution prevention and protection of marine habitats.

And this I think is interesting, we have an Environmental Crimes Investigation Unit. The city has a unique Police Department/Fire Department Environmental Crimes Unit, which officers have police authority and hazardous waste materials training combined. This unit works with various agencies to investigate and prosecute environmental crimes, including stormwater pollution.

These are but a few of our environmental programs. Together all programs will serve to protect and preserve our waterways and beaches in a cost-effective manner.

Now let's look at some innovative items in the tentative order.

The tentative order provides for TMDLs. These are new permit items that provide for TMDL's for trash and other pollutants when adopted by the Regional Board.

Monitoring of the City of Long Beach waterbodies. There has been quite a bit said about that already. I won't go into that unless you want me to later.

We're working to cooperate with other agencies for regional waterbody testing monitoring. And we have 25 percent Xeriscape requirements. Pervious area requirements. New developments must have areas designed to reduce or absorb stormwater runoff. Proposed projects cannot exceed pre-development runoff in those areas where the potential for increased stormwater discharge rates can result in an increase in downstream erosion.

Proposed parking lot study. By July

15th, 2000, survey private parking lots with ten or more spaces, exposed to stormwater runoff to determine the amount of pollutants generated by these sources and the measures taken to remove litter by the parking lot operators.

Increased parking lot sweeping to a minimum of one time per month for public agencies, for uncovered parking lots with spaces greater than 25.

Uncovered parking lot washing program to be developed by October 1, 2000, and implement an uncovered parking lot washing program for public agencies.

Increased litter can placement.

We're running out of time. I'll just keep on going.

Provisions for covered trash areas; increased street sweeping; pesticide application on an "as needed" basis, rather than routinely. Provisions for GIS, Geographic Information System, database recordkeeping. Increased education for commercial businesses; developers; the general public where we've committed to make 1.5 million impressions per year; school children; city employees.

We're trying to reach out to everyone

we can. These are items that are over and above the current 1996 municipal NPDES permit and will allow a two-year jump start towards improving water quality, especially in the area of water quality monitoring with Long Beach and regionally.

At this time, I would like to address Regional Stormwater Monitoring Program agreements as we previously mentioned.

The trend is to have more regional monitoring. Currently, counties and cities are meeting to development cooperative agreements. The Los Angeles Watershed cities have been developing a draft agreement since March of 1999.

Also, seven counties have recently conducted two meetings, with Southern California Coastal Water Research Project as the lead, to develop agreements for cooperative monitoring, similar to the Santa Monica Bay project between the city, the county and the scientific research community.

The purpose of these agreements are to set the parameters for consistent, meaningful data collection and for shared funding for these regional monitoring projects. The current participants of this project are SCCRWP -- which we've already talked about -- Orange County, Riverside County, San Bernardino County, San Diego County, L.A. County, San Barbara County, Ventura County, UC Davis, Cal State San Diego, Camp Pendelton, EPA, the Regional Board and even Caltrans.

This activity serves to validate that agreements between public agencies are currently being proposed to improve water quality, and could be modeled for the City of Long Beach in our proposed cooperative regional monitoring agreements in permit year three.

The City of Long Beach has received the support of many public agencies on our request for our proposed permit.

The following are a few examples: The Executive Advisory Committee; the City of Azusa; City of Claremont; City of Covina; Diamond Bar; San Dimas; Irwindale; and we received Lakewood today; South Bay Council of Governments, which is 16 cities; and others.

And we would like these to be put in the public record as support from the above-mentioned cities. Many cities support our request for adoption of our proposed permit, as it provides flexibility in implementation of programs and sets the stage for other cities to apply for their own permits.

In summary, the City of Long Beach is very proud of the proposed permit and request its adoption today. Not only will it allow the CIty of Long Beach to better protect, preserve and improve water quality, but also it can serve as a model for other cities to do the same.

We sincerely believe that the adoption of this permit will protect our waterways and provide a means for regional cooperation in the implementation of the requirements of the Clean Water Act, which can improve water quality for the entire region.

Thank you.

I would be happy to answer questions or at least attempt to.

MR. NAHAI: Do we have questions of Mr. Holland?

I would just like to say on behalf of the Board that I understand that you and your staff contributed significantly to the atmosphere and cooperation in order for these negotiations to be brought to us this day. And it is sincerely appreciated by us.

And it goes to show that when people

from state agencies and local agencies and the environmental groups cooperate together that a great deal can be achieved.

I had one question to ask you, though. And it goes to page 15 of the permit.

And it reads -- it's Section 2 and it says: "The permittee shall inspect" then (a) says, "those portions of the storm drain system consisting of storm drain pipes 35 inches in diameter or greater for illicit connection within five years."

That seems an awful long time. Why is it five years is necessary for those inspections?

MR. DICKERSON: Which paragraph number, please?

MR. NAHAI: I'm a page 15.

MR. DICKERSON: 2 (a)?

MR. NAHAI: 2 (a).

MR. HOLLAND: The water department -- which we had one of our water Board members here this morning. He had to leave and go to another meeting. He was hoping to be here and hear the deliberations.

This water department is headed by the water Board, appointed by the mayor and council, is responsible for maintaining our storm drains. And they have a comprehensive program. And to go through and to do this, they had asked us to give them a five-year period because we have a tremendous number of these.

And I was just told that they are asking that the program would be moved up more than five years. But it was based upon the resources available to go through and do video checking of all the lines and to do that visual inspection analysis and then the determination of what needs to be done. So it was based upon the resources that they had that they committed to it to a comprehensive program.

MR. NAHAI: What would the inspection program commence?

MR. HOLLAND: It's underway right now. They've been doing it as we were developing this.

MR. NAHAI: So it's ongoing?

MR. HOLLAND: Yes. And they're hoping to beat five years. But five years is what they laid out in their work plan is what they felt that they could do it with the resources that they had available and they're trying to implement it sooner than that, they've already started it.

MR. NAHAI: Thank you very much.

MR. HOLLAND: Thank you very much.

MR. NAHAI: Going now to the cards.

The first one I have here is for Mr. Moore.

MR. MOORE: Good afternoon. Gary Moore with the City of Los Angeles. I wasn't laughing at the opportunity to comment. After hearing two hours of wonderful cooperation, it's hard to be the first person that has a concern. So that's why I was chuckling as I walked up here.

MR. NAHAI: That's what the public hearing is for.

MR. MOORE: Right. Thank you for that opportunity.

We have some concerns regarding provisions of the Long Beach permit, which indicates that the requirements in the separate permit would be applicable to all cities. We appreciate the change that was made, but we don't think it's gone far enough. We believe it should be deleted completely.

The City is a strong advocate for improving stormwater quality with limited resources and several court mandates, we must be sure that the programs we implement are cost-effective and complement one another to the maximum step possible. With that in mind, several of the provisions of the Long Beach permit would prove inappropriate to the City of Los Angeles.

The permit was publicly noticed as a Long Beach permit and not as a standard condition for all stormwater programs.

Furthermore, we're concerned that the requirements included in the permit are applicable to business and industry, and as we are all aware of this morning or this afternoon now, that only one commenter from industry is here today.

We received in the City of Los Angeles comments and concerns from business as we've been moving forward in implementing our permit. We have several concerns, including cost effectiveness of the proposed BMPs and controls.

Three of the examples that I have for you this morning are -- in the permit they called out for street sweeping to be done twice a month. The City did a study and found that street sweeping had limited benefit towards reducing stormwater pollution. With the number of miles in the City of Los Angeles, it would be prohibited to do this in the City of Los Angeles. Our current permit requires us to do it once a month.

Secondly, there was a requirement, as we've talked about this morning, to do an uncovered parking lot washing program. This may be appropriate to the City of Long Beach, but it's contrary to the City's ordinance that bans such activities as part of our water conservation program.

I think also during the general public comments we heard this morning, that to clean one parking space, it would take 2 to 7 gallons of water. If you look at this on a regional basis, you're talking about a lot of water.

Third example that I have for you is regarding the 25 percent use of the Xeriscape. It's inconsistent with the City of Los Angeles's policy, which is to enhance the urban forest for air quality and other beneficial quality of life issues.

One other thing I wanted to talk about was that since it was brought to our attention this morning about the SUSMP -- is the acronym we call it, so everyone has their own take on it -- is that we want to go on record that we have very serious concerns by putting in the requirements that we discussed this morning. And we are working with the County of Los Angeles and we've submitted comments to them.

Just a little bit more here.

Several of the proposed requirements may have multi-media impacts. And what I mean by this is that the City is very concerned about the potential of solving one environmental problem by creating another. We must have the opportunity to review and evaluate control options for environmental impact.

Because of the unique needs and requirements of local government, it is important that each city participate in the development of their own individual permit.

Since the City did not participate in the Long Beach negotiations, and as discussed, the City has several difficulties and concerns with the conditions in the permit, we respectfully request that the requirement that has been modified, note 16, be deleted completely.

And I want to thank you for the opportunity to comment.

MR. NAHAI: Thank you, Mr. Moore.

The next card I have is from Ms. Eileen Ansari.

MR. KESTON: Should we hold all comments until -- or if we have a question --

MR. NAHAI: We can ask questions of the individuals.

MR. KESTON: Maybe this is a question

of Jorge.

If the City of Los Angeles has an ordinance that says, "Will sleep" -- "will sweep" -- excuse me.

MR. LEON: I'm sorry. Will do what? Will do what?

MR. KESTON: If the City of Los Angeles has an ordinance that says, "We will sweep one time per month," and if they have a water conservation ordinance that says, "We can't clean the parking stalls with water because it uses up too much water," or if they have an ordinance dealing with air quality that is inconsistent with these ordinances, what do we do?

I mean, do we prepare an overriding ordinance and then the City must comply and change their ordinance? Or do we go and find out as to each of these instances what the City's ordinance -- they may have absolute good reason and that reason may not be water quality. But it may be -- from the City's point of view, it may be an overwhelming reason which might take precedents. How do you deal with that from a legal point of view?

MR. LEON: Well, I think what we would do -- I'm going to suggest that what we would do is negotiate with the City and try to work it out. But clearly your question stems from the comments with Mr. Moore who just said you're tying us into a whole bunch of predicaments here.

And rather than answer your question, I would like to say that Mr. Moore's comment, while well taken, I think we have a good answer for it. This permit does not bind the City to do anything, the City of L.A. Rather, the finding -- first of all, it is a finding -- as Xavier pointed out during his presentation, findings don't bind anybody to do anything. It's just a factual basis for where we go with the permit, No. 1.

No. 2, the City will have its opportunity to negotiate with Xavier, with Dennis and the staff to work out problems like the one that you just pointed out, if it happens to exist, when we get to working out the City of L.A.'s permit; whether it happens to be an individual or group permit.

You know, I think that's the best way to answer your question that we wouldn't be forcing something on them that would create a legal issue for them. We don't want to create an issue for them or for us. But the finding is merely a finding. And the City of L.A. and the other cities will get their day to negotiate appropriate permits for those other jurisdictions.

MR. KESTON: I guess Mr. Moore ended his comments by saying he would like something deleted and I didn't pick up exactly what it was. But is that something that you're going to address from a legal point of view because you want to make sure we don't wind up in lawsuits with every city across Southern California because of ordinance problems?

MR. LEON: Sure.

MR. DICKERSON: To make that particular issue hopefully very concise and resolve, it's the first item on the change sheet, No. 16. And as Jorge pointed out, it's really just a factual basis. It has no binding authority. It's really just kind of nice language to kind of set the stage. And I don't think it's mandatory, not required. And unless Jorge has a strong objection, I would just say take it out.

MR. LEON: Take out the language?

MR. DICKERSON: Yeah, on 16.

Okay. I guess I better talk to my attorney.

MR. SWAMIKANNU: If I may just add a little bit.

The final objective of this is for water quality. And when this issue comes up for the City of L.A., if we issue one in the future, we would consider that. We would make whatever adjustments are necessary to achieve the water quality objective.

For example, if there is a conflict with the water conservation ordinance, then we would suspend the requirement when the water conservation ordinance is in effect. So there are adjustments, but we cannot deal with that right now because we don't have the City of L.A.'s permit with us. We have the City of Long Beach's permit with us.

MR. NAHAI: I think it's important that that be clear on the record. What is before us today is the permit for the City of Long Beach, not the permit for the county or City of L.A.

And the language, as I understand it, before read "That the Regional Board will ensure that Stormwater Management Programs for areas within the county that drains into the City of Long Beach would be consistent with the requirements of this order" and that was changed -- or the proposal is that that be changed to state that the "Stormwater Management Programs for areas within the county that drains into the City of Long Beach will complement the

R0073548

requirements of this order."

Now, I understood Mr. Moore's concerns to be truthful. The first concern was that this permit is going to serve as a model. It may serve as a model, but that doesn't mean that it's going to be verbatim binding on other jurisdictions.

And the second issue is whether the statement that the Regional Board will ensure that Stormwater Management Programs for the County of L.A. will complement the requirements of this order, whether that would obligate us somehow to impose upon the City the requirements that are similar to those here.

I think the word "complement" appears innocuous to me. But we also need to consider from our point of view whether -- because we can't be put in a position as well for the City of Long Beach, that we're committing to them that we're going to impose something else on other jurisdictions. We don't know if we're going to impose something else on another jurisdiction.

So given that, what is the recommendation? That we delete the language altogether or --

MR. KESTON: If it's an "objective" as

opposed to "ensure," that's a different thing.

MS. LYON: I would like to make a comment.

I'm very concerned, though, that the City of Long Beach is going to be stuck with things coming downstream. I mean, they're receiving everything that's coming down from further north. I would think that they would want to keep this language in. I don't know. I need to hear from them.

MS. MUNOZ: Yes. My name is Barbara Munoz from the City of Long Beach.

And I would like to say that we do have storm drain systems within our jurisdictions that are not only City of Long Beach, but also the County of L.A., Caltrans.

So, in essence, we would like to keep this language in to make sure that their systems are also maintained on stormwater quality.

MR. LEON: Now, that pretty much squarely hits the issue that I think you said, can we commit ourselves to do something in future permits. I would recommend that you do.

But on the other hand, it does provide a certain amount of -- the statement as stated in there currently with the innocuous phrase "complement" versus "consistent with," I think it provides the City of Long Beach a certain amount of assurance that you're going to consider what action is being taken today in the future permits.

On the other hand, if you learn in the negotiations and discussions with future cities that there are some inappropriate provisions in this permit, then it would not be applicable to those future permits or shouldn't be. You don't have to do it.

I think the City understands that a finding isn't a commitment that binds anybody, but it is a statement of assurance. And maybe that kind of statement here on the record is what all the parties need to hear.

From the City of L.A., No 1., you're not going to be bound by what is in this permit. Although, it certainly does look like a model and we planned it that way because we want to do the leg work now to set up the base for the future permits.

MR. NAHAI: What if the word "ensure" were to be changed to "will employ reasonable efforts to ensure"? That way it's not a legal commitment on our part, but it does mean that we will use our efforts to make sure that it's all complementary.

MR. HOLLAND: Mr. Chairman, may I say something?

We've been working on this in a goodwill basis. And I have every expectation that that will continue to be the norm, not only with your staff, but with all agencies. I think one picture -- and I could have shown you lots of pictures showing what we deal with, what comes down those two rivers. We want whatever can be done, but it needs to be done in a cooperative fashion.

I think our own personal experience, the City of Long Beach, and the way we've approached this when we sit down and we talk about the issues and we work in a goodwill basis, a good faith effort. I think out of that, good people will come up with the right solution.

So the kind of language you just talked about, Mr. Chair, is fine with me because I trust your staff. I trust the staffs of the other cities and the environmental groups that we all work in a good faith effort to deal with the issue that I showed you on that one slide, all the debris and trash and the sediment and everything that comes down those rivers. We've got to work together.

I would hope that we would not get hung up on the language today, per se, that there will be an agreement among us all that that's an objective we need to be working on in a reasonable way.

MR. NAHAI: Thank you.

MR. KESTON: Mr. Chairman, I am not a lawyer, but somehow the words "best efforts" is a legal phrase. And I would like to -- if we go and change -- if we decide to change it, I think it would be better to change it to say it's our "objective" that everything is consistent, as opposed to "we will ensure that we use best efforts."

That would concern me from the point of imposing something that we don't intend to impose and then somebody downstream comes and says, "But you said that's your best efforts and you haven't gone out of your way to do that."

MR. NAHAI: We can deal with that when we come to the language of the permit.

Thank you for your patients.

MS. ANSARI: Thank you very much. Mr. Chairman, Members of the Regional Board and honorable guests, I'm Eileen Ansari, council member from the City of Diamond Bar, delegate to the San Gabriel Valley Council of Governments, and also a director of Southern California Association of Governments where I serve as the chairman for the NPDES committee.

I would like to say that the City of Diamond Bar supports the Long Beach permit for the process by which any jurisdiction and the county can operate its own permit.

The City of Diamond Bar, a city of 68,000, is not quite the same as the City of Long Beach with 450,000 people. However, clean water is the objective of all of us.

The Long Beach permit addresses several concerns that the San Gabriel Valley Council of Government expressed in a letter to Dennis Dickerson last year. We're pleased to see that the Long Beach permit contains a reopener clause that allows the permit to be modified any time during the term of the permit; allows potable water to be discharged to the storm drain system; and model programs, especially development and construction, have been simplified, made more reasonable and easier to understand.

Executive Director Dennis Dickerson, the Regional Board members and the environmental community should applauded for the work on this permit with the City of Long Beach.

Still we ask that the Regional Board correct two problems that the San Gabriel Valley had raised several months ago. And I'm asking it because I think it's setting a precedent with the City of Long Beach.

That it can remove from the legal authority the section prohibiting untreated wash water to the storm drain system. This provision can be interred to mean that it's permissible to discharge treated wash water to the storm drain. The problem is that there is no way wash water can be treated before it goes to the storm drain.

First, discharging wash water through some type of treatment device, such as an oil/water separator, would violate the discharge prohibitions section of the permit. The discharge of wash water to the municipal storm drain system constitutes an illicit discharge under the permit.

I would like to say that we support the City of Long Beach permit. And we realize that this is not a cookie-cutter permit for every city, but we also have to realize that every city is individual. And the main objective is clean water under the Clean Water Act.

Thank you.

MR. NAHAI: Any questions?

MS. LYON: Do we have a change for that or not?

MR. LEON: A change regarding best efforts and goals?

MR. NAHAI: The remarks about untreated water.

MR. SWAMIKANNU: The section she's talking about is the section on legal authority. And what we have defined legal authorities as is the municipality has the legal authority to enforce against the discharge of untreated --

MR. NAHAI: Which section are you on?

MR. SWAMIKANNU: Page 9 and 10.

This section basically says if the city has demonstrated legal authority, these are the kinds of things that it has to be enforcing. The discharge of treated wash water is okay because they're removing the pollutants. And so the legal authority prohibition should be, again, the discharge of untreated wash water.

Now, untreated wash water can be sent to the sanitation system, or they could use some kind of treatment system to remove oil. What we're asking the City is to have the capability to enforce against situations where wash water is released to the storm drain without undergoing any process.

One thing that would take that out of the process is if it has an NPDES permit. And occasionally we do issue NPDES permits for wash water.

So I do not really understand what the concern here is. I think what the City is trying to say is if there is an illicit discharge when you discharge wash water and so it should not have to demonstrate legal authority to enforce against untreated wash waters released to the storm drain.

My recommendation is basically that since it's only a legal authority requirement and if the wash waters are directed to the sanitation system, you have no problem. If they have some kind of treatment device, you have no problem. You could make a decision at that point whether that needs an NPDES permit or not.

Any questions, Mr. Chairman?

MR. NAHAI: Thank you, Xavier.

Let's move on. The next card I have is from Ms. Terri Grant.

MS. GRANT: Good afternoon. My name is Terri Grant. I'm employed by the Los Angeles County

Department of Public Works, but I'm here today speaking on behalf of Mr. Desi Alvarez, chair of the Executive Advisory Committee, to provide the letter of support that Ray mentioned earlier in his presentation.

The Executive Advisory Committee for the Los Angeles County Municipal National Pollution Discharge Elimination System permit wishes to express a support for the City of Long Beach's application for their own NPDES permit.

We support the concept of local control for stormwater programs as we feel that greater progress will result in the City's tailored individual requirements for their unique needs and abilities.

As such, the EAC understands that the Long Beach permit is city-specific and many parts may not be applicable to other municipalities. Nonetheless, we support the City's efforts to create its own unique program.

MR. NAHAI: Thank you very much.

Any questions of Ms. Grant?

Next card I have is from Mr. Ron Wilkniss.

MR. WILKNISS: Good afternoon,

Mr. Chairman, Members of the Board. My name is Ron Wilkniss. I'm with the Western States Petroleum Association with the trade association in the western United States, California and several surrounding states. And it tends to be the majors of the industry that are our member companies.

Many of our members own and operate retail gasoline outlets, also known as RGOs, that will be impacted by the requirements in this NPDES permit.

I would like to preface what I expect will be brief remarks with an apology to the staffs of both the cities of Long Beach and the Los Angeles Region. Regretfully, I became aware of this issue only fairly recently. And I do hope that my relatively late arrival on the scene has not caused them undue inconvenience.

Our own interest is focused on the proposed requirements for retail gasoline outlets. We have submitted a comment letter. And I would like to thank the two staffs for giving our comments favorable consideration.

I would like to underscore for you that we did not suggest that there should be not requirements for retail gasoline outlets. Rather, we did suggest that the requirements be made consistent with those from the retail gasoline outlet stormwater best management guide published as a consensus prereviewed document on the California Water Quality Task Force. It's quite a mouthful, isn't it?

In March of 1997, they participated in that process representatives for the independent marketers, as did EPA; the State Board; the Los Angeles Regional Board; the Santa Ana Board; numerous other local regulatory agencies.

And, again, I would like to emphasize, what we produced back in '97 was a full peer review consensus document.

You have partially addressed our concern for consistency, however -- and it's only slight "however" -- I do note that there now appears to be an inconsistency -- I guess more accurately a direct conflict -- with some of the requirements of the source controls that are contained in Table 5-1 of Appendix B.

And I'm specifically referring to measure SC 2. SC 2 requires, among other things -- and SC 2, by the way is not contained in the package. SC 2 is from an earlier California stormwater -- and I may have the incorrect title, but basically it's a

BMP handbook also produced by the California Stormwater Task Force.

There are several requirements within SC 2 that were evaluated and specifically rejected by the task force when they subsequently published -- that is to say four years later -- the BMP guide specifically for service stations.

I would like to offer one suggestion in this regard. It occurs to me that a few simple words in what would be a new paragraph 12 to the effect that in the event of a conflict, it is the March '97 task force that will take precedents.

And once, again, I would like to emphasize that both BMPs -- that is to say, the BMP handbook from which SC 2 derives, as well as the later retail gasoline outlet stormwater issues were both published by the California Stormwater Quality Task Force. It is merely that the RGO BMP guide represents more current thinking.

Thank you.

And once, again, I would like to thank Dennis and Xavier very much for their assistance. And give my apologies for coming in the scene so late.

I would be pleased to answer any

questions that you have.

MR. NAHAI: Questions for Mr. Wilkniss?

MR. KESTON: Do you know what page he's talking about?

MR. SWAMIKANNU: B 1 Appendix.

MR. KESTON: 1146.

MR. NAHAI: Xavier, I would like to hear your response to Mr. Wilkniss's indication that there is a conflict between a reference of the BMPs in the new paragraph 12 and a requirement that are in the appendices.

MR. SWAMIKANNU: I think I have a simple solution to the issue that has been raised. What he has raised is the fact that there is a reference to a source control best management practices from an earlier addition or an earlier handbook. And that's referenced in Table 5.1 in the Appendix B 1.

And one way to deal with that conflict that he talks about is remove SC 2 and put in the reference to stormwater quality task force handbook from '96.

That would take care of the conflict and we don't have to make any other adjustments.

MR. NAHAI: On the Appendix B Table 5.1

in what is the third line after the words "vehicle and equipment fueling," in the column corresponding to that, you would remove SC 2?

MR. SWAMIKANNU: SC 2 and put in the reference to the handbook, which is actually in your change sheet. On the first page, did you look -- we would put in that reference as opposed to SC 2.

MR. NAHAI: Right. The 1990 --

MR. SWAMIKANNU: Exactly. That would make it consistent, there would be no conflict.

MR. NAHAI: Does that take care of the issue?

MR. WILKNISS: An elegant solution.

Thank you, Xavier.

Thank you very much.

MS. LYON: Thank you.

MR. NAHAI: The next card is from Mr. Ted Morton.

MR. MORTON: Thank you very much. My name is Ted Morton. I'm the California Policy director for American Oceans Campaign, which is a non-profit organization based in Santa Monica, California. I just joined the staff here in California in February. And this exercise provided a wonderful opportunity for me to learn about the local stormwater issues here.

And I wanted to extend my congratulations to the officials of the Board, the County of Los Angeles, and the City of Long Beach and other environmental representatives who participated in the past few weeks of intense negotiations. I just want to particularly point out and thank Steve Fleischli from the Santa Monica Bay Keeper and Mark Gold from Heal the Bay. They provided the leadership of the general environmental community.

That being said, I do have some concerns that I would like to address. And one was mentioned earlier this morning about the need for clear performance standards and requirements for the development section of the proposed permit.

And I would strongly recommend that you specify the requirements and the context of the permit and make that decision rather than wait for another process to come down the line when we're not quite sure what date the elements of that process would be; and you're making some kind of reference sort of into the future, looking into a crystal ball to sort of see what those types of provisions would be.

I think it would be fair and clear if

we go ahead and make those decisions today and put that into the language of the permit.

And the other issues I have relate to the monitoring section of it. I think that there needs to be a greater emphasis on source, identification, and a greater emphasis on the effectiveness of the BMP. Both of those were listed within the permit. The Appendix C that identifies the monitoring program as before, it is a little unclear about what kind of commitments the City is making in terms of what they will be doing to identify the sources of pollutions going upstream to try to resolve the problems related to those problems. And also, what they will be doing on examining the effectiveness of best management practices.

What I saw in the appendix was they were going to be doing this in some kind of annual report where they would be listing potential sources of impairment.

And then also, they would be proposing special studies for BMP implementation. I think those should be strengthened a little bit in a firm commitment from the City to do more of those two issues.

The other one addresses monitoring sediments for toxicity. And I understand that there is an effort underway -- a regional effort underway to do some work on toxic sediment testing. But, again, the other two points I think it should be clear in this permit -- in this program that Long Beach is putting forward that they are going to be committing to working with others to do these sediment toxicity studies rather than just proposing that that would be one element of a larger regional study to do.

Thanks for taking my comments.

MR. NAHAI: Do we have any questions of Mr. Morton?

Xavier, do you have any responses to Mr. Morton's comments?

MR. SWAMIKANNU: I mentioned this earlier. I think this whole stormwater monitoring is preview science. And a study conducted a couple of years ago by the Southern California Coastal Water Resources Project that looked at stormwater monitoring in Southern California among the different municipal programs, there was no consistency.

The methods of measuring the pollutants that were measured, source identification, all those have not been standardized. Which is why there is a statewide effort now through legislation to bring more consistency so that we're able to come back.

The fact that we find toxicity because of a particular protocol might not mean anything unless you standardize the process. And that is why I think the participation of regional efforts in Southern California will go a long way to identifying the issues that have been raised by the environmental community.

Monitoring for monitoring sake is just not good enough. It's a waste of dollars. And I think a little more patients and a little more direction will go a long way towards answering the kind of questions they want answered.

So my recommendation is that we encourage regional participation where those entities exist. And for certain monitoring, like establishing trends. Mass emissions, those are already being required under the monitoring program. It's the unknowns that we want regional efforts for. And I think that's the action the Board should favor.

MR. NAHAI: Thank you.

MS. DIAMOND: I have a question. One more question.

When you talk about regional monitoring, do you have any time lines in mind? I mean, how long would we have to wait to get some good information?

MR. SWAMIKANNU: Let me take one example I think that's the clearest example and probably the best example of what is beginning to happen.

Southern California Coastal Water Research Project has performed regional monitoring for the treatment plants, waste water treatment plants for perhaps 30 years.

So in the last three or four years they have established a regional protocol for monitoring sanitation waste water treatment plants. The same entity is now bringing together an effort to monitor stormwater. And what they're in the process of developing is a five-year cooperative agreement to study these issues. First of all, prioritize the questions that need to be answered with regard to stormwater and then begin within six months to answer those questions.

And I think that's a concrete example of what is before us that wasn't there in 1990, it wasn't there in 1996 when we adopted the countywide program.

So time frame is in the next five years. But many of the important questions, like: If I find toxicity, how do I trace the source? Those protocols could be established, I would think, within the next two years.

MS. DIAMOND: Thank you.

MR. NAHAI: Okay. The next card I have is from Mr. Ray Tahir.

MR. TAHIR: Mr. Chairman, Members of the Board, my name is Ray Tahir and I represent a number of cities on NPDES matters.

I have four letters here that offer support for the Long Beach permit. And I would like to read one of them into the record. It's a very short letter. And it basically echoes what the sentiment is, I believe, from a majority of Los Angeles County.

"Dear Mr. Dickerson, the City of Lomita urges the members of the Los Angeles Regional Water Quality Control Board to approve the City of Long Beach's application for an NPDES permit. The City understands that the new permit is specific to the City of Long Beach, parts of which might not be applicable to the

City of Lomita or other cities.

"Nevertheless, the City supports Long Beach's application for the following reasons; one, it would allow the City of Long Beach to have an NPDES permit, free of the several problems associated with the existing permit.

"And beyond that, it would establish a precedent that would allow this City and other cities in Los Angeles County to also opt for a new, less problematic permit prior to the expiration of the existing permit, which is due to expire in July of 2001, hopefully at least.

"As you know, the current permit has been of no small concern to municipalities of Los Angeles County. A corrective NPDES permit, such as the one proposed by the City of Long Beach, as described in the accompanying Stormwater Management Program, would make compliance a less difficult and uncertain experience.

"Further, it would facilitate this City's efforts to improving the quality of runoff of our receiving waters in a more cost-effective manner."

Beyond this, I would like to revisit the issue of the treated runoff from the associated wash water provision, which is on page 10 of 33. And more specifically, is covered under provision F and G.

I understand Dr. Swamikannu's response. The problem with it is that this particular provision has nothing to do with discharging wash water into the sewer system. And let me run through this and see if it makes sense.

Under F, the Department says "Prohibitive discharge of untreated runoff in the washing of toxic materials from paved or unpaved areas (inaudible)."

From this it can be inferred that it's okay to discharge treated runoff associated with the washing of toxins or any other material, for that matter, to the MS 4.

MS 4 here, as defined in the existing permit and as defined in federal regulations, includes streets, gutters, catch basins, storm drains, or any conveyance natural or man-made outreach to convince stormwater to receive water. It does not include the sewer system.

There is no way, by the way, that you

can treat wash water before it goes into the stormwater system.

As a matter of fact, in order to do that -- and you could do that conceivably by routing the water through a treatment-control device, such as an oil/water separator or a catch basin enter. But that would be in violation of the discharge prohibition section of this permit, which does not exempt wash water as a permissible discharge to the storm drain system. That needs to be made clear.

If you were to leave the language the way it is, it would invite certain dischargers to use those devices or water separators and catch basin inserts as a means of discharging impermissibles in the storm drain system. I think the environmental community would agree that this is something that they don't want to happen.

And lastly, now that I have put this little bur in the permit, I would like to extend my congratulations to the Regional Water Quality Control Board staff, Dennis Dickerson and Xavier Swamikannu, in particular, and to the environmental community who have obviously lent its support to this permit.

And I'm more than happy to entertain any questions if you were to have them.

MR. NAHAI: So your suggestion really echoes Ms. Ansari's suggestion, which is that the word "untreated" be deleted from Subsections F and G --

MR. TAHIR: And Dr. Mark Gold suggested that.

MR. NAHAI: Okay. We haven't heard from Mr. Gold yet.

MR. TAHIR: He mentioned that. I don't want to put him on the spot.

MR. NAHAI: But in terms of the amendments to this, you're proposing that the word "untreated" be deleted from 7 and G?

MR. TAHIR: Right.

MR. SWAMIKANNU: Mr. Chairman, I have no problem with that.

MR. TAHIR: Thank you so much.

MS. DIAMOND: So that's a new change?

MR. SWAMIKANNU: Yes.

MR. NAHAI: Okay. The next card that I have here is from Mr. Eugene Bromley.

MR. BROMLEY: Good afternoon. I'm Eugene Bromley from EPA Region 9, stormwater coordinator for EPA Region 9.

I'm here today to urge the Regional

Board to adopt and propose the stormwater permit for the City of Long Beach. We've reviewed the draft permit and we think it's consistent with the Clean Water Act.

And we're also prepared to send you a letter of endorsement for the permit as was requested.

And the changes that we've heard about today, I don't think would effect our endorsement of the permit.

There are a couple of issues that I wanted to talk about here today in regard to the permit.

One of them is the receiving water limitation language. Things I want to clarify. As many of you know, this has been a contentious issue in California for nine years now, ever since the first permits were issued back in 1990.

And the draft Long Beach permit uses the language which EPA worked out through discussions with California taxpayers, the State Board and environmental groups. And as was mentioned, the State Board has now adopted that language in the order of June 17th.

The order says that you have to have

that language now. That's the same language that we used for Riverside County and Vallejo in California.

So the point I wanted to just make very clear is is that we support the Long Beach permit on this issue.

Also, we've looked at the Stormwater Management Program that has been talked about, was described by the City of Long Beach. We think it's thorough and consistent with the regulation and covers the main components of the regulation and we support it.

And it's good to also see that it's detailed and descriptive in a lot of areas like how many industrial inspections you have to do. And exactly when you have to clean out the catch basins. Exactly how much public education to do.

We think that helps with the enforceability of the permit and it also helps define what MEP is. Cities and counties have been clambering for many years about: What is MEP? How much do we have to do? Now they know.

Also, we looked at monitoring. And EPA is encouraging less chemical monitoring and more use of alternate monitoring tools, like bioassessment tools; habitat assessment tools; toxicity testing.

Some of the alternate measures of the effects of still water dischargers.

And we think that the permit appropriately is moving in that direction. So we would support the permit in that area as well.

One last issue that hasn't been raised yet today, but I have been told by Board staff that this issue has been raised by some commenters. It is a matter of: Should the city have to go through this part-one, part-two permit application at this time?

And we would say, no. We consider Long Beach -- we consider this to be a reissuance of the permit that was originally issued in 1990. Because Long Beach, was cited in the 1990 Los Angeles County permit, so this is a reissuance for Long Beach. And EPA came out with an interpretive policy in 1996 as to what a reissuance application should consist of.

And what you should do is submit an updated Stormwater Management Program and monitoring program, which will reflect your experiences during the previous permit term.

We think the City of Long Beach has done that. And so we would support the permit issuance on that issue as well as.

So I guess that's about it.

MR. NAHAI: Any questions of Mr. Bromley?

Thank you very much.

The next card is from Ms. Jacqueline Lambrichts.

MS. LAMBRICHTS: I'm Jacqueline Lambrichts with the Friends of the Los Angeles River. And I would like to just say "ditto."

The second largest density of our members live in the City of Long Beach, many along the Los Angeles River as well as the San Gabriel River.

And all want clean air, clean water to drink, clean water to recreate in, greenspace for recreation, aesthetic and quality of life reasons. All these many hopes and desires are not that unreasonable. And the expectations for this municipal stormwater permit were high, especially with the City involved in a lawsuit. And the lack of participation by its members in the process.

Unfortunately, this permit does not live not up to the expectations. And especially if it is to be considered as the model for new permits. And I think that's really one of the big concerns and issues we have.

I may be new to the black box of municipal stormwater permits and monitoring for landuse impacts, but the monitoring design is inadequate to address either upstream contributions or Long Beach contributions and those of individual businesses. The City of Long Beach is an integral piece of the puzzle of the Los Angeles/San Gabriel watersheds, and it's not setting a precedence to effectively evaluate the upstream and sidestream sources and to subtract these from those emanating within Long Beach. Once this is in place, it is easier to point the finger upstream.

Our members in Long Beach are involved in a review of the Open Space Element of their general plan. Some are involved in the process as part of the Environmental Strategic Task Force. The sustainable cities concept for Long Beach resulting from the work of the Environmental Strategic Task Force is not well represented in the new development and pre-development design and structural Best Management Practices requirements of the permit before you.

There appears to be a disconnect between what our members and friends of Long Beach desire in this permit, and what the environmental community desires in this permit, and what is actually before you.

I am aware that the monitoring can be modified by the Executive Officer after the introduction of this permit. And through the Environmental Strategic Task Force we have put language for ordinances to address the means development and pre-development issues.

Thank you.

MR. NAHAI: Dr. Mark Gold, please.

MR. GOLD: Good afternoon. My name is Mark Gold from Heal the Bay in Santa Monica, 2701 Ocean Park, Suite 150.

A couple of things I want to say right off the bat, which is that we felt that the negotiations themselves with the City of Long Beach I thought went very, very well for the most part, considering the fact that people seem to forget that the only reason we are here is because Long Beach sued over the fact that they didn't like this permit to begin with.

So facetiously I would like to thank Jim Hankla for taking a new job and also for getting a new City Council there. Because I think that really makes a big difference in negotiating with

Long Beach. It seems to have definitely opened their minds for environmental protection purposes. And we think that, by in large, the stormwater permit is a pretty good permit.

Now, that being said, we're still opposed to the permit because we came in day one of negotiations, which was in a very accelerated time line; I think we must have met for 50 hours in a six-week period or so. And we said that new and redevelopment was the No. 1 issue to Heal the Bay.

And as you can tell within this document, new and redevelopment is basically not adequately addressed. And I think it's a very dangerous precedent for this Board to defer what the requirements are going to be, quote, on page 16 on No. 6, "The SUSMP will incorporate the following requirements: A, provisions associated with the SUSMPs adopted by the Regional Board."

Now earlier you talked about maybe that will be by mid-September, but we have no idea what those requirements are going to be. I can tell you right now, based on how vehement I think some of the cities are going to fight over this, I doubt it's going to come out what our position was; which is that we were willing, as a compromise, mind you, not from our original position, to accept the NRDC L.A. County Department of Public Works agreed upon on 100 percent of the runoff from a 0.75 inch storm must be either treated or infiltrated. That was actually a compromise for us to agree to do that.

During negotiations, of course, we were told it was too late in the process; that the City of Long Beach, even though the County was willing to do that, felt that it would still put them at a competitive disadvantage on attracting new business; and that they wanted to really defer to see what the Regional Board had to do with the other 84 cities within the region.

We find that absolutely unacceptable and poor permit writing to defer something as major as this to a later date. You've heard Heal the Bay talk here time and time about where we're really going to make the long-term mark on reducing stormwater pollution is going to be through changing the way we do development and redevelopment in the region where we're really trying to keep more of the runoff on site and treat more of the runoff on site rather than building basically from property line to property line and having the polluted runoff go on parking lots and go straight into the storm drain without any treatment whatsoever.

So I thought we were very, very clear on that within our comments -- I mean our comment letter. And basically it has not been addressed. And, in fact, it's just being deferred to a later date because of some artificially imposed judicial deadline that, frankly, Heal the Bay and the rest of the environmental community have nothing to do with.

We're not party to this lawsuit. So it made the negotiations, as you can imagine, quite difficult when really you're being told that some judge, who we have nothing to do with, is really who is imposing the time line.

Also, if this goes forward, I really feel like the organization, Heal the Bay, will have no choice but to appeal the permit to the State Water Resources Control Board. And as you know, we only have 30 days to appeal this permit. And doing the math, I'm sure you can figure out that we will have to file the appeal long before the Regional Board is going to have the opportunity to review the model program for SUSMPs.

And so that's going to be a pretty unfortunate circumstance as well that really the environmental community, as this permit is written, will probably have -- at least Heal the Bay anyway; I don't want to speak for the other groups -- will have no choice but to appeal this permit to a statewide Resources Control Board.

That being said, on monitoring there is a couple of issues.

We're very grateful for the fact that there was a compromise made this morning on adding Los Cerritos monitoring one year rather than two years out. I think that's very, very important.

This whole reference which we've heard probably about 15 minutes of presentation on for SCCWRP and the regional stormwater efforts, that's all well and good and I applaud the effort, but I fail to see it anywhere in the stormwater permit. So that's a nonenforceable commitment. And, of course, we are looking to write permits that are enforceable, not something that we promise to do something in good faith.

Where you are going to hear me say that time and time again because the compliance record on stormwater permits from 1990 on for municipalities has not exactly been the best. So good faith isn't really enough to make sure that our receiving waters are actually being protected.

The other thing in regards to monitoring is referring you to page 11 of 33 in the requirements where it says, "Six items that the City of Long Beach monitoring program shall do" and one of the things is Item 6 "Evaluate BMP effectiveness." In no way, shape or form does this monitoring program do that.

And there is also a number of other items in here that are not adequately done; "evaluate water quality and toxicity in receiving waters," et cetera, et cetera.

So if you look at those requirements, most of where that gets addressed is three years down the line with some monitoring program that will be negotiated with upstream cities within the watershed. We have no idea what the dollar amount is. We have no idea of what "fair share allocation" is going to be.

And so we're basically being asked to buy off on a monitoring program that we have no idea what it's going to be.

And as we've seen with the TMDL lawsuits and the settlement requirements and those who developed TMDL, I don't think I would be very comfortable as a Regional Board knowing that you're not going to get any new information that's going to be of any use whatsoever for the L.A. River and San Gabriel River from this permit for at least the next three years.

And that's pretty troubling in light of, as I recall, some of the L.A. River and San Gabriel River TMDL requirements to kick in in years four and five. So I wonder what data is going to be used to develop those TMDLs.

So with that being said, I know there is obviously severe limits on time, and so if you have any questions, I would be more than willing to address them at this time.

MR. NAHAI: Yeah. I would like to try to summarize, if I could, your areas of concern so that we can have them respond.

MR. GOLD: Sure.

MR. NAHAI: The first area of concern and the most important one, obviously, is with respect to the redevelopment and new development. And I'll ask for a response on that in a second.

But the second area of concern, as I understood it, was with respect to participation in regional monitoring programs, you would like to see a reference added specifically to SCCWRP?

MR. GOLD: Since we've been hearing that, that would be one thing that would be an improvement to the permit. But beyond that, I think it's a dangerous precedent to basically defer permit conditions, especially as part of a settlement, three years down the line.

MR. NAHAI: I understand. I'm going to ask you a specific question about that.

The third area of concern was just how much monitoring this provides and especially the fact that it defers to allocating in the future sometime monitoring responsibilities and allocation of costs between Long Beach and other cities.

MR. GOLD: Correct.

MR. NAHAI: Regarding the issue of new developments and redevelopments -- I want to get some more explanation from Staff on that -- but if we're really in a position that our Staff feels that they just simply do not have adequate information at this point to impose the 100 percent .75 inch requirement that you alluded to, but that by September 15th they will be in a position to bring back to us specific proposals and recommendations regarding new developments and redevelopments, wouldn't it be wiser -- from an environmental point of view -- to take the permit that we have now, to adopt it, and then supplement it when the additional information is with us?

Or if we don't do that, do we not run the risk that what we have in hand may be lost by the time of all of that information actually becomes available?

MR. GOLD: The reason why I disagree is that if you had 20 cities here basically saying that they don't want any firm commitment for new and redevelopment from the standpoint of -- whether it's the .75 inch storm at 100 percent treatment or infiltration, or the .6 inch storm, or the 1 inch storm, or whatever it might be, it's going to be a politically dicey position.

And it's not going to be just the City of Long Beach's permit you're talking about. You're going to see 20 other cities lined up basically saying why they can't do it for their particular site conditions. You know you're going to hear that.

And that to me is troubling. And it seems to me that the precedent has been set with the L.A. County. And it seems that that's something that was negotiated. We were not party to that negotiation whatsoever. We literally found out about this a few days before the last negotiation session that we were allowed to, in this artificial deadline period, have with Long Beach and the Regional Board.

And it just seems to me that Long Beach's original concern was they didn't want to be so far out there on a limb that they were having this competitive disadvantage. Well, if the county is already going to do this, then it seems to me they're not going to be the only one on that limb. Those are two pretty big parties that are out on that limb, L.A. County and the City of Long Beach.

So it seems to me that clearly that what you need to do is provide the consistency and go forward and finish this permit right now and provide new development requirements.

MR. NAHAI: You mean today?

MR. GOLD: Today.

MR. NAHAI: What are you suggesting that we put in as the development requirements?

MR. GOLD: Well, the thing that we would suggest is the .75 inch, what the county, basically, has already set precedent by adopting internally. So it's there.

Believe me, we gave five other different choices. You know how Heal the Bay negotiates. We don't just say "We're opposed." We gave five different options from various different regions around the country. We didn't get responses on any one of those. It was one of those, this is going to be Long Beach's toughest issue. Let's save the hardest thing for last. And to be candid, we never got there.

MR. NAHAI: So I understand what you're saying, you're not saying, let's defer the entire permit until we're ready to deal with the new development and redevelopment issue. You're saying we're ready to deal with that issue right now; we have standards that can be implement -- not implemented, but that can be included in the permit today, that's what you're saying?

MR. GOLD: Absolutely. But the thing that would have to be taken into consideration -- and I know I'm playing Jorge's role here -- is that that would probably be constituted as a "substantial change." So you better seriously take into consideration that since that was not something that was in there previously.

And I know all my environmental community people are stabbing me in the back right now.

But the reality is that, you know, this is something that we proposed throughout negotiations with other alternatives. And it's not precedent setting because the county has already adopted it.

MR. NAHAI: The idea is to do something that's going to be effective. So I'm sure they're not stabbing you in the back.

Any other questions for Dr. Gold?

MR. KESTON: I guess the point, though, is if you do something like that, you then have to notice -- you have to go out and notice everybody and come back here again and have another hearing.

MR. GOLD: But if you adopt this as is, we're going to appeal. I mean there is no ifs, ands or buts, we will appeal.

MS. DIAMOND: Explain again what would happen if we adopt it with this suggestion from Heal the Bay today, if we wanted to do that?

MR. KESTON: I think you have to ask Jorge. But the effect is that we have to notice this to everybody and have another hearing so people can comment on new issues that are brought forward.

MS. DIAMOND: I understand. So that's basically the answer?

MR. SWAMIKANNU: Mr. Chairman, may I

just comment on what Mark said?

MR. NAHAI: Yes, please.

MR. SWAMIKANNU: He said that the precedent had been set between the County of Los Angeles and NRDC. And that number was negotiated in a separate agreement.

Now, for an agency like this to adopt that number, we have to do independent review. That has not been done. So it's not a precedent for us. It's simply another option that's out there. That's how I would see it. That's how I think Staff sees it.

MR. GOLD: But where was the independent review of our other three options? I mean, that never happened either, even though we provided those six weeks ago -- I mean six weeks before the 30-day notice.

MR. DICKERSON: Our representative from EPA may have a very salient comment.

MR. NAHAI: Let's hear from Mr. Bromley.

MR. BROMLEY: I wanted to say --

MR. NAHAI: Mr. Bromley, you're going to address us on this issue of new development and redevelopment?

MR. BROMLEY: New development.

I just wanted to say that we have already been through something like this in Arizona where we still issue NPDES permits. And we issued permits for the cities -- the one in Arizona needed a permit just like Los Angeles. And for some of them, new development standards were deferred pending new information.

And the way it works, is you issue the permit, like the Phoenix and Tucson, and then they develop new development standards and submit them later.

But the point is that as long as you preserve everybody's right to comment on those standards and appeal those standards in accordance with NPDES regulations and whatever the state procedures are, everybody's rights are preserved by the process that's laid out by the Regional Board.

So I don't really understand -- I mean, I think that there is a concern here that just isn't real. I think that the Board has procedures which address the concerns that have been raised here.

If somebody doesn't like the new standards or what is in these SUSMPs, which were developed later, then all of the appeal procedures remain available to them. And as long as that's the case, nobody's rights are compromised.

So I think that the process that is underway here does preserve everybody's rights and addresses these concerns. Again -- is that clear?

MR. DICKERSON: If I may respond directly.

First off, the impression is that we're ignoring the issue. We are not. The whole redevelopment issue is built into the permit. The framework is to bring it back to you in the very near future, as we've already discussed.

Very likely at that time we will have specific provisions in place that are applicable to Long Beach. And quite frankly, I think Heal the Bay's appeal is going to be moot at that point, because the standards will be in place even before it gets heard by the State Board.

The implication is that there is something in the County permit right now that specifies standards that are in effect now. That's not the case. They're subject to approval and they're to be submitted to us very shortly. So the requirements built into the permit years ago in '96 come borne with these proposals basically now. And we're at that point. So we really don't lose a lot in terms of time.

We've already covered the NRC negotiation issues, how that is built in. So that's really my comment. I just wanted to emphasize, we're not ignoring this issue at all.

MR. NAHAI: Any questions of Staff?

I did want to hear Staff respond to Dr. Gold's concerns about the monitoring issues.

Could Xavier comment on that?

MS. DIAMOND: He just stepped out.

MR. NAHAI: I can see he didn't want to talk about that, did he?

MR. DICKERSON: We are going to need Xavier to respond to that, but one of the major issues that I was aware of was the Los Cerritos Channel is now incorporated and will be through part of the change that we have, which the City agreed to today. So that was a major hurdle that was still outstanding.

MR. NAHAI: But in the interest of getting everything complete, Dr. Gold had additional concerns about monitoring the well.

MR. DICKERSON: Perhaps we can come back to that question shortly.

MR. NAHAI: In that case, the next one is Mr. Steve Fleischli.

MR. FLEISCHLI: Good afternoon, Mr. Chairman, Members of the Board, Steve Fleischli, executive director Santa Monica Bay Keeper, P.O. Box 10096, Marina del Rey, 90295.

I would thank a lot of people. There are people that need to be thanked. But I want to make sure we don't lose sight of what this is all about today.

Today is about ensuring that a frivolous lawsuit results in a constructive settlement. That's really what we're here today to do. We can't lose sight of the lawsuit. I want to talk a little bit about the new development that Mark Gold raised.

Early on in the settlement negotiations, both Mark and I drew lines in the sand on our main issues. My main issue happened to be the water quality limitation language. I'm satisfied with the way that's played out at this point in time.

The new development, though, is a concern in the environmental community. And I want to respond to a couple things that were said. In particular, I want to respond to one issue raised by

EPA on this with regards to your ability to simply preserve these other rights as long as everyone has the opportunity to comment, then it will be consistent with the Clean Water Act and move forward in that fashion.

Unfortunately, what Mr. Bromley is not aware of -- because their office is in San Francisco -- is what has really transpired over the five years with this.

Essentially, we had a permit in place that took a year and a half to negotiate that was supposedly a consensus process. Unfortunately, that didn't prove to be the case and Long Beach sued on that.

When Long Beach sued, what happened was everything in the municipal stormwater context from the Regional Board staffing prospective stopped; it stopped right there. And every single resource and every Staff member was diverted to defending the Long Beach issue. Members were in depositions; they were preparing responses to motions. Things like that.

So to say that we can wait even longer and simply preserve everyone's right to comment on these issues is somewhat disingenuous because, in fact, this program should have been done a long, long time ago. And one concern is that we continue to delay these things.

In the original permit we could say, "You come back to the Regional Board in a year, in two years, and we will approve your plans and we will move forward." That seemed to prove very ineffective, at least from my prospective. It's better to address the issues up front.

And so I would encourage the Board to adopt new standards now or simply push the permit -- which I know no one wants to do because of the judge and getting on the bad side of the judge -- but either do it now or push the permit.

And please recognize that when we did negotiate this -- and for several months Mark was very firm on this issue. And I have to back him up on it. We said 100 percent treatment for all runoff from certain types of new developments.

At the last moment, we did realize that the position had been negotiated for .75. And out of good faith and because I think the folks of Long Beach have been very cooperative throughout this whole process, we were willing to stick with it at that point in time.

But I think after today, at least from

many groups' prospective, .75 is going to be out the window and we're going to go back to 100 percent.

If we're going to take and move forward, we need to move forward. .75, you know, it comes up to snuff with the county, but we really have an opportunity -- especially now that we're two years behind on this particular program in Long Beach -- to move forward even farther.

So I would encourage you to consider that very carefully.

A couple of other issues I wanted to respond to.

Mr. Wilkniss raised the issue of the parking lot -- or excuse me -- the gas station fueling areas. We're opposed to that change in the change sheet on that.

We think -- and this goes back to an issue that we talked about a couple months ago with regard to BMPs.

What we have here is a reference to a management practice guide that Mr. Wilkniss has represented of being a consensus document. And it's interesting to note in the listing of those folks who participated in the consensus process of building that document, there was not one environmental group named in there because there was not any environmental representation in preparing those documents.

So what it is in my mind is simply a list of BMPs. And you might remember on the County, when we adopted that order with regards to the list of BMPs, the Board made a modification to say that they would choose from that list in the maximally effective manner, as opposed to just having a list and individual facilities could do whatever they want. They could choose the least restrictive; they can choose the most restrictive.

And so what we would encourage is that instead of making reference to this guide, you simply make reference to that they will implement BMPs that will prove maximally effective of preventing polluted runoff from those fueling areas.

And if they want to come back and respond, if their handbook, in fact, does provide them the opportunity to reduce pollutants in a maximally effective manner, then that's fine. And that issue has been preserved for them. And we still have the opportunity to ensure that people aren't just choosing the easiest thing on the list to move forward there.

I agree with the comment that was made earlier on page 10 to take out the word "untreated." That makes a lot of sense to me.

The last thing I would like to express is I don't want people to get the impression that this permit and this negotiation is an invitation for 85 separate permits throughout this region. I think that would be a tremendous burden on Staff. And I don't want people to get their hopes up that every single person is going to have -- or excuse me -- every single municipality is going to have their own permits.

I do think this is a somewhat unique situation. We did review all sorts of things we should look at on a watershed basis to make it a little bit easier for Staff to manage and for everyone to comment on these things.

I would like to close by thanking Ray Holland and Rose Collins, in particular, from the City of Long Beach. I thought they were very cooperative. And I appreciate their professionalism and courtesy. I don't think we would have seen that two years ago.

Thank you.

MR. NAHAI: Questions for

Mr. Fleischli?

I have a question about the .75 percent standard.

What happened in this issue in your discussions and negotiations with the City?

MR. FLEISCHLI: Well, I'll tell you, the way it started out was -- and Mark can speak to this as well, this was his biggest issue.

It started out with 100 percent of the runoff needs to be treated or infiltrated in some way, shape or form to address the issue before it becomes a problem. And the development stage is really the time to do that.

Now about -- oh, I guess it was about three days prior to the close of negotiations, we got word from L.A. County and from Xavier that some language had been negotiated between NRDC and L.A. County that had not, to that point, been available to anyone because it just came out at the last minute that they had agreed to this .75.

And so we sort of scrambled and said well, okay, we had our 100 percent standard for unlimited runoff and let's now play off what the County has agreed to. Because Long Beach's biggest concern with 100 percent was we don't want to stick our neck out too far. We don't want to discourage development in our communities. We don't want to be there all alone to have people pointing fingers at us.

So this actually -- while it made us feel somewhat awkward -- it actually gave us an opportunity to say, okay, well, you're not going to be out on your own anymore because L.A. County has done it. And hopefully, the Regional Board will recognize -- as Mark said -- that there are now two large entities out on a limb.

And when the time comes for you to adopt this SUSMP, you'll say, look, these guys are doing .75. And let's all get on board here. That's what BMPs are. That's the best that's out there, at least in Southern California. So let's move forward.

I think Alex Halperin can talk about it a little bit more. According to their consultants, some cities go as high as one inch and a little higher even.

MR. NAHAI: But in the negotiations, Long Beach was not amenable to the .75 inch standard?

MR. FLEISCHLI: No, they were not. They were not for either end. Their concern was still that they would be too far out in front; that when the other city comes up, they might get a .6 standard or something like that and then Long Beach is going to be too far out in front.

And I think one of their concerns -- I'm not sure that Mr. Holland would represent this -- is that the county is a different situation because it's a county government rather than a city government. And they don't want to see them being the only city government that's out in front.

And I would also say for Mark Gold to comment on legal issues of substantial change and things like that from this, I think the .75, it's been out there; Long Beach is clearly aware that that was an issue that was going to be discussed today. I don't think there is a substantial change that would require 30 days due notification.

For Mark to make statements like that is like me commenting on monitoring programs. It's not within my purview.

So Thank you.

MR. KESTON: Could I ask you a question, Steve?

This stormwater permit or all stormwater permits are very significant. And I know they are to you; and they are to Mark; and they are to the Staff and everybody else.

Could you give us an idea of what -- is there any general percentages of where the major pollution -- is the new planning and development 50 percent of it? Is the car washes 40 percent?

I mean we're talking about 30 or 50 things across a pretty broad spectrum. And if we take an action here today to deal with one, do we then give up immediately dealing with the 95 others that are maybe 98 percent of the problem? Is there any percentage or any concept that you have that you can share with us, Steve?

MR. FLEISCHLI: You know, to my knowledge right now on the broad scale issues, there are not. There are some breakdown of what particular industries might contribute. EPA's general sector for industrial; stormwater (inaudible) breaks down; some of those significant contributories for those things; and things like gas stations and refining operations; and those sorts of things are certainly on that list.

In terms of what new development contributes and whether we might be missing other opportunities, I think one thing that has not been expressed today, but should be clear from the lack of expression on it, is that most of the other sources that we think are contributing to the problems have been addressed in some way, shape our form in this permit in a manner that makes I think most people fairly comfortable that we're doing what we can on a lot of those, like restaurants and other sorts of things.

And so new development, while we don't have a number, I think some of that stuff will come out in TMDL development hopefully. But it really is the unique opportunity to deal with the situation beforehand.

And unlike most of the other things that we're trying to regulate through this permit, whether it's a restaurant or a shopping center or a gas station fueling facility, we don't really address it before the problem is created in the first instance.

If we can design these facilities to accommodate polluted runoff and to treat it in some way, shape or form, then we won't have to deal with these other types of things like diverting storm drain systems. We'll have dealt with that type of facility up front.

And there are only certain facilities

that are covered within this requirement, the proposed requirement; certain large development projects, things like that.

MR. KESTON: Thank you.

MR. NAHAI: Well, then, let's hear from Mr. Halperin first.

And then, Xavier, Dr. Gold's comments regarding monitoring, would you give us a response on that in a second?

Last, but by no means least, Alex Halperin.

MR. HALPERIN: Thank you. Alex Halperin with the Natural Resources Defense Council, 6310 San Vicente Boulevard, Suite 250, L.A., 90048.

Mr. Chairman, Members of the Board, we're at a significant turning point in the development of the L.A. municipal stormwater permit for the entire L.A. area.

As we all know, this is being considered as a model for future permits. And I think it should be considered very carefully.

For the most part, there are a lot of advances in this permit, which I think are commendable. And I think that the process that Long Beach and Heal the Bay, Bay Keeper, and the Board went through have produced some significant advances.

However, there is one big whole and that is the redevelopment/new development area.

The question here is whether we create a permit and leave an issue open and go through who knows what kind of process in the next few months to come to resolution or whether developing this permit now will result in the permit.

And the only major remaining issue seems to be the size of the storm that needs to be captured. That doesn't need to be revisited here. That issue has been resolved. The county and the principal permittee of the permit has already resolved the issue. I was the one who negotiated it with the County. They wanted larger than .75 inch threshold for storms to be captured.

There are many cities across the country that do a one-inch storm. Generally the ratings are decided based on the size of storm in an area; based on the hydraulic in the area. Many cities do it based on the one-year 24 hour storm, which is the largest average storm any area gets in one year over 24 hours.

Los Angeles has less rainfall than a lot of other things areas. So the one-inch standard adopted by many of the cities around the country is even a little bit low for the Los Angeles.

Nevertheless, we negotiated with the county and were willing to comprise and to go down to .75 inches. There is absolutely no reason that any city in this area should be adopting a standard any lower than that. And to impose a standard lower than that would be to really unjustly put the county out on a limb.

So I think there is every reason to simply wrap this up, adopt the standard that's been adopted by the County of Long Beach and to have a completed permit.

In addition, I would just like to comment on one other point. The proposed change with respect to the gas station fueling stations. I would just like to agree with Steve Fleischli.

This is, again, language that was negotiated with the County. We negotiated rather than simply having a list of BMPs, that the language state that the performance standard be to adopt that BMP or combination of BMPs, which will prove maximally effective in having a list. This would actually create a performance standard that would be meaningful for the fueling stations.

I would also agree with the removal of the word "untreated" in the waste water section.

One other point. I'm sorry. I'm just collecting these as we went through the day.

You mentioned that the five-year period was -- it seemed awfully long for a review of all the City of Long Beach's sewer systems, storm drain systems.

Again, we have a precedent for that at County. The County has agreed (inaudible) within one year. And I believe it's three years for their enclosed systems. I think you're correct that five years is, again, going backward from what we have already worked out with the County, imposing weaker standards and leaving the County out on a limb.

Thank you.

I'll be happy to take any questions.

MR. NAHAI: How do you react to Dr. Gold's view to put into this permit the .75 inch standards at this time will constitute a substantial change and therefore cause the entire permit to be --

MR. HALPERIN: Have to be renoticed. Yeah. I don't think that that's correct actually. Yes, it was brought up with Long Beach and is already in the county program, which is a public program. I don't think that it would need to be renoticed.

MR. NAHAI: Thank you.

Any questions?

MR. SWAMIKANNU: Mr. Chairman, you wanted me to address monitoring issues that were brought up by Dr. Gold?

At first he requested that there be some kind of recognition, the regional monitoring resource project if indeed that's what Long Beach intends to do. This came to the attention of Regional Board staff very recently. And I had encouraged Long Beach to investigate that opportunity.

And they had told me that they're willing to be part of that effort. So adding a statement to that effect in the monitoring section is not an issue. I would like to ask Long Beach to raise any objections to that, but I don't think they have any.

MR. HOLLAND: No.

MS. DIAMOND: What about the comments from Mark Gold that the regional monitoring is not enforceable because it's not part of the plan?

MR. SWAMIKANNU: That's the issue that I was addressing. We can make it part of the plan at today's meeting. We can add in language that says "Long Beach will participate in that process."

And then it becomes -- any results from there apply.

The other issue is that the monitoring program is sort of a dynamic program. As you find more, you tend to make modifications.

And under the permit presently, the City is required to report to us on the monitoring program on an annual basis and make modifications to the Stormwater Management Program.

Now, when those reports come into the Regional Board, the Executive Officer has the authority to make modifications to what you see before you today.

So it's not cast in stone at this point. At least the monitoring program is not, because the whole process of monitoring is to be able to monitor in the right circumstances and make the appropriate changes.

Now, on the second issue of the fact that some of the monitoring is being delayed under three years, hence, for example the Los Angeles River and San Gabriel River. And that comment has to do with the fact that the rest of the county and the cities have 1996 permit, which expires in two years past.

So at that time where the monitoring for those permits would be modified to accommodate different parties and any new information we have. If Long Beach comes out today and monitors the Los Angeles River or San Gabriel River, let me remind you that these rivers are already being monitored by the County under the countywide program. This is an add-on.

So it's probably not reasonable to expect the City of Long Beach to pick up monitoring for the rest of the permittees, only because it's the other permit that's under discussion now.

They have accepted reasonable monitoring for what comes off their city. And that's where the monitoring should lie. I think they're providing a piece to the larger equation of issues in the region.

In addition, the way we constructed the countywide monitoring program is to provide answers, for example, like Mr. Keston asked: How much does new development contribute? The counties are developing a model based on what is coming out.

In a year's time we'll be able to model

and answer some of those questions. Those same land uses in the City of Long Beach, we will be able to make those kinds of estimates based on those models.

So those models are applicable in Long Beach as well. So what we should see from Long Beach's monitoring program is providing additional answers to this countywide effort.

Questions?

MR. NAHAI: Yes, I had a question on a different topic.

So any other questions on monitoring?

Regarding the RGOs, how do you respond to the position that the 1997 document was basically a document negotiated between state agencies and the business community; that it did not have input from any of the environmental groups and therefore should not serve as the model that is being inserted into this permit?

MR. SWAMIKANNU: The answer to that is the opportunity to comment on the document was there for the environmental community. There was no participation. But the document itself is what is being applied by other municipalities statewide.

And there was representation from the Regional Board staff as well as State Board Staff to make sure that the BMPs that were negotiated in that is something that's reasonable.

Now, we can the elevate the requirements, the level of BMPs that are required for that particular issue. I think a larger concern for the environmental community is that they have not read the document. And so they're a little uncomfortable agreeing to something they've not seen.

And so there are two options here, either they disagree and leave -- let's not change it. Or the other opposition is to go with the fact that -- I was on the task force as well making sure that the requirements were reasonable.

So they just have to trust that they are technically sound.

MR. NAHAI: Your position is that it's technically sound and it's a sensible environmental regulation?

MR. SWAMIKANNU: Yes.

MR. NAHAI: And it would adequately protect?

MR. SWAMIKANNU: Yes. Any elevation will have to have sufficient cause. And this is sort of a base line and we're just talking.

MR. NAHAI: Thank you.

MR. SWAMIKANNU: Thank you.

MR. NAHAI: Those are all of our public comments.

I did have one question to ask Mr. Holland.

Mr. Holland, if the standard of 0.75 inches has been accepted by the County, why is it not palatable to the City of Long Beach?

MR. HOLLAND: Let me make a brief statement first.

You can see it's been a difficult negotiation. Even though we've done a lot of thanking and we've had our arms linked, we've had some very intense discussions. But I think it's a positive thing that we stand here today with this being the main issue that we're talking about, and all of the things that we're talking about. We are advancing the cause for clean water.

As to the .75, that was negotiated between the county and NRDC with none of us involved, even Heal the Bay or Santa Monica Bay Keeper, to my knowledge. In fact, they said here that they were not aware, they were not part of that. So we were not part of that, we're not sure -- I think as your Staff has indicated -- I believe the technical foundation for that, the technical basis for it.

And as I understand it, it only applies to the unincorporated areas of the county. It does not apply to any of the other cities. And I'm sort of going to give you a lesson in government here, and probably some of you already know that, but unincorporated areas are not the same as cities. Cities, this issue really hits home at the problem in the state; and that is, how cities are funded.

And what has happened with the way the things happened in the state is development is one of the key funding sources for cities to provide the services to their cities. And cities are competing against one another for development.

You heard big box developments. You've heard of entertainment complexes. And all these kinds of things. Cities were spending money to bring developers in because that generates revenues to pay for the services for the average citizens. Because the citizens taxes in no way pay for the services they receive.

And the county in unincorporated areas are funded differently than the cities. If the City of Long Beach is out on the point all by itself, we cannot be compared to the unincorporated areas.

We're at a competitive disadvantage. And developers -- some of you may know developers, some of you may be developers -- they go to the bottom line.

Now that's what they will look at. And if we have a requirement that costs them to do more development, they're going to if given a location in another community, go to another community. And that may be just across the street to do their development and we lose the revenues from that development. It's critical to the funding of a city.

Now, all that said, we, Long Beach, are not opposed in the concept to consider this issue. And we look forward for it to be discussed. And it may be that .75 is the appropriate number.

But I think there needs to be some technical analysis of that. We need to hear from your staff. We need to hear from other experts. We need to hear from other cities. And we need to determine if .75 is, in fact, a good number; not just a number that was negotiated over here in secret to try to settle a lawsuit.

It needs to be shown that it's reasonable and practical and can be accomplished and meets the clean water goals.

And we want to be part of that. We're not going to resist that. We're going to work and try to see that appropriate standards are in place. But to put that on us right now is a major, major issue. It effects our funding. And I can tell you that the City Council understands this, not just Staff. They understand because this is at the heart of how cities are funded.

We understand what they're trying to accomplish. We don't disagree with what they're trying to accomplish. We think the points that have been made are good points. But we cannot afford to be out there all by ourselves. Okay?

MR. NAHAI: Thank you for that explanation.

MR. HOLLAND: Any other questions?

MS. DIAMOND: Well, I guess just to sum it up for myself, we're basically saying we're back where we started, in a sense. Because we could deal with this issue, except that we have this lawsuit, which is this line that we have to deal with. We could take the time and come up with the standard for all the cities, but if we took the time before issuing this permit, we would have a problem with not having this lawsuit settled.

MR. HOLLAND: Well, as I understand, I think your Staff indicated that. And I said, I think it really boils down to basically one issue. I mean, there have been some other questions, but we're basically willing to work around with those concerns.

It seems to me that we've heard that there are ways that this can be dealt with. Go ahead and prove this and indicate that we will work along the lines of trying to come to a conclusion on that. And then what is resolved in that process, a public process, not private settlement negotiations, but public process is brought forward here and it's aired out in the public way

That's the only piece of our permit that is put off to the future. And that's just -- we've heard September the 15th. It's not that far off. And we're standing here before you saying we want to work and cooperate in that process.

I think I need to let your legal staff and your technical staff tell you how that can be done in the permit process. But I think to run all the risk -- I've heard the city attorney; I've read the order from the judge. I can't help that.

We wish that we would not be in that situation, but we're there. And the judge has been very firm about this. And we think this one issue can be resolved by putting forward to this process and it will be hopefully resolved in the September time frame. Maybe I've said too much.

MS. LYON: I would like to ask Jorge a question.

By waiting until September 15th and publicly noticing this and inviting all the rest of the cities that would like to know about new development language with regards to these permits, can we at that time incorporate that new language into Long Beach's permit and make it enforceable?

MR. LEON: Yes.

MS. LYON: I don't see any problem with that. To me, in the long run this is going to give us better water quality, better everything. Municipalities don't like being left out of the process. I sat on a City Council. I know what it's like to be included. And the problem with the original county permit, the cities felt like they were left out.

So I would say that -- my feeling is that I would like to go ahead and approve the permit today and then add the language later in September when we can get this all aired out.

MR. LEON: As drafted, the permit requires that -- it contemplates that as soon as we deal with that issue, it becomes an enforceable provision in the Long Beach city permit.

MR. HOLLAND: And we agree to that. We just think it needs to be a public process where all the issues are laid out there. And we understand from a technical standpoint; from an environmental water quality standpoint; and from a physical standpoint. So we just weigh all those issues and we do it all as a group.

MR. LEON: And if we do put off adopting any permit today, one of the consequences, of course, is the other many, many permits don't come into play.

With that said, may I do a little bit of record housekeeping?

I didn't hear a response. I assume it's okay.

MR. NAHAI: No.

MR. LEON: I would like to move the Staff files for the Long Beach stormwater permit into this record.

I want to make clear what the record consists of because that was an issue in the earlier litigation. And in order to avoid that as an issue on any further appeals in this matter, I want to make sure that those files are part of the record.

And in addition, since they're referred to in the findings of the permit, Volumes 12, 16 and 23 of the administrative record for the Los Angeles County permit, I would ask that those files be admitted into the record of this matter. They have to do with water quality references, respectively, MS 4 permits and guidance documents. And they are all relevant to the adoption of this permit.

MR. COE: Do you need a motion?

MR. NAHAI: Do you need a motion to include them in the record?

MR. LEON: If the Chair says, "So be it," that's all we need before you close the hearing.

MR. NAHAI: Well, with that, we will close the public hearing.

(Whereupon the proceedings were adjourned at 3:20 p.m.)

POLICY STATEMENTS:

TORRANCE, CALIFORNIA, JUNE 6, 2000 - 9:00 A.M.

* * * * *

CHAIRMAN BAGGETT: Good morning. This is the time and place for the hearing to review the actions and failures to act by the Los Angeles Regional Water Quality Control Board concerning the Standard Urban Stormwater Mitigation Plan, or SUSMP, pursuant to Los Angeles Municipal Stormwater Permit.

I'm Art Baggett. I'm Chair of the State Water Board. On my right is Board Member John Brown.

BOARD MEMBER BROWN: Good morning.

CHAIRMAN BAGGETT: To my left is Mary Jane Forster.

BOARD MEMBER FORSTER: Good morning.

CHAIRMAN BAGGETT: And Pete Silva.

BOARD MEMBER SILVA: Good morning.

CHAIRMAN BAGGETT: We're also assisted today by staff, acting Executive Officer, Ed Anton, somewhere out there; staff counsel, Betsy Jennings; and Bruce Fujimoto and Marianne Jones assisting also.

This hearing is being held in accordance with the hearing notice dated May 12th, 2000. The purpose of this hearing is to receive oral testimony and policy statements that will assist the Board in reviewing the actions of the Regional Board. As stated in the hearing notice, the deadline for submitting written evidence has passed, and the Board does not intend to accept any further written evidence today.

This hearing will not be conducted according to technical rules of evidence. The Board will accept any evidence that is reasonably relevant. Hearsay evidence may be used for the purpose of supplementing or explaining other evidence, but over timely objection will not be sufficient in itself to support a finding unless it would be admissible in a civil action.

Questions from the Board or the Board counsel to any participant and procedural motions by any designated party shall be in order at any time.

Following today's hearing, the Board will retire to closed session to deliberate on the evidence the Board has received. The Board's deliberations will include the evidence in the administrative record from the Regional Board. A draft decision on the petition will be formulated and distributed to the public. Considerations of the draft decision will take place at a future Board meeting which will be noticed.

At this time I would like to list the persons who have been granted designated party status. Pursuant to the hearing notice, there are four groups that are designated parties for the purpose of today's hearing. The entities are all the cities named as petitioners, Building Industry Association of Southern California and Building Industry Legal Defense Foundation. Second is Western States Petroleum Association. Third is Natural Resources Defense Council, Santa Monica BayKeeper and Heal the Bay. And fourth is the Los Angeles Regional

Water Quality Control Board.

No other persons submitted a request to be a designated party by the deadline provided in the hearing notice. Therefore, all other persons who are in attendance today who would like to provide comments to the Board are considered interested persons.

Designated parties and their witnesses who will be providing testimony under oath are subject to cross-examination and may cross-examine other parties. Interested persons will have an opportunity to provide policy statements. Interested persons will not be under oath and not be subject to cross-examination but may be asked questions or asked to respond to clarify any questions from the Board, staff or others at the discretion of the Board. Interested persons do not have a right to cross-examine the parties.

I will address the time limit issue. To ensure that all participants have an opportunity to participate in the hearing, designated parties have been asked to limit their testimony to 60 minutes or less, and interested persons have been asked to limit their statements to three minutes or less.

The Board has received copies of all written documents, so all participants are asked to summarize their written comments in their oral presentations. Participants with similar comments are requested to make joint presentations, and participants are asked to avoid redundant comments. I may allow additional time if I believe the speaker cannot reasonably present the pertinent information within that allotted time.

If you intend to speak today and have not already done so, please fill out the speaker cards at the front table.

I must also note that cross-examination of witnesses will not be counted against the 60 minutes for the parties for your case-in-chief.

Assisting the Board today is the staff counsel, Betsy Jennings. I'll ask her first to provide a brief description of the actions of the Regional Board in approving the SUSMP and the issues before the Board. We will then take policy statements from the interested persons. Following the interested persons' policy statements, each of the designated parties will put on their direct testimony in the following order: The cities named as petitioners along with the Building Industry Association of Southern California and Building Industry Legal Defense Foundation; followed by the Western States Petroleum Association; the Regional Board; and Natural Resources Defense Council, Santa Monica BayKeeper and Heal the Bay.

At this point we'll have cross-examination. After the case-in-chief will be cross-examination of each party in the order they spoke. There are two changes which have been requested and granted in the order. That is first Dr. Horner, NRDC's witness, and Margaret Clark, City of Rosemead. Both could only be here this morning and will testify first and second respectively.

Finally parties will each have three minutes' time for closing statements. That's it.

MS. JENNINGS: Good morning, Mr. Chairman, Board Members, and members of the audience. The purpose of this hearing is to consider further evidence and policy statements in the matter of the Los Angeles Regional Water Board's adoption of the SUSMP, or Standard Urban Stormwater Mitigation Plan. The issue of SUSMPs arose from the 1996 Municipal Stormwater Permit issued by the Regional Water Board for discharges throughout Los Angeles County.

The permit required the permittees to develop a program for regulating run-off from development including best management practices, or BMPs, prioritizing types of development and applying specific BMPs to specific types of development through the SUSMPs. The process for developing this program is laid out in the permit, and you will hear much about that process.

The end result was that the permittees proposed SUSMPs and the Regional Board directed its Executive Officer to approve SUSMPs with different provisions than the permittees had proposed. The three major differences are: One, the Regional Board's version requires mitigation of .75 inch of rainfall, while the permittees version has a narrative design standard; two, the Regional Board added two categories of development, parking lots and environmentally sensitive areas, to the original seven categories listed in the permit; and three, the Regional Board's version applies to all development in the original seven categories, while the permittees version applies only to discretionary projects. There are other differences also that you will hear about during the testimony.

The administrative record is lengthy and it contains numerous comments from interested persons. We also received lengthy submittals prior to this hearing. You've all received copies of those submittals.

At the risk of offending parties by omitting some of their arguments, I will tell you that in my view there are two central issues in this hearing.

The first issue concerns procedure. This issue can be summarized by asking if the Regional Board acted properly in adopting its version of the SUSMP. In reviewing the permit, and you will have copies of the relevant provisions in your binders, was the Regional Board authorized to revise the SUSMP the permittees had submitted; and if so, did it do so following the correct procedures.

The second issue concerns technical aspects of the SUSMP. The most controversial provision of the SUSMP is the requirement to mitigate the first .75 inch of rainfall from storm events. Mitigation may involve treatment or infiltration and there are some exceptions and waivers. The permit requires that BMPs, or best management practices, that reduce pollutants in stormwater to the maximum extent practicable or MEP.

The technical questions can be summarized is whether it is beneficial to water quality and practicable to require mitigation of the first three quarters inch of rainfall from these types of developments. The related issue is whether there may be adverse impacts from such mitigation.

There have been several procedural issues raised, most of which I feel that were resolved amicably during the last few weeks, but I know that we did receive this morning one written comment and perhaps other parties may have other procedural issues. So I would recommend before you proceed that we quickly dispense with the procedural issues, if you would like.

And with that, I will end my comments unless there are questions from the Board Members.

CHAIRMAN BAGGETT: Thank you. We have received four written objections. Does the petitioner want to make any comments on your objections?

MR. MONTEVIDEO: No, Mr. Chair. Thank you. I think they're stated.

MS. JENNINGS: Mr. Montevideo, could you approach the microphone?

MR. MONTEVIDEO: Sure.

MS. JENNINGS: Give your name for the record, for the court reporter please.

MR. MONTEVIDEO: Good morning, Mr. Chair, Members of the Board. My name is Richard Montevideo.

I'm here on behalf of the Bellflower, et al. petitioners, as well as petitioner, the City of Arcadia.

The objections that we submitted are four-fold, but primarily they go to timing in terms of receipt of documentary evidence by the Regional Board itself, as well as receipt of a summary of their testimony.

There was also an issue of a videotape that was referenced in a letter that we received from the Regional Board on Monday, whether or not that videotape will be a part of their presentation today. We actually attempted to view that videotape in time for the hearing. We're told because of copyright reasons they could not give us a copy. We then attempted to make arrangements to actually view it at the Regional Board offices and were told that could happen yesterday, but towards the afternoon we got a call basically saying we don't have the tape available, if we wanted to review it we could review it sometime this morning.

Of course, that doesn't give us sufficient opportunities to look at potential evidence. So we ask that that videotape as well as the late submitted documentation be excluded.

CHAIRMAN BAGGETT: This is the overnight package dated June 5th and 6th. I will sustain the objection on that one.

MS. JENNINGS: Just to be clear, there was some further exhibits that I received at my office yesterday afternoon, June 6th, and they were dated June 5th, and I believe Mr. Baggett is saying that as to those records that they would not be admitted.

CHAIRMAN BAGGETT: We have not seen --

MS. JENNINGS: I did not make copies -- I did not see them until 5:00.

MR. MONTEVIDEO: We did receive them yesterday. There are some documents that I believe are pertinent to Dr. Horner's testimony that we may attempt to use in the form of cross-examination to address Dr. Horner's points that he raised in his summary of testimony, but beyond that we would ask they not be admitted for purposes of proving the Regional Board's case.

So there are certain documents that we feel are appropriate for cross-examination purposes and we'll bring them up at the appropriate time and submit them to this Board for admission.

CHAIRMAN BAGGETT: And in terms of your -- my colleagues, we have one copy.

MR. MONTEVIDEO: I have extras, if I may.

CHAIRMAN BAGGETT: If I could, so they understand.

MS. JENNINGS: The tape, the videotape that he was mentioning was referred to in the letter. I've never seen it either, so I assume that the Regional Board has changed its mind. They haven't submitted it.

BOARD MEMBER FORSTER: I have a question. Betsy, I don't know if I understand what Mr. Montevideo said in the last three sentences. We're not accepting --

MS. JENNINGS: We're not accepting.

BOARD MEMBER FORSTER: -- yesterday, but he wants to cross-examine on something that's in that?

MS. JENNINGS: My advice is that we are not accepting new evidence today, period, but any written evidence I would tend to recommend against. And if somebody wants to offer it, somebody this morning asked if he could offer it as, quote, rebuttal. I said all evidence is supposed to be in already. So I will certainly recommend against any new documentary evidence coming in today from any party.

MR. MONTEVIDEO: If I may be heard on that point. The rules specifically stated that rebuttal testimony need not be identified up front and also for cross-examination purposes or to impeach a witness, and if we're able to use written documentation to impeach a witness, it should be able to come in for that purpose.

The other issue I want to point out with respect to our objections, we learned yesterday that the Board is intending on offering to the Board Members testimony from two of the Board Members as a part of the their case-in-chief or response to our case-in-chief. Our concerns with that is that testimony of Board Members, individual Board Members, is frankly not relevant to these proceedings. Unless they're going to testify to an event that they saw, which is unlikely, they simply cannot offer relevant testimony with respect to these proceedings. Only the Board collectively, the actions of the Board collectively, are relevant but not the testimony of individual Board Members in making that decision. And there's case authority cited to that effect.

So those are the objections in short order that we've listed.

CHAIRMAN BAGGETT: We'll hear from opposing counsel.

MR. LEON: Good morning, Mr. Baggett, Board Members. Jorge Leon for the Regional Board. If I may I just have a couple of comments on the objections posed by Mr. Montevideo.

With respect to the video, it was the plan of the Board to consider providing a display of the video if the State Board Members wished to have video background of the subject that we're discussing, which is stormwater, and we thought it might be useful, but we weren't able to get copies to the parties, partly because of copyright problems, but it was never an intent to actually -- as part of our presentation. So we're withdrawing that.

With respect to our Board Members speaking, we do still offer Mr. Nahai's comments as part of our presentation because we do believe that it would be helpful for you to understand the Board Members' consideration of the issues. Despite the fact that Mr. Montevideo says that the issues or the presentation need not be relevant, I believe that it could be something that you would be interested in hearing.

And finally with respect to the summary of respondent's proposed evidence, we did provide a copy of a two-page memo to Betsy Jennings on Friday that indicates who the speakers for the Board would be, and on that line I provided a copy of that, by the way, to each of the parties in the proceeding this morning because they indicated that at least a couple of them had not received it. But with respect to Francine Diamond, we would like to withdraw Ms. Diamond, one of our Board Members, as a speaker and replace Francine Diamond with Alexis Strauss from the USEPA. Alexis was one of the folks who submitted comments before the deadline on this proceeding.

MR. MONTEVIDEO: If I just may be heard on the last issue. Now we're hearing the morning of the hearing that there's another witness from EPA that's going to testify on behalf of the respondent. Had we known that in advance, we would have spent more time looking at the comments from EPA and preparing for cross-examination.

A public participant is not subject to cross-examination. A witness of the Regional Board is subject to cross-examination. It truly is unfair surprise in this case.

CHAIRMAN BAGGETT: I think I'll rule now. I would sustain the first objection. The information provided the 5th and 6th is not timely, so the Board will

R0073640

not be able to hear that as evidence.

In terms of the relevancy of the Chairman, Mr. David Nahai, I consider that relevant testimony and would overrule the objection.

Third, the third objection you had was providing the comments on what testimony the witnesses for the respondent were going to say. I would I guess partially overrule. I think the Regional Board can bring in -- have their witnesses testify to evidence in the record and the evidence which has been submitted to the Board but nothing beyond that, and I think the two-sentence summary, so if they could limit their comments to that information.

The fourth objection has already been withdrawn, the videotape, so that was resolved.

MR. MONTEVIDEO: Mr. Chair, the additional issue that just came up is the replacement witness, adding the EPA witness.

CHAIRMAN BAGGETT: I think I would have to sustain the objection to that. It's inappropriate, that we should have had prior notice. And I notice there will be opportunity under the public policy statements. Federal EPA does have comments on the policy statements, and I think Ms. Strauss will be allowed to address the Board and the public at that time.

MR. MONTEVIDEO: Of course. Thank you.

CHAIRMAN BAGGETT: With that --

MR. LEON: Mr. Baggett, I'm sorry. The

overnight package.

CHAIRMAN BAGGETT: Right.

MR. LEON: With respect to those, just one point I failed to do when I came up the first time. The overnight package was nothing more than supplemental material attachments which were intended to be part of the package that was received by the Board and parties on May 31st. Mostly they were letters and attachments to materials submitted by Western States.

MS. JENNINGS: My understanding is they will not be in the record.

CHAIRMAN BAGGETT: They will not be in the record. They were received too late in fairness to other parties.

With that, if there's no other objections, at this time will be the direct testimony of Dr. Richard Horner.

I think at this point I might as well have all parties who are going to testify today, if all parties can stand and I'll do all witnesses and parties, not policy statement folks.

Do you promise to tell the truth in this proceeding? If so, answer "I do."

(Response by all parties and witnesses)

CHAIRMAN BAGGETT: Thank you.

Dr. Horner.

MR. HELPERIN: If I may. Good morning, Mr. Chairman and Members of the Board. Because

Dr. Horner is a witness, I had anticipated interrogating --

MS. JENNINGS: Identify yourself.

MR. HELPERIN: I'm sorry. Alex Helperin, and I'm with Natural Resources Defense Council representing Santa Monica BayKeeper and Heal the Bay.

Because of the status of Dr. Horner as a witness, I had anticipated examining Dr. Horner. He has not prepared a statement and he will simply be responding to my questions, if that's all right.

Is there a way that I can have access to a microphone so I can ask Dr. Horner the questions and --

MS. JENNINGS: Unfortunately I think we only have one microphone, which also is going to be difficult with cross-examination.

BOARD MEMBER FORSTER: Can you take that one?

MR. HELPERIN: That's fine with me.

RICHARD HORNER,

having been previously sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. HELPERIN:

Q. Can you please state your name for the record.

A. Richard Horner.

Q. And can you please describe your educational background.

A. I have bachelors and masters degrees in mechanical engineering from University of Pennsylvania, Ph.D. in civil engineering from the University of Washington with a specialty in environmental engineering and science.

Q. What is your current occupation?

A. Research Associate Professor, University of Washington, and also a sole proprietor.

Q. How long have you been teaching?

A. I've been teaching altogether 31 years of which 19 have been at the University of Washington.

Q. Is there a specific focus of your research and scholarship?

A. My focus has been on urban water resources over the past 23 years which includes urban stormwater and all of its respects, as well as the receiving waters that get those effluents, stormwater effluents in urban areas.

Q. Have you published any reports or articles on these issues?

A. I have something over a hundred total publications of which somewhere around 70 are technical reports and 30-some-odd ones that are refereed journal-type presentations, and some others as well.

Q. Do you also have practical experience with the implementation of structural stormwater controls?

A. Yes. In my sole proprietor work, I work for local and state government agencies, in some cases for EPA as well, and for the consultants that work for those agencies. Mostly those are -- most of the associations that I've had and in that work I do more or less the same kinds of things as I do in my research, and that is the sources of pollutants in urban stormwater, how they're transported through the system, their impacts within the ecosystem, how they are best monitored, and solutions to those problems, what we generally call BMPs.

Q. So altogether you've been researching on these issues, writing on these issues, consulting on these issues for --

A. In the case of urban water resources, for 23 years. And my total professional experience is back to 1966, so that's 34 years.

Q. Are you familiar with the hydrologic conditions in the Los Angeles area?

A. Yes, I am.

Q. Are you familiar with the extent or degree and nature of development in the Los Angeles area?

A. Yes. I have worked in the area for the past approximately seven years, been here dozens of times. I've been in just about all the neighborhoods, most of the miles of freeways, and many of the major streets as well.

Q. Are you working on any projects in the Los Angeles area now?

A. Yes. I am working as the court-appointed monitor on the permanent injunction issued against District 7 of Caltrans, and in that position my role is

R0073645

to interpret their degree of response and evaluate it. I have a similar role in the District 11 case in San Diego, and in the past have also worked on cases involving several cities and two counties, a couple of court facilities in this area.

Q. Do you believe Los Angeles County has a stormwater problem?

A. Yes. I think the documentation and several reports in the past five years, couple of reports anyways, bears out there are ecological problems and problems with human exposure to the stormwater.

Q. And do you think -- if this problem is left unmitigated, do you expect it will get better or worse or stay approximately the same?

A. I understand the projections of population growth in this area are for it to continue at a relatively rapid pace, as we have seen for the last 50 years with fits and starts, and seen it growing still very rapidly because these pollutants that are used in the landscape that every individual is associated with or responsible for are directly associated with population and particularly with the things that people build and what they drive, that the problems will get worse unless they're mitigated.

Q. How does development in particular affect the stormwater pollution problem?

A. Well, development puts down hard surface, I suppose it's its real hallmark, and it's that hard surface itself that begets the problem in that as rain falls and it doesn't have anywhere to go in the natural soil and vegetation system. It runs off rapidly from those hard surfaces and quickly is transported into receiving waters and its ultimate receptacle, in this case the Pacific ocean.

And in going through those water courses, just the volume alone, even if it were distilled water because it's more water, faster than they're accustomed to, and the erosion of those stream channels is a problem to the organisms there as well as sediment load and sediment transport.

And in addition, what happens on those surfaces in driving applications, even on lawns, pervious surfaces, applications of pesticides, fertilizers, all the myriad of activities virtually and residentially and industrially going on. And so what you have is a greater release of pollutants in terms of -- you know, even given drop of water, given a cup of water, how much is there in that volume, but also there's more volume. And so the multiple of those two, volume times the concentration of pollutants, means you have more total mass of pollutants going into the receiving water and collecting into that ultimate receptacle, the ocean.

Q. How does a development planning program assist in mitigating that problem?

A. Well, development planning program in my mind is fundamentally a two-pronged approach. The first prong is what we call variously non-structural source controls, and that is basically to stop the contact between pollutants and rainfall or run-off so that they can't get into it in the first place.

And there are many examples of that particular prong. Just two in industrial areas is keeping the industries' raw materials, products or waste products out of contact with rainfall and run-off just by covering, for example. In the case of residences, it's educating them in how they use products, for example, what they put on their lawns.

The other prong is often what we call structural treatment, and that is recognizing that we're not going to occupy this earth and not ever release anything. So there's a point at which we have to put in further backstops to -- between the point of generation and the receiving water, and that's what we call structural best management practices.

Q. First you keep the pollutants out of the water, then to the extent they still get in you use treatment control that's a fundamental part of the program to get them out?

A. That's correct, yes.

Q. Are you familiar with the SUSMP that's at issue here?

A. Yes, I am.

Q. Does it create the same sort of plan, development planning you just described?

A. In fact, it does create that exact kind of program.

Q. Are you familiar with the list of approved structural best management practices that are approved for use in conjunction with this SUSMP?

A. Yes.

Q. Are you aware of any doubt on the effectiveness of those BMPs in removing pollutants?

A. It's one of the major activities that I have pursued over the past 23 years and so I'm aware of a lot of data.

Q. Can you give me a sense -- have there been studies other than yours?

A. Well, it goes back to approximately the time that I was getting started. I was working as a graduate student at that time with people generating some of the first data, and particular in this case in highway run-off.

At the same time there were others elsewhere in the nation, and the world in fact, that were beginning the same sorts of studies. At that time, also EPA started its nationwide urban water run-off program. It had as a component the effectiveness of ponds as a best management practice. And since that time that work has continued, myself and many others in this content and elsewhere in the world.

Q. There's been widespread study of this issue for 20 or 30 years?

A. That approximate time, and there are now databases assembled by civil engineers, for example. EPA has a summary database that came out last year. The Center for Watershed Protection in Maryland has concerned itself also with this question and the overall data.

Q. Do these studies discuss the pollutant removal efficiencies of these BMPs with respect to specifically the pollutants that are of concern in the Los Angeles area?

A. Yes, they do.

Q. Can you give us a sense of just how effective these BMPs can be, these treatment structural BMPs can be, at removing those pollutants of concern?

A. I'll give you a couple of examples quickly.

Let's take solids, the particulate matter, and we need to recognize that in urban run-off, the other pollutants, generally speaking, are mostly associated with the solids in some physical or chemical connection. And so if you do a good job of getting the solids out, we can get those things that are highly associated with the solids. They include particularly the organic chemicals, industrial origin pesticides and so on, and that array of best management practices that you see up there, including ponds, constructed wetlands and vegetative filters and sand filters and other medium filters, can reliably remove 80 percent of the total loading that goes through them and, in fact, this comes from the EPA database.

I would lean toward the higher end of the ranges that they give there as reliable performance assuming that state-of-the-art or maximum extent practicable design and construction and maintenance is undertaken with them. One of the metals --

MR. MONTEVIDEO: I'm sorry, Mr. Chair. I just want to get some sense as to where this is in the record.

MR. HELPERIN: This was Exhibit K to NRDC's comment letter of January 14th, 2000.

MR. MONTEVIDEO: Thank you.

THE WITNESS: One of the three prominent metals in urban run-off is lead, still though we no longer have leaded gas, and it is heavily associated with the solids. These BMPs can reliably get out 75 percent, at least of the lead. Copper and zinc are the two other prominent metals. They are somewhat more soluble, but reliable performance at 50 or 60 percent is possible with these metals.

I should point out that infiltration is a special case because to the extent that you can infiltrate the run-off, you can remove those pollutants from contact with surface water so the infiltration can be up to 100 percent effective.

Q. BY MR. HELPERIN: Can you tell me -- we've talked about the fact that these BMPs can actually remove the pollutants of concern, but what does that actually mean for the purposes of the beneficial uses of the receiving waters?

A. Well, the -- I think the receiving water that you focus on more than any other in the Los Angeles area is to the ocean, and I started my involvement down here with cases involving Santa Monica Bay, so that's what I know the most about. And as I've characterized that, that's a receptacle body of water. It's a sink. And to the extent the contaminants can be removed somewhere between the point of generation and that ultimate sink, they will not have to -- they will not become a part of the pollutant burden in that sink.

So therefore, it's sometimes said that a removal efficiency of 50 percent isn't very impressive, but that's 50 percent that's not going to get that into that ultimate sink, and in many of these, as I said, many of these contaminants are removed at a higher level than that.

Now, there are other receiving waters of concern. There are the streams and rivers on the way to the ocean, and realize that a lot of these are concreted but they are perhaps subject to restoration some day, but some are still in natural conditions. Their biological integrity remain, Melvin Creek (phonetic) and parts of Santa Clara River, and those water bodies, too, are subject to urban run-off, both the quantity impacts as I pointed out earlier and also the quality impacts, especially as urbanization increases. Up to like the 40 percent impervious level water quality begins to become a factor in those fresh water bodies even though it passes through fairly rapidly into the ocean.

Q. The petitioners are going to be introducing later a report by Scott Taylor and G. Fred Lee (phonetic) which indicates these BMPs are more effective on the dissolved contaminants rather than the particulates and that because of that perhaps they're not going to help us out.

What do you think about that study?

A. I have to correct the way you say the question. Their reports say it's more effective on the particulates than the dissolved, and that so far as it goes is true, but there's several factors we have to recognize.

One, as I said earlier, many of these contaminants are highly associated with the particulates, and as they travel with the particulates and get into the receiving water, they can be released solublized into the water in a more mobile form.

Secondly, these contaminants, even if they stay in the solid state with regard to directly into the sediments in the fresh or salt water are then toxic subject to impacts delivered to the bottom dwelling organisms and there's a lot of evidence in the general literature to that effect, too.

And thirdly, the BMPs do have some effectiveness on the dissolved contaminants. Copper and zinc are partially in the dissolved state. However, lead is a very minor part in the dissolved state, and there is some removal of the dissolved contaminants as well. 30

percent removal is still important.

Q. Can I ask you to give us a sense from your personal experience as to what land use is considered to be at a particular risk of contributing these pollutants to stormwater run-off?

A. The uses that are listed in the standard plan are certainly appropriate, but just to give a couple of examples of those, parking lots, especially those that cycle vehicles in and out rapidly as they -- when they're subject more in the stop-and-go mode of releasing contaminants, and gas stations.

Q. With respect to gas stations, WSPA, the Western States Petroleum Association, will be testifying later that there are significant issues, or problems that is, with the only types of mitigations that gas stations can use allegedly. For example, they'll state that filtration systems often clog and back up. Is that true of all filtration systems?

A. Well, the types of filtration systems that they might consider are sand filters, other medium filters including compost and some other media, vegetation filters, and catch basin inserts are listed on that particularly chart. And I think that they're referring to catch basin inserts which have small scale devices and at the scale of about this lectern top here, and they don't have a large capacity and there is definitely experience with them clogging.

However, sand filters in my own personal experience in one of my own studies clog slowly and the -- the other media filters, such as the compost put on the market five years or more now, also are in that category. It's a rather slowly developing problem.

Q. And even for the ones that do potentially clog, is that an insurmountable problem?

A. I looked at catch basin inserts as sort of limited in their general application, but gas stations have to be one of the best potential places to use them because gas stations are attended. They're out sweeping up the cigarette butts, so it's not really a very -- a great addition to their work load to check every day during the rainy season and after it's rained and find out if it needs to be cleaned out.

Catch basin inserts are greatly improving, or least they seem in the very near future to be putting some very improved ones on the market. Professor Stenstrom at UCLA is testing those in his laboratory and he's getting some very good results on performance.

Q. Let me switch for a moment to the .75 inch standard that's been adopted by the Regional Board here.

Based on your experience with these programs, and with the Los Angeles area hydrology in particular, do you think that standard is appropriate?

A. That standard is appropriate but it's minimally acceptable in my view.

Q. Is there evidence in the literature or otherwise to support using the standard of that size would be effective?

A. Yes. Yes. The performance of a BMP, structural BMP, is directly dependent on its size. It's the most fundamental characteristic that needs to be built into its design, sufficient size to give the residence time for the water so that we can reach these efficiencies that were up there, which have been proven under design conditions equivalent to that or even greater.

Q. Have programs like this been implemented elsewhere?

A. There are hundreds of programs that use a design standard around the country.

Q. And is this chart accurately representative of the -- your experience with programs in other places in the country?

A. Yes. That's a chart that, in fact, I helped to prepare. It comes from a study that I participated in as one of the co-authors. The listed author is Watershed Management Institute. I was one of the four human authors.

Q. So this chart then shows that you're saying there are literally hundreds of places in the United States that have, if you look at the right-hand column, bolded text, numerical standards that are actually higher than the Los Angeles County standard; is that correct?

A. That's correct. And this study was of 32 particular programs, but some of those programs represent many municipalities, such as state of New Jersey or northeast Illinois Planning Commission.

Q. When you worked on the L.A. County program, what size minimum standard did you suggest for the Los Angeles area?

A. I recommended one inch based on capturing and treating a larger percentage of the total run-off volume.

Q. Just a couple final questions. The December 7th, 1999 draft of the SUSMP that is proposed by the Regional Board included a rooftop exemption. What was your opinion of that?

A. I don't subscribe to that because I've seen evidence that roofs, in fact, are not innocuous. We need to realize that there is -- there are airborne contaminants that land on any impervious surface, including roofs, and also there are some rooftop materials that are contributors, but I think the airborne is a bigger issue, too.

Q. Have you ever seen a provision for rooftop exemptions in any of the other programs that you've studied in the country, either this study here or elsewhere?

A. I don't recall seeing such provision.

Q. Finally, petitioners will claim later today the Regional Board should have followed a specific process in developing this SUSMP that was laid out in certain exhibits that would have been a process of further study and consensus building prior to implementing any program.

Do you think that given what we know today about

Los Angeles, about pollutant removal efficiency, that they should have waited and done those additional studies?

A. No. It's past due. As I say, there are many municipalities that have gone through this and established their programs, even in the state of California. We know very well what is the maximum extent practicable with respect to the performance of these BMPs. We know from a couple of studies in southern California coastal water research project and for an earlier epidemiological study that the problems that exist in particularly Santa Monica Bay have both ecological and human impact implications.

So there is no justification for going through a lot of studies, a great deal of additional monitoring. The time is very right now.

MR. HELPERIN: Thank you, Dr. Horner.

MR. MONTEVIDEO: I'm going to object to the last question and the answer, Mr. Chairman, on the grounds that he asked for a legal opinion, in effect, on the application and the permit and this witness is not an attorney, not a judge. He's not frankly qualified to give that opinion.

MR. HELPERIN: May I respond to that?

My question was not for a legal opinion but rather from a technical standpoint whether Dr. Horner believed there was enough information at this point about the conditions in the Los Angeles area, the effectiveness of a program like this, that it was warranted that it would be implemented at this time.

MR. MONTEVIDEO: With that qualification, I'll withdraw the objection.

CHAIRMAN BAGGETT: Before we ask for comments or questions of the Board, if you have cell phones or pagers, please put them on silent or turn them off. It would be appreciated.

Any questions from the Board Members?

BOARD MEMBER FORSTER: I have a question.

EXAMINATION

BY BOARD MEMBER FORSTER:

Q. Dr. Horner, one of the issues raised in some of the testimony was about the impact of infiltration on groundwater. Could you address that?

A. Yes.

Infiltration is a practice you have to approach carefully for two reasons and that is certainly one of them. If the soils are extremely course and if transport is rapid and the water table position is high, close to the surface, there is a potential for contamination to groundwater.

On the other side of it is the other point, and that is that some soils are the opposite. They're incapable of passing the water effectively through the soil and getting it off the surface, so they fail from that respect. So what it means is you have to be very careful with fitting it into the right locations, and neither those that are too restrictive to water passage or too loose in terms of transporting contaminants to groundwater.

There are soils in the modern texture groups, the soils of the same sorts as garden top soil, that are very appropriate for infiltration. It's a matter of how many there are and being sure that you locate them in a particular area with effective -- knowing that what those characteristics are.

So infiltration does have its uses, but one needs to be careful from both of those respects.

BOARD MEMBER BROWN: Thank you, Mr. Chairman.

EXAMINATION

BY BOARD MEMBER BROWN:

Q. Have you done any work, Dr. Horner, working with areas that have more of the regional master plan, regional considerations? For instance, service stations don't lend themselves very well to BMPs. All those are good ideas but they're more intensive and I would expect that, as an example, unless they're really intended to (inaudible), there are other areas that are more than capable of having retention of the .75 inches or greater.

Have you done work or studies that would address the issue more on a watershed basis as opposed to individual sites and how you may take the same amount of dollars a service station, as an example, might spend to do a little bit of help and spend those same dollars elsewhere within the community and do a whole lot more help?

A. Well, I've certainly been associated with the regional approach (inaudible) counties and many municipalities that is under a management plan, water quality management plan, and so there are standard provisions that apply as minimum requirements to all the municipalities.

I'm certainly aware of efforts in the Chesapeake Bay region which are very much watershed driven. There are -- one particular program in that area, City of Alexandria, Virginia, which is one of the oldest and densest cities in the United States, that has a very far-reaching program in applying BMPs in what they call "ultra urban areas," and these include gas stations, they include commercial developments and all matter of development. Of course, there's not much in-fill area. It's mostly redevelopment, but they're applied the same to redevelopment.

I don't necessarily agree that the gas stations are a hard application. They're certainly a hard application for something that takes up much space on the surface, but what we talked about here primarily and have highlighted on the slide there go on the pavement. They don't take up space. They do need maintenance, but again because they're not out sitting in some remote place, they're around all the time, I look at it as a part of the business. It's a new part of the business, but it's one that I think, you know, they can -- they get used to and I don't think it's that much additional burden on them.

And I would add that something else they've done in Alexandria that could be adopted in this case is that they have worked with the local suppliers of the concrete vaults that form the boxes for these things, for the sand filters, and they've gotten them to produce what they need in a series of off-the-shelf sizes, so you can walk in and get what you need for a particular size drainage area and it's approximately half the cost. And I think that it would be a very good project for a trade association like Western States to get involved in that for their members, a program like that.

CHAIRMAN BAGGETT: Questions from the Board Members? Staff?

EXAMINATION

BY MS. JENNINGS:

Q. I had one question which follows up Mr. Brown's, which is do you have experience on, I guess I would say, more effective to have projects on individual properties, sort of basically where the ultimate responsibility is the property owner versus a city, let's say, creating a larger pond that then all properties drain to? Do you have experience comparing those types of projects?

A. Well, I have experience with observation in this area, and this argument has gone back and forth probably ten years or more of regional versus localized. And there are arguments both ways.

The arguments attempt to make the most sense for the use of some regional construction, especially in new developments when it can be done as part of the overall plan and then it gets -- it's a prominent facility and it's more likely to get the maintenance attention and there's one authority that would be responsible for it.

But there are arguments on the other side as well and they concern in some cases that the fiscal fluctuations of the local government agencies over the years and whether they will, in fact, be able to fulfill those responsibilities.

So I can't say that I'm firmly convinced one way or the other. I think it needs to be a case-by-case basis. I think redevelopment only rarely would you get regional to work out very well because redevelopment tends to occur a parcel at a time, and I think that people most likely would choose localized. So I think some of the new developments, especially the residential and commercial projects, would do very well to consider it.

BOARD MEMBER BROWN: I'll help with Ms. Jennings' question.

R0073663

FURTHER EXAMINATION

BY BOARD MEMBER BROWN:

Q. Have you been in the city of Fresno and seen what they've done?

A. I've not been in that city. I've passed through it. I do know what they've done. Of course they've used infiltration to a large extent.

Q. They have infiltration basins all over that city and the flood control district maintains those. And I'm sure they're very effective in accomplishing what our goals would be here.

A. They are. I think they do have a different geology.

Q. The thing is you have one entity that maintains those, and my suspect is the dollars to maintain those types of infiltration basins are not only effective but cost a whole lot less money than individual.

A. There are instances in which you can't go wrong with infiltration, if they're set up right, and they seem to be fortunately in such a pocket. I would say the Los Angeles basin overall is not. There are some places in which it would have that misfortunate circumstances, but I can't offer it as a general hope for the whole area as it is in Fresno.

CHAIRMAN BAGGETT: Any questions from petitioners? Any cross-examination?

MR. MONTEVIDEO: Yes, Mr. Chair. On behalf of Arcadia and Bellflower, I'll be asking questions.

MS. JENNINGS: I think you'll have to stand up here, Mr. Montevideo.

MR. MONTEVIDEO: Do I need a microphone?

MS. JENNINGS: It helps us to take it down and make sure we've got everything.

CROSS-EXAMINATION

BY MR. MONTEVIDEO:

Q. Good morning, Mr. Horner.

A. Good morning.

Q. My name is Richard Montevideo. I'm representing the Bellflower, et al. petitioners, as well as the City of Arcadia today.

I have some questions for you in terms of your testimony and other issues that arose after looking at the exhibits that have been submitted on behalf of NRDC and related to environmental organizations.

It seems from the -- your testimony in the slides that you put up there that you had worked extensively at least in looking at studies conducted in various municipalities across the country. Would that be an accurate statement?

A. We conducted a survey, questionnaire survey of 32 programs.

Q. Did you work with the various cities in the various jurisdictions across the country?

A. I've worked with some of those cities, but some were cities and counties and states. They were all represented, as well as regional entities. I've worked with some of them, but they were throughout the country so I have not had personal work experience with most of the them.

Q. In your opinion, is it beneficial to work with the cities in developing a program of this nature?

A. Yes. I think working together is a good strategy for anybody.

Q. It's important to not only work with cities but the entire affected community; is that correct?

A. Yes.

Q. With respect to the Los Angeles SUSMP program that's been proposed by the Regional Board, have you had any contact with, for example, the City of Rancho Palos Verdes?

A. No.

Q. Have you had any contact with the City of Bellflower?

A. No.

Q. Arcadia?

A. No.

Q. Any of the 33 cities that are identified as petitioners?

A. I couldn't name those cities. I could tell you which cities I have had contact with.

Q. You could, but my question is are you aware of any contacts with many of these cities or any of these cities that are identified as petitioners?

A. Well, I've had contact with three cities.
Q. Why don't you tell me what those cities are.
A. El Segundo, Hermosa Beach and Beverly Hills.
Q. None of whom are petitioners in this proceeding. But you do agree that it's useful to work with the cities in the entire community to put together a program that basically fits the particulars of, in this case, the County of Los Angeles?
A. Yes.
Q. You made a comment in response to the last question that was asked of you on direct examination about the process that was followed under the permit and some contention -- you made a claim that you were concerned that there had been too much delay already and the process was sufficient. Do you recall that testimony?
A. Yes.
Q. Have you seen a copy of the permit for Los Angeles County?
A. I've seen one.
Q. You've seen it. Have you read it?
A. I did at one time. It's been some time.
Q. In your opinion, is it important to understand the requirements in the permit in developing a SUSMP program, particularly if that permit spells out what is to be done for purposes of developing the program?
A. Understanding would be essential, yes.
Q. And is it important before you can make a

statement about whether the SUSMP program that's been proposed for Los Angeles County is a minimal requirement, is it important to understand what the permit says about that requirement?

A. Well, I think we have to back up here a little bit and put myself in my own correct context, and that is I'm a scientific and technical person and I think that all the scientific and technical evidence backs up my statement that I made in response to that direct question.

I -- I am not an institutional consultant in terms of program interpersonal relations, so I'm commenting on the area has allowed its water resources to become degraded and I think the scientific and technical evidence supports that and that the means are available to forestall it.

Q. So when you made the contention about the permit and the delays and the need to move quickly and this is a minimalist effort, you then weren't referring to a minimalist effort?

MR. FLEISCHLI: Can I object to the issue of -- you said move quickly and move forward, and I believe -- I don't know if we can have things read back, but I believe that Dr. Horner said --

CHAIRMAN BAGGETT: Wait. I want to know what the question is.

MR. FLEISCHLI: I want to object on the grounds that he's misstating what the witness has said in the past on very minor issues, but I think -- I understand where he's heading. And when he says that Dr. Horner said we needed to move forward with something in a timely -- quickly, all of this, I think what Dr. Horner said he just repeated it there. Dr. Horner said there's sufficient evidence to move forward now.

MR. MONTEVIDEO: Frankly, this is a witness with a lot of experience.

MR. FLEISCHLI: I understand that but I don't want you to be --

MS. JENNINGS: Gentlemen, this certainly is not appropriate to be arguing back and forth. There is an objection.

CHAIRMAN BAGGETT: Mr. Brown.

BOARD MEMBER BROWN: I'm concerned with the procedure here, Mr. Chairman. When a Board Member speaks, I would appreciate it if nobody else talks. Do you understand? I want to know what the question is before the -- I am interested in the objection. Finish your question and then we'll listen to the objection. When the Chairman talks, let's listen to the Chairman and ask for permission to speak from the Chair.

Finish the question, then I'm interested in your objection. No more arguing. Finish your question.

MR. MONTEVIDEO: Yes.

Q. Let me ask it this way, Dr. Horner.

Would you agree at a minimum the permit should be a starting point before preparing any SUSMP?

MR. FLEISCHLI: I have no objection to the way he's phrased that question.

THE WITNESS: Yes, it's an appropriate starting point.

Q. BY MR. MONTEVIDEO: Now, do you know whether or not in accordance with the permit that we have before us today whether that permit provides for the application of the SUSMP program to discretionary versus non-discretionary projects?

MR. HELPERIN: Objection. I believe Mr. Montevideo is asking for a legal opinion with respect to the contents of the permit. Dr. Horner is not here as an expert on the permit or on the law. He's here as an expert on the technical and scientific issues.

MR. MONTEVIDEO: He has testified about the importance of the SUSMP program. He has testified about how it's overdue, in so many words. And correct me if I'm not entirely accurate in using your words, Dr. Horner, but he's just testified that the permit is the starting point for the SUSMP program. And I'm asking him then if it's a starting point whether, in fact, he knows whether the terms that are in this SUSMP program are actually terms that are allowed under the permit. That's where I'm going with this.

If it's a starting point, then I presume that any scientist is going to pick it up and look at it and base the terms of the SUSMP program with the terms of the permit.

MS. JENNINGS: If I can make a comment, Mr. Baggett. I do think that this witness has clearly been put forth as a technical expert. All of the requirements for expertise are shown and there was no objection. And certainly not a lawyer and certainly not even I gather a citizen of California is entitled to interpret the permit provisions, and it seems like that your statements, your questions, don't go to that and they would be appropriately done in your direct testimony, arguing that. I presume your argument is well, gee, I think it goes further than the permit and that I believe that the testimony was simply that from a technical standpoint.

CHAIRMAN BAGGETT: I'll sustain the objection. Move on.

MR. MONTEVIDEO: Yes.

Q. You have testified with respect to the SUSMP program being a minimalist effort or something to that effect; is that correct, Dr. Horner?

A. I said that the design standard was the minimum that I would consider to be acceptable as a design basis.

Q. Okay. So you weren't talking about the other provisions of the permit dealing with the categories of development, so to speak, that are to be impacted by the SUSMP?

A. That statement pertained potential to the .75 inch of rainfall.

Q. So should we assume that your entire testimony when you talked about the SUSMP program was primarily focused on the .75 standard?

A. I don't believe that we could read back my testimony and conclude that. It was one element.

Q. In terms of the SUSMP program itself, for example, were you offering an opinion on the appropriateness of applying the SUSMP program to redevelopment as defined in the program?

A. I wasn't asked that.

Q. And do you have an opinion on that?

A. My opinion is that it definitely should be applied to redevelopment.

Q. Okay. Do you have an opinion on whether or not it should be applied to discretionary, or I should say, non-discretionary projects?

A. I'm afraid I'm just not up enough on the legal and regulatory definitions of those terms to answer that.

Q. So the answer is you don't have an opinion; right?

A. No.

Q. Do you have an opinion on whether the SUSMP program should be applied to environmentally sensitive areas?

MR. HELPERIN: I'm going to have to object. I'm sorry. I believe Mr. Montevideo has mischaracterized Dr. Horner's testimony. Mr. Montevideo is asking if Dr. Horner believes that the SUSMP should be applied to discretionary as well as non-discretionary projects.

Dr. Horner said that he didn't understand the legal distinction. Mr. Montevideo has mischaracterized his testimony that he does not have an opinion on that. It's not the case that Dr. Horner does not have an opinion. He simply does not understand the distinction and could not very well have an opinion.

MR. MONTEVIDEO: I'm not sure I understand the objection.

CHAIRMAN BAGGETT: Sustained.

Q. BY MR. MONTEVIDEO: Environmentally sensitive areas, do you have an opinion on whether or not the SUSMP program should be applied to environmentally sensitive areas as defined in the SUSMP?

A. Yes, I think it should be applied.

Q. How is environmentally sensitive areas defined in the SUSMP?

A. I do not know that.

Q. But your opinion is that it should be applied irrespective of how it's defined?

A. I can't quote you the definition.

Q. Do you want to tell me generally?

A. I -- no, I don't believe that I can. I have not made an effort to get the words precisely right, but I have an understanding of what environmentally sensitive -- where environmentally sensitive areas lie in the County of Los Angeles.

Q. Do you have an opinion as to whether or not other environmental mandates should be complied with, specifically the California Environmental Quality Act, or whether they have been complied with?

MR. HELPERIN: Objection.

Q. BY MR. MONTEVIDEO: I'm asking whether you have an opinion on it.

MR. HELPERIN: Objection. Whether it should be -- can you repeat the question? I'm sorry. I think it calls for a legal conclusion.

MR. MONTEVIDEO: I asked him if he had an opinion on whether other environmental mandates should be considered in developing the SUSMP program.

MR. HELPERIN: Other legal environmental mandates and whether or not they apply or should apply is a question of law.

CHAIRMAN BAGGETT: Sustain the objection, unless you can rephrase it.

MR. LEON: I would also like to enter an objection, Mr. Baggett.

Mr. Montevideo is obviously on a pattern to continue asking questions that have to do with legal issues and I think it would serve all our purposes much today if he could be instructed to remain -- to stick to the program directly and not get on the legal issues.

MR. MONTEVIDEO: Frankly, in terms of the rules, I am permitted under 11513 to go beyond the scope of direct.

CHAIRMAN BAGGETT: But if you could focus your comments.

MR. MONTEVIDEO: Can we --

CHAIRMAN BAGGETT: We'll be here two full days at this rate.

Q. BY MR. MONTEVIDEO: Dr. Horner, do you recognize this? This is actually Exhibit L. I think you had put this up earlier.

A. Yes.

Q. These standards in other states, do you know if the standards, the numerical standards that are applied in other states, are applied to all redevelopment as well as development?

A. I could not say that it's applied uniformly to redevelopment. It is applied to new development, but I know certainly of instances, particularly in that area, where it applies to redevelopment.

Q. But you can't say that for every one of these programs that each these programs apply the exact same numerical standard to redevelopment as they do to development?

A. I can't say that.

Q. And in fact, you have some studies up there from the state of Florida. Isn't it true that the state of Florida recognizes a need to apply different standards to development versus redevelopment?

A. I don't know that for a fact.

Q. Have you looked at the studies in the state of Florida?

A. Well, this was done several years ago and certainly we looked at them, but I can't answer that specific question at this point.

Q. Let me show you a document which is -- has a cover letter date of May 31st, 2000, but behind it are a series of responses to questions by the Florida Bureau -- effectively the Department of the Environmental Protection Agency in Florida. There's a series of questions, but attached to is an article entitled best management practices for urban stormwater management.

Do you see the attachment?

A. Yes, I do.

Q. This is a document that was actually submitted by the Regional Board, belatedly, but it has in here -- if you turn to the third page of that report beginning with treatment requirements of older systems.

Do you have that in front of you?

A. Yes.

Q. If we can have the next slide please.

MR. FLEISCHLI: Can I object here since there's a pause? We're going to make the same argument that Mr. Montevideo made this morning with regard to his inability to review these documents. Dr. Horner obviously has not had the opportunity to review these documents. This is the first time he's seen them. It's going to be very, very hard for him to make any sort of determination standing up here in discussions with an attorney as to what these documents say, especially what his professional opinions of them are.

R0073676

MR. MONTEVIDEO: Mr. Chair, frankly that's what cross-examination is all about.

CHAIRMAN BAGGETT: Under the rules you can present these documents for cross-examination purposes and also under the rules we take evidence and the weight is given as a Board.

MS. JENNINGS: Just to be clear, Mr. Montevideo, this was one of the documents submitted by the Regional Board; is that correct?

MR. MONTEVIDEO: Correct.

CHAIRMAN BAGGETT: Continue.

MR. MONTEVIDEO: Yes. On page 36 of that report, if we could have the next slide please.

Q. We were just briefly talking about development versus redevelopment in the application of different standards. Can you take a look at the first sentence of this report?

A. The highlighted one?

Q. Yes. Correct.

A. Yes.

Q. Talking about numerous problems inherent to a highly urbanized area make it nearly impossible to apply the same stormwater design and performance standards that are applied to new developments. Do you agree with that statement?

A. We actually have three situations, and I think we're in the third one. We haven't talked about that. We have new development, we have redevelopment and we have retrofitting of existing development that is not going to be development. I believe this is talking about the third one.

Q. So I guess first, do you agree with the statement? Do you believe that's an accurate statement?

A. With respect to a development that's existing, standing static, it's not going to change and not reconstructed, yes, I agree with that.

Q. What about --

A. But not with respect to redevelopment as I define redevelopment.

Q. In terms of a static development, why do you believe this only applies to static development?

A. Because a redevelopment is, according to the definitions that are adopted for that, and they vary, but under your framework and other frameworks there is a substantive change to the layout which permits much more flexibility in what's constructed.

Q. Okay. But in terms of the application of that statement to redevelopment versus retrofitting, why do you believe that that statement is only intended to apply to retrofitting versus redevelopment?

A. It says so.

Q. Okay. You want to point me to the language please, sir?

A. Last word in the first line, B.

Q. You want to give me the word please?

A. Retrofitting.

Q. Why don't you help me out here. I'm looking at the first sentence.
A. I'm looking at the heading.
Q. Okay. So your position is that the application of the design standard to new developments versus redevelopment, that there should in effect not be any distinction between the application of the SUSMP program to development versus redevelopment?
A. No, not as redevelopment is defined.
Q. Even if the redevelopment -- were you finished? I'm sorry.
A. Yes.
Q. Even if the redevelopment is occurring in highly urbanized areas, do you believe the same standard should be applied?
A. Generally speaking I do, yes. There's room for flexibility in all designs, in new development too. But generally speaking I think the standards should apply.
Q. Well, when you said there's need or there's room for flexibility, should there be flexibility in a SUSMP program, different standards for redevelopment as opposed to development?
A. No.
Q. So where do you get the room for flexibility?
A. Flexibility comes in in one way just in the best management practices selected. Not every practice is appropriate for every site. That's true in new development and redevelopment.

Q. Do you believe there should be room for flexibility when you're applying it to redevelopment versus development?

A. No, I don't.

Q. And this statement that you believe should only be interpreted as applying to retrofitting as opposed to redevelopment in general.

A. I not only believe that it should apply to that, I believe that the author of this -- and I know that author very well. He was one of the co-authors of this study we talked about a while ago -- meant it to apply to that because I know how he defines retrofitting, the same as I do.

Q. You think this report is a well-written report?

A. This report?

Q. Yes. You know the author.

A. You only directed me to one sentence.

Q. You were just talking about the author. I was trying to understand whether if you believe the author, in your opinion, had written a good report.

MR. FLEISCHLI: He obviously has not had an opportunity to read the entire report.

MR. MONTEVIDEO: I will withdraw the question.

MR. HELPERIN: Just a point of order as well, Mr. Chair. I believe Mr. Montevideo's cross-examination has now taken up more time than the direct examination. We have made arrangements for Dr. Horner to catch a flight at 12:30 and it is now 11:30. I would like to suggest that the Board may want to structure the cross-examination in a way that's going to make it possible for Dr. Horner to make the flight.

MR. MONTEVIDEO: I will move as quickly as possible.

CHAIRMAN BAGGETT: Realize you're going to be cutting into your time for the other petitioners.

Q. BY MR. MONTEVIDEO: Mr. Horner, you talked about a program -- and can we have Exhibit L back up please -- in the state of Maryland and you have some experience with the program in the state of Maryland?

A. It was one of those that we surveyed.

Q. How long has Maryland had some type of SUSMP program in place?

A. Well, how long it's had a stormwater program in place goes back to the early '80s at least.

Q. 1982 sound about right?

A. That's about right.

Q. Have you heard of the 2000 Maryland stormwater design manual?

A. If it's the same one that you're referring to, I know their new manual, yes.

Q. Is it true that manual has been in the works for five years now?

A. I couldn't confirm that, whether or not that's the case.

Q. Okay. How long has the Regional Board SUSMP program been in the works, as far as you know? The Los

Angeles Regional Board SUSMP program.
A. I don't know that.
Q. Do you know if it's even under a year or over a year?
A. I couldn't answer that.
Q. Do you know if the Maryland program defines very redevelopment as broadly as the Los Angeles program?
A. I don't know that. I would have to compare them statement by statement.
Q. Are you familiar with the results of the Maryland program? That is, does the state of Maryland believe that their program has been effective?
A. There are elements that they believe have been effective and elements they have changed.
Q. Would you agree with the statement they've only had modest water quality improvements?
A. Well, I don't know that I can agree or disagree with that statement, but there are many factors concerned with the Chesapeake Bay outside the state of Maryland.
Q. Okay. Are you familiar with the program in Washington, the state of Washington?
A. Yes.
Q. You talked briefly about a rooftop exemption and your belief that the rooftop exemption was appropriately deleted or that rooftop water should be included in the SUSMP program; is that correct?
A. Yes.
Q. Is it true the Washington SUSMP program provides

for some exemption for rooftop water?

A. I'm not aware that it does.

Q. Let me show you a copy of their program.

MR. MONTEVIDEO: This again, Mr. Chair, is a document that came in just yesterday from the Regional Board. It is a series of responses to questions -- questions from the state of Washington, specifically the Washington State Department of Ecology.

Q. If you could turn to page 2 of enclosure one to the letter.

A. Okay.

Q. Do you have that page in front you?

A. Yes.

Q. Do you see the item B, the draft 1999 stormwater manual?

A. Yes.

Q. Do you see the second sentence there, the draft manual includes definitions for pollution-generating impervious surfaces and pollution-generating pervious surfaces. Non-pollution generating surfaces would include residential roofs, commercial roofs that do not accumulate pollutants in events of fugitive (phonetic) emissions, isolated bicycle lanes, other ground surfaces that are not subject to vehicle use.

A. Yes, I see it.

Q. Do you understand that the state of Washington makes a distinction between certain commercial and residential roofs and provides different standards, if any standards, to those types of -- to run-off from those types of facilities?

A. They've proposed as a draft provision in the new manual to do so. The old manual did not.

Q. Now, do you understand that --

A. But I disagree with it.

Q. But nonetheless, they are proposing it; correct? And nonetheless, it does not exist anywhere in the Regional Board's SUSMP program; correct?

A. I'm sorry?

Q. There is no rooftop exemption presently in the Regional Board's SUSMP program?

A. No. I understand it was deleted.

Q. Very good.

MR. HELPERIN: If I may, Mr. Chair, we have five minutes. Dr. Horner will have to leave.

MR. MONTEVIDEO: I am almost there.

CHAIRMAN BAGGETT: Okay.

Q. BY MR. MONTEVIDEO: I'm going to talk briefly, Dr. Horner, about the application of the SUSMP program in Los Angeles. I want to get your opinion on whether you believe -- how you believe this SUSMP program will apply to actually individual homeowners within the County of Los Angeles for a moment.

Let me give you a hypothetical. Under the Los Angeles SUSMP program as proposed and adopted by the Regional Board, if I owned a 25-year-old home in what is called an environmentally sensitive area and needed a permit for a new roof, would I have to comply with the numerical mitigation requirement of .75 inches of rainfall, captured and retrieved?

A. I can't answer --

MR. FLEISCHLI: Can I object as well?

MR. MONTEVIDEO: I have very little time.

MR. FLEISCHLI: I understand that, but this is again layer upon layer of definitions. Obviously Dr. Horner is here to talk about the technical expertise, not the definitions in the SUSMP of -- I'm not so worried about environmentally sensitive areas, but redevelopment or rooftop, is that 50 percent of a change of a project that would constitute --

MR. MONTEVIDEO: If it's a hypothetical that he doesn't understand, I'd be more than glad to fill in any details.

Q. Dr. Horner, again I have a 25-year-old home. I live in Los Angeles County. This is a hypothetical. I want to put in a new roof. I live in an area that's classified as an environmentally sensitive area and I need to get a permit to put on my new roof.

Do I have to comply with the .75 numerical design standard?

A. I have to take your word, first of all, that you would be subject to a control. I don't know that. I told you I don't know that.

Q. So in terms of the breadth of the application of the Los Angeles SUSMP program, you don't technically have an opinion in general or you don't have an opinion with respect to this particular hypo?

A. Technically do I have an opinion or do -- I say -- I'm just unwilling to answer a hypothetical question that I'm not sure is based on a provision you actually have to comply with. It may be. It may not be.

Q. I'm asking you that question. You don't know one way or another.

A. I don't know one way or the other.

Q. Very good. Let me give you another hypothetical.

MR. FLEISCHLI: Obviously it's a legal determination.

CHAIRMAN BAGGETT: Sustained. Continue.

Q. BY MR. MONTEVIDEO: If I remodel the interior of my home, let's assume for the sake of discussion that I have a 2,000 square foot home on a 5,000 square foot lot. I'm remodeling the interior of my home, and let's assume for the sake of discussion, for the purposes of my hypothetical, that that constitutes redevelopment if I affect a thousand square feet or more of the interior of my home.

Now, the question is I have a 5,000 square foot lot. I have a 2,000 square foot home. Most of it is frankly hardscape and flows to the street. How would one go about trying to comply with the numerical design standard of .75 inches of rain?

MR. FLEISCHLI: From a technical standpoint --

R0073686

if I might object, is that a technical question or a legal question?

MR. MONTEVIDEO: I asked him how would one go about complying with the .75 standard.

THE WITNESS: I'll refer you to --

MR. HELPERIN: I'll have to object on relevance grounds. The case that a home meeting the characteristics Mr. Montevideo has just described would not indeed constitute redevelopment. The changes he's talking about would not constitute redevelopment under the SUSMP. How one would go about determining how the SUSMP would apply is completely irrelevant and creates a situation in which we're trying to define how we comply with --

MR. MONTEVIDEO: Mr. Chair, I asked him to assume all that. I'm just trying to find out --

CHAIRMAN BAGGETT: I'm asking if you're asking his technical opinion or his legal opinion.

MR. MONTEVIDEO: Technical opinion.

Q. How would one comply with the SUSMP?

A. I'll refer you to three people -- it's one of your local groups. They outfitted a house in south central L.A. with a very similar situation as you describe. Relatively small house, relatively small yard.

Q. Is this the article you were talking about?

A. I saw it in a conference presentation. I didn't see the article. It does look like the house.

Q. Please proceed.

R0073687

A. I said I would refer you to the creative techniques that they used in that particular situation which includes cisterns, a roof redesign, yard storage of run-off, reduction of impervious area, quite a comprehensive small scale application, very impressive.
Q. But a set of creative techniques nonetheless; correct?
A. Well, nothing that's beyond technical realm. People have used cisterns for thousands of years.
Q. Let's talk about cisterns.
A. We've just forgotten how to talk about them.
Q. This article shows us --
MR. LEON: Mr. Chairman, sort of a point of order. In all fairness, I have some questions that I would like to ask Dr. Horner. I see that the hour is getting late. I don't know how far Mr. Montevideo is going to go.
CHAIRMAN BAGGETT: One more minute. One more minute and let the other parties.
MR. MONTEVIDEO: Yes.
Q. Cisterns have been in place for a long time. This article talks about the cost of that cistern. If we can just move it down to the bottom of the page a little more, cost if it were being mass produced by a manufacturer, the cost of that cistern being $10,000 for this home. Is that 3,600 gallons about right?
A. I have no idea.
Q. Do you have any idea --

A. It sounds awfully high but --
Q. Pardon me?
A. It sounds awfully high.
Q. This is a study that was done in Los Angeles by the Tree People, in quotes, and this is again in the administrative record. It quotes the cost of that cistern being $10,000 assuming it were mass produced. So you don't have an opinion --
A. I don't have an opinion. I can read it where it says that, but I don't have an opinion on that.
CHAIRMAN BAGGETT: You have 25 seconds.
Q. BY MR. MONTEVIDEO: Dr. Horner, have you looked at the impacts of the L.A. SUSMP program on affordable housing at all?
A. No.
Q. You're familiar with San Gabriel Valley?
A. Oh, driving through the freeway.
Q. Have you looked at the impacts of this program on the water quality throughout the San Gabriel Valley?
A. No.
MR. MONTEVIDEO: Very good. Thank you.
CHAIRMAN BAGGETT: Thank you. You've got just a couple minutes.
The petitioner first and then have the respondent. The other petitioner first and then the respondent. You can keep your questions brief and we'll forego redirect.

CROSS-EXAMINATION

BY MR. WELCH:

Q. Dr. Horner, I'm Lyman Welch on behalf of the Western States Petroleum Association. I'll keep my questions brief and direct you to the testimony you gave about the gas stations and potential treatment mechanisms.

You mentioned sand filters and compost filters --

A. Yes.

Q. -- as a potential treatment mechanism that could be used for gas stations.

A. Yes.

Q. That would require the construction of a fairly large underground vault; is that correct?

A. It would require an underground vault. Fairly large is a relative term. Its size is dependent on the drainage area that discharges to it.

Q. The use of both a sand filter and compost filter would require an underground vault?

A. That's correct.

Q. And if gasoline or other petroleum products happened to be spilled at a gas station and you had a sand filter or compost filter in place, that would result in the product flowing into this underground vault and contaminating the sand or compost material?

A. But both of these filters have a presedimentation chamber in which there would be considerable ability to catch a spill, and it may or may not depending on the medium, depending on whether it does so by being pushed along by a high flow, run-off, stormwater run-off flow at the same time.

Q. You would agree, though, that the product would enter the underground vault?

A. Yes. I think that would be one of the eminent uses. It would be a line of defense against an accidental spill.

Q. Wouldn't you also agree it would be a risk of explosive gases building up in the underground vault?

A. I think that's always a risk at a gas station.

Q. This would be an additional risk in the underground vault?

A. One presumes that it would not be allowed to remain there any time, that it would be gotten out. We presume maintenance. People are not going to ignore these occurrences.

Q. You mentioned Mr. Stenstrom's work on insert filters --

A. Yes.

Q. -- at UCLA.

A. Yes.

Q. And these are testing of insert filters that Mr. Stenstrom is doing in the laboratory at UCLA?

A. Yes.

Q. He hasn't done any testing of the practicability of using one of these insert filters at a gas station, has he?

A. I don't think he's out on the street, so to speak, yet. These are relatively recent inventions and getting their first tests. In fact, their first tests were last year and I don't know what his plans are, but like with any other product development it's in an early stage but moving along. Certainly he would go there.

Q. So it's fair to say that the usability of these insert filters is still in the testing stage.

A. These particular ones. There have been insert filters around for a number of years and there are proved versions, and I characterize them as soon to come along on the market with improved performance capability.

Q. It would be fair to say the older version of the insert filters didn't work well because of the clogging problems?

A. There are certainly instances of that and those instances could be cut way down with regular maintenance attention such as could come at a place with a regular attendant. A lot of the applications were not in those places.

Q. Are you familiar with the November 1999 study that the City of Sacramento did on insert filters?

A. No, I haven't seen that one.

MR. WELCH: Thank you.

I have nothing further at this time.

FURTHER EXAMINATION

BY BOARD MEMBER BROWN:

Q. On your BMPs that you're suggesting here, knowing that engineers like to do economic analysis, have you had economic analysis on alternatives to address this issue either on a regional basis or individual or both?

A. I have not done economic studies myself. I'm aware of the economic analyses that have been put together, watershed protections work, that I'm on their editorial board, but I have not done economic studies myself.

BOARD MEMBER BROWN: Thank you.

CHAIRMAN BAGGETT: We're running very tight on time.

MR. LEON: Thank you, Chairman Baggett.

CROSS-EXAMINATION

BY MR. LEON:

Q. Mr. Horner, thank you for your patience. My name is Jorge Leon. I'm the Regional Board's attorney. Just a couple of questions.

Were you involved in the development of the SUSMP program with the Regional Board?

A. I was not directly involved with it. I was involved with the settlement with Los Angeles County.

Q. That was the county program?

A. Yes.

Q. Thank you. Are you familiar with the Florida stormwater control program?

A. To some degree.

Q. Do you have an opinion as to whether their program is effective, working or not?

A. Florida has a reputation of being one of the top programs in the country, certainly probably in the top three without much argument.

Q. There was an article on the slide a few moments ago, if we could have that up real quickly. We don't need it.

You recall the slide that was up there about the article and the program that was developed?

A. Yes.

Q. Sort of an innovative program. Do you know what kind of a storm that was set for, the number of years? Was it 133 years?

A. I'm sorry. I couldn't confirm that. I wish I could.

MR. LEON: Thank you. That's all the questions I have. Thank you.

CHAIRMAN BAGGETT: I understand there's a time issue here, so we will forego the redirect or recross unless you want to stay longer.

THE WITNESS: No, I'm afraid I can't. Thank you very much.

CHAIRMAN BAGGETT: With that, we have one other witness, Margaret Clark.

MARGARET CLARK,

having been previously sworn, testified as follows:

STATEMENT OF MARGARET CLARK

MS. CLARK: My name is Margaret Clark and I'm the Mayor of Rosemead. I appreciate your taking my testimony. I have a memorial service this afternoon.

I am also on, and have been for eight years, the San Gabriel Basin Water Quality Authority which is overseeing the groundwater cleanup of (inaudible) in the San Gabriel basin, and as such I'm very concerned about this issue. I'm also a board member of the Los Angeles San Gabriel River Water Shed Council, and as such I do share the goals of the SUSMP program in the sense of reducing contaminants to the surface waters. I'm interested in conserving the water for the San Gabriel basin for which 80 percent of the needs are provided from local sources and I'm also interested in possibly reducing the size of future storm drain needs, but I do have some very serious concerns about this program from an environmental standpoint.

I am testifying today on behalf of the petitioners to address the problems created by the Regional Board's failure to comply with either the letter or the spirit of the California Environmental Quality Act.

Our lawyers will provide you with the legal arguments as to why the Regional Board should have complied with CEQA, but I want to give you factual reasons why the Regional Board and all the environmental groups here should respect potential significant adverse impacts on the environment that may be created by the Regional Board's SUSMP.

In addition to the requirements of CEQA, the permit itself gives the discretion to the permittees to consider other environmental mandates. As you see the first paragraph, consideration shall be given to the type of development and the potential for stormwater pollution when determining the applicability of BMPs. Cost-effectiveness, ease of maintenance and consistency with other environmental mandates may also be considered.

These permittees must be permitted to exercise that discretion and to consider other environmental mandates and specifically to consider the full potential of adverse impacts from what the Regional Board is trying to mandate.

In addition, consistent with CEQA, other available alternatives to address these issues must be considered at the beginning of the process other than the option that has been forced on everyone by the Regional Board. Other alternatives must be considered before we create another environmental disaster such as what occurred with the use of MTBE to preserve our air at the expense of our water quality. Please let us learn from this and other failed environmental policies.

First, the evidence that is in the record before you shows that the Regional Board has not considered the potential of vector control problems, including specifically mosquito and rat problems and other infestation problems that may arise from having standing water with sludge and sediment existing for extended periods of time. We have a letter from the greater Los Angeles vector control district that has already expressed reservations about the path that the Regional Board is requesting that we embark on.

This is in regard to the study they're doing with Caltrans on the pilot project for the best management practices.

This letter says, "We are finding that most of the studies reinforced man-made water retention BMP devices produce mosquitoes. Left unmanaged, we believe the natural 'infiltration devices' will also contribute to mosquito problems. Unquestionably there is a potentially serious mosquito nuisance and public health consequence associated with broad establishment and implementation of these devices, and that deeply concerns the mosquito abatement district. Therefore, the abatement district is willing to participate and support any manner or action that seeks to prevent local and regional development and installation of such devices that contribute to the production of mosquitoes and/or other public health vectors."

We need to look at the environmental impact before we move forward with this or any other similar project. We also need to consider the groundwater impacts from the accumulation of pesticides in the concentrated area.

Next we need to consider what we're doing to our communities, particularly to our economically disadvantaged communities and how this program may disparitly impact smaller, higher density developments. You will hear how we will lose affordable housing if this program is implemented and the Regional Board's failure to consider this impact.

What we haven't heard and the Regional Board hasn't analyzed is the potential adverse health effects to these communities from creating large retention basins in the midst of a multi-unit project. Where is the environmental justice in all this? We need to look at our communities who are bearing the brunt. Aren't we asking these lower income communities to bear the larger brunt of the solution in comparison to others? Please let's consider this impact before we move forward.

And the other aspect of this problem, of the development, is what are we doing to our ability to redevelop the areas in our inner cities? Many of our cities represented here today are built-out, and yet we are being asked to provide affordable housing within our inner cities. Doesn't this really lead to urban sprawl? If we cannot afford to develop in the inner cities, it will lead to development in the green areas, and that is exactly what we as environmentally concerned citizens are trying to prevent. And it would certainly inhibit the new wave of smart growth. So we need to look at that issue.

Third is the issue of our groundwater quality. I know that there are certain exemptions or waivers in what the Regional Board is proposing, but how closely has the Regional Board analyzed this problem and particularly how long will it take before there is such a concentration of pollutants in a particular infiltration basin before these pollutants reach our groundwater? In effect, are we making the same mistakes we made with MTBE where we traded off water quality for air quality? Are we trading our groundwater quality for surface water quality?

I was very involved in the MTBE issue about four years ago when we were on the various city and environmental committees that I was on, and I remember asking the Air Resources Board coming to our committee and providing testimony that this was -- we had to clean up the air and it would not get into the groundwater because all they had to do was make sure that all the underground storage tanks were double lined and all the pipelines. I asked the question at the time, even if could you ensure that, which is very unlikely, I said what about a natural disaster such as an earthquake? And of course, they didn't listen and now we have a very, very serious ground water contamination problem. As you know, all the wells in Santa Monica City were shut down because of MTBE and that's extremely expensive to clean it up once it gets in there.

So I'm very passionate about this issue being on the San Gabriel Basin Water Quality Authority. Millions of dollars go to the cleanup, and let's look at it before it happens. I don't want to come here four years from now and say "I told you so." That doesn't help. Let's look at it before it happens, please.

Finally, has there been any consideration of available alternatives such as a regional approach to addressing these issues rather than addressing these issues on a site-by-site or project-by-project basis? And as Mr. Brown pointed out, he asked the question, a very good question. Are there more effective ways to do it on a regional basis?

We as cities are not opposed to spending the money to solve this problem. We acknowledge there's a problem, but if there's a better way to do it on a regional basis, more efficient, please let's spend the money that way.

As we have over time with our other environmental policies and statutes such as CEQA and the endangered species or even simply our own experience with sewage systems versus our septic tanks, in many cases it makes sense to solve these problems on a regional basis rather than on a site-by-site or project-by-project basis. This is one of those occasions.

We ask the State Board to consider all

appropriate alternatives to avoid the potential significant adverse impacts that have not been fully considered by the Regional Board before we embark upon a potentially disastrous environmental path. If we are truly concerned about our environment, we won't and we can't just do something; rather we must do something that is right for our environment.

Thank you very much.

CHAIRMAN BAGGETT: Petitioner, do you have any questions for your witness?

MR. MONTEVIDEO: No, not at this time.

CHAIRMAN BAGGETT: Is there any cross-examination?

EXAMINATION

BY BOARD MEMBER BROWN:

Q. Ms. Clark, has there been efforts with the water control districts in counties to address this problem on a local basis that you have been satisfied with, at least pointed in the right direction or should be?

A. I really don't know. I do know that at our SCAG environment committee we've had testimony from the Orange County District that is implementing a regional -- diverting the stormwater into the sewer treatment system. And if that's feasible, in my opinion that's much more cost-effective to know that the water is going to be treated before it's discharged.

Q. It might be worth your while, I'm sure you're familiar with it or others are, with what Fresno is doing in this issue.

A. That sounded very interesting, what you said. I was very interested in that.

Q. I forget the director's name. Doug Harrison. He has done just an outstanding job addressing this issue on a regional basis and it might be worth your time and others to visit.

A. I would love to study that. Maybe the SCAG people here could get that information for us. Appreciate that.

CHAIRMAN BAGGETT: Any questions from Board Members or staff?

CROSS-EXAMINATION

BY MR. HELPERIN:

Q. Good morning, Ms. Clark. You testified a lot today about the risks posed by the incorporation of these best management practices into various types of development.

Do you have a background in engineering?

A. No, I don't. My husband is an engineer and I have two daughters. You see, this is --

Q. One of my best friends is an engineer.

A. Can I make this point, though, that that's the very reason when the MTBE issue came up. All the engineers had it all right. We're going to put this oxygenate in and methyl tertiary butyl ether won't hurt anything and this is going to be wonderful. They didn't listen to the practical questions from people like me in the public. What's it going to do to the groundwater?

Q. You've also testified about the biological concerns with respect to mosquito breeding. Do you have a degree in biology?

A. No, I don't.

Q. Are you aware there have been studies done all over the country on mosquito breeding best management practices?

A. I would assume there were.

Q. Are you aware of the results of those studies?

A. And I hope the vector control district, I would assume they know these studies and they're not going to go off on a limb.

Q. Are you aware that there has been no problem with adult biting mosquitoes in any place in the country where these types of best management practices have been adopted?

A. I'm not aware of that but I know encephalitis is a very serious disease and I have a lot of grandchildren I'm concerned about.

Q. I would not argue that point. Are you aware that despite all the studies that have shown some breeding within the BMPs in the Los Angeles area there has been no evidence of adult biting mosquitoes in the areas of the BMPs?

A. I am not. Was it done in the summertime?

Q. Yes, it was.

MR. MONTEVIDEO: If I could please. May I raise an objection? Her last question raises a good point. We need some foundation for these questions. You're making statements where there's no foundation anywhere in the record. If you say we have records or documentation to show her that supports what you're saying, but beyond that there's no foundation for the questions.

CHAIRMAN BAGGETT: I'll sustain the objection. Lay some foundation.

MR. HELPERIN: I have been and will be testifying as a fact witness throughout this testimony. I have been working on BMP-related matters for the last two years, and I don't have with me today the studies on mosquito breeding, but I am personally aware of some of those studies and am personally aware of the results of some of those studies. But I will limit my questions to only those things of which I am personally aware.

MR. MONTEVIDEO: Mr. Chair, again, I think the issue here is whether there's a foundation in the record. It's not a question of his personal knowledge.

MR. HELPERIN: Personal testimony is an admissible form of evidence, Mr. Chair.

MR. MONTEVIDEO: But I thought this was Ms. Clark's testimony.

CHAIRMAN BAGGETT: He is a witness. Counsel, the challenge we have here is we've taken two witnesses out of order. In retrospect, it was not the best thing to do. We've done it to accommodate both parties in this case, and it is very challenging considering there have been no statements, none of the rest of the case-in-chief. We're throwing on both sides and it's a challenge.

If you could, I think it's things we're going to get to later when you get to the full case-in-chief. You don't have to make that --

MR. HELPERIN: Certainly. I wanted to address the mosquito issue because Ms. Clark focused on it and I wanted to at least bring up some of the --

CHAIRMAN BAGGETT: You'll have that opportunity later.

MR. HELPERIN: Just one final question on that issue, and if it's not acceptable, that's fine.

Q. Are you aware of mosquito-eating fish? Do you know there is such a thing?

A. Oh, yes.

Q. Do you know those are regularly put into retention ponds that have standing water in order to prevent the breeding of mosquitoes?

A. I would assume so, but I don't know if you can do that who's going to be monitoring that on each retention pond.

Q. You are aware that's a regular component of the program to prevent mosquito breeding.

A. Yes. Sure.

Q. Another question. You had testified earlier with respect to the permit and the language of the permit and that it makes provision for review of other environmental issues; is that correct? This is a direct copy of a section of the permit, and I believe the section you quoted is the second underlined section where it says the cost-effectiveness, ease of maintenance and consistency with other environmental mandates may also be considered; is that correct? Do you see that's under Section B?

A. Yes.

Q. Which is the list of recommended BMPs which is separate from Section C, which is the one that contains the text about the SUSMP?

A. Say that again.

Q. The permit mandates a lot of programs, and within the development planning program the permit mandates multiple programs be developed by the permittees of the Regional Board. One of the programs that the permittees and the Regional Board have to develop is the development planning program. Subsequently to that they have to develop a list of BMPs, recommended BMPs, which the Regional Board then approves. Subsequently to that they adopt a SUSMP.

The text that you quoted is in the second program. It's relevant to the development of the list of BMPs and it should have been and was taken into consideration at that time. It's not relevant to the --

CHAIRMAN BAGGETT: What is the question?

MR. HELPERIN: I just wanted to know if she was aware of this distinction in the permit.

CHAIRMAN BAGGETT: Okay.

MR. HELPERIN: Thank you.

Q. You're from the City of Rosemead; is that right?

A. Yes.

Q. Has the City of Rosemead implemented continuous deflection systems? It's a BMP for the control of stormwater pollution.

A. I don't know.

Q. Do you know if the City of Rosemead has implemented any retention basins?

A. We are considering it on one of our projects that is coming in.

Q. Has the City of Rosemead implemented any of the structural BMPs that are at issue here today on a regular basis throughout the city?

A. We are doing the porous pavement on our senior housing project at my request.

Q. So you actually have no personal experience with the implementation of any of the BMPs.

A. Well, they haven't been required and we have done some, but not the ones that we want to make sure they're helpful to the environment.

Q. So your concerns here are speculative, essentially.

MR. MONTEVIDEO: Objection. Misstates her prior testimony. Misstates her answers.

CHAIRMAN BAGGETT: Sustained. Rephrase.

Q. BY MR. HELPERIN: So you have no personal experience with any of the problematic, potentially problematic issues that you've raised here today.

A. Oh, yes. Let me tell you about a treatment plant that the San Gabriel Basin Water Quality Authority is implementing in the La Puente County Valley project.

Q. What kind of treatment plant?

A. It's (inaudible) chlorite. It's the first in the nation.

Q. Is this a structural stormwater control?

A. It is not structural stormwater control. What I'm going to tell you is what the Department of Health Services is requiring of the water producers.

Q. I appreciate that, Ms. Clark. We're actually here to talk about structural stormwater controls.

A. And that's exactly what they did with MTBE, sir. They were concerned with air quality and they weren't with groundwater.

CHAIRMAN BAGGETT: Please continue.

THE WITNESS: On my example? They're requiring the water producer to identify all potential chemical compounds that might be found in the groundwater that might contaminate -- that might reach the wells in the future. And what we are asking is why isn't the Regional Board not even identifying the fate of reasonably expected pollutants? That should be required to be performed before you implement these things, and I'm very concerned about this.

Even the table, if I might, I didn't understand all of it from your other witness, had 80 percent, 70 percent, 60 percent. What about the 20 percent? What about the 40 percent?

Q. BY MR. HELPERIN: Those percentages would potentially get into the water as the hundred percent.

A. That concerns me. If you accumulate that, you've got a problem.

Q. Right now it's at 100 percent.

CHAIRMAN BAGGETT: Could we --

THE WITNESS: It's going to the surface waters. It's not going to the groundwater.

CHAIRMAN BAGGETT: Any more questions?

MR. HELPERIN: A couple more questions. I apologize.

Q. The Orange County program that you mentioned, are you aware that that program deals only with dry weather run-off?

A. Yes. Bob Jorrell gave us a --

Q. And just one last question. Has there been any administrative civil liability issued against the City of Rosemead by the Regional Water Board?

A. No.

MR. MONTEVIDEO: I object. I'm not sure she understands the question, Counsel. She doesn't have a law degree.

Q. BY MR. HELPERIN: Do you know if there have been any fines issued or draft fines issued against the City of Rosemead by the Regional Water Quality Board?

A. Not to my knowledge.

MR. HELPERIN: Thank you.

CHAIRMAN BAGGETT: Any other parties wish cross-examination?

If not, then I'll ask my colleagues if we want to take a break now. So we will break one hour for lunch, come back at 1:00 and begin the policy statements. We will be in recess.

(Lunch recess taken)

CHAIRMAN BAGGETT: Let's go back into session.

When we recessed was the public policy comments. Again under public policy there's no cross-examination of public policy commentaries. They are not sworn witnesses.

We have a number of blue cards. We will limit to three minutes unless there's questions from the Board Members themselves. With that, we'll just go down in the order.

We have Gilbert Canizales. When you come up, if you could please state your name for the record and if you have a business card you want to give the court reporter.

MR. CANIZALES: I actually had some information I wanted, letters, copies.

CHAIRMAN BAGGETT: That's fine.

MR. CANIZALES: My name is Gilbert Canizales, and I'm here on behalf of the State Senator, Betty Karnette. In the interest of time, I'll just read a portion of the letter to convey the Senator's view.

"Dear Chairman, I am writing to respectfully urge the State Water Resource Control Board to grant the petition appealing the Los Angeles County Standard Urban Stormwater Mitigation Plan at your meeting today and to order that the Regional Water Control Board develop a comprehensive plan in cooperation with the affected cities, businesses and builders. I make this request on behalf of 33 cities in Los Angeles County and the affected businesses and industries that are appealing the Regional Board plan.

"Let me say up front that I am not opposed to stormwater run-off treatment solutions that are targeted, cost-effective and have some demonstrated assurance of results. Unfortunately, the current SUSMP proposal does not meet those requirements," and as was mentioned earlier by, I believe, the Mayor of Rosemead and others who have testified here today, there's a list here on page 1 and 2 of the number of ways that this proposal can be improved.

And finally again, on behalf of Senator Karnette, I strongly urge the State Water Resources Control Board to remand the SUSMP to the Regional Board and to order hearings and workshops on the development of equitable, scientifically based plans to control stormwater run-off.

Thank you.

CHAIRMAN BAGGETT: Thank you. Any questions? Thank you for your comments. Thank you.

Next we have Alexis Strauss, United States Environmental Protection Agency. Is she back? I know she was here. We can go to Mark Pisano and Colin Lennard.

MR. PISANO: My name is Mark Pisano. I'm the Executive Director of the Southern California Association of Governments, and I have with me general counsel who would be available for questions should there be any. I also have copies of my testimony for the Board Members.

SCAG recognizes that water is a fundamental element of this region's future prosperity. As such, water quality is a key focus of SCAG's current planning efforts. We are working with the non-profit organization Tree People to incorporate stormwater best management practices into our livable community's program guidance. We're also participating with Caltrans statewide, but also within our regional effort to identify cost-effective solutions that policy members can support.

We're supporting the Malibu Creek Watershed effort and augmenting our regional database and stand ready to lend expertise to watershed planning efforts. And finally, we're committed to reviving our areawide best management policy, 208. The Clean Water Act provides for 208 as the areawide stormwater planning process, and a recent law article pointed out that 208 was intended as the main tool to deal with non-point source problems and also with stormwater, and as such it would address many of the key issues now being addressed in this hearing and in the debate on TMDLs.

SCAG is the agency designated to run this process in southern California. In 1979, we produced an areawide waste water treatment plan with the participation of numerous elected officials and advisory panels, and even though this plan is now out-of-date, a new plan is in the process of being developed. We're in the stages of working with other -- with many of the agencies within our region to update our plan.

Furthermore, Section 208 can provide more enforcement certainty to the Regional Board since there's a requirement in federal statute that all permits issued in our region must be consistent with this plan.

Please understand that SCAG's member jurisdictions recognize the value of clean water to the region, its economic benefits and environmental benefits, and we stand ready to achieve those goals and to protect those resources, but the means of achieving it are fraught with uncertainty and the Regional Board's approach asks jurisdictions with limited funds to take financial and political risks.

The problem as far-reaching and serious as water quality should not be addressed in a veritable vacuum of knowledge or (inaudible) effectiveness of solutions. The best management practices called for in the stormwater --

in the Urban Stormwater Mitigation Plan are of unknown effectiveness for many pollutants. The Regional Board's proposal is fraught by a lack of knowledge and resources and even the nature of pollutants in our region's non-point source run-off.

The Section 208 process will provide the scientific data among participants that will allow them to identify those BMPs that are effective in controlling pollutants. As a key participant, the Regional Board can share much needed analysis of waste loads and targets that need to be achieved in order to improve water quality.

I'm not going to go through all the issues on cost because I see my time is coming to a close, but I want to note that we're not going to solve this problem unless we look at it inter-jurisdictionally and unless we look at it within watersheds, unless we look at it among governmental institutions and pull together a coordinated and cost-effectiveness program.

There's too many issues unknown, there's too many debates and just too much differences in order for us to be successful. I'm free to address any questions in my testimony.

BOARD MEMBER BROWN: Do you have any ideas of how enforcement occurred in the working with SCAG 208?

MR. PISANO: Yes. Board Member Brown, there's a provision in the statute that says that permits be consistent with 208. 208 is designed -- and let me note that I was in EPA, worked on the legislation and administered that program nationally before I came to my position. It was designed to provide the kind of input, the kinds of analysis and to resolve the differences so that permit conditions can, in fact, be explicitly written and so that enforcement can pursue and there's both permit enforcement and Porter-Cologne enforcement.

If we follow the provisions that are laid out in statute, we can put together, I am convinced, a cost-effective and enforceable program, and one in fact we can get achieved consensus and make all the various trade-offs that we have to make.

MR. LENNARD: If I may just add to that as well. Under the 208, obviously you've got a bottoms-up approach. What we're dealing with here is top-down, and if you look at the very reasons for the 208, it was designed being a bottoms-up approach to water quality. In addition, 208 is very specific with respect to economics and environmental consequences.

CHAIRMAN BAGGETT: State your name.

MR. LENNARD: My name is Colin Lennard. I'm General Counsel.

BOARD MEMBER FORSTER: I'm curious. When L.A. had their hearing on their permit in January, there was a proposed permit on the street and then the permit was modified during the hearing. Were you supportive of the original proposal before it was modified at the January meeting?

MR. PISANO: We did not take a formal position in favor of or opposed to the permit. What we testified at that hearing was the approach that was being taken, it did not have the necessary consultation nor did it follow the kinds of processes that would lead to enforceable permit actions.

We're neither opposed to nor are we supportive of across-the-board numerical limitations. In some areas they may work. In other areas they may not. What we want and what we testified at that hearing to the effect of is let's carry out what was intended under federal statute. Let's carry out a mutually coordinated program so that we can be effective and our elected officials can go back to their community and say they achieved necessary environmental goals but at the same time attained the community objective.

BOARD MEMBER BROWN: What are you now proposing the State Board do?

MR. PISANO: What we did in our initial hearing and what we're doing today is that -- is that the State Board be a co-participant with us in revision to the 208 plan revision. We are working with the POTWs and working with our members and working with Caltrans to develop an intergovernmental funding program and implementation program. And I outlined the rudimentary elements in my testimony today.

Specifically I am proposing that this Board direct as policy for this state that its Regional

R0073716

Boards within our region -- we have five Regional Boards within our region -- that those Boards work with us in a coordinated effort to develop a 208 plan. We can live with the schedules that you're laying out in your permit processes, but what we're asking for is that the intended intergovernmental decision making framework that is in statute be able to follow in our region.

CHAIRMAN BAGGETT: Thank you. Next we have Manuel Acamazon, Irwindale, followed by Councilmember Bruce Barnes from the City of Cerritos.

MR. ACAMAZON: Good afternoon. My name is Manuel Acamazon. I'm the Mayor Pro Tem for the City of Irwindale. Thank you for the opportunity.

We do have some concerns. As a representative of many people, I'm not the only councilperson that will speak to you this afternoon. I normally don't like to read what I like to say, but for purposes of accuracy I would like to read my statement. Irwindale opposes the SUSMP by saying that it is an unreasonable cost, costly and its benefits of improving water quality is questionable. The City of Irwindale is a developing community and like other cities it is very, very interested in commercial development and housing development. The City is planning to reclaim its defunct mines for commercial use and build low to moderate income housing for its growing population.

The SUSMP proposed by the Regional Board frustrates these plans. The City of Irwindale is not like other cities like Santa Monica. As a city they don't have problems to get businesses. Nevertheless, Irwindale has to work hard to attract builders to develop in the city by offering incentives.

The SUSMPs offered by the Regional Board would be a de-incentive. Of course City of Irwindale is also concerned about environmental issues, and I think nobody argues that. We do have environmental concerns. Nevertheless, our residents like going to the beach. We enjoy fishing and the surf. Our citizens also like to fish in clean waters. We certainly don't want to aid in any practice over which we cannot control -- that we can't control the threats to those beneficial things.

What bothers us, however, is the Regional Board's reason for requiring certain developers to put infiltration devices in every parking lot with 25 or more spaces. We understand these devices basically reduce oils, grease and metals from parking lots, but the Regional Board has not explained to us how oil, grease and metal from run-off sources (inaudible). We would like the Board to explain this to us in writing, and instead of generalization we would like specifics.

We know some things about urban run-off. We know that bacteria is mostly from sewage released and causes beach closures and causes illness to swimmers. We also know that decaying vegetation can contribute to high levels of bacteria, but this is something we in Irwindale can help fix.

For example, we are expanding (inaudible) of our catch basins. During dry periods the flat gates stay closed keeping out trash, pet droppings, leaves and grass clippings and other sources of bacteria and viruses. When it rains, the gates open up to a lot of run-off to enter the storm drains so it doesn't flood. We have already installed four of these devices in our city. We believe that these devices are more effective than the controls proposed by the Regional Board for new developments. Our devices reduce bacteria and viruses throughout the river and also keeping out other sources, but we have a hard time seeing what benefits would result from controls that reduce oil, grease and metals.

Also we understand that if these expensive devices are not properly used, they won't work. If Irwindale has spent its resources to follow the state and federal mandate, we at least deserve to know in specific terms, not generalizations, what we are getting ourself into.

That concludes my statement I would like to go on public record, but one other thing. Many of our cities, we're looking for funding in different areas. We have a project we want to work for some funding. This is going to put a damper on not only the people we're trying to help, we need more details from you, better results of what you're trying to accomplish so we as a people directly, the residents of our country, of our state, can make better decisions not based on one thing that you've come up with.

I know that a lot of things have become controversial. Nevertheless, we're not fighting environmental rights, which is good, but we also need to be balanced in the things we do and I think you need to consider that.

I thank you for your time and I hope that you come to a good conclusion that's best for the people. Thank you.

CHAIRMAN BAGGETT: Thank you. Councilmember Barra followed by Councilmember Shaw. Bruce Barra. If he's not here, you're next.

MS. SHAW: Good afternoon. I'm Marlene Shaw, Councilperson for the City of Compton, California, and the reason I was a little concerned some of the people just coming in, but basically you've heard all the technology, the details, the issues. You had expert witnesses this morning, Dr. Horner, his position and research.

I have to tell you that first I have not done that type of research, so I can only deal with what I know as a fact that affects my city and other cities across this nation, especially the State of California and Los Angeles County.

The City of Compton background is 112 years old, chartered in 1888. The population consists of about 51 percent black, 47 percent Latinos and I would say the 3 percent of others. Basically we are 10 square miles and we have over 100,000 people, so that would give us about 10,000 people per square mile. Being a city made up of black we are, naturally we have financial constraints. We do everything we can to try to make the lives of our citizens livable.

We are one of the highest taxed cities in Los Angeles County, if not the state of California. I often listen to my constituents who say that we pay more taxes than Beverly Hills. Given all this, to say the mandates you are requiring of us, we really cannot afford to pay for that as a city. We cannot raise our taxes. We cannot depend on the actual developers to do it because if it costs them too much to develop, they will not come into our city, and we do have a problem trying to bring developers to come into the city.

The plans that we have, like the performing arts center, we have plans that this will affect all of the development and businesses that we're planning for our city. Also, although we have over 10,000 people per square mile, our arena assessment requires us to have over 721 more housing. We have areas that we're trying to develop. We have brown fields we need to work with. They all need a corridor going right through our city at this particular time forcing a lot of different construction to look different places while we're going through these changes.

So I'm saying from the City of Compton, and I do not know if anyone has researched a city like the City of

Compton where you have the overcrowdedness, where if a person has an older house and has to put a roof on, if they're to meet the requirements that you have, then they won't be able to put the roof on because they won't be able to afford the catch basin or drain, whatever you're going to require in order for them to do that. They can't afford to paint the house because if they paint the house and the water goes into the storm drain, then we have to prepare to do different things.

Your gas stations, we have a lot of gas stations, a lot of fast foods in our city. We have a lot of those types of businesses that really and truly as a city, if we are to try to meet all your requirements, we cannot do that. If we don't do that you can fine us up to $25,000 a day. If you do that, then you can have the city because we can't afford that.

(Laughter)

MS. SHAW: It's almost time, so basically what I'm trying to talk about with the catch basins, somebody mentioned the fact well, do you understand that if you have a pool and the water is in there you can put this in and put that in, I don't know what they put in. Mosquito abatement, I understand that. A mosquito bit me last night.

(Laughter)

MS. SHAW: But basically what I'm asking for is an understanding. If you would just for a minute put yourselves as a policy person in the city like the City of Compton, facing those types of restrictions, trying to figure out how you're going to be able to even survive as a city, not being able to tax your people anymore, not having the revenues because there are no monies to go along with these mandates, not wanting to run our development out by the high cost.

I'm asking for consideration, even that the cities would have some type of control understanding and being able to make the determinations as to where we can do these different things and also an understanding as to what cities like the City of Compton where you have more cities like the City of Compton in this state will be able to work with you and try to meet your requirements.

I thank you very much for listening to me and actually for your understanding and consideration.

Thank you very much.

BOARD MEMBER BROWN: Has your council addressed the issue of how your city might in itself be concerned with the problems that we're facing here and how you control the run-off?

MS. SHAW: First thing, we've always wanted to make sure our storm drains are clean because when it rains and water comes up, we don't want it flooded, but also I was an environmentalist. I believe in clean air. I believe in drinking clean water. I'm a official person. I believe in OSHA. I believe in all these things.

I have with me today my person from -- our public director, Mr. Dante, and Mr. Ferrington, another Councilperson, is on the way, but because -- this morning I stayed because it's so important to us for this, our council. Some other things either Mr. Dante could answer. As a councilperson I say yes, we need this. I do know that things need to be put in place. I can't say oh, we've got the filters for every storm drain. I'm not going to tell you that because I really don't know, but I do know that we have approved projects that try to meet the mandates, but we also have to ask that you have some understanding and see that cities like the City of Compton to be able to work with you to try to meet the mandates and still be able to thrive as a city.

BOARD MEMBER FORSTER: I want you to know I taught school in Compton in 1965.

MS. SHAW: Oh, you did? Which school?

(Laughter)

BOARD MEMBER FORSTER: I can't remember.

(Laughter)

MS. SHAW: I'm very glad because we are very proud of our city, our school district and our college. Compton College used to be at the Compton High School (inaudible) facility. My mom moved into Compton in 1951 and we're still in the same place. It needs a new roof, too.

(Laughter)

CHAIRMAN BAGGETT: We've got Charles Sihler, City of Pomona, then Alexis Strauss.

MR. SIHLER: Good afternoon, Members of the Board. My name is Charles Sihler. I'm an engineer associated with the City of Pomona. I'm a former member of the L.A. County Executive Advisory Committee. I spent over 30 years in the water industry.

The SUSMP as issued would create an enormous financial burden for the City of Pomona. The City of Pomona, while one of the five largest communities in the Los Angeles County area, has less than half the general fund tax base of the other communities of its size. Over 60 percent of the population is minority and we have over half of our area that's been designated for low-moderate income.

While we subsequently have been built out, the development requirements would stifle homeowner, developer and redevelopment efforts within the city to try and build it up and bring it back to the (inaudible) of the past. While some may say that the communities are all being treated the same, in the eastern part of L.A. County we are the easternmost city. The adjacent communities of Chino, Chino Hills, Ontario and Montclair have no such restrictions as the SUSMP. This renders us as far as local development dollars way behind the power curve if we have to enforce it as posted.

While studies in other areas may have shown severe detriment to receiving waters from run-off, a seven-year study of the Los Angeles Long Beach Harbor area with regard to a non-NTBS issue showed the only contaminant noted to be fecal coliform. That was coming -- that level was the same as was coming out of the mountains, which meant animal waste.

We have over 800 catch basins within the city. If we were to make the modifications to meet the goals that are stated, you would subsequently kill all of the social-related programs, the senior, the youth, library services and park maintenance. The City and the citizens have done an outstanding part to clean the environment through common sense BMPs, enforcing and working with them. The SUSMP, as issued, reflects an extreme example of a government mandate, unfunded government mandate, on our community.

Based upon the data and testimony that I have heard and seen, over 60 percent of the county that does not drain into the Santa Monica Bay, the L.A. and San Gabriel River basin areas, is being colored by Santa Monica Bay data. I would ask you to review this and overturn the SUSMP as issued in favor of a consensus-based, CEQA-compliant plan.

Thank you for your consideration.

CHAIRMAN BAGGETT: Thank you.

Alexis Strauss followed by Jack Hazelrigg, Greater Los Angeles County UCD. Apologize.

MS. STRAUSS: Thank you. Thank you, Board Members. I'm Alexis Strauss, Environmental Protection Agency.

We believe the Board has a strong legal and factual basis as well as a compelling responsibility to adopt these requirements to control stormwater pollution which should come as no surprise. The petitioners, as well as the other municipalities subject to the permit, have been engaged with the Regional Board, EPA and others since 1990 regarding the L.A. County MSW permit. Ten years later I feel we have yet to realize the intent of the implementation of this very permit.

At issue here is but one of several reasonable and necessary implementation measures that the Regional Board believes, and we at EPA agree, is needed to reduce pollution from stormwater. We know the impacts of stormwater pollution in southern California have been very well documented, both public health impact and the economic impact of beaches polluted due to stormwater flows.

This hearing and the actions that we have been forging together is about toxics in toxic amounts, not about mosquitoes. This is about fish that are too contaminated to eat and beaches that are closed because they are too polluted for swimming, and the challenges for us all professionally regardless of the comments at the hearing is what we can best do to fix these problems.

These problems will continue to plague us unless the Regional Board can fulfill its appropriate regulatory and leadership role. The Standard Urban Stormwater Mitigation Plans provide a consistent and common-sense approach for the development of planning at the point in the process when pollution prevention requirements can most efficiently and cost-effectively be incorporated into a project. If this Regional Board requirement, which you have seen is already operational in several other states and municipalities, is not upheld, I believe it will cause worsening conditions, costly retrofits, and worst of all the piecemeal approach to stormwater (inaudible) of our municipalities.

The overall scheme for controlling stormwater pollution is best achieved through matching municipalities' land use authorities with the Regional Board's regulatory authorities so the cities will take increased responsibility to work with and not against the Regional Board in controlling the key sources of stormwater pollution.

We have a very long way to go to achieve our mutually held clean and safe water goals and the MS-4 permit is a vital tool. We are seeing high levels of non-compliance with the state's general construction stormwater permit, and we can ill afford to postpone the full implementation of this permit.

The Regional Board sponsored an exceptional level of outreach through workshops, meetings and solicitations of comments, and throughout the past year the staff and the Board Members have revised in response to those very comments. The Regional Board has emphasized that we must achieve efficient BMPs and giving flexibility in meeting the design standard.

Let's give this permit our full support and hope that we can realize its promise, less we have to turn instead to more restrictive and less flexible approaches. I think you may realize that we have to reissue this permit in a year and a half. (Inaudible) implementing the permit. This is no time to digress into alternative planning processes of 20 years past and no longer useful in our current implementation of the Clean Water Act. We have made hundreds of voluntary watersheds succeed in southern California, but we cannot succeed in our overall efforts if we cannot make major gains in stormwater pollution.

We've done what we need to do with the point sources. We have to make major gains with the non-point sources. So I would urge you that we have to (inaudible) to achieve compliance. I ask to you support our efforts at last to implement this vitally important plan.

Thank you.

CHAIRMAN BAGGETT: Any questions? I have a couple of you. You have a nationwide perspective, I assume, of what Maryland and Florida and other states have done. Is this out-of-step or more restrictive?

MS. STRAUSS: It doesn't appear to be more restrictive. It's a unique situation where we have 86 participating municipalities, and I think what we're missing in the discussion thus far is -- the majority of what we need to do is agreed upon and there are a few things that are points of tension. One of them is the

.75 precipitation. (Inaudible) trigger that, go further than that, and the Regional Board have been actually comparing that.

I think the overall package is a difficult one to compare elsewhere with other land use authorities. We have a highly urbanized area here that's highly built-out. There probably are places that Fresno -- the optimal situation that Fresno has devised. We don't necessarily have the same flexibility in land use in the urbanized land use basin. I think the mechanics here is typical of what we're seeing in other cities, and I personally, through the efforts of the California Stormwater Task Force, believe that the collective intention of the municipalities, the state agencies, and the other participants here to a level comparable to anywhere in the country. We just haven't gone as far as we need to to do it. We just haven't gotten that consistent commitment and partly because we have not implemented this permit yet and we're ten years down that road and about to reissue.

CHAIRMAN BAGGETT: In your written comments you talked about cost-effectiveness studies and analysis and cost analysis you've done on the MS-4. Is there anything -- have any of these proposed BMPs been analyzed?

MS. STRAUSS: I think that the Regional Board has gone through all of that in developing the last year's worth of submittals in the meetings that we participated in. I think where EPA took that a step further into something not relevant to today's discussion, which is the phase 2 stormwater program which is upon us as well and is referenced, we have a long way to go with phase 2. We have got to get phase 1 under our belt and running. I'm worried that we're not doing that. (Inaudible) Clean Water Act requirements under 403 in this situation and I would like us to succeed. I think we have most of the stuff and there's a little bit with some of the cities that we need to work past.

BOARD MEMBER BROWN: Ms. Strauss, you're right. The City of Fresno in that area did lend itself quite well to that overall broad-based solution. Of course we could always be hopeful that other areas would have some similar opportunities; maybe not the same, but opportunities for a regional approach as opposed to an individual approach.

My question is, you see that there might be opportunity for some compromise -- not compromise but maybe like a variance in the .75 as areas differ here. The importance for BMPs of types that are suitable, economically feasible and suitable, vary also with the problem in the areas you just mentioned with Fresno. The .75 seemed to be a contention with some of the cities in that's a lot of water to contain. I recognize some of the other cities across the country are .25 and greater.

Is there some way in your mind that we can leave some of that discretion for variances with the locals as opposed to state mandate?

MS. STRAUSS: I think that the documents I have read in preparation for the last year's worth of work on this permit, there was room that the Regional Board was offering in how those could be met. I don't have the expertise of the first speaker in knowing the proper design standard. I have no engineering expertise whatsoever, and I dare say given the enormity of the task before us and given that the cities had proposed .6, that we're rather close in where we're headed and perhaps whether it's .6 or .75 or 1.0 or .8, that this is what we're trying to define is the bare minimum of what we're doing to turn the corner on stormwater.

So in terms of a regional solution, the difficulty is not necessarily whether it's .75 or something else. The basic threshold of our governments is that land use planning authority that exists at the city level. It does not exist on a regional level, although maybe a hundred years from now it might. The basic authority for when I want to develop a multi-unit dwelling exists at the city level. They do not exist at the regional level and we have to match up what the cities do in their land use authority, regardless of where you choose to actually set that number or return it for comment.

BOARD MEMBER BROWN: The .6, since the cities did seem not to object to that as strenuously as the .75, what if the State Board set a .6 to say .75 and have some discretion to the local communities as to what that should be? I guess that's the question, if you think there's room for that consideration.

MS. STRAUSS: I think legally (inaudible) answer to the flexibility, but I think practically it would be fascinating to turn that question into an answer. If you have heavy rainfall here, here, a dry rainfall here, here and calculated what the differences including water traveling through storm drains to the beach, I don't know what that would mean in terms of mass loadings and terms of likelihood for pathogen and other impacts to beaches.

If we were sitting in the middle of what was happening in Huntington Beach, some of the cities wouldn't be making this argument. There was a phenomenal impact from that to a very small source. Once you know the answer to that, the volumes of the loadings themselves turn the corner on solving the problem. And even though individual cities can comment on them, their own development needs, we all share the desire, I even share it now that I live up north, a desire to be here in winter because it's so much warmer.

The beaches are the identity of southern California, and regardless of where we live in this basin, a lot of people go to the beach. More people go to the southern California beaches than the rest of the country combined. And if they're closed, we have a completely different set of problems and we know what it is to have those closed, and those restrictions are going to be with us for a long time.

CHAIRMAN BAGGETT: Thank you very much.

MR. HAZELRIGG: Yes. My name is Jack Hazelrigg. I'm the General Manager with the Greater Los Angeles Vector Control District. I have with me one of my colleagues, staff members, (inaudible). He's our scientific technical services director to answer any questions that you may have.

You've already seen presented to you earlier today testimony and evidence, a letter especially written by Mayor Clark that addressed some of our concerns regarding the SUSMP. Basically what we are requesting is that the Board simply consider the negative impact on public health as a consequence of SUSMP.

And what do I mean specifically? We're really concerned about the mosquitoes that could occur from an extensive application of the devices that are proposed in SUSMP. For example, we know that if these devices are indeed implemented, they will produce mosquitoes and produce quite a bit of mosquitoes. We know that because we're involved in the Caltrans pilot project right now in District 7 that has similar devices installed along the freeways. There's 14 of these devices now installed and several are being constructed, and each one of these devices except for one there is notable and abundant mosquito breeding occurring in each of these devices.

So what we're asking here is indeed on one hand you may be providing the benefit, but you also have to understand that there may be a detriment or consequence to the benefit and that will indeed be implementing throughout the County of Los Angeles a tremendous production of mosquitoes, possibly other vectors that we have not really involved studying at this point in time.

My district represents 34 cities and a partial area of the County of Los Angeles. Many of these cities are parties today at this hearing, some are not, but our perspective is one of public health.

CHAIRMAN BAGGETT: Questions?

BOARD MEMBER FORSTER: The devices that you're using for Caltrans, are they the -- what are they?

MR. HAZELRIGG: Every one of the devices that the expert witness was here and had on the overhead are being implemented in the Caltrans pilot project study right now.

BOARD MEMBER FORSTER: All?

MR. HAZELRIGG: Each and every one of those devices, yes.

BOARD MEMBER FORSTER: Are some less apt to be a mosquito breeding place than others?

MR. HAZELRIGG: The infiltration device is the one that has not proven to produce any mosquitoes at this point in time, but we did not have a lot of rainfall in the season to be able to assess some of the consequences of the filtration devices because normally what happens in those devices is the water will percolate and the water won't be present after three to five days. We need water standing for three to five days before we have any mosquito breeding.

It's not actually the devices. The devices in themselves are probably technically poorly designed in producing mosquitoes, but it's a consequence of not managing the devices that we're concerned with.

My experience in 25 years in mosquito control, environmental groups, we've dealt with a lot of environmental projects. On paper, they look fine. Unfortunately, there isn't generally money that's provided afterwards to support and manage the program in these projects and that's when we're faced with the really horrendous mosquito problems.

CHAIRMAN BAGGETT: Thank you. Andrea Harrington, City of Claremont, followed by Leanne Hamilton, City of Arcadia.

MS. HARRINGTON: My name is Andrea Harrington with the City of Claremont. We just wanted to show our support of the original system. We think the money would be better spent.

CHAIRMAN BAGGETT: Leanne Hamilton. Charles Redden from City of Covina.

MS. HAMILTON: I'm Leanne Hamilton with the City of Arcadia. While the City didn't prepare a separate statement, we support the efforts of the presenters for the petitioners in the cities that you're going to be hearing from and yourselves to find more reasonable solution to this problem.

I'd like to thank you, distinguished Board Members, for holding this hearing in such a timely fashion and coming to listen to our concerns about this problem and hopefully find a more workable solution.

Thank you.

MR. REDDEN: My name is Charles Redden. I'm with the City of Covina. On March 7th, 2000, the City Council of the City of Covina passed a resolution publicly supporting the petition to the State Water Board in contesting the action taken by the Regional Water Board regarding the reduction of the Standard Urban Stormwater Mitigation Plan.

There were two areas of concern that sparked this resolution. One, that there was no scientific proof that the retention treatment program works to reduce pollutants which impact streams, rivers and oceans. These new unverified standards will affect new and existing development with substantial initial and ongoing costs to the cities. Number two, that the established agreed-upon method to create the SUSMP was unilaterally done by the Regional Board in violation of the terms of the current NPDS permit.

These procedures were established for fair, effective ways to prevent stormwater pollution. The procedures were turned on their ear in a closed session of the Regional Board. The new SUSMP requirements should be reversed. It is not effective and it was not created properly.

Thank you.

CHAIRMAN BAGGETT: Ray Tahir, City of Montebello, followed by Heather Hoecherl.

MR. TAHIR: Good afternoon, ladies and gentlemen. My name is Ray Tahir and I represent cities of Montebello, Commerce and the City of Whittier. I'd like to kick things off by responding to Alexis Strauss's comments relative to the pathogen material.

I should point out these controls have done absolutely nothing to reduce the amount of bacteria or viruses that go into the storm drain system. (Inaudible) parking lots, more specifically to capture oil, grease and some unspecified metals. The problem is that no studies have been done. Local studies have been done documenting that oil, grease and certain metals have an impairing effect on (inaudible).

The other issue I would like to address is that of the .75 design standard. Cities don't have a problem with that, whether it's .75 or one inch or a half inch. The SUSMP adopted by the Regional Board compelled mandatory BMPs that infiltrate or treat run-off. That is the issue. More specifically, it's for any new development designed to have 25 or more parking spaces. With that in mind, I would like to read the statement prepared by -- actually, that I prepared on behalf of the cities that I represent. The cities see the SUSMP as (inaudible) economic development. The cities, however, do not understand how our rivers will benefit by requiring developers to put in these expensive devices. In other words, what is the justification? Is it because they have parking lots? Okay. Please tell us how parking lots are polluting rivers and oceans in Los Angeles County.

Also, tell us which metals are polluting these. Zinc? Lead? Copper? Particulate form of solid? Please tell us. Don't tell us about how these problems exist elsewhere in the United States. Tell us why they are a problem here in Los Angeles County, why are they a problem in the basin (inaudible) water, and please explain to us how much an increase will be reduced by these devices on thousands of miles of roads and highways that also receive oil, grease and metals from vehicles.

Are the cities going to have to put these expensive devices in storm drains too? If so, who is going to pay for these devices? Also, what about parking lots in existing developments? Are cities going to be required to implement these expensive devices as well?

The cities want to do their part in minimizing the amount of chemicals that go into the storm drains, but it cannot spend a lot of money to do so. Cities are not in the business of cleaning up the environment. For example, the South Coast Air Quality Management District, (inaudible) in Los Angeles County, not cities. We are not in that business.

As a local government, cities take care of local issues. We provide fire and police protection. Cities also provide seniors with various services including affordable housing. What cities want right now (inaudible) is affordable housing and job opportunities. That's the business cities are in.

If the state and federal government wants to help cities enforce mandates regarding environmental regulations, then it should provide the necessary financial wherewithal to do so. With that in mind, (inaudible) SUSMPs adopted in January and revert back to the SUSMPs the cities submitted back in July of 1999.

Thank you very much.

BOARD MEMBER FORSTER: Is it Mr. Tahir? What do you do with the City of Montebello? Are you a Councilperson?

MR. TAHIR: I'm a consultant.

BOARD MEMBER FORSTER: You're a consultant.

MR. TAHIR: They could not be in attendance today, so they authorized me to make this statement to you.

BOARD MEMBER FORSTER: Do you recognize that the L.A. area has a lot of impaired water bodies? You didn't seem to think that there were any.

MR. TAHIR: Yes, indeed, I'm aware of that. I should also tell you that the (inaudible) restoration project plan states with respect to oil and grease, it says that oil and grease mostly dissipates rapidly and are not considered problematic in Santa Monica Bay. I also took a look at the Los Angeles County 1998-99 stormwater report, and I couldn't see anything in this report that said that grease from new developments were problematic or had an impairing effect on receiving waters.

I also looked at the 303-D list for the Los Angeles basin. I couldn't see if grease was specified as being problematic. In some places, you're absolutely right, ma'am. What we need to do, though, is we need to do a receiving water study that identifies exactly what the pollution problems are for every reach of every receiving water of the basin. Once you do that, we'll be able to target these pollutants and then allocate or assign appropriate BMPs, structural or not structural, and deal with it. We've got to have a baseline first. We can't rely on studies elsewhere.

BOARD MEMBER BROWN: You just answered my question. The question is, what do you think should be done.

MR. TAHIR: The first thing that ought to be done is to assess the problem. How can you prescribe a solution without knowing exactly what the problem is? You can't, once again, rely on problems based on study data elsewhere. Florida, you have some very aggressive stormwater management program requirements relative to new developments. I believe there is an 80 percent solids reduction requirement. They need to do that because they're protecting a specific impaired (inaudible) beneficial uses, (inaudible) blue crabs. For

Florida, it's the Everglades. But those studies have to be done.

BOARD MEMBER BROWN: I got that from your statement. That's fine. I just want to make sure that I understood you that you feel the cities don't have any responsibility in water cleanup.

MR. TAHIR: Oh, no. Quite to the contrary, but cities -- and all of you know this. Cities have limited resources. The Councilman from the City of Irwindale mentioned earlier that Irwindale is putting in (inaudible) catch basins to catch trash and fecal matter. Well, fecal matter definitely is a source of pathogenic material; right? Pathogens responsible for beach closure. That's what cities want. That's something they can see, they can understand. They can't understand these problems that have not been defined yet, or grease has not been defined. And you can't talk about mitigating certain metals without specifying copper in particulate form or copper in solid form. That has to be done first. That's real critical.

If you don't do that, what this becomes really is a lot of cities have the impression this is really a political scene.

CHAIRMAN BAGGETT: Heather Hoecherl followed by Lynn Jacobs.

MS. HOECHERL: Good afternoon. My name is Heather Hoecherl and I would just like to read a prepared statement for Ellen Mackey who was unable to attend due to unexpected conflict.

I am a senior in college with the Ecological Society of America. Today I am strongly requesting consideration for rejection of the SUSMP standards adopted by the Regional Board. It has become the tendency to marginalize the opinion of scientists who supply the technical information and becomes (inaudible) people who would twist information or the lack thereof for their own agenda.

The technical information presented to the Regional and State Boards assisted them in holding the line against backroom politicking that (inaudible) and endangers the future quality of the L.A. River. Technical information must drive the decision making process, not political considerations.

The last most egregious time in L.A. we saw political considerations take priority over technical information and recommendations, the L.A. taxpayers lost $273 million to the Belmont High School project. Technical information from scientists and engineers described the potential variables involved in selecting the Belmont site, but the information recommendations were inconvenient, therefore, overridden.

It has been said that the implementation of these SUSMPs will increase housing costs substantially. Housing cost increases are not enough to make a substantial difference in homeowners (inaudible) in exchange for helping to ensure lush, clean riparian zones and high water quality for their children and grandchildren.

Southern California is usually the trendsetter for the rest of the nation, including Texas. Now is the time for everyone within the sound of my voice, the respective boards and development community, to step forward and to do the right thing, finally.

Thank you.

CHAIRMAN BAGGETT: Lynn Jacobs and then Sarina Morales-Choate from the City of Santa Fe Springs.

MS. JACOBS: Good afternoon, Chair and Members of the Board. My name is Lynn Jacobs. I'm President of a company called Ventura Affordable Homes that endeavors to build affordable housing in southern California.

While the previous speaker's letter was very concerned about technical data, I don't acknowledge the previous speaker as an expert on affordable housing and saying that this will not affect housing costs substantially.

The concerns that I have as someone trying to provide affordable housing, and also as a Planning Commissioner of the City of Ventura, we're looking statewide at a policy which started, I think, both from the ground up and also from the national level called smart growth, and smart growth may be interpreted as sustainability, livability. It's a very popular concept which, among other things, embraces choice and smart environmental decisions.

To be able to do this, we have to both provide housing for people and provide a safe environment and control effective use of limited resources, and one of our most limited resources in southern California in general is land. The cost of land and the cost of development has increased dramatically, almost as dramatically as our population increase and our lack of housing production.

We need to use some real creative thinking in developing appropriate standards here. I'm not speaking as a scientist, I'm not speaking as a technician, but there are two areas that concern me as someone trying to provide housing for people in California.

One is the requirement that post-development run-off shall not exceed the predevelopment run-off on property, and the other is the requirement on housing of ten units or more, whether they're multi-family or not. This makes it very difficult to do in-fill housing, which is what's mandated by most of our comprehensive plans and smart growth concepts to reuse brown fields to provide in-fill housing and to increase density within cities. It makes it very difficult to take a one-acre parcel that's in a downtown area and put ten units on it. It's almost impossible to reach that prerun-off stage from a technical point of view as a builder.

I would be happy to answer any questions you might have, and thank you for allowing us the opportunity to speak. I do want to make one more personal comment as a Planning Commissioner. We had a hearing in Ventura last night until 11:30, applause and boos, and I want to compliment both the Board and the audience for such a certain behavior today.

BOARD MEMBER FORSTER: I have a quick question. You're from Ventura. Doesn't the County of Ventura have a stormwater permit in effect that you all agreed to that's similar to this?

MS. JACOBS: I knew you would ask me this question. The Ventura permit is currently under consideration by the Regional Water Quality Control Board and they deferred the hearing on that, continued it pending the outcome of this because they were trying to make it comply with the new L.A. permit, and in Ventura we had a lot of concerns about that as well. I know that's not the subject of this particular hearing.

BOARD MEMBER FORSTER: I'm sorry, L.A. Regional Board. I just wanted to share something with you. One of my biggest concerns is your issue, not impacting affordable housing. So we're going to look at that very seriously, but there are simple techniques, and probably you haven't even gotten that far to look at them yet, but simple techniques to use in depressing playgrounds or there's books out there with ideas that I don't think they're insurmountable, that you could do double duty.

You would use your green spaces to be more capable of holding some water before it goes off on the street. So you have to be creative and we're going to try to be creative because we do not want to hurt affordable housing.

MS. JACOBS: I appreciate that tremendously. I think the difficulty that I'm having and my fellow affordable housing builders are having is that I can only speak with knowledge from Ventura County. The requirements that we see, given our limited land with our new save our agricultural resources initiatives, which has put a lot of the developable land that was previously zoned for development into permanent open space, is that we don't have the number of acres available to provide our housing needs, even if we take our SCAG regional numbers and the units that are available and built them out at maximum density.

We're trying to combine higher density with appropriate green space. Ventura County has some unique challenges in that our drinking water is in aquifers that are very close to the surface, and this retention basin approach, from the examples I have from my engineers and landscape architects that work on my projects, is not functional. I believe that there are some additional -- let me state it differently. If we have environmental regulations, it should be accompanied by more solutions and ways to implement than I'm seeing at this stage.

CHAIRMAN BAGGETT: Sarina Morales-Choate followed by Bill Pope.

MS. MORALES-CHOATE: My name is Sarina Morales-Choate and I represent City of Santa Fe Springs and I just wanted to read a letter from Assemblyman Calderon basically urging you to consider the appeal, that he states a couple of the flaws in the SUSMP as approved and some potential adverse impacts.

And then just one brief thing I'm going to read from it, he's not opposed to solutions that are targeted, cost-effective and have some demonstrated assurance of results. Unfortunately, the current SUSMP proposal does not achieve these tests and we just wanted you to consider his remarks.

Thank you.

CHAIRMAN BAGGETT: Thank you. Bill Pope followed by Heather Kuiper.

MR. POPE: Thank you. I am Bill Pope and I'm here to praise Caesar, not to bury him today.

I applaud what you're doing. I have a very personal interest in this. I recently said in my car that I was here to represent my son. It's probably too late to save my son but maybe to save his kids. My son is a 26-year-old musician and song writer. He released his first album last year called Orange, which is love songs here about his experiences growing up in and around Santa Monica Bay. He produced a second album this year, Spinning Top, dealing with the frustration of many things, one of which is losing his hearing at the age of 26 from repeated ear infections as a teenager. Both his doctors, Dr. Adair in Santa Monica and (inaudible) in Beverly Hills, believe that his ear infections, repeated

R0073748

ear infections were the result of him spending too much time in Santa Monica Bay in the area around the Pico and Ashland storm drains. The infections he got they think they have traced in that area, at least there's a direct correlation between that.

After several thousands of dollars and two operations, he is still losing his hearing, which may jeopardize his career. So I applaud what you're doing for his kids and those to come in the future.

A lot of the arguments that I've heard here today to me seem terribly insignificant compared to what you're trying to do. I've read the proposal, and to me it's just basic common sense. It's the thing anybody should do that is going to take benefit from using something like the land. They should then become responsible for doing what the land itself should have done and could do on its own.

Whenever we take something from somebody, we are responsible for making up for their loss. Anybody who gets hurt in an accident has the right to sue and the person responsible then thus make amends and support that person in some way to make up for the loss of their ability to do something themselves.

And this proposal seems to do just that. It doesn't need a lot of scientific evidence around it. Scientific evidence could be seen easily to anyone who had stuck their head under the water and been scuba diving in Santa Monica Bay back in the '40s and '50s.

Compared to what it looks like today, it's obvious we have done irreparable damage. Maybe not irreparable, maybe nature can heal itself if we stop. So I applaud what you're doing.

Thank you.

CHAIRMAN BAGGETT: Thank you. Heather Kuiper followed by Joan Greenwood.

MS. KUIPER: Good afternoon. I'm Heather Kuiper. I'm trained as a public health epidemiologist, and so usually when I speak in public I'm talking about data and statistics, but today I'm hear as a community member. Bill and I may be some of the few people who are not here as part of our jobs. (Inaudible) unfortunately, but they say that when a letter is received by a public official it often represents maybe even a thousand people's opinions. So if it takes 15 minutes to write a letter, we've been here several hours. It's possible that I represent several thousand people and without diluting myself with images of grandeur, I want to represent the idea that Bill and I are trying to represent a large group of people who care about the environment and the people in Los Angeles.

So what I would like to do is tell but a few of the ways that I have personally felt the impact of Los Angeles's urban run-off problem. First, when I worked for the County Health Department, some coworkers and I formed an ocean swimming club. We would meet at my house before work, get on our wetsuits, run down the beach, jump in the ocean and swim the mile back up the coast. We then car pooled to work and would feel great, and I just thought that L.A. was great. I loved the ability to do that.

But then I started to feel chronically sick and realized that in order to feel healthy and be healthy, I would have to give up regular swimming in the ocean. I felt angry and scared that I was so vulnerable to public policy, especially when it led to the end of a wonderful activity that should be a part of the fabric of a healthy community.

Second, I'm dismayed at the amount of trash on the beach, especially after storms. On several occasions I've gone to pick up trash on the beach and been overwhelmed. Additionally, I take all of my out-of-town guests to the beach and to (inaudible) lagoon. I want these activities to be a source of pride and to be able to show to them that Los Angeles is not as bad as everyone thinks it is. When I reach the beach and see an overflow of trash, I do not feel pride and my guests' opinions of Los Angeles go unchanged.

Finally, my intention of speaking today is to bring home that these standards under consideration and protecting the beaches and broader environment also protect people and so build the foundations of an integrated society.

I'm here trying to represent the people of Los Angeles who make up that society. I cannot do an adequate job because my face is only one color, I come from only one country, and in my home I speak only one language. But if you go to the beaches, you will see they are a magnet for all the different races and cultures of Los Angeles. The beaches are a beautiful and peaceful point of convergence for the people. We need this place to be healthy and safe and to be a place that people can feel proud of.

A safe beach and ocean is a vivid reminder that our public officials are watching out for us. So in your deliberations, please keep in mind these broader implications. Los Angeles's problems are grave and I urge you to uphold SUSMP's rigorous mitigation of the urban stormwater without loopholes and mitigations. The community awaits your decision.

Thank you very much.

CHAIRMAN BAGGETT: Joan Greenwood followed by Arturo Cervantes.

MS. GREENWOOD: Hello, Members of the Board. I first would like to express my concern over -- despite the fact that I had participated in the public hearings on the SUSMPs, I was not sent a notice about this meeting and I feel that I was denied my opportunity to present formal testimony and to be cross-examined by the petitioners' attorneys. So I hope you will bear with me because I did not learn of this meeting until yesterday.

I'm here today to speak on behalf of the Wrigley Association, which is a neighborhood association representing 20,000 residents in the City of Long Beach. We support the actions taken by the Los Angeles Regional Water Quality Control Board with respect to the issuance of the municipal stormwater urban run-off discharge within Los Angeles County.

In the city of Long Beach, I also sat on the environmental task force, and the environmental task force began meeting in September of '98 as part of the city's strategic planning process. We met twice a month until June of '99, in which case we made our recommendations which essentially would support the SUSMPs and the best management practices under the umbrella policy of sustainability and green architectural principals.

There were two public citywide meetings. At the conclusion of the second meeting, the chair of the environmental task force then persuaded the chairs of the other four task forces that our environmental roles and the sustainability and green architectural principles are viable for our city.

We have looked at the cost-effectiveness. We have looked at the issue of affordable housing. In fact, the mayor appointed to the environmental task force a person with the Olsen Company who is charged specifically with looking into affordable housing in the city of Long Beach. The gentleman did not object to any of the recommendations made by the environmental task force.

The city council has held several workshops.

The recommendations have gone to the various city departments, and the environmental task force has the distinction of being the only task force whose none of their recommendations were thrown out. So this now will go through one more workshop and we expect next now the city council will adopt the goals that have been set forth by this environmental task force, which leads me to believe that the people who live in Long Beach want these SUSMPs.

We believe they are reasonable, they are well-grounded in science and technology, they are cost-effective, especially when you look at flood control and flood management practices and the cost of infrastructure if we don't do it on affordable housing. We do have a recent development in the Wrigley District where the developer put 18 homes on two acres. He ended up getting a premium from those homes because people liked them and he complied voluntarily essentially with the SUSMPs.

If we compare this to another single-family affordable housing project where the homes were much cheaper but highly subsidized by the Cities of Signal Hill and Long Beach, we see it as the cost of the land, not the cost of complying with the SUSMPs. And as a society, we would be far better off subsidizing SUSMP BMPs than the cost of the land.

In closing, I would like to urge you to deny the petitioners' request and carry out your responsibility to the people of Long Beach as mandated by the public trust doctrine. By the laws of nature, these things are common to all mankind: The air, running water, the sea, and consequently the shores of the sea. This is according to the Institutes of Justinian (phonetic) that goes back to 533 AD. This doctrine also applies to the creatures that inhabit the oceans, estuaries and rivers and shores.

The people of Long Beach are relying on you as the public trustees of this standard to defend our right to enjoy the benefits of clean, healthy rivers and beaches. I am an analytical chemist. I am the former director of an environmental lab. I have studied extensively the data on San Pedro Bay, the beaches and rivers of Long Beach, and I do not agree with the fact that we have not gotten good baseline data. We have it. We have the indicators. We know what the right thing is to do.

Thank you.

CHAIRMAN BAGGETT: Thank you.

MS. JENNINGS: I have to apologize for that one person's name, hopefully, out of the 350 or so on the list. That was the only one that got left off. I don't know if it was the Regional Board or us. I apologize.

CHAIRMAN BAGGETT: Bruce Barnes, City of Cerritos.

MR. CERVANTES: Good afternoon, Members of the Board. My name is Arturo Cervantes. I'm a civil engineer with the City of Vernon. I manage the sewer and stormwater programs there. I would like to basically just explain a practical problem that we would be having with the numerical design standard here at the city. We are exclusively industrial, so let me read a little bit of what I have in some of my notes.

Incorporating a numerical design standard into the SUSMPs will create a problem for the City of Vernon. The City of Vernon is five square miles. The city's zoning plan identifies (inaudible) to the SUSMPs. Industrial, heavy industrial and commercial, 95 percent of the city is composed of either industrial or heavy industrial, of heavy industrial land use, and we're fully built-out. Because of the typical land area that industrial facilities require, 90 percent of the new developments and redevelopments will be required to comply with the parking lot requirements in the SUSMP. These facilities will be required to build structural BMPs.

However, page 15, number 12 of the SUSMP recommends against filtration BMPs for these types of facilities and industrial land use. For industrial areas that leaves only the option of constructing BMPs which are directly connected to storm drain lines. Storm drain lines, however, haven't been built in about 30 percent of our city streets. To meet the numerical design standard, the city would then have to build a 1000-foot main to comply with or develop these BMPs.

Basically the version of the SUSMPs proposed by the Regional Board would encourage developers out of the city. Additionally, this numerical design standard may discourage current facilities from retrofitting or structurally buildings that don't meet code in the city of Vernon.

The City of Vernon acknowledges there is a problem with pollution statewide. However, the numerical design standard has not, through appropriate studies, been determined to be a solution. I would like to compare this to another project that I'm taking care of for the City of Vernon.

Gateway Cities performed a study on the truck traffic impacted intersections in southern California and determined that one of the intersections in our city, (inaudible) determined that intersection to be the worst impacted intersection in southern California. That interchange ties directly to that. We decided to fund 35 percent of construction related to that project, but we were also seeking state money to do so, the remaining 65, but before we can seek state money for a project, the state requires one to perform a project study report. Once we do that, we go through the application process of MTA to prove that that, in fact, is a problem and that we need state money to solve that problem.

Second, before we get to money one more time, we have to prepare a project report. Again, we've got to prove we have a problem and this is, in fact, a solution. There is a problem because it's already been proposed.

Before we spend state money, we're required to perform studies, then a design and then construct it.

We're asking that the state do the same for us, prepare studies. Just one study will be sufficient and the City will foot the money.

Thank you.

CHAIRMAN BAGGETT: Thank you. City of Cerritos, anyone? We have one final card, if anybody else wants to speak. Bruce Reznik.

MR. REZNIK: Good afternoon and thank you for letting me speak today. I'm Bruce Reznik from San Diego BayKeeper. We've heard a lot today, and frankly to touch off as far as stormwater goes, essentially we've been doing nothing and it's not enough and that's clear, but I'm here, like I said, on behalf of San Diego BayKeeper, but also on behalf of the entire environmental community in San Diego, most of whom could not join us because the City of San Diego Natural Resource Committee is having a hearing on SUSMPs down there as we speak now because of our municipal stormwater problem coming up.

So I think it's very clear to say that everyone in San Diego, I think everybody in California, is looking to leadership from this Board. We are looking for you to step forward and approve the SUSMP requirements or SUSMP standards as adopted by the Regional Board.

In a lot of what we've heard today, it's very easy to lose sight of what we're talking about. Getting lost in the host of acronyms and legalese and frankly red herrings that range all over the board from MTBE to issues -- I don't want to get into mosquitoes. We lose sight of the issue that's here and that's clean water and how essential that is, how essential it is to our environment, how essential it is to public health, how essential it is to our economy that's so tourist dependent. I can't tell you how essential it is to issues like environmental justice.

You heard on one side housing and you don't hear on the other side of commercial fisherman who lose their jobs, lose their livelihoods, and possibly even water. Communities of color and disadvantaged communities that fish in San Diego and fish in Santa Monica, they lose that fishing and lose that opportunity because of our polluted bays. There are unattendant consequences of inaction as well as action and we need to consider that.

We know our waters are woefully polluted. There are 500 water bodies that basically don't meet Clean Water Act standards, 1700 total impairments which need TMDLs. TMDLs are a very expensive last measure when you don't do preventive maintenance. We know that (inaudible) should be ratcheted up and refocused on that. Our non-point source pollution is a growing source of our problems, and you hear figures from 40 to 70 percent of our pollution problems are non-point. We know the greatest indicator of non-point, what causes that, is loss of pervious open spaces in favor of impervious surfaces.

As soon as we develop, as soon as we lose our open spaces, as soon as that's replaced with concrete, more of our pollutants flow. It's the single greatest indicator. As we develop, we continue to degrade our already polluted waters.

What else do we know? We know that we failed. Everybody in this room has failed. We have failed the people of California. We have failed to protect our precious natural resources in California and we cannot continue to fail. SUSMPs are a necessary first step and it is a first step that is not sufficient. We know that. As our municipal stormwater permit is coming up in San Diego, we're going to be demanding a lot more SUSMPs. We're going to be demanding numeric effluents on impervious cover, and while it's appropriate, building moratoriums or pesticide controls, whatever is needed to restore our waters. But in the battle of clean water, every single battle, every step we take is imperative, and SUSMPs are one of those imperative steps to address the impacts of future growth, to add specificity to a permit and make it enforceable and to shift the burden of stewardship to those entities that profit. They profit and they need to clean up after themselves.

The last thing -- I see the red light -- I think it's so imperative to remember is to remind every here that those most impacted by the decision here today, most impacted, are not yet born. Every day we delay, every development that goes in without these kinds of requirements is a lost opportunity to protect our resources. And we have a decision to make today, whether we are going to take a proactive stance in preventing future harm or whether we're just continuing to shift the burden to our children and our children's children to clean up the mess we continue to make.

Thank you very much. Questions? Thank you.

CHAIRMAN BAGGETT: Thank you. Councilman Joe Cvetko, City of Bellflower.

MR. CVETKO: Good afternoon, everybody. My name is Councilman Joe Cvetko with the City of Bellflower. My city also opposes the SUSMP adopted by the Regional Board in January. Bellflower sees the SUSMP adopted by the Regional Board as a proposition that holds little promise in improving water quality and would cost the city much in terms of deterring development.

Bellflower needs and wants development. We need to expand our retail commercial sector to widen our tax base. As you must know, Bellflower and other cities are largely dependent on sales tax revenues to support critical municipal services. We have focused a great deal of effort on trying to revitalize our commercial sector, but we have a long way to go.

Our city continues to grow in population and along with growth comes an increase in demand for city services. Costly new requirements would be devastating to our community development efforts while we perceive limited return in water quality improvement. An increase in development costs could place affordable housing out of reach for our senior citizen community, plus even first-time home buyers, a community in which a few years is going to be the largest population bubble group in society because of baby boomers.

Housing for low and moderate income families is also likely to slow down because of increased development costs resulting from costly SUSMPs. Developers are likely -- not likely to develop in areas that have very costly development requirements. Our fear is that developers will go to neighboring counties where the SUSMPs are not as stringent as they are in L.A. County.

Please overturn the Regional Board SUSMP and allow the cities to implement the version they submitted last summer. I would like these statements to be entered into the public record. I would like to thank you. And my personal opinion, it seems to me the environmentalists are trying to over-regulate mother nature, and you know what they said about regulating mother nature. You don't want to fool around with mother nature, i.e. floods, hurricanes and stuff like that.

Thank you.

CHAIRMAN BAGGETT: Thank you. We have two other ones, Larry Forester and Jayme Laber.

MR. FORESTER: Larry Forester, Mayor Pro Tem, City of Signal Hill. I apologize for the confusion to the Board and the Council because Margaret Clark did have a funeral to go to. I hadn't filled out a card. So I apologize.

I'm here as Mayor Pro Tem of a very small, two-and-a-half-square-mile city representing about 160,000 residents. I also have an M.S. in ocean engineering, so I'm extremely environmentally conscious. I look at the SUSMP as currently structured and say to myself is there accountability? Is there accessibility? Is it in the public's best interest? My answer to that is one size does not fit all.

I look at my affordable housing program in the City of Signal Hill where we have 144 homes going in. We're creative. We've done it with redevelopment money in conjunction with a shopping center. I look at my own condo association where we just put a new 8,000 square foot roof on our building.

We are land-locked on a hill. There is nowhere we could put a collection basin. Absolutely none. I think that's what a lot of this program does not deal with. I do not think it's an effective program.

Let me add one step further. I had done some research that I know a bunch of public work engineers with various cities have worked with the Regional Board. I have been told, and maybe somebody correct me if I'm wrong, the Regional Board basically threw out all of that information and did a shotgun on their own.

I would like to conclude with a statement that I had made to the press, and I'll read it exact, and that is, "The potential environmental benefits of this rule are speculative at best. Worst yet, economic impacts these rules place on the taxpayers and consumers have not been considered." And again, I have to say that I'm in very mixed emotion because being an ocean engineer I am very environmentally sensitive, but I want a more effective, better enforceable type system that cities can live with. I'll answer any questions you have.

BOARD MEMBER BROWN: What do you think should be done?

MR. FORESTER: I think they should go back to what the public works directors presented to them, go through that report and reevaluate it. My knowledge, which is information or hearsay, is that it was thrown out cart blanche. I don't agree with that.

I look at what we do in Signal Hill right now. I look at the best management programs used. I look at a program where we literally covered an entire hill with plastic where we're building a water reservoir and shut down a project for almost three months to prevent water run-off. So I think we are doing things, and I do think the Regional Board can work better with the local communities and cities.

I thank you for your time.

CHAIRMAN BAGGETT: Thank you. Now, last call here. Public comment?

MR. LABER: Jayme Laber with Ventura County Flood Control District. I'm an engineer with them. My comments are not so much on the appropriateness of the

L.A. County document and the design standards but how it has a direct impact and bears on the Ventura County permit that is going to be including a similar SUSMP document that L.A. is having.

Our concern in Ventura County is that the SUSMP document will be perceived as an end-all document for all jurisdictions in the state and will lead to no flexibility to allow for consideration of other local hydrology such as we have in Ventura County. The Ventura County Stormwater Quality Management Program has been very proactive in using land development guidelines to get criteria. The L.A. County SUSMP is contrary to the treatment of .75 inches of rainfall. In Ventura County we're using two different values. 70 percent annual capture rate is what we're using for volume-based BMPs, and flow-based 10 percent, and we feel that these have worked in Ventura County.

In Ventura County you can see detention basins, grassy swales, constructed wetlands and numerous other BMPs in Ventura County. With the ability to keep the flexibility currently built into the current program by being able to apply conditions based on engineering judgment and taking into account like the type of project, the location of the project, pollutants of concern and connection to channels, we feel that the 70 percent annual capture rate that we're using in Ventura County is very appropriate. It was developed based on unit basin storage volume developed for Ventura County

R0073765

using Ventura County hydrology and we -- an increase of going from 70 percent annual capture rate to an 80 percent capture rate is a 10 percent increase and increases a detention basin requirement 20 to 40 percent larger than what it would be for 70 percent. By increasing that 10 percent, that 20 to 40 percent larger basin only will be removing an additional 26 percent of total sediment, so we feel that's flexibility for Ventura County and we don't feel we should be locked in with L.A. County based on their hydrology and there's -- we would like to see some flexibility built into that.

CHAIRMAN BAGGETT: Thank you. Questions?

BOARD MEMBER FORSTER: Are you going to give your comments to the staff? Some people have handed out comments.

MR. LABER: I don't have them typed up in a format.

BOARD MEMBER FORSTER: They can be written.

MR. LABER: I can give them. I'll hand them in.

CHAIRMAN BAGGETT: Thank you very much for all of you who have taken the time to come and give your thoughts to the Board from the policy standpoint. We do appreciate very much that you take time out from other lives to do that. We feel it's important.

With that, before we take a break, we have theoretically, if the four cases-in-chief, if you will, can keep to the times remaining we could be out in time, as I understand, to return to an annual event, a cultural event in Los Angeles.

BOARD MEMBER FORSTER: The Laker game.

(Laughter)

CHAIRMAN BAGGETT: At least I understand that. And then we'll do the cross-examination and closing statements tomorrow morning. I just don't think -- unless people want to stay. We can see how it goes, but I think we'll be pushing it myself. I would like to get at least the four cases-in-chief done today.

So let's take a ten-minute recess. When we come back, the testimony of the cities will be up and they have 53 minutes remaining. And NRDC, you have 39 minutes of your allotted time.

(Recess taken)

CHAIRMAN BAGGETT: We're back.

After much discussion, I think we'll continue with the four cases-in-chief. There are four witnesses from three parties that cannot make it tomorrow morning, so we will try to do those recrosses after we're done with the three different parties, David Nahai, Ray Pearl Ms. Zinke and Dr. Gold. Those are the four that have a challenge tomorrow morning, so we'll try to get through those today also.

Continue.

RICHARD MONTEVIDEO,

having been previously sworn, testified as follows:

STATEMENT OF RICHARD MONTEVIDEO

MR. MONTEVIDEO: Yes. Good afternoon, I guess it is, Members of the Board and Mr. Chair. Thank you for the opportunity today. My name is Richard Montevideo. I am counsel for Bellflower, et al. petitioners as well as the City of Arcadia today.

We are here challenging the appropriateness and properness of the action taken by the Regional Board on January 26th, 2000, as well as the action taken by their Executive Officer as a follow-up to that action.

We've heard a lot today about water quality and we've heard a lot today about the need to improve our water quality, and frankly that is an important issue for us but it's not an issue for us today. Mr. Pope's son had a problem, has a problem he's dealing with. We've heard other testimony today dealing with trash on the beach. There is a problem in Los Angeles with water quality and water quality in Los Angeles needs to be improved.

The discussion today kind of reminds me of a talk that I gave at the Constitutional Rights Foundation on behalf of the Constitutional Rights Foundation a couple of years ago to a group of high school students, the Surf Rider Foundation, on the environment and cleaning up the environment. I asked the question, "Who here is in favor of a clean environment," and of course all the hands went up. The next question I asked, "Who here is a polluter," and you look around and no one put their hand up. By the end of the discussion almost everyone had their hand up.

The point here is that if I ask a question today who here is in favor of water quality, I'm sure all hands would go up, including all hands on behalf of the petitioners. The issue that we're dealing with today is not a question of whether or not we have a water quality problem, whether the water needs to be improved, the quality needs to be improved.

The issue really is the best approach given what we know today about water quality, consistent with the process laid down by Congress in our state legislature. That's what we're striving to do today, what's the best approach consistent with the process that's been laid down by Congress in our state legislature.

Now, I am here representing some 33 cities, and on top of that we have other cities who have submitted letters of support. In total we have 40 cities out of 85 cities in the county, along with representatives of the BIA, who have expressed great reservations and concerns about the action taken by the Regional Board. We also have additional entities, public entities who are concerned with the action taken by the Regional Board.

Let me first say that in spite of the Regional Board's and NRDC's comment that this is a small subset, obviously it's a very significant number of cities that are in the county that have concerns with what the Regional Board did. Why do so many cities and the BIA and even WSPA have concerns with what the Regional Board did? There are several issues that need to be addressed.

First is the flagrant violations of the permit that we believe the Regional Board in the action they took and the potential disastrous environmental consequences that could result if we go down that path without fully looking at where we're going and striving the best approach to look at water quality.

Second is the significant financial impact on virtually every sector of our community that will result if we go down a path that isn't well thought through.

Third is frankly the failure of the Regional Board to follow the deliberations -- the deliberate and collaborative process required by law, and a process that if we accept their approach is in effect, from our perspective, an arbitrary process and takes us down a path of not knowing where we're going, a directionalist path. At the same time we lose the time and we lose the financial resources to really put into addressing the problems that we have and putting together a plan that will hopefully work the particulars of Los Angeles County.

This in sum and substance is why we are here today. The question then arises, the Regional Board is an agency charged with the responsibility of addressing water quality. Why, Mr. Montevideo, would you contend that they haven't acted appropriately to address water quality? The answer lies in the record that's before you and in the testimony that's been provided and in the staff reports that have been provided by the Regional Board. The answer they have for not following the process they should have followed is frankly they are number one, under staffed; number two, admittedly under-funded; number three, admittedly they no longer have the time to deal with the issue because they have delayed in their review of other programs; and frankly number four, they are faced with lawsuits from the environmental organizations.

This particular document is a January 19th, 2000 memo from Mr. Dickerson. He states at the bottom of page 1, and this is in volume 2 of the administrative record, "Additionally, the inadequate staff available to this program results in our inability to move more quickly. For example, I've had to expend a great deal of my time on technical staff related to the municipal permit to close the gap between what we must do with the limited staffing we have. Only one staff person is assigned to this project, and total funding from the permit is $10,000 annually."

You add that to the concerns that they have expressed because of potential suits from other organizations. If you look at paragraph 3, the full paragraph 3, third paragraph on the page, I quote, "The unfortunate effect of adopting EAC's argument," which is a procedural argument, basically here's what you're supposed to do under the permit. "The unfortunate effect of adopting the EAC's argument to adhere at this time to the scheme laid out in Order 96-054 would be to further seriously delay implementation of the SUSMP without providing any real additional procedural protections to the co-permittees." One, obviously we don't agree with the statement, but secondly it only address procedural.

How about substantive issues? He goes on to state in the staff report, this is dated January 18, 2000, "It would also expose the Regional Board to court action for failure to timely move toward program implementation." So the result is we have a program that's affecting 8, 9 million people that's in effect been developed by a single staff person with the funding of $10,000 who frankly admittedly was out of time, and was in effect provided a number by the NRDC and the other environmental organizations to use that they pulled out of the settlement agreement between the county and the NRDC.

He didn't have time to do his own research and do his own work and didn't have the funding. He's one person, yet at the same time he's attempting to develop a program that applies across the board throughout the county that ultimately would be applied, as we heard today, to Ventura County and potentially even San Diego County.

Now, in his testimony before the Regional Board, Dennis Dickerson states, "The staff issue -- I hope you recognize that everything we've done is on the basis of one individual working full-time, already overburdened, already spending -- diverting resources away from the things that we should be doing, just to focus on this issue." So in effect he's saying that the person has other things to do on top of what he's doing here and the other issues are presumably just as important.

"We truly need more staff. I'm looking for yes, more staff, more money in order to get this job done." This was a plea by Mr. Dickerson to his Board to say "I need help." The consequences of him not having the help and not having sufficient funding was that we ended up with a program where 40-some cities plus a number of entities throughout the county have expressed strong reservations with and objection to. The consequences is that we're going to be spending tens of millions of dollars, if not more, to implement a program that frankly has not been thought through.

Now, one of the concerns that we have is that this program that's before you today was not adopted in accordance with the terms of the permit, and I want to take a step back and talk about the permit for a second.

Why is the permit so important? Why do we keep talking about the permit? Well, as you heard from the representative from the United States Environmental Protection Agency, they want to move forward on the permit. That's what their concern is. This permit was initially issued back in 1990 and reissued in 1996. It is this permit that provides the basis and the authority to proceed with the SUSMP program. It is this permit, frankly, that includes or that fully encompasses the authority and the jurisdiction of the Regional Board. Without this permit, the Regional Board has no authority to regulate. With the issuance of this permit, they have authority, presumably, if it's been provided by the State Board, but their authority is limited then to this permit.

This permit was issued under the Clean Water Act and it was issued under the Porter-Cologne Act. Once the Regional Board issued the permit, it fully exercised its discretion. Just as the permittees have to live with the terms of the permit, frankly so does the Regional Board.

Now, the NRDC and Regional Board has made comments and made arguments in their briefs as to why our position is not well-founded. One of the things, however, that you won't see in their briefs and in their arguments is the position that the Regional Board can move forward and adopt a SUSMP program that is in direct violation of the terms of their permit.

They argue the Regional Board otherwise has authority under the Porter-Cologne Act or Clean Water Act to take these types of actions. That may or may not have been true if we didn't have a permit that was in place. The County of Ventura and San Diego County are in the process of looking at a revised permit. They're in a completely different situation than these permittees before you here today.

Today we have a permit in place. That permit provides for specific terms that have to be followed in developing a SUSMP program. Let's talk about that.

There's two basic areas of the permit that we believe the Regional Board effectively violated. One area deals with the preparation of the SUSMP program and what needs to go into the SUSMP program and the purposes of it. The second area deals with the procedural review and approval of the SUSMP program.

Looking at page 33 of the permit -- by the way, I do want to comment that when I went back to look for the permit in the administrative record, I didn't find the entire permit. I actually had to submit it as Exhibit 1 to our submittal. It's indicative of the fact that the Regional Board doesn't consider they're bound by the permit. If they don't have the permit in place, they don't have any authority to govern these cities with respect to the SUSMP we're talking about. But we do have as Exhibit 1 the permit that's before this Board as a part of the administrative record.

When you look at page 33 of the permit, these are the operative provisions, pages 33 and 34 that deal with the preparation and development of the SUSMP program. The first point I want to make and the first issue that jumps out at you is who is the principal permittee, which is the county? In effect, who are the parties that are to develop the SUSMP program? It tells us right in the language of the permit. The principal permittee in consultation with the permittees shall develop a development planning guide as materials for use during planning and permitting of all development projects requiring discretionary approval.

Now, there are three things that are supposed to be developed by the principal permittees along with the other permittees. One is a model documented system. Second is a list of BMPs. That's A is the model documented system, B is the list of BMPs, and then C is the Standard Urban Stormwater Mitigation Plan which is to incorporate the BMPs that were developed as part of subsection B.

Nowhere in the permit does it say that the Regional Board is to prepare the SUSMP program. Nowhere in the permit does that say if the permittees don't do it by X date, the Regional Board will take over that process and submit it. Nowhere in the permit does it give the discretion to the Regional Board in any way to simply mandate their own devised SUSMP program on the permittees.

The language of the permit itself, which this SUSMP program is developed under, says it's the permittees that are to develop the SUSMP program. So the Regional Board's action, unilateral action is outside the terms of the permit and is in express violation of the terms of the permit.

The next violation is the question of whether they can apply the SUSMP program to non-discretionary projects. When you look at the terms of the permit itself, it says in very clear terms permitting of all development projects requiring what? Discretionary approval. There's nothing in here about non-discretionary projects. To continue, Item A-1, priority projects are development and redevelopment projects requiring what? Discretionary approval.

Moving down to page 34 -- page 35. I'm sorry. So there's two instances where we see the word discretionary projects and projects requiring discretionary approval. Item 3 says in order to integrate stormwater -- I'm sorry. Item 4, next page. Item 4, developer information program.

The principal permittee, in consultation with the permittees, shall develop a model program not later than January 30, 1998, to inform developers seeking discretionary approvals. Thereafter, at the bottom of page 35, in order to integrate stormwater management considerations into discretionary development projects, you see the word discretionary throughout this permit. You don't see the word non-discretionary throughout the permit.

The Regional Board's in effect last-minute inclusion of non-discretionary projects is in direct violation of the expressed terms of the permit.

What's the next violation of the expressed terms of the permit? Well, if you look at page 34 of the permit, it talks about SUSMP programs in particular and says Standard Urban Stormwater Mitigation Plans and guidelines preparation not later than six months after the Regional Board's approval of the BMPs. That time frame was met.

It then goes on to say the SUSMPs shall incorporate the appropriate elements of the recommended BMP list, so you have to look at the BMPs that have been incorporated into the SUSMP itself. And finally at the minimum, SUSMPs and guidelines shall be prepared for the following development categories. The categories that are supposed to be affected by the SUSMP program are development categories, not locations.

What the Regional Board has done is include a new category outside of development categories called environmentally sensitive areas. Unfortunately, the permit doesn't allow for the expansion of the SUSMP program to anything other than development categories. At the time the permit was adopted, the Regional Board actually thought about environmentally sensitive areas, and in their course of their consideration of environmentally sensitive areas, they actually address the issue of environmentally sensitive areas.

But they didn't do it under item C, the SUSMP program. They did it under a model documented system. They said the documented system shall consider location of the project with respect to designated environmentally sensitive areas and the slope and erosion potential of the site and surrounding areas. So yes, they thought about environmentally sensitive areas. Yes, it was an issue, but it was an issue to be addressed as part of the documented system, not as a part of the SUSMP program itself.

The SUSMP program was supposed to apply to development categories, not areas or locations of the county. The inclusion of environmentally sensitive areas into the permit, into the SUSMP program, is outside the terms of the permit and is a violation of the permit.

What are the other violations of the permit? The substantive violations committed by the Regional Board in adopting the SUSMP program are actually evidenced at the top of page 34, again of the permit. Consideration shall be given to the type of development and the potential for stormwater pollution when determining the applicability of BMPs.

The issue there is consideration shall be given to the type of development and the potential for stormwater pollution. Did they consider the type of development and the potential for stormwater pollution? First, keep in mind this consideration is supposed to be given to the -- it's at the discretion of the permittees for developing -- who are developing the SUSMP program.

Secondly, they are supposed to at least give some consideration to type of development. We have here a one-size-fits-all standard. That's one of our primary concerns with it. We talked earlier about programs that are existing throughout the country. Dr. Horner wasn't able to say what aspects of those programs applied in terms of redevelopment projects.

Here we have a program that, in effect, applies to new development of 100 or more homes, but at the same time it applies to somebody who is in need of a discretionary permit if they are in an environmentally sensitive area or if they simply have a hillside home; if they have to change their roof, which doesn't increase any impervious surface. Just merely changing the roof would require that they comply with requirements of the SUSMP program. There are a whole slough of other examples that would arise.

The issue here is did they consider the type of development for potential of stormwater pollution. The answer is no, they developed a one-size-fits-all program that doesn't allow the flexibility to address the nuances of the individual developments.

The next sentence says cost-effectiveness, ease of maintenance and consistency with other environmental mandates may also be considered. Cost-effectiveness is something permittees are saying has to be considered. How can the Regional Board possibly take a position that they should not consider cost-effectiveness, yet they are. Their position is we've looked at cost but we don't have to consider cost-effectiveness of the program, simply whether or not it's economically feasible. That's different than cost-effectiveness of the program.

Also, other environmental mandates. One of our primary concerns is that the Regional Board does not provide an opportunity for these permittees to look at other alternatives such as a regional approach. A regional approach only makes sense. It needs to be reviewed. Maybe it's not the best approach, but it should be considered and the Regional Board hasn't given us the opportunity.

Finally is the issue of post-development run-off. The permit says that post-development run-off can increase over predevelopment run-off at levels, but they're supposed to maintain the predevelopment levels to the maximum extent feasible. So post-development run-off, there's a specific standard that's included in the permit, levels to the maximum extent feasible. What did the Regional Board do with their SUSMP program? If you look at the Regional Board's SUSMP program, they don't have the standard of maximum extent feasible. They simply prohibit increased levels of run-off in post-development.

So in short, we have a series of violations of the expressed terms of the permit by the Regional Board. One, they have unilaterally adopted the SUSMP program even though the permit says the permittees are supposed to develop the program. Two, they've applied it to all non-discretionary projects. Three, they've applied it to something other than development categories by applying it to environmentally sensitive areas. Four, they failed to consider the type of development and the potential for stormwater pollution from these developments. They've developed a one-size-fits-all program. Five, they failed to consider the cost-effectiveness of their program, not whether it's feasible economically but the effectiveness, the cost-effectiveness of the program. Six, they failed to consider consistency with other environmental mandates and CEQA. Seven, they've included an outright prohibition on post-development run-off in violation of the standards set forth in the permit itself to the maximum extent practicable.

Now, those are the substantive violations of the permit. Let me very briefly cover with you the procedural violations of the permit because there is a separate section that deals with submittals to the Regional Board and how the Regional Board is supposed to address those submittals.

If you turn to page 21 of the permit, there is an expressed provision called the environmental review process that is supposed to be followed by the Regional Board in considering submittals from the various permittees. It states -- this is under subsection G. "In addition, it provides a method to resolve any differences in compliance expectations between the Regional Board and permittees prior to initiating enforcement action," any differences in compliance expectations.

So the way this process is to work is the permittees submit their program, which they in fact did in July and then resubmitted in August of 1999. At that point, you move to Section 1-A of Subsection G, and the Executive Officer then has 120 days to review and approve or disapprove the program. Did that occur? No. They simply ignored it and proceeded with their own program.

After that point in time, the Executive Officer, if he's notified that the permittees simply want to implement their own program, which just happened here -- I'll get to it in a minute -- he then has 10 days to respond and provide his comments. That process was followed by the permittees but was not followed by the Executive Officer. If the Executive Officer believes there was a problem with the SUSMP program as has been submitted by the permittees, he is supposed to provide the permittees an opportunity to correct the concerns that he has raised. He specifically, under Subsection G-2, is supposed to provide the permittees a notice of intent to meet and confer; in effect, to get the parties together at a table to address the issues, to see if they can address the issues that the Regional Board has with the permittees' SUSMP program, not a program developed by somebody else. Did that process occur? No. No meet and confer was sent out by the Executive Officer, no action was taken by the Regional Board on the permittees' SUSMP program.

After that point in time, if after the meet and confer the parties can't work things out, the Executive Officer will send out a notice of program deficiency. If they can't work things out, he then suggests an amendment to be sent out by the permittees. The permittees then have an opportunity to send out the amendment, and after an additional 120 days, the Executive Officer has to review the amendment to look at the issues and whether or not the amendment is acceptable.

The permit actually gives the Executive Officer 120 days. If they were concerned about the timing with the submittal, they could have responded in a matter of days. Unfortunately they didn't respond at all to the permittees' program. They simply proceeded to implement and approve and seek to implement their own SUSMP program in direct violation of each of these provisions in the administrative review process.

What are the consequences if this review process is not followed? The consequences are that the Executive Officer shall not take enforcement action against the permittee until the Executive Officer has notified the permittees in writing that the administrative review process has been exhausted and that the Executive Officer has determined that a violation exists warranting enforcement.

The Regional Board's position is well, we only have to comply with this if we want to take enforcement action. If we don't want to take enforcement action, we don't think we necessarily have to comply with this. I'm not sure how that would work. If they want to pursue to enforce their own SUSMP program, they still have to come back to this administrative review process. When they do that and come back to this process, they come back and sit down at the table and presumably bring all the parties that are affected by the program and figure out a way to make this thing work in Los Angeles County.

The reason the Executive Officer did not proceed and take the time to comply with the administrative review process is what he tells you right here. "It would also expose the Regional Board to court action for failure to timely move forward toward program implementation."

So why in short did the Regional Board simply short-circuit the process? Number one, it's a threat of litigation, frankly, and who does that threat come from? Undoubtedly it comes from the environmental organizations. Just this last week even the State Board was served, from what I understand, with a lawsuit from the environmental organizations. The NRDC has sued the county. The number that we're talking about today came out of the county settlement. NRDC has sued the City of L.A. The NRDC has sued a number of cities within Los Angeles County.

We heard some cross-examination of Mayor Clark today about whether they were complying with the SUSMP program, and in effect it's environmental McCarthyism. There is a fear that if you stand up to follow the process, if you poke your head up and take a chance of saying well should we, they're going to one, point out your inadequacies, and two, they're going to sue you. You combine that with understaffing, underfunding, and the Regional Board was already behind the eight ball.

The result is we have a program that's been taken out of the county settlement with the NRDC and effectively jammed down the throats of the permittees in this case. Frankly, that's not a way to be conducting public policy. What we need to do is to work through the process under the permit. Look at the terms of the permit and adopt a program that works for Los Angeles County considering the types of developments and the particulars in Los Angeles County, not simply look at programs across the nation. Sure, consider the data, but look at the particulars. Don't apply the same standards to somebody putting on a new roof that you would to a gasoline service station.

What do we ask this Board do today or tomorrow? We ask that you look at the evidence before you and not to decide, frankly, whether Party A or Party B is in favor of water quality or whether we have a water quality problem. We know we're all in favor of water quality and we know we have a water quality problem. What we ask that you do today is follow the path laid down by Congress and laid down by our state legislature.

Second, we ask the Board consider all the evidence and determine whether or not the Regional Board complied with the substantive and procedural terms of the permit.

Finally, we would ask that the Regional Board consider bringing all of the parties that are involved in this issue to the table, not just the environmental organizations. Let's have the plaintiffs sit down at the table with the Regional Board. Let's have councilmembers. Let's have developers. Let's have the builders. Let's have the restaurant association. Lets have WSPA. Let's look at the issues and pool our collective thoughts and mind set together and come up with a program that works for Los Angeles County, not simply a program that Dennis Dickerson, in effect, had to adopt because he just had to do something. Let's adopt the program that works for our particular problems and addresses our particular concerns.

The evidence that's going to be presented to you and has been presented to you shows that the Regional Board did not act appropriately or properly when it ignored the expressed terms of the permit. We ask this Board issue an order in accordance with the terms of the permit, in accordance with the finding that the Regional Board did not act appropriately, and that this State Board take action beyond just doing something, that this Board take action doing something that's right for Los Angeles County.

At this point I would like to have Richard Watson come forward and provide information for you on technical issues.

BOARD MEMBER BROWN: I have a question for you, Richard.

MR. MONTEVIDEO: Yes.

EXAMINATION

BY BOARD MEMBER BROWN:

Q. What do you mean when you say follow the path laid down by federal and state?

A. The Clean Water Act sets forth a procedure to be followed in terms of adopting the permit to reduce the discharge of pollutants to the maximum extent practicable. The regulations that have been adopted to carry out that provision talk about what goes into adopting a permit.

The Regional Board presumably followed those regulations to adopt a permit. After they've adopted the permit, the permit then sets forth what is supposed to be included in the SUSMP program. In effect, they're saying within the authority given to you by Congress. Don't attempt to act outside of your authority and outside of the permit.

Q. Working together to develop a program, do you have any idea or suggestion with all of these cities who would be on point with the go-ahead and end up as the responsible party that could provide some assurance that these things are going to happen that we would include?

A. There's a number of things we can do. This State Board has the authority to actually, if it wants, to impose a mediation or arbitration, but mediation approach solution before it makes its final decision. It has the authority to bring the parties that are involved in the issues to the table. If you're asking who those parties are, the County already has the Executive Advisory Committee who has worked very closely with the Regional Board and the environmental organizations throughout the course of the various other programs on the permit. I would continue to use that agency or that entity, so to speak.

I also would bring in the Southern California Association of Governments, who I do think has authority here and who I do think could add a lot to this process to look at a more regional approach. I think representatives of the building industry should be involved, potentially the restaurant association, at least extending opportunities to the affected parties to get involved.

Let's roll up our sleeves and see if we can work out a process that makes sense for L.A. County, but a process that requires individual homeowners -- if you look at the example from the Tree People, to spend $10,000 if they have a hillside lot to put on a new roof doesn't make any sense. I'm not saying it doesn't make sense for certain types of developments or maybe certain new developments, but the standard needs to be addressed and we need to take a look at the types of pollutants and recognize we have a problem. We clearly have a problem, but let's figure out what the problem is and where it's coming from and put together a team.

Q. Has there been discussion with the organizations about doing something like this before today?

A. Mr. Watson can probably address the issue better than I can. The Regional Board has been in a very difficult position, frankly. This is hearsay because I'm giving it to you third-hand, but I'm understanding they were told the environmental organizations did not want to sit down at the same table with us at the same time and discuss. They wanted to talk directly to the Regional Board and the Regional Board was basically conducting shuttle diplomacy.

The offer was made before. We're willing to do it now. In fact, we think it makes sense, but let's get everybody, not just the environmental organizations.

BOARD MEMBER BROWN: Thank you.

BOARD MEMBER FORSTER: In your opinion what's the difference between the discretionary and non-discretionary?

MR. MONTEVIDEO: It's a significant issue because it effectively will probably double or more than double the application of this program. If somebody is trying to put up -- if it's a hillside residence, for example, they want to put up a retaining wall that's greater than six feet, in most cities they're going to need a non-discretionary permit. If it's a hillside, all of a sudden they have to comply with SUSMP requirements.

So if you're in Rancho Palos Verdes, the entire city basically is in an environmentally sensitive area or drains into an environmentally sensitive area. So any non-discretionary permit that applies, all of a sudden they have to take their existing layout of their home and try to figure out a way to collect three quarters of an inch of water and address or treat three quarters of an inch of water.

The hypothetical in the article that the Tree People -- that was on the Tree People's example actually is a real concern to us. The hypothetical that I posed to Dr. Horner, we didn't necessarily get through it all, but it's a realtime situation. You're talking about a 2,000 square foot home on a 5,000 square foot lot. It's very common in Los Angeles County. If that lot is already landscaped and it's done, existing homes are going to fall into that, and if it's in an environmentally sensitive area or if it's like Mr. Forester's apartment or condominium that's on a hillside, any discretionary approval that you need, if you go in and need some plumbing permits and need electrical permits, in certain situations all of a sudden you have to go back and really landscape the whole house. How do you accommodate three quarters of an inch of rain? In many cases they don't have enough room, putting aside the dollars.

MS. JENNINGS: I have one question.

EXAMINATION

BY MS. JENNINGS:

Q. When the gentleman from Ventura County spoke, he seemed to be talking about what the number was that they could accept. From reading the transcripts, it appeared that at some point the counties and cities were proposing a number of .6 and then .75 was adopted, but it appeared to me that that number was actually never officially proposed by the cities and the county.

Is there a number which the cities and the county would accept or are they only willing to essentially say it has to be totally within the discretion of each city what that would be?

A. The short answer is yes, I think there is a number they would accept but it's not just a number. I can't emphasize enough that this program applies across the board.

Q. I'm not talking about exceptions, but if there's a number, what number is that?

A. I think that number has to be -- first you have to look at the development. The number may change from development to development or to redevelopment projects.

Q. I think I'm asking because the Board Members would like to know. Is there a number that the cities and the county would support like they supposedly at some point were looking at .6, or are they basically saying there's so much flexibility that's necessary that there should be no number?

A. I don't believe they're saying the latter. The reason I'm struggling, Ms. Jennings, is I can't tell you the number and apply it across the board. I think yes. Are they willing to live with a number? Of course they are, but the number has to be taken in context in terms of where the project is and whether it's the in-fill project versus out in open space, and it also has to take into consideration the differences in pollutants, the run-off.

I think there is a number and I think that number is going to be a number for one project and potentially a different number for another project. Is the .6 acceptable? I think in some cases it would be but undoubtedly not in all cases.

Q. I suggest, if I might, I think you might have a better answer. I think the difficulty for the Board is everybody is saying we don't like what the Regional Board did and we're going to do a good job ourselves, and the Board Members may want to know what's the bottom line. And you don't have to answer that now, but you may --

A. I would like to make a comment on that. You've put your finger on the problem. The reason I can't give you a specific number is because it hasn't gone through the process of development. The reason we haven't gone through the process of development of numbers is because the Regional Board took the number out of the county settlement --

Q. I don't want to get into an argument with you, but you did have the process and the County made two proposals and I'm asking is there a number that they would live with.

A. I think the answer is yes, but I can't tell you what the number is.

MR. SMITH: If I could just respond to that. My name is David Smith. I'm the general counsel for the BIA. We are making a presentation collaboratively with the cities.

I think the BIA position, to address your point again without belaboring it, we would stress substantially that particularly when you're talking affordable housing components and in-fill projects, an across-the-board number, a one-size-fits-all approach is potentially problematic for a lot of reasons. And while a standard, the general standard may be appropriate, looking at it from the builders' side -- you heard from Ms. Jacobs today -- particularly those builders who are focused on accomplishing the affordable housing need and increasing mandates for affordable housing, the constraints are very different when you're talking about pushing into the suburbs and open space and you have a little more flexibility or whether you're just talking about how much green space are you going to have, can you use it for filtration or not.

When you're talking about these parcels, any across-the-board number for that presents potential problems and we would ask that some level of flexibility -- and this is where the consultation process -- we want it to come back to the consultation process to address these individual concerns.

MR. MONTEVIDEO: Mr. Chairman, may I ask how much time we have remaining?

BOARD MEMBER BROWN: Question.

FURTHER EXAMINATION

BY BOARD MEMBER BROWN:

Q. If my math is right, I suspect you've already figured this out, but three quarters of an inch containment on a quarter acre lot is 4500 gallons.

A. I've seen calculations of over an acre at 27,000 gallons, so that's probably a little low.

Q. An acre I have at 18,000 gallons.

A. I've seen notes from the Regional Board and other numbers have been in the 20,000 gallon range. So I think --

Q. Basically 20,000 gallons, so a quarter acre lot would be in the neighborhood of 4,000 to 5,000 gallons.

A. Sounds about right.

BOARD MEMBER BROWN: That's pretty hard.

CHAIRMAN BAGGETT: 22 minutes remaining and the light will go off at five.

RICHARD WATSON,

having been previously sworn, testified as follows:

STATEMENT OF RICHARD WATSON

MR. WATSON: Richard Watson. I will give you a little bit of my resume in preparation. I have attended Stanford University. I have degrees, bachelors and masters, from UCLA, completed all the requirements for a Ph.D. except for the dissertation from the University of Alberta. I'm a planning consultant. I spent 15 years with a Mission Viejo company and an engineering company that was purchased by it. I've been working in stormwater since the fall of 1990. I'm currently a member of the Executive Committee of California Stormwater Quality Task Force. I chair the TMDL Watershed (inaudible) Committee and I'm part of a consulting team working with Caltrans. In fact, I sited the various structural BMPs that Dr. Horner discussed earlier.

What I would like to do is graphically demonstrate something we've said already, and that is that we don't deny there is a problem. And really going back to (inaudible) and the ultimate BMP is us. By that I don't mean just builders and the cities, I mean all of us.

I would like to take that in saying we're not opposed to the SUSMPs as they were presented by the municipalities, but we do have problems with the numbers. We're not really here to argue the numbers today. We want the opportunity to work together to determine appropriate numbers in response to the question from

Betsy earlier.

There are differences of opinion, and if you apply some formulas that are from the water quality capture, applying numbers from the Denver drainage menu which was just revised in September, you get amounts that are considerably lower than here, and I did a little few calculations and come up with a number. If you use .5 imperviousness and use a 24-hour drain time, you might have something like a quarter of an inch. If you take .9 imperviousness in a 40-hour drain time, then you have something like -- and I forgot to write it down. I think it's .47. So you get a range of numbers depending on what you use.

What is our position? Our interests in the building industry are a little different than those of the cities because we're the ultimate target. The industry has supported the municipal BMP because we share an interest in a workable program. We support the joint development of numerical design criteria. Our engineers, just like the engineers in the cities, like to design to numbers but we want to be part of the game. And so we want to work with the various players so we have numbers that work in the two permits.

We're concerned also that the Clean Water Act is being refashioned into a tool to stop building and development. We're concerned that our builder members may spend time investing in structural BMPs right now and then as soon as the TMDLs are adopted, it's going to be determined those particular BMPs don't meet TMDLs so they're going to have to do something all over again.

We're also concerned about the impacts on housing costs and availability, and you'll hear much more about that later, but one thing that we do know is that affordable housing will become much more difficult to supply. One thing we haven't discussed so far is that homeowners associations may be burdened with some very long-term operation and maintenance costs.

The Regional Board is admittedly handicapped by staff and budget limitations. We talked about that a little bit already, but they should be providing good leadership based on sound science, and the fact that they're limited doesn't mean that they have an excuse for outgrading their own permit as was discussed earlier. The attempt was laudable, the process was not. From a planner's point of view, good intent does not equal good regulations. Doing something to do something to placate others might placate some critics but it doesn't generate respect for the regulations or the regulators. I think for the regulations to be successful, the regulated community should respect the regulators and the regulations.

We want our representatives of the major parties -- and this is a little repetitious. We want to sit down together. The regulated, the regulators, the environmental interests, sit down together and work through some numerical design criteria. One example,

R0073798

Florida had about 29 drafts or something and 100 TAC meetings before they adopted some regulations and they worked together to do it.

Another example is Denver. This one I find interesting was left off of Dr. Horner's list but was in the original presentations that we saw at the Regional Board. I'm not quite sure why it was left off the list. They've come out with a new manual and it could be the numbers I mentioned before that didn't match exactly, but this revision -- and it's a revision, not a new document. It took over a year with an advisory committee, had lots of input, and it's basically a design manual with policies set by each jurisdiction.

A term that someone used already, one size does not fit all. There are a lot of problems in an urban area and trying to make one particular size fit. This says -- this particular quote talks about watershed loading. We have that coming. They're called TMDLs. So this whole idea of one size fitting all is a real problem and we actually talked about watershed configurations. The permit talks about that too, but we didn't get into that in this process.

One of our concerns is that the Regional Board -- neither the Regional Board nor the Executive Committee focused on the nexus between water quality standards, in other words beneficial uses, and water quality objectives and these criteria.

We requested several times that the Executive

Officer or staff convene meetings with interested parties at the same table, and it appears that because the environmental group said they didn't want to meet with us -- I can only talk about from a personal perspective -- because I was told directly by one of the attorneys present in the room that they didn't feel they had a need to meet about it.

One of the things that we're concerned about with this process is we think it's doomed if you don't bring the knowledgeable participants together. That means engineers -- and I'm not one, I'm a planner so I don't fit into that category -- the developers and the builders. If they're left out, it's just plain not going to work.

We're also concerned that the Executive Officer -- neither the Executive Officer nor the Board itself paid any attention to our basic premise that it was really appropriate to take this process, follow the process that was in the permit and work together to put numbers in the next permit cycle, which I think was what Alexis said is only 18 months away, and the report of waste discharge is next February. So it wouldn't delay us very much in the process that the Regional Board, or the Executive Officer, has said may take us a century because we're dealing at the margins and in redevelopment and new development. So there is time. You're not losing much to do the process right.

Another concern of ours is that when the

Southern California Association of Governments offered to use its good graces to pull the people together, it didn't work. The municipalities came. One of the staff members for the Regional Board came at least once. The building industry was there. WSPA was there. Other industries were there, people who were invited. The environmental community chose not to participate. So the SCAG folks were trying to explore could they help us in some way with this regional question that Mr. Brown has asked about earlier.

We were sitting down to try to figure out how to do something, to have a mix of regional and on-site perhaps. Basically the Regional Board had an ad hoc process instead of following the process laid down in the permit. I must say that Dennis Dickerson was very gracious, made himself available, but he did not establish that process to bring us all together, and that was quite frustrating. And I think he understands how frustrated we were about that.

One of our other process concerns, and this is from a planning process, is that during that January 26th meeting it became readily apparent that the staff and Board Members had a different document than we had in the audience. That was really disconcerting. There had been a revision the night before that the audience members did not have and that was a problem.

There was also a bit of incomplete staff work and that's because of the time limitations. I think in the written document I included several examples and I'd just like to mention one. That's that environmentally sensitive issue. Early in the process various of us drew attention to it. It was a three-prong definition. At first we didn't have the maps, we didn't have the lists, and what we were envisioning is this sort of vice business of coming from this side and this side and some other direction, and conceptually everything could be incorporated. It turns out it's not quite that bad.

We didn't see what came out when Dennis approved it. That was not before us before the January 6th hearing where he was asking the Regional Board to direct him to approve the SUSMPs that he had done, not the ones the cities had done.

Also we were really concerned about what constituents of concern he was really addressing or they wanted to address because different BMPs address different pollutants of concern and we're sitting here waiting, just watching the TMDLs come down at us.

So we were proposing that maybe we look together to put together a program in this SUSMP framework that would get us towards addressing the 303-D list because we have some 700 segment pollutant combinations here in 90 group TMDLs in 13 years. So we know we're going to be doing more. The problem is could we use this process to work towards that one. They didn't want to.

One of the things that also bothered us was numeric design criteria that were developed thoughtfully in other parts of the country were taken, brought out here. We didn't do piloting, we didn't peer review them and they were put in by the staff in the SUSMPs. In those other areas there was testimony that's in the record by Bob Collacott who personally called the various entities and it was from two to six years spent developing those programs involving the regulated community, and that was the problem.

Also one of the things that was surprising to us is that as we were going through this process and we reached that critical date on January 26th, the County has not yet determined how to implement its settlement with the NRDC. They now have. I understand there's a manual. There's a workshop day after tomorrow, so we'll get to see the manual. So they have an idea how to implement it, but it was very complicated on how to figure out how to do the types of projects and it will be interesting to find out what they determined they can do, but it had not been done and the Regional Board was giving its directive to the Executive Officer to adopt the SUSMPs.

The Regional Board and the Executive Officer really appear to be more interested in doing something rather than in following an orderly, technical, scientifically sound process, and that from a planning point of view was really disheartening because there had been other things like the urban development TAC of about four years ago that Mr. Gold and I were both on. I think we spent about a year working through that. This wouldn't necessarily take a year, but the process was not followed.

One of the things that came up earlier in some discussion was the state general permits, and I have perceived that the State Board-issued general construction permit is being confused with the Regional Board-issued municipal permits in part because as you know, your own permit, the general construction permit in section ten has BMPs in it and those do have to be -- it's strengthened with the latest revision and the Regional Board has responsibility to enforce those permits and it seems like it's being used to shift responsibility from the Regional Board to the cities, that is the SUSMP.

What would constitute regulation based on sound science? One of the things that we think needs to be done is look at the beneficial uses in the receiving waters. That was mentioned earlier by Ray Tahir, and even if you only want to go that far, at least look at the identified water quality impairments and get at those.

One very practical thing that could be done -- it was a question I think Mr. Brown has asked earlier. What would you do -- one of the things I would like to see you do is advise the Regional Board or involve yourself to convene an advisory committee similar to the public advisory committee that you have for AB 982. That one is a little contentious but it has 24 members, environmental communities, and I know there have been some problems but it does get people to the table. And that could be set up differently, but we need that sort of mutual working together.

I think we need to review what's been done elsewhere in the country and review it together, not just have Rich Horner's survey and documents I have and other people have, but to really sit down and go through them maybe one at a time and say what's applicable here, what's not applicable here. I think we could view the staff proposal, that is the numeric part, as sort of an interim guideline and conduct pilot projects. I don't mean adopt it and say you're going to come back and change it. Adopt the SUSMPs as they were submitted by the municipalities and there could be this guideline that says you think it should perhaps be .75. I gave you numbers earlier that said it could be less than that. Do some pilot projects and you've got six watersheds in this permit and do it by watershed.

Require the L.A. co-permittees to follow a process similar to the one that's in the current permit. In other words, have them implement what they were not allowed to do, and that is in the report of waste discharge they tell what you performance standards are needed. In the next permit cycle they work those out. That's what the current permit says.

Basically permit cycles should come first. This quote from the Florida plan or from the document conveying it, you do performance standards before you establish design criteria. We haven't followed that and we're doing it kind of backwards.

Design criteria obviously include many factors that have to be considered. Cost and effectiveness are important and we don't have the answers. I'll give you a couple numbers in a minute, but we've had various cost estimates. We really haven't sat down at the table and worked them through together. It's almost like apples and oranges sometimes.

There was one particular one that was almost a joke, and I think the staff may have got it from the city. I'm not sure, but $33 to maintain retention basins. Most maintenance crews can't even get out to a basin for $33, so there was some slight problems we had with those numbers.

Numbers from elsewhere, Texas is estimating at about 3 to 5 percent of the basin construction cost in constructing BMPs are needed for maintenance, and Florida has estimated it takes about 5 or 10 percent of the land area to comply with their rules. Granted, that's partially flood control, but if you get into the control of the peak discharge, that's about the same thing.

Some generalized numbers, these came from a newsletter that was, I think, referenced earlier. What the costs will be, we don't know exactly because we don't know what BMP would be in there, but if you take something like a media filter, which is turning out to be very costly to construct in California because of our earthquake standards, something like $27,000 an acre served. So you can figure that out for whatever size project and whatever density. Infiltration basins, about $20,000. Filter strips, in other words grassy strips where you have to worry about level grade so the water can flow in evenly, about $17,000. Swales are cheaper, about $10,000 per acre served. Detention basin, about $10,000, and then you get down to the inlets or inserts that were mentioned earlier.

What do we recommend? We recommend that the Regional Board convene that Technical Advisory Committee I mentioned, have equal numbers of environmental, regulated, industry folks to advise the Regional Board and the Los Angeles co-permittees on performance standards, et cetera.

We further recommend this TAC should include representatives of SCAG and perhaps the State Board because as mentioned earlier, this could be a precedent. It's obviously going to be because San Diego is considering it and the L.A. Board is considering it for Ventura. And grant the petition. Order the L.A. Regional Board to order the July or August one and then proceed working towards the next permit.

Any questions?

MR. MONTEVIDEO: Mr. Chairman, I'm curious that the questions that occurred in the last were -- do we have any leeway on the two and a half minutes?

BOARD MEMBER SILVA: Just a real quick question. Relatively how long would it take to form this committee and come up with a recommendation?

MR. WATSON: I don't think it would take very long to form the committee. You just have to say who you want to have on it and delegate some names of representatives.

BOARD MEMBER SILVA: Given the (inaudible).

MR. WATSON: You have the Executive Advisory Committee and they could name -- you come up with a number, they could name people, industry representatives could name some people, and we would want to be there.

The question is how long would it take to come up with an agreement and that if you've got a whole bunch of standards to review, if you review them properly, it will take a little bit of time, but the framework for the process is there.

The existing permit says that the permittees should assess what performance standards are needed, include that with the report of waste discharge in February, and then in the next permit cycle work through all the details. So you have a process, it just wasn't followed.

CHAIRMAN BAGGETT: Thank you. Two minutes and 46 seconds.

DEE ZINKE,

having been previously sworn, testified as follows:

STATEMENT OF DEE ZINKE

MS. ZINKE: Hi. My name is Dee Zinke and I'll endeavor to be as brief as I can.

MR. HELPERIN: I'm going to have to object. We were not informed of this witness. The only witnesses that Mr. Montevideo designated were himself, Ms. Clark, and Mr. Watson.

MR. MONTEVIDEO: Actually, Mr. Chair, I didn't even designate myself but if I could be heard on the issue. The notice that went out by the State Board did not require that the individual witnesses be identified. The regulations allow for that but do not require it.

Because the notice did not ask that we provide the names of all the witnesses, we did not do so for fear that nobody else, everybody else would do the same thing and not provide the names of the witnesses. According to the notice that was sent out by the Board itself --

CHAIRMAN BAGGETT: I'll overrule the objection but you are limited to what testimony was submitted as evidence. The witnesses cannot speak beyond what was submitted. You are down to two minutes and 46 seconds.

MR. MONTEVIDEO: If we -- Mr. Chair, if we have -- unless -- if we can get some stipulation on additional time, I would be more than willing to grant additional time.

CHAIRMAN BAGGETT: If the other petitioner wants to use its time, do you plan --

MR. WELCH: We would be happy to yield some time.

MR. MONTEVIDEO: 20 minutes?

MR. WELCH: We'll give you 20 minutes of time.

MR. LEON: One point. We had asked at the beginning of the proceeding to have Alexis Strauss named as one of our witnesses and that was not allowed.

CHAIRMAN BAGGETT: That was not allowed because her testimony, there was no evidence or testimony submitted in your brief and submitted to the Board. I think petitioner has produced significant information, evidence which I assume the witnesses are speaking to information.

MR. MONTEVIDEO: Correct.

CHAIRMAN BAGGETT: On the record, and I think that's the difference.

MR. HELPERIN: Mr. Chairman, if I may. For the record I do find this objectionable and on the basis of basic equity, on the basis of unclean hands, on the basis of waiver, on the basis of estoppel. Mr. Montevideo was able to preclude a representative from the Environmental Protection Agency from speaking to this Board on information which there was no reason to believe was outside the scope of the submitted testimony that was submitted by the Regional Board, solely because she was not named.

These witnesses were not named. Mr. Montevideo in fact stated that part of the reason why Ms. Strauss should not be allowed to testify was because he was not aware she would be testifying and, therefore, he could not appropriately prepare for cross-examination, to examine her with respect to her credentials or her experience. That is certainly true with respect to these witnesses --

CHAIRMAN BAGGETT: You'll be allowed an opportunity to cross-examine. I'll still overrule the objection.

MR. HELPERIN: For the record, I would also like to object to the transfer of time from the Western States Petroleum Association to the cities. I don't believe that it's appropriate for one party to be able to speak longer simply because another party has less time.

CHAIRMAN BAGGETT: If you would like 20 minutes, we can talk about it.

MS. ZINKE: Thank you. I hope it does help that you do have my outline identifying my name and my position for the Association.

I'm Dee Zinke. I'm the Executive Officer for the Building Industry Association for the greater Los Angeles and Ventura Counties, and I come before you today to talk about the issue of affordability in housing and to clearly identify the unintended consequences for this (inaudible).

Less than one half of the Los Angeles families earning a medium income can afford a medium priced home today. This is 20 percent below national levels. For every $1,000 added to the price of a home, 25 families are priced out of home ownership in the state of California. At any given night here in the southland, 100,000 people do not have a place to sleep at night that they call home. 50 percent of those are children and 50 percent of those are children under the age of five.

As population increases, this housing crisis continues to worsen. Last year Los Angeles again posted the highest population gain of any county. Housing this population is a very real challenge. The regulations that were proposed and adopted by the L.A. Board do not take into account any variation in housing type. Ten units of single-family detached housing are treated the same as ten units of multi-family condominiums. This is a one-size-fits-all eat-it which shows no sensitivity to affordable and (inaudible) housing.

43 percent of all California families rent rather than own their own homes and renters face the greatest affordability challenge right now. In Los Angeles and Long Beach area, 51 percent of renters are paying over 30 percent of their income for housing which is the standard that we look to. In addition to that, our renters -- and when you look at who we're talking about, 59 percent of African-Americans are renters; Latino population, it's about 57 percent, and this is significantly different than the Caucasian population

that is an issue of significance to the minority communities.

Worse, the proposed regulation hits in-fill hardest where land is scarce and expensive. Most in-fill projects are site-constrained. Site-specific volumetric controls could become a major expense for these projects. According to the Department of Housing and Redevelopment's recently issued report, Raising the Roof, most of the state has enough land capacity to accommodate housing needs, except Los Angeles. Let me repeat that. Except Los Angeles County.

We hear a lot lately about environmental justice that was said earlier this morning and assuring that our poor and minority communities are getting a disproportionate share of pollution. In this case it's the redevelopment projects, the areas which are most in need of urban renewal that are disproportionately penalized by the cost of imposing this proposed rule. Once more, the inventory of in-fill land contains many contaminated sites and there is absolutely no recognition of the environmental benefit of cleaning up of these sites for the health of the watershed.

We'll all be interested in encouraging job centers, i.e., smart growth. This rule makes it easier for land-rich to comply but extremely difficult for urbanized areas. The result is low income or moving out, causing other environmental problems. According to the California budget project report, "Locked Out:

California's Affordable Housing Crisis," families seeking affordable housing are being forced to move out of metropolitan core areas creating longer commute times, greater air pollution and loss of open space; or the alternative is that they're moving in together, burdening our already overstressed infrastructure.

New York Times in February reported in an article about the San Gabriel Valley that low incomes and high housing costs have led to widespread overcrowding and used an example of ten people paying $100 each to live in a single trailer. In another recent article about the crisis in housing Councilman Mike Oferra (phonetic) was interviewed. He stated that hundreds of thousands, maybe as many as a million people, in our city live in substandard housing conditions. Most of these people are kids. One in seven people lives in overcrowded housing conditions.

Studies indicate that children who live in overcrowded or substandard housing are more likely than adequately housed children to suffer a variety of health problems, and that was in the "Locked Out" report as well.

There isn't a builder in this room that advocates we should be exempt from water quality standards where at a minimum affect (inaudible) long-term best management practices, which I think it continues to be ignored in the testimony. We're interested in practices to improve the quality of water run-off in addition to our construction management practices.

What is absent in this permit is flexibility to address the broad variation in development from rural to highly urban dense areas, from high and luxury housing to affordable low income housing, to allow regional solutions versus site-specific solutions.

You have several options before you today. We would urge you to work within the appropriate permit process and move forward with a program that encourages the most effective BMPs that actually serve to clean the water. If you wish to pursue, or in this case support, the Regional Board's numerical standard, what we would like to do is again reiterate using the next 15 months or year to actually develop the evidence and accepted engineering standards that demonstrate and improve water quality.

Right now we are engaged in and support water management efforts and as a result have an affinity for regional solutions to protect the health of the watersheds including habitats and estuaries and bays.

California is now in its eighth year of providing less than half of the homes needed to shelter its population. That is 125,000 units a year we're short or up to a million up to this point for the existing population. Los Angeles population is expected to grow from 9.8 million to 11.2 million by the year 2010. It is a fallacy to assume that we will address the impact of this population through constraints on new housing.

If we increase the cost of housing and price people out of the market, there will be greater environmental degradation as our sewage, water, waste treatment infrastucture is overtaxed beyond its intended capacity. We believe this is a very real unintended consequence, adding cost to the housing in the urban and affordable housing markets.

The job of the Regional Board is obviously to improve and protect water quality yet fail to fully understand the impact on housing in that process. As stated in the last hearing, shelter is considered one of the most important basic needs, but clean water is no less precious. If more children are priced out of a home because we are guaranteeing them clean water to drink, I will sleep better at night. Right now I don't believe that those merits stand to achieve that goal.

We still maintain that the clean water initiative, which is a program that was proposed as a coalition at the last Regional Board hearing where all stakeholders work together, goes much further to addressing our water quality needs as a more appropriate process to address appropriate changes to standards readopted in July of 2001.

Thank you.

CHAIRMAN BAGGETT: Thank you.

MR. HELPERIN: Mr. Chair, I would like to lodge the same objection with respect to any witnesses the Cities of Bellflower, et al. proffer.

CHAIRMAN BAGGETT: Overruled also.

ILENE ANSARI,

having been previously sworn, testified as follows:

STATEMENT OF ILENE ANSARI

MS. ANSARI: First of all, I'm Ilene Ansari, Mayor Pro Tem for the City of Diamond Bar. I have six pages of testimony, but on the basis of making it short, I'll try to explain the issues that are of concern to cities.

CHAIRMAN BAGGETT: We have your testimony in the record already?

MS. ANSARI: You have my testimony in the record. I am Mayor Pro Tem for the City of Diamond Bar. I am also on the biodiversity council because this is of importance to me. I'm vice chairman of the Energy Environment (inaudible) for SCAG and I was the chairman of the NPDS committee. Before I ever became an elected official, I was an environmental activist and I'm also by profession a registered nurse and a former associate professor of nursing. So let me get those on the record.

The concerns that we have as elected officials is first, the unfunded mandate. And the concerns that we have as elected officials, my City of Diamond Bar has 58,350 people. We are a contracted city. We are a very mean, lean city and this is concerns that we have.

We're concerned about the Clean Water Act and we're concerned about the comments that were raised at the meeting that was held on January 26th. When the staff of the Regional Board recognized the significant expenditure of the MS-4 program and mentioned the fact that the financing of the program offers a considerable challenge for municipalities, a proven successful mechanism is the establishment of stormwater utility fees which are assessed on the property owner based on stormwater run-off generated from the site. And I will not go into detail on this.

The problem that we have is we are extremely limited by law with Proposition 13, Proposition 62 and Proposition 218. We would have to run a utility user tax in order for us to reach the mandate of this requirement of the NPDS. Right now, as it stands now in the state of California, 60 percent of the cities have been able to pass utility user fees. But in L.A. County, only 40 percent have been able to pass those utility fees. So that is very difficult for us to be able to do in our city.

We as cities do not have the discretionary funds or monies for this. My city of 58,000 has a budget of $10.2 million. As it was stated at one of the meetings, and when I questioned them two years ago at a seminar that was held at USC, I was told the fee would be anywhere from $4 per person to $11 per person. If you go by the amount of people that we have in my city, that's over $650,000 a year on a budget of about $10 million.

So we are concerned about how we are going to reach the stormwater run-off.

The other issue that we have is the lack of scientific basis for this, and we have concerns with this. This is going to be environmentally sensitive for our city or is going to have other problems similar to what MTBE had, and we'll find out afterwards.

What we want to do is work with the entities so we can come up with a permit that deals with all of us. So what I'm asking you to do is please mandate -- if you mandate the SUSMP, I wish that you use verifiable scientific data and that such a plan be funded by the state of California as required by the California Constitution. Under the Porter-Cologne Act, you're required to do a cost analysis of how much it's going to cost the cities. We in the cities want to work together for clean water. That's what we want for our children. I as a nurse want that. I don't want health issues, so let's work together.

Thank you.

MR. MONTEVIDEO: For the record here's a copy of her testimony.

MS. JENNINGS: Now I have a problem. I know the Chairman said we had a copy, but I couldn't find that. Are you saying you're trying to submit testimony today right here? You know that was not allowed. She can make the remarks she made, but my recommendation is testimony clearly can't be admitted right now.

CHAIRMAN BAGGETT: I assume from representation of counsel --

MS. JENNINGS: We did not have that?

MR. MONTEVIDEO: You did not have that. I was curious because she shortened her comments.

MS. JENNINGS: He just assumed that you had --

CHAIRMAN BAGGETT: That was the representation of counsel earlier. If that's not the case --

MR. MONTEVIDEO: You had it at some time, but that's --

RAY PEARL,

having been previously sworn, testified as follows:

STATEMENT OF RAY PEARL

MR. PEARL: Good afternoon, Members of the Board. My name is Ray Pearl, Deputy Director of Government Affairs for the Greater Los Angeles Building Industry Association. I'm going to cut my comments down significantly but start off by saying we in the building industry continue to be frustrated and dumfounded by the Regional Board staff, that they took us down the numerical standard path. They have put the cart before the horse by saying let's solve some unnamed problem with some kind of solution and we'll figure the rest out later. That doesn't make sense. That's not only bad science, it's also bad policy.

How about defining the problem? Which

pollutants do you seek to reduce? What are the non-point sources that generate these pollutants? Why not develop policies that will actually reduce pollution from these identified sources? No one, including Regional Board staff, has yet to cite a single study that shows how this proposal will be effected in Los Angeles County.

From the very beginning we have had one simple, basic question. How will we measure if we abide by this new requirement if we have successfully achieved water quality? We asked Dennis Dickerson that very question. His answer was there was absolutely no way to know. In a meeting we held with him, his exact words, and you've heard them alluded to before, these were Dennis's words, were that we, quote, "Just have to do something." That statement from a public official is unbelievable and sad. That is absolutely no way to conduct sound policy. It does, however, illustrate one of our main concerns.

This policy is a shot in the dark and has no chance of achieving water quality. This policy attacks the home building industry. And if you are to believe Heal the Bay and others, that alone will solve our water quality problem. The Regional Board sought to address one minuscule, microscopic portion of the stormwater run-off issue. What good is it to clean water only from new development if nothing has been done to address the millions of people already living here?

I want to stress we've been here before and where we were with the Air Quality Management District.

In the early 1990s, they pinpointed development as a major source for dust contributing to air pollution in the southern California area and they sought to heavily regulate our industry. After extensive studies, however, the determination was made that development's impact on air quality was much less than originally assumed. The original assumption was that development was two-thirds of the problem. After conducting extensive local studies, it was determined that new development was roughly 9 to 11 percent of the problem. Quite a difference.

The AQMD therefore focused its efforts elsewhere because of real world evidence in the southern California area. That is all we're asking for in this situation. Why are we afraid to be more thorough?

You are also under a serious misconception if you believe the environmental rhetoric that this proposal will keep beaches open and drinking water safe. It will not clean the bay, it will not keep beaches open and make water safer for aquatic life. As long as I've lived in southern California, I've only heard of beaches being closed because of oil spills, sewage and medical waste. Beaches are not closed because new homes are built.

My final question is this: Based on sound science, what specific contaminants does the Regional Board attribute to new housing? Unfortunately the answer is still unknown and not addressed in the proposal.

Lastly in my presentation, I have asked a number of serious and basic questions. You may believe them to be rhetorical, but they are not. We met with Dennis Dickerson and Xavier Swamikannu on three different occasions. On October 25th, 1999, we met with Dennis and Xavier. On November 12th, 1999, we met with Dennis by himself, and again with Dennis on January 24th, 2000.

I want to stress once again that every single one of the questions I've asked in this presentation were asked of Regional Board staff. They have never to this day been able to provide us an answer to a single one of those questions. I hope you will ask them why. Maybe they will answer your questions.

Thank you.

MR. MONTEVIDEO: We have Mr. Desi Alvarez to provide some testimony.

DESI ALVAREZ,

having been previously sworn, testified as follows:

STATEMENT OF DESI ALVAREZ

MR. ALVAREZ: Good afternoon, Mr. Chairman and Members of the Board. I'm Desi Alvarez, Director of the Public Works for the City of Downey, also Chair of the L.A. County Stormwater Permit (inaudible) Executive Advisory Committee.

The permit has various provisions and requirements aimed at improving overall run-off of water (inaudible) process (inaudible) which requires the preparation of SUSMP. The permittees submitted a SUSMP to the Regional Board that met all the requirements of the permit and it was a result of much effort and anticipation of many constituents. This SUSMP was, in fact, an economical approach to reducing the amount of pollution generated from urban areas.

However, the SUSMP was not considered by the Regional Board and no formal action was taken on it. Instead, it was replaced by one which was and does not have broad support, and most importantly is neither practical nor economical and unfortunately did not result in improvements in water quality.

The SUSMP adopted by the Regional Board fails to take into consideration the diversity of land uses and development activities in Los Angeles County. It is a treatment driven approach with little scientific basis. Any plan that will require the application of (inaudible) technology should be based on adequate study to demonstrate effective removal of pollutants that are typical, that is local conditions. The technology should be based on clearly defined parameters representative of that found in local run-off and sets amounts of pollutant removals that is expected. This was clearly not done. None of the testimony that was presented to date, presented here, will provide this information.

The SUSMPs adopted by the Regional Board require the use of (inaudible) technology. They're not specific about what technology to use. In effect, we do not know if any of the technologies that will be used will do anything to remove any significant amount of pollutants. One thing is certain. They will place a financial burden on every sector of our communities and lead to a whole series of unintended consequences that we have yet begun to figure out.

The SUSMP submitted by the permittees not only met all of the L.A. County municipal stormwater requirements, but actually took advantage of a proven approach to reduce the amount of pollutants in stormwater. The Plan would implement the use of best management practices that could be tailored to specific needs of individual communities and would result in reducing pollutants (inaudible) consistent with the requirements of the Clean Water Act.

It is a plan that makes sense and a plan of which we are supportive. We are asking that you basically request the Regional Board to implement the SUSMP as was submitted by the cities and would be happy to work with them on additional modification with the support of a broad-based community, not just a small group of organizations.

Thank you.

EXAMINATION

BY BOARD MEMBER BROWN:

Q. Has L.A. County performed any studies, investigations to determine why the beaches were closed?

A. Why the beaches were closed? Generally the beaches were closed because of high pathogen counts.
Q. Have they done any study to try to determine the cause?
A. It's generally sewage spills, or one of the things that you do see in stormwater is high bacteria count and that comes from many sources. A lot of those sources --
Q. My question is have you done any technical studies to determine what the problem is or what's causing it. My understanding of what you're estimating, your estimation probably is true. I don't know. Have you done any scientific analysis or study?
A. I'm not familiar with any specific studies.
Q. The next question is would the County do such a study now that the problem has been brought to light. More specifically would the County, in your opinion, be a good, responsible party to try to determine why your beaches were being closed?
A. The County may be a good party to do that. I would agree. They would be one party. There are other organizations that may assist in that effort.
Q. I understand, but somebody's got to go on point here if this state doesn't. It would seem like the County would be an alternative for consideration to go on point and be a responsible party to try to determine what the cause is and to prevent it.
A. I would hope that they would, but not being

R0073826

part of the county organization, I can't speak for them.

Q. Has it been discussed?

A. To answer your question directly --

Q. That's fair, but has it been discussed within your group, within your own --

A. I think that the County has taken a leadership role in this permit. They have funded a lot of the monitoring requirements and I think they would probably be available to assist in the study. That's the best I can do for an answer.

Q. Can you get an answer, do you think?

MR. MONTEVIDEO: Maybe by tomorrow.

BOARD MEMBER BROWN: Thanks.

MR. MONTEVIDEO: Barbara Ferraro.

BARBARA FERRARO,

having been previously sworn, testified as follows:

STATEMENT OF BARBARA FERRARO

MS. FERRARO: Hello. I'm Barbara Ferraro. I'm a Councilmember in the City of Rancho Palos Verdes and I'm here to express some of our concerns about the SUSMPs that the Regional Board adopted in January. I'm going to make this very brief.

One of the aspects of the new regulations that will have a great impact on our city is how they have designated areas as environmentally sensitive. This is important to the City of Rancho Palos Verdes because nearly the entire City of Rancho Palos Verdes is within an area designated as environmentally sensitive. That's right, the entire city.

Our staff has read and reread these regulations and asked the Regional Board whether virtually the entire city is within this environmentally sensitive area and have been told that it is. The problems come when we have a person -- we have mostly in-fill left. How can a person simply installing a new roof have to include a detention basin as part of their project? We feel like this is quite unreasonable. My colleague John McTackert (phonetic), who is also a Councilman in our city, and our Public Works Director are also here. And if you have any questions, they would be happy to come up and answer them.

I want to point out that we believe it is to everyone's benefit to improve the quality of water. No one is more conscious than we are, having seven miles of coastline. We understand very well the importance of these regulations. However, the way they've been proposed they're not really workable. They're too far reaching for our residents.

I urge you to request your staff to work more closely with members of our staff, with the cities, to prepare regulations that can be reasonable and attainable.

Thank you.

CHAIRMAN BAGGETT: Thank you.

MR. MONTEVIDEO: Mr. Chair, that concludes my presentation. Thank you and thank you to counsel for WSPA.

CHAIRMAN BAGGETT: Let's take five.

(Recess taken)

CHAIRMAN BAGGETT: Let's reconvene.

I have a question for counsel here. Since we just finished the first case-in-chief, maybe this will help simplify it a little bit for some of the witnesses. Which witnesses do the other parties intend to cross-examine? If there aren't any you're planning on cross-examining, we can dismiss them now and they can go on their way. Maybe you can contemplate that.

Do you have any of the petitioners' witnesses you will cross-examine? There's seven of them. We've already done Mayor Clark.

MR. WELCH: I don't think we have any cross-examination of the co-petitioners' witnesses.

CHAIRMAN BAGGETT: Think about it. I'm sorry. I'm trying to help move the process along here. I'm not proposing we do this cross-examination now.

We'll go back in recess.

(Recess taken)

CHAIRMAN BAGGETT: We'll reconvene.

MR. FLEISCHLI: I was just going to point out that we have discussed this and have no cross-examination questions for Ms. Ansari, Mayor of Diamond Bar, but we would like to have an opportunity to cross-examine all the other witnesses.

CHAIRMAN BAGGETT: Okay. So I guess you're excused. With that, let's reconvene and get on with the next case.

LYMAN WELCH,

having been previously sworn, testified as follows:

STATEMENT OF LYMAN WELCH

MR. WELCH: Good afternoon, Mr. Chairman and Board Members. My name is Lyman Welch appearing on behalf of the Western States Petroleum Association. We are here for a specific reason that's different than much of what you've heard this morning and this afternoon.

The Western States Petroleum Association, or WSPA, is here because the SUSMP requirements implemented by the Los Angeles Regional Board will have a considerable impact on new and redeveloped retail gasoline outlets in the Los Angeles region and potentially in other regions of California as this program is implemented elsewhere.

Retail gasoline stations have a special circumstance that's different from any of the other developments that are covered by the SUSMP regulations. Gasoline stations are typically found in urbanized areas. They are located on small parcels of land, and the nature of their operations requires that they have gasoline and motor oil present to dispense to cars and vehicles that come through.

When running a gasoline station, it's important to prevent any contamination of the subsoil or groundwater from spilled gasoline or motor oil that happens, and gasoline stations take extensive precautions to try and prevent any groundwater contamination. For example, gasoline stations typically have an impervious surface, concrete, throughout the area of the gasoline station just to prevent infiltration of gasoline or spilled product into the subsurface or groundwater. This is just one of the steps that gasoline stations take to prevent groundwater and the soil from being impacted.

Now, the SUSMP, one of the -- in fact, the major concern that WSPA and gasoline stations have with the proposal is that the proposal requires gasoline stations to either infiltrate their run-off or to treat their stormwater run-off. And as I've noted, infiltration of run-off simply is not practicable for the retail gasoline stations.

To prevent groundwater contamination, they need to have solid concrete surface and there's no potential for infiltration of stormwater into the ground as a potential remedy for any stormwater pollution.

Keep in mind that the Clean Water Act under which the SUSMP was implemented requires that the BMPs are developed -- were to the maximum extent practicable. When you're looking at that requirement, that doesn't mean that you have to put on every single kind of possible treatment device that is known to man. You have to look at the cost-effectiveness of particular BMPs and you need to look at whether they're effective at all, and you need to look at health and safety concerns that are relevant to different types of management practices.

The Western States Petroleum Association has taken a very proactive approach to stormwater contamination in gasoline stations. Back in 1995, you'll hear that WSPA ordered a study to specifically look at all of the different types of best management practices that could be used by retail gasoline stations to prevent or reduce stormwater run-off containing pollutants.

The different types of best management practices -- and you've heard some of this today. They are -- management practices or operational procedures are one type of BMP that can be applied. And those types of operational procedures have to do with things like sweeping the ground, posting signs at your gas station, tell people not to top off their tanks when they're filling gasoline, and other types of management procedures that can be implemented day-to-day by people who are working at the gasoline station to prevent spills which could run off in the storm event. Now, those types of source controls can be very effective at preventing stormwater run-off pollution.

You'll also hear there's a second type of control, a structural control that you can implement where you design your site so that the stormwater runs off in a particular way to prevent pollution, and in particular gasoline stations you'll hear one method of structural control is to design your fueling station so that any spills won't easily run off of the fueling area and that stormwater can be directed away from the fueling island area so that stormwater which comes onto the site from nearby locations won't interfere with any or won't pick up any contaminants from the fueling island.

There's a third type of best management practice which I'll call treatment controls. Those are using devices such as you've heard, sand filters or inlet filters, which actually instead of reducing the pollution at the outset try and treat it if you have a spill and something gets into the stormwater.

Now, WSPA looked at all of these types of best management practices or BMPs, and as a result of the study in 1995 and 1996, you'll hear they found there were a number of operational procedures and source controls that were effective at controlling stormwater pollution. You'll hear there are a number of structural controls that can be implemented such as using Portland impervious cement to prevent stormwater pollution. They found that those can be very effective in preventing pollution from gasoline stations. In fact, in studies that were conducted, the data show that when a retail gasoline station uses those types of operational procedures and structural controls that virtually all of the contaminants found in stormwater are below levels that would be of concern. So by using those two types of controls you effectively eliminate the pollutants from going into the stormwater levels that are of concern.

Now, the third type of treatment system was also looked at by WSPA, and you'll hear that the different types of treatment systems that are available that can practically be used in a small area of a retail gasoline station where you have these requirements for an impervious surface, those types of treatment systems, the data show -- there's really no data to show that these treatment systems actually work.

After WSPA concluded its study, later it became involved with the California Stormwater Quality Task Force. As you know, the California Stormwater Quality Task Force is a regional group of regulators and other interested parties that got together and took an independent look at the requirements that can be used at retail gasoline stations to prevent stormwater pollution.

In 1996, a working group got together -- and you'll hear more about this from some of the people that were involved in this working group -- and together with representatives from the Regional Board staff and from the State Board staff they came up with what's Exhibit A to our attachments, a best management practice guide for retail gasoline outlets.

This best management practice guide was designed to offer guidance throughout the state, not just particularly limited to one area like the Los Angeles region but throughout the state, to all retail gasoline stations, and not only new gasoline stations or modified gas stations, but even existing facilities. This best management practice guide contains recommendations for procedures that can be applied across the board.

You'll see that the best management practice guide incorporates the operational procedures as well as the structural controls that I mentioned earlier, and that you'll also find the stormwater task force that looked at treatment devices found that there wasn't enough data and they weren't justified by peer review to support using treatment devices in retail gasoline stations since the operational procedures and the structural controls, if applied properly, would prevent any significant stormwater run-off problem.

So we have this guidance that was developed by an independent party that took an objective look at the requirements that should be used as BMPs for retail gasoline stations. In the process when the Los Angeles region was developing the SUSMP proposal, representatives from WSPA appeared before the Regional Board and submitted writing in August of 1999 that referred to the work they had done, including the best management practice guide, and also appeared at the hearings in September and January before the Board and again expressed WSPA's support for application of the best management practices the stormwater quality task force had developed.

WSPA supports the best management practices in the stormwater practice guide, both the operational procedures and the structural controls, and urged that the Regional Board consider that. Well, surprisingly, although just a year ago when SUSMPs were considered, the Regional Board in that proceeding referenced the best management practice guide from the stormwater quality task force. In this case just recently, a few months ago, you'll find that when the final SUSMP proposal was proposed by the Los Angeles Board, you'll see in Section 14, Table 1, pages 16, 17 and 18, the Los Angeles Board has a list of a number of resources and references that people can look at for best management practices. And although the SUSMPs apply to retail gasoline stations, you can look all day through these suggested resources and you won't see the stormwater quality task force best management practice guide.

Why is that, especially when WSPA was present at the meetings and suggested inclusion of these best management practices? It's unclear why they weren't included when they were developed just to address this problem. They should have been included, and it's true that the SUSMPs proposal does include a few of the operational procedures that are in the best management practices guide but certainly not all.

The main concern that WSPA has with the SUSMPs proposal is that the SUSMPs proposal requires treatment mechanisms to be included for retail gasoline outlets, but the data just isn't there to show that they are effective. There's no data to show they're effective in controlling stormwater pollution from gasoline stations. There's no evidence to show that they're necessary because the stormwater quality task force best management practices when applied properly are sufficient to control pollution in stormwater run-off.

The other concern that WSPA has is there was really not significant study to demonstrate the cost-effectiveness of the treatment BMPs that were proposed by the SUSMPs, and we know that basically what the Los Angeles region did is apply this one requirement that applies across the board. Whether you're a parking lot, a gasoline station, or a single-family home, you have to comply with the same requirement, but it doesn't look at the special circumstances that are faced by a retail gas station.

You've heard today and you'll hear from our witnesses that sand filters and compost filters require construction of an underground vault that presents risk of explosive gases and concerns of the workers that have to go in there. If you have a leak of product that goes into an underground vault, there is potential for contamination of media and a potential safety hazard. If you had a leak that gets in there and a car drives up, you could have an explosion.

By implementing the SUSMPs in the Los Angeles region and mandate that these underground vaults be installed at gasoline stations, from WSPA's perspective it's simply not a very well thought out idea to be putting underground structures in at a gas station which could promote gas and oil getting into the subsurface. We have had a lot of problems with underground storage tanks leaking and contaminating problems. Do we really want to have more underground structures that can lead to similar problems? We don't think that's the best idea. It is not a sound scientific approach, either. So that's what you'll be hearing from our witnesses here today, about the special circumstances that apply to gasoline stations.

Now, you may be also wondering what is it that we're asking you to do. You've heard today that there have been a number of procedural concerns and we certainly echo the concerns that the permit was not followed here. I think there's really no disagreement that the provisions of the permit were not followed, and we've also identified a number of other procedures that weren't properly followed that could have corrected some of these deficiencies. For example, the provisions of CEQA were not applied properly, the Administrative Procedures Act requirements were not followed, and the unfunded mandate procedures. If this is a discretionary act, there's no funding here for the cities to implement any of these provisions. There are a number of deficiencies that we've identified in our pleadings that are before you. I won't belabor them now.

So bottom line, what are we asking the Board to do? You have before you the California Stormwater Task Force guide containing best management practices for retail gasoline outlets. What we would ask you to do is to remand this matter to the Regional Board with directions that as for retail gasoline outlets, that they apply the procedures here in the best management practice guide as the BMPs that should be applied for the retail gasoline outlets in the Los Angeles region.

And as you've heard today, these same best management practices were developed by a statewide committee and can be applied throughout the state, so the direction that the Board gives today can be used in Ventura County, in San Diego and throughout the state of California. WSPA will fully support the application of these best management practices that have been developed for that purpose.

CHAIRMAN BAGGETT: Thank you.

MR. WELCH: Thank you.

BOARD MEMBER BROWN: Question.

EXAMINATION

BY BOARD MEMBER BROWN:

Q. You made two assumptions, Mr. Welch. First assumption is that if procedures are properly implemented that you had in place, there should be no spills of gasoline.

A. That's not exactly true. I think it's inevitable that at a gasoline station you're going to have some spills in the normal course of operation. What we are saying is that if the best management practices that are implemented in this guide which require a quick, prompt response to any spills that occur so that absorbent material is put down and then swept up and spills are managed when they occur, by implementing those types of procedures as well as having the structural controls that are included in here, those in combination prevent any significant quantities of pollutants from entering the stormwater from gasoline stations.

Q. The second assumption is that if there is a spill and it does go into a containment area of some sort, the concern is the explosion that could occur or other harmful reactions. Assuming that there is gasoline or product available to enter those containment facilities and that's not a good idea, what would you suggest be done for the product?

A. As I mentioned before, one of the procedures in the best management practice guide would be to put absorbent material down to absorb the gasoline. Keep in mind that this is taking place on an impervious Portland cement surface which would prevent the spill from getting in the ground.

Q. I understand and I concur with that. The assumption you made was that there was gasoline in the vessel and that's dangerous. So if you make an assumption that there's gasoline in the vessel and that's not a good idea and it got there somehow, some way, what would you recommend that would be done with that containment and how would you handle it?

A. Okay. Well, my assumption is that if the SUSMP treatment requirements are imposed and a particular system is designed which requires an underground vault such as a sand filter or compost filter we discussed earlier, you would have this underground structure. It's designed so that gasoline product would run into it. So as a result of the design of that system, you will inevitably end up with contaminated material.

If you -- if that were to occur, then you would have a number of concerns. First, with an underground structure there are particular health and safety requirements that would apply.

Q. That's not the question. The question is, if that's not a good alternative because of those reasons that you're mentioning -- and I'm not disagreeing with that at all. If that's not a good alternative and there is product that becomes available, what would you do with it? How would you handle it? What's your suggestion?

A. Perhaps I'm not in the thrust of your question. Our response would be to have a quick response to absorb the spill, contain it and clean it up on-site and not -- and by not requiring a treatment device that has an underground structure, you don't have this problem.

BOARD MEMBER BROWN: Thank you.

CHAIRMAN BAGGETT: You've got two witnesses still? Let me throw out the Chair's ongoing attempt to keep a harmonious atmosphere while deliberating. The last two respondents, you might want to consider doing your opening statements and your one witness each that cannot come back tomorrow and finish your case-in-chief tomorrow morning, if that's possible.

If the two counsel want to think about that, it might be one way to solve Dr. Gold's problem and not keep us here to where we aren't functioning as alertly as we should be. With that --

MR. WELCH: If there are no further questions.

CHAIRMAN BAGGETT: You're still on pause. Does that make sense?

MS. JENNINGS: Can I ask one question?

MR. MONTEVIDEO: We would not have any objection.

CHAIRMAN BAGGETT: There's no objection, but does that make sense? I know Dr. Gold can't come back and we can't stay until 8:00.

MS. JENNINGS: Maybe I could ask a quick question of Mr. Welch while they're conferring?

I wanted to clarify. In the BMP manual that you provided, you are aware of the disclaimer stating that none of the Regional Boards or State Board endorse that manual?

MR. WELCH: Yes. I am aware of the disclaimer, but it is and was designed as a statewide guidance.

MS. JENNINGS: By the industry, those -- you referred to them as regulators. It's by the industry and the cities like the permittees before us.

MR. WELCH: There were a number of people involved in the development of the stormwater quality task force guide. In fact, they're listed. At least the members of the working group are listed on page 1. I won't read them all.

CHAIRMAN BAGGETT: Staff for the respondents?

MR. LEON: Your proposal is fine by the Regional Board. In fact, what we would propose is Mr. Nahai is willing to come back tomorrow. He's the person we wanted to take out of turn. He is willing to come back tomorrow morning.

CHAIRMAN BAGGETT: So you prefer to do your whole case-in-chief tomorrow instead of tonight? Okay. If there's no objections, that's one.

MR. HELPERIN: Would that mean that we would be going before the Regional Board and changing the order then?

CHAIRMAN BAGGETT: It sounds like they're willing to wait. Does that present a problem to you?

MR. HELPERIN: Dr. Gold is not here at the moment.

CHAIRMAN BAGGETT: He's here.

So the Regional Board, that will be continued to tomorrow, so we're slowly -- so we have from the petitioners, we have two witnesses that will not be able to return tomorrow, I understand. You have two witnesses that you want to cross tonight.

MR. MONTEVIDEO: The two witnesses that are going to be leaving are Dr. Gold and who was the other one?

CHAIRMAN BAGGETT: It's just Dr. Gold.

MR. NAHAI: I'm willing to come back tomorrow morning, but my question would be how long are you proposing to go this evening.

CHAIRMAN BAGGETT: We've got to be out of here by 7:00. I would like to go to Dr. Gold. Finish up WSPA and do Dr. Gold.

MR. SMITH: How long does WSPA have to go?

CHAIRMAN BAGGETT: 20 minutes.

MR. HELPERIN: It's fine with us, especially that it would allow our other witness to leave now but obviously we would have to with the understanding he would not be able to testify tonight if things change.

CHAIRMAN BAGGETT: We will only finish WSPA's case-in-chief and continue with Dr. Gold, cross-examine Dr. Gold and the two witnesses, if you desire.

MR. HELPERIN: That's fine.

CHAIRMAN BAGGETT: Very good.

Let's continue.

MR. WELCH: WSPA will call Ron Wilkness.

RON WILKNESS,

having been previously sworn, testified as follows:

STATEMENT OF RON WILKNESS

MR. WILKNESS: Good afternoon, Mr. Chairman and Members of the Board. My name is Ron Wilkness. I'm with the Western States Petroleum Association.

As you may know, Western States Petroleum Association is a trade association. Our territory is the western United States, and it is the majors (inaudible). Many of our member companies will be building or remodeling retail gasoline outlets and will of course be impacted by the requirements of the SUSMP adopted by the Regional Board.

I would like to preface my remarks by stating that the RGOs are truly unique among the nine categories of planning projects to actually (inaudible) SUSMPs, and I will be telling you why this is so. My comments will be specific to retail gasoline outlets and I would also like to apologize for my informality. I'm recovering from surgery and I haven't yet learned to tie a tie with one hand.

I joined WSPA in 1993. I've been involved with matters pertaining to stormwater run-off at service stations since 1994. I presented testimony to the Regional Board both on the June 1999 Long Beach municipal permit and the Los Angeles County SUSMP. So I have had some considerable personal involvement with these issues.

I would like to start my testimony by telling you that WSPA takes pride in our efforts to reduce any adverse impacts that stormwater may have. For example, we recognized the impact of used motor oil, so several years ago we partnered with the City of Los Angeles to co-sponsor a used oil recycling program. And my little plastic funnel here has at the bottom -- in fine print it says, "recycle used oil." Here's a toll free number to call for information. This is a public service of the Los Angeles County Department of Public Works and Western States Petroleum Association.

I have several other examples of our involvement with stormwater quality issues. We have participated in several studies on the quality of stormwater run-off from RGOs. We (inaudible) a study to evaluate stormwater BMPs and the study was run by Geomatrix. Mr. Timothy Simpson of Geomatrix is the witness that will be following me and he will be telling you more about that study. In any event, all of this work led up to our participation for retail gasoline outlets. This guide as you have heard was published as the work product of the California Stormwater Quality Task Force. The task force created a working group. We were a part of that working group, I was personally, Mr. Simpson was, a couple representatives from our companies were.

We met over the period of approximately one year to develop this guide, and I think that you have a copy of the guide included as one of the exhibits.

CHAIRMAN BAGGETT: The Board has a copy.

MR. WILKNESS: Thank you. I would like, if I may, to read two sentences from the letter of transmittal from Robert Hale, the chairman of the task force, identifying -- describing the purpose for the guide.

I quote, this guide was produced and published by the California Stormwater Quality Task Force, an advisory body of municipal agencies complying with stormwater regulations. The purpose of this guide is to assist municipal agencies and retail gasoline outlets -- I'm sorry -- subject to stormwater regulations in attaining compliance with such regulations. The Clean Water Act identifies BMPs as a means by which the discharge of pollutants is reduced to the maximum extent practicable. MEP means that you must take into consideration the gravity of the problem, physical feasibility, public health, and social benefits.

WSPA agrees with the need for stormwater BMPs. We value the benefits that come from the implementation of appropriate BMPs and we continue -- as counsel has already told you, we continue to support the task force BMP guide as the definitive set of stormwater BMPs for retail gasoline outlets.

The guide is also recognized as the most appropriate set of BMPs for RGOs by numerous stormwater regulatory agencies. For example, up in the Bay Area, it is simply referred to as the standards that must be complied with. The Los Angeles Regional Board specifically included the BMP guide by reference in their June 1999 order for the City of Long Beach, although curiously there is no longer any mention of the BMP guide in the L.A. County SUSMPs or in their more recent proposed order for the County of Ventura. The guide is not even -- as you heard, the guide is not even listed as one of the references.

With that by way of background, I would like to speak briefly to the issue at hand. Please remember that our concerns are solely with stormwater requirements applicable to retail gasoline outlets. I would like to briefly address the nature and extent of any problem caused by run-off from RGOs, then I would like to talk about the mitigation requirements of the SUSMP.

First, is there a problem? We truly believe that run off-from a well-maintained RGO does not cause any significant adverse water quality impact. The Regional Board in its attempt to justify the need for the SUSMP, and in particular mitigation requirements and numerical standard, has not produced any data to the contrary and neither has anyone else, at least certainly not that we have ever seen.

I have mentioned that RGOs need to be well maintained. What do I mean by well maintained? We would suggest that the criteria for a site to be deemed well maintained should be implementation from the provisions of the task force BMP guide. I would like to emphasize that the BMP guide also applies to existing stations. There are separate requirements that we devised when we developed the guide for new or remodeled sites and separate requirements for existing sites.

Uniform implementation of the requirements of the BMP guide would ensure that stormwater run-off from RGOs does not cause adverse impacts. We do not believe that any additional requirements are either necessary or appropriate.

I would like to talk now about mitigation techniques. We were pleased to see that the Regional Board included some of the provisions in the BMP guide in the L.A. County SUSMP. However, the additional requirements in the SUSMP are not appropriate for retail gasoline outlets. These additional mitigation requirements are either to treat the run-off or to promote its infiltration into the soil, and there are significant problems associated with both of these two proposed mitigation measures when applied to an RGO.

First with respect to treatment. The Regional Board has not provided any information supporting the efficacy of any form of treatment for run-off from RGOs and certainly no data regarding performance in the field. There are two types, two primary types of treatment for infiltration and gravity separation.

With respect to filtration, experience tells us filters and what has been fairly commonly required is a catch basin or catch basin inserts. These plug rapidly and become simply totally ineffective. I've heard they cause ponding. I've also heard that newer designs have some sort of overflow provision so when the filtration units themselves flood, it allows water to flow through, untreated.

Dr. Horner has alluded in his testimony this morning, alluded to new catch basin inserts that are being studied at UCLA in the laboratory. Perhaps these will be interesting, but again laboratory data is an awful lot different from data in the field and again, there is definitely the question about heavy installed or implemented task force BMPs. There are residual gravity separation devices that at least two conditions be satisfied, controlled flow rate and relatively high inlet pollutant concentration. Neither of these two conditions can be satisfied at a retail gasoline outlet.

Very troublesome to us is the optional or alternative for infiltration. The task force BMP guide clearly states the requirement for using impervious pavement at RGOs and it does so for a very good reason, protection of the subsurface environment. If there is an accidental spill of gasoline and such spills are an unknown occurrence, I don't believe that we want to provide direct conduit for product, gasoline in this case, to run into the ground, and that would be exactly the case with any form of infiltration that I can think of.

As your Board is aware, the State Board's Division of Clean Water programs is currently proposing amendments to the USC regulations to protection of the subsurface environment. The concept of providing for infiltration of RGOs runs completely counter to the goal of the USC program. And again, I'm not talking about infiltration of stormwater but I'm talking primarily about our concern about infiltration of gasoline product.

I would like to conclude by emphasizing the following points.

Number one, California Stormwater Task Force BMP guide is the definitive set of BMPs and they're applicable to both new and existing RGOs. These effectively reduce potential pollutants and run-off from well-maintained RGOs to the maximum extent practicable. The group of regulators -- we were there as participants I guess, but they were the ones that published the guide.

Additional mitigation measures, that is measures beyond those in the BMP guide such as those required by the SUSMP, weren't justified. These additional measures have still not been justified and were not justified (inaudible) SUSMP.

As far as mitigation options are concerned, once again, we don't believe there is data that filtration works. Therefore, WSPA would respectfully request that SUSMP will not be required of RGOs.

I thank you for your attention. I would be happy to answer any questions.

MR. WELCH: WSPA will call Timothy Simpson.

TIMOTHY SIMPSON,

having been previously sworn, testified as follows:

STATEMENT OF TIMOTHY SIMPSON

MR. SIMPSON: Good afternoon, Board Members. Could I ask how much time we have left?

CHAIRMAN BAGGETT: You've got about ten minutes.

MR. SIMPSON: My name is Timothy Simpson. I'm a principal at Geomatrix Consultants, a California-based consulting firm. I'm here today on behalf of Western States Petroleum Association to discuss the SUSMP requirements for retail gasoline outlets.

My brief background, I hold bachelor and masters degrees in civil engineering and I've been involved in stormwater management and compliance issues for the past ten years. I'm a licensed civil and geotechnical engineer in the state of California.

Over the past ten years I've established nine statewide stormwater compliance groups under California general industrial standard stormwater permit, and these groups involved nearly 500 facilities located throughout California. I currently manage eight monitoring groups, and I'm also serving as a consultant on water quality issues for a wide variety of dischargers, including landfills, scrap yards, auto dismantling facilities and one of California's major airports.

The majority of the work I've done over the last ten years involves collecting and interpreting stormwater quality data and consulting on the efficacy of various stormwater management practices. A lot of my practice is helping clients spend money to improve water quality, helping them decide how to spend that money effectively so there's a beneficial impact on water quality.

It's already been mentioned the report that was done by -- I was a principal author and you've been provided Exhibit B in the materials that were provided from WSPA and it's our report entitled Stormwater Best Management Practices for Retail Gasoline Outlets. I would like to briefly describe the purpose and the results of that study.

The report that you have is the final work product from the two-part study that we did. The first part was performed in 1994 and included a characterization of water quality from a number of gas stations that were -- that we called normally operated and maintained. We all know there are outlyers out there. There are dirty gas stations out there. There's also clean stations. There's definitely a difference when people manage stations.

We selected those stations that were mainly the member companies of WSPA that were well managed and didn't cherry pick trying to find the clean ones. We tried to find a diverse cross-section of stations based on the number of vehicles that were fueled.

When I say normally operated and maintained, those are stations that implement regular management practices. There's a reason they look clean. It's because they sweep the stations, they perform regular site inspections and they implement standardized spill prevention and mitigation procedures. It's very important.

We did this characterization to provide a basis for various structural and non-structural management practices and to compare the results to other sites, to compare gas stations to other dischargers. The findings of the study, which also included extensive data search of all the data that was available at that time regarding gas stations, suggested that the normally operated and maintained retail gasoline outlets are not the, quote, hydrocarbon hot spots, that they had been characterized by regulators in the past. Also, the concentrations of metals, hydrocarbons and solids were no higher than a lot of other sites such as roads and parking lots which indicated to us that they don't warrant to be singled out for special regulation.

Additionally from our study we went back recently, and using the multi-sector, the federal multi-sector permit which has established benchmark concentrations which weren't available at the time of our study, we looked at those benchmarks and compared them to what we found in our study, the mean concentration from our study.

We found that suspended solids, which include hydrocarbons and most metals, were significantly below the benchmark concentrations. Those aren't effluent limitations, those are identified by EPA and they're termed monitoring triggers by EPA, but EPA has also said if you fall below the multi-sector benchmarks, your discharge will pose little concern on water quality impairment. That shows that implementing normal management practices has a real positive impact on water quality from gas stations.

The second part of our study was to use the characterization data that we had collected and to evaluate the various pollution prevention measures and treatment BMPs that could be used for RGOs in the ultra-urban environment with very limited space. The outcome of our study was the recommendation that the BMP focus, the money that should be spent on BMPs should be spent mainly on pollution prevention practices which are those practices that are relatively simple and they're generally simple facility modifications that result in clean, well-run service stations that are not a problem for the water quality perspective. Just some brief examples of what we identified, use of overfill prevention equipment, posting signs against topping off tanks, using canopies and Portland cement on fuel islands, a very important one, avoiding run-off across fueling areas, eliminating the hosing down of service stations, regular sweeping of exposed areas, having standardized and implementing those standardized spill prevention plans, and very important, employee training.

In contrast we found there are significant problems associated with trying to treat run-off from gas stations. First, our characterization study indicated that the best way to characterize stormwater is that it's episodic, and when it does rain you get a lot of rain, and it's got relatively low concentrations of contaminants. That's a very difficult engineering challenge to solve how to deal with that.

For example, we looked at oil water separators which are often installed at gas stations in response to regulatory requirements. Under ideal conditions, an oil water separator will be treating down to about 10 to 15 parts per million for petroleum hydrocarbons. What we found in our study was that the high end of our concentrations for oil and grease and petroleum hydrocarbons was about five parts per million. So what we're putting into these boxes is much lower than what we hoped to achieve out the other end. So the efficiency in these oil water separators just isn't there for these low effluent concentrations.

Other problems we found with treatment BMPs being effective for gas stations is that they can be expensive and difficult to maintain, and as a result they don't get maintained. A study performed in Maryland that was cited in our document found that none of the hundred oil water separators that were installed in the metro D.C. area had ever been maintained, and as a result they became sumps that collected contaminants and basically discharged those contaminants during storm events. They became more of a problem than they were solving.

We also found other issues associated with installing any sort of vault to collect run-off at gas stations. From a practical perspective, any device that's going to collect run-off is also going to collect any spilled product, which can create a significant explosion hazard and make it much more difficult to clean up spills when they do occur. If the spills are difficult to clean up, then they're not going to get cleaned up through this box. You're not going to know it's there. It's going to be buried. The attendant is not going to know it's there. It creates an explosion hazard and -- a potential explosion hazard, and it's going to go unnoticed and the first storm event it's going to be discharged. It's much easier not to have the box in place. The spill will occur, the attendant sees it and follows the spill prevention plan and mitigates that spill.

It's already been mentioned that right after our study was completed we worked with the water quality task force to discuss appropriate best management practices for retail fueling operations. Jeff Bruso (phonetic) of the Bay Area Stormwater Management Agencies was the chair of the group. I was a participant along with representatives from the State and some Regional Boards. Bruce Fujimoto was part of that group as well as Xavier Swamikannu, and I do recognize that the state did not endorse the plan, and I remember the discussion of that. The state, they were participants in the process. The State and the Regional Board said that they couldn't endorse the plan because it would constitute a regulation but they were active participants in the process that occurred over a year period.

The goal of the work group was to utilize the experience and judgment of the 14 work group members to evaluate the structural and non-structural BMPs potentially applicable for retail fueling operations and develop a set of technically valid BMPs. The outcome of the work group's effort was the best management practice guide which has been provided. Many of the BMPs described in the task force BMP guide are contained within the SUSMP. However, the one significant difference between the task force BMP guide and the SUSMP is that the SUSMP requires the mitigation through infiltration or treatment of the first three quarters of an inch of run-off.

I would like to discuss real quickly what that requirement means for gas stations. The one method that a lot of dischargers will probably try to use is the infiltration, and a lot of our practice is to mitigate soil and groundwater issues. And believe me, we don't want to infiltrate stormwater at gas stations. Although it's job security for a hydrogeologist, it's not good for the soil and groundwater of California to infiltrate at gas stations.

The other method is to treat the first three quarters of an inch, and I've already discussed the problems associated with that. The task force also looked --

CHAIRMAN BAGGETT: Close.

MR. SIMPSON: The task force also looked at those BMPs and said that the effectiveness and efficiency of these BMPs and other BMPs not listed was insufficiently peer reviewed and, therefore, they cannot be recommended for use statewide. And there's no new information that has shown that these BMPs were effective. There's a recent study done by County of Sacramento that's evaluated all of the various ultra-urban stormwater BMPs and it shows that 13 of the 14 are not acceptable for use in the ultra-urban environment.

In summary, I urge the Regional Board to simply adopt the BMPs that this task force came up with, and the real benefit those could be adopted at all gas stations, not just the ones slated for redevelopment. And that's going to have ultimately a much more positive impact on the water quality.

Thank you.

CHAIRMAN BAGGETT: Thank you.

We now have -- let's continue with Dr. Gold. I think he is the last.

We'll continue. Last is Dr. Gold.

DR. GOLD: Heal the Bay.

CHAIRMAN BAGGETT: Heal the Bay. NRDC's witness.

MARK GOLD,

having been previously sworn, testified as follows:

STATEMENT OF MARK GOLD

DR. GOLD: Good evening. I'm Dr. Mark Gold. I'm the Executive Director of the environmental group Heal the Bay. I'm an expert here for today. My background is I have a bachelor's and masters in biology from UCLA. I have a doctorate in environmental science also from UCLA, and I'm a member of EPA's Federal Advisory Committee for urban wet weather. I'm a member of the faculty at UCLA in the school of public health and water quality, and also I've conducted research on local water quality for about the last 15 years.

Just some background. Unfortunately with the order, some of this really should have been heard earlier but that's the way it goes. The economic benefits of coastal waters, this is based on the State Department of Resources numbers, the study done under Governor Wilson a few years ago, that ocean-dependent activities generate about $9 billion annually for southern California. It's actually -- and then $10 billion statewide coastal tourism. Of that, approximately $1.5 to $2 billion is generated annually in L.A. County coastal tourism, and Santa Monica Bay alone, 50 to 60 million people visit the Santa Monica Bay annually.

Characterizing the urban run-off problem in L.A. County, it's pretty much widely agreed upon that stormwater run-off is the largest source of impairments to Santa Monica Bay. Southern California has one of the worst run-off problems in the country.

I can go into each one of these categories in detail, but I don't have much time. We have beaches with very poor water quality. Many of them have poor water quality during dry weather, and about 75 percent of the beaches have poor water quality during wet weather. There's been numerous cases, numerous studies where aquatic toxicity has been found in both run-off and sediments in front of storm drains, contaminated sediment problems, trash and debris problems and increased erosion sedimentation and habitat degradation caused by pollutant run-off and peak run-off flows.

To give you a background on what you, as the state of California, have done in putting together -- the Regional Board has put together the 303-D list of impaired water bodies in 1998. That's the one that I'm referring to. As you know, this list was approved first by the Regional Board then by you, the State Water Board, and finally by EPA.

In Region four alone, we're unfortunately blessed with 156 impaired water bodies and water body segments. 734 specific impairments caused and then 19 major pollutants of concern. Common contaminants of concern, many are associated with polluted run-off of heavy metals such as copper, lead and zinc, oil and grease, PAHs, trash and debris, TSS, pathogens, nutrients and pesticides.

A little further into the contaminants of concern in urban run-off in and around the L.A. region is that numerous studies have found that concentrations of contaminants of concern in the region's storm drains exceed federal and state water quality criteria. There was in 1993 a UCLA study done for the American Oceans Campaign that demonstrated that just recently the 1988 and 1999 L.A. County monitoring points, data points, actually exceeded those standards, and then if you look at beach water quality, the routine monitoring program from the L.A. County Department of Health Services, the City of Los Angeles and the L.A. County Sanitation Districts shows you time and time again that bacteriological standards and health department standards are exceeded.

And then SCCWRP, Southern California Coastal Waters Research Project, has done numerous studies over the last 20 years that demonstrates that water quality exceeds a number of existing water quality standards.

On the beach contamination issue, which has been studied at length, that's actually been a lot of my research, has demonstrated that storm drain water has high concentrations of indicator bacteria. Even antiviruses get in there, and you also see at the beach very high concentrations of bacteria where people swim.

In 1996 the epidemiological study, completed under the auspices of the Santa Monica Bay Restoration

Project, demonstrated that those people who swam right in front of storm drains were far more likely to come down with upper respiratory infection as well as acute gastroenteritis. There's a demonstrated adverse health effect related to stormwater that occurs. This is during dry weather. During wet weather, as I reiterated before, over 75 percent of the beaches have poor water quality and exceeded at least one health standard.

On toxicity, there has been studies that have shown toxicity of stormwater flows within the region at Ballona Creek as well as Malibu Creek, Bisete (phonetic) Bay, as well as others. SCCWRP in 1996, this was using the sea urchin fertilization test, as well as the abnormal environmental development test -- the sea urchin fertilization test is far more sensitive, and if I recall correctly, roughly a dillution of around six to one or so still caused significant toxicity in run-off from Ballona Creek.

SCCWRP also did another extensive study on Ballona Creek working with USC and they demonstrated that within Ballona Creek a well-developed toxic plume extended into Santa Monica Bay up to two miles offshore. So they found toxicity in samples collected during a storm again in sea urchin fertilization tests. Usually the toxicity is caused by -- in fact, in Ballona caused by zinc -- as well as copper and zinc as we all know is heavily associated with automotive and run-off sources.

Also, the L.A. County of Department of Public

Works 98-99 annual report demonstrated that those toxicities in Ballona Creek run-off in sea urchin fertilization tests.

On trash and debris, again SCCWRP's southern California bight study they had been doing on and off for the last five, six years, what they found just in doing their Bendix (phonetic) surveys and sediment collection is that 25 percent of the bottom of Santa Monica Bay contained man-made materials. That is trash from run-off is basically getting in there. I won't get into too much detail other than the fact financially, the annual cost to clean up all the trash on the beach, not to mention the receiving waters, literally costs millions of dollars every year.

Contaminated sediments, we often have contaminated sediment on hot spot problems at the mouths of our storm drains, on our toxic hot spots. There's 14 sites of concern, that is hot spots, that have been identified in the L.A. region. This is from the bay protection toxic cleanup program.

In Marina del Rey and Ballona Creek, for example, where it's widely agreed upon that the source of contaminated sediments at the marina entrance channel and at the mouth of Ballona Creek is indeed Ballona Creek, it's been estimated 725,000 cubic yards is identified as contaminated with pesticides as well as heavy metals and PAHs. And the good news on that front is that a vast majority of that has been just recently dredged up and disposed of at the Port of Long Beach slip fill project, but normally that costs approximately a hundred bucks per cubic yard for disposal. I think that's important to note as well.

We see this sort of accumulation of sediment frequently at Ballona Creek, as well as the L.A. River. We actually have seen circumstances where the marina channel, entrance channel, has been shut down where boats can't get in and out because of sediments coming from run-off, as well as we've seen the Catalina Shuttle shut down for some period of time because of shoaling at the mouth of the L.A. River.

The high flow rates caused by urban run-off can cause ecological impairments. We've seen that in a number of different regions, Malibu Creek Watershed. We've seen sedimentation erosion (inaudible). Malibu Surfrider Beach is the most polluted beach along Santa Monica Bay. That would be because of Malibu Creek and the watershed around it. A great deal of habitat degradation, stream bank erosion, slope instability, those sorts of things caused by high peak loads of run-off causing problems within that watershed.

On water quality impacts of increased population, imperviousness, a lot of this work has been done by the Center for Water Protection, Tom Scheuler (phonetic). I think you got quite a bit of the material submitted from the January hearing. You see things like increase in peak discharges, increase of volume run-off from storms, increase in run-off velocities, the increase in the frequency and severity of floods, reduced stream flow during dry weather due to reduced infiltration, and then reduced infiltration and groundwater recharge.

On ecological impairment, you can see biological integrity gets reduced and the (inaudible) assemblage is reduced diversity as well as loss of sense of species, and that's directly related to increased impermeable area within a given watershed. Similar research has been done within the state of Ohio as well as the state of Washington.

Then the final slide, the role of new and redevelopment in creating the problem. When you have increased stormwater pollution, you have high volumes, high velocity of surface run-offs and high concentrations of pollutants within the run-off. By creating these impervious surfaces, obviously developments with a dramatic effect of increasing quantity and quality of stormwater run-off. In fact, in a lot of work that Tom Scheuler and others have done, you really start seeing permanent adverse effects ecologically on that 10 percent impervious surface within a watershed or subwatershed.

That's the extent of the comments that I have. There's a couple of things I sort of want to clear up from earlier testimony. One is as an aside.

The San Gabriel Valley has been drinking infiltrated stormwater for over three decades, the Whittier Narrows and Montebello Forebay Project. That's something that I would just like you to know. That's specifically stormwater and reclaimed water that's used for groundwater recharge there.

On catch basin filters, there's been a lot of discussion as well. Michael Stenstrom, professor from UCLA, could not make it for today. A lot of people expected him. In the study that has been completed, I might add, contrary to popular belief, roughly 80 to 85 percent pollutant removal efficiency for oil and grease and PAHs for absorbent filters. This was done in a lab. There's also been about a year's worth of work in the field where they've taken absorbent and run the tests in the lab again after the material has been out in the field for sometime.

Lastly, on the Tree People's infamous Tree People slide that keeps popping up, and I can't believe this one got in this, the Tree People house was designed -- are you guys ready for this -- for a 133-year flood. This is not like your typical storm. The fact that everyone is talking about cost of cisterns and those sorts of things, obviously you're missing the point of the whole Tree People exercise. This was a 133-year storm.

BOARD MEMBER BROWN: That was for a 133-year storm. How is that different from the three quarter inch?

THE WITNESS: Three-quarter-inch storm, if I'm not mistaken, is less than the one-year mean event storm, the average storm for a year.

BOARD MEMBER BROWN: You put information on economics and that was appreciated, particularly the broad scale. That helps us. I would suggest that you've also put up some good slides showing the concerns and the shape of Malibu Creek and such.

One thing that we've worked hard on is trying to do watershed master planning as opposed to addressing specific issues. We get a lot of mandates ourselves and try to address TMDLs and streams programs that we get that are individually submitted to the state that we have to respond to individually as opposed to trying to do watershed master planning, which is the thing that you mentioned, water, soil conservation, grasses and that range on down to control of what the homeowner may or may not do.

So with that in mind and with the information that you have submitted that the problem is evidently very real -- and I don't think anyone is doubting that -- the question that I have and has been presented here several times is, how best can we fix it. And I didn't hear anything on that from you and I'd like you to, if you have something on it that relates to watershed master planning, as an example, or the limited dollars that we have as a community in order to address these issues.

And when you go ahead and piecemeal things like we have had to do on this state level because of mandated programs, we really question if we are spending our dollars that we have in the most efficient manner possible, where if we had the opportunity to do master planning of watersheds, we would have a higher level.

So the question begs, with your knowledge and background on this information, is what we're asking these people to do, is that the best expenditure of all of our efforts and money or is there a better way of addressing the issue and earning more for our investments?

THE WITNESS: In answering the question, my organization -- I've been involved in numerous watershed planning efforts, as Mary Jane can attest to. I've chaired the steering committee for the Santa Monica Bay Restoration Project as well as I've been involved in that since its inception. I've been part of the Malibu Creek Watershed planning forever, and our founder, Dorothy Green, is the chair of the L.A. San Gabriel River Watershed Council.

Our point on stormwater is that there is no one magic bullet in solving this problem and one of the focuses here is not on all the other factors that are within the stormwater permit. We are literally focusing on new and redevelopment here today. In that regard, I honestly believe based on my background in this field that putting new and redevelopment standards in place where it's a heck of a lot easier to do it at the new and redevelopment stage to implement BMPs that are effective there rather than going back to retrofitting and built-out facilities and buildings is a very, very smart way to go in reducing pollution coming off of urban areas.

So we strongly believe that and our organization has been involved in finding out more about this tomorrow. I co-wrote Santa Monica's ordinance with Craig Perkins and their city attorney's office back in 1992, and we've learned a lot more about the real world experience (inaudible). Santa Monica was a success there.

CHAIRMAN BAGGETT: Any questions from Board Members, staff?

Cross-examination.

THE WITNESS: This will be nothing compared to the deposition I just had on the DDT shelf.

MR. MONTEVIDEO: I hope that's the case, Dr. Gold.

CROSS-EXAMINATION

BY MR. MONTEVIDEO:

Q. Good evening, I guess it is by now. My name is Richard Montevideo and I'm with the petitioners.

A few questions. First, there was some discussion about that Tree People article and that is a study that was done by the Tree People. Do you recall --

MS. JENNINGS: If you want to stand up, could you hold the mike please?

MR. MONTEVIDEO: I'll just sit down.

Q. Do you recall the size of the cistern used in that experiment?
A. Not off the top of my head.
Q. Would it surprise you -- would the number 3600 gallons surprise you?
A. I've seen it and it's pretty substantial. I wouldn't be shocked by that. And again, it's for the 133-year storm. It's not for a three-quarter-inch storm.
Q. So you think that 3600 gallons is a substantial cistern?
A. For water storage on a single-family home, yeah, probably.
Q. How much -- there was some discussion earlier today about the amount of run-off from a quarter acre. Do you have any estimates as to the amount of run-off from a three-quarter-inch storm over 24 hours?
A. It's a little late in the day. I don't think I'm going to be doing math answers right now.
Q. So you can't answer the question?
A. No, I could, I just would have to go back and calculate it out.
Q. Can you give me a ballpark?
A. Three-quarter-inch storm, so --
MR. HELPERIN: Objection. The question calls for speculation. If you would like Dr. Gold to do the calculation, he can do the calculation, but I don't think it makes sense for him to make a guess right now.
CHAIRMAN BAGGETT: I would sustain the objection

unless you've got it off the top of your head.

THE WITNESS: I don't have it off the top of my head.

CHAIRMAN BAGGETT: Sustained.

Q. BY MR. MONTEVIDEO: The cost of the Tree People study, I believe that cistern was $10,000 for the product itself and the installation. Do you recall that being the case?

A. I've talked to Andy Lipkis, and obviously Andy is the President of Tree People, if you don't know. That was designed especially for that particular site, and so it was literally put together as a one-time manufactured unit. If there was a mass-produced unit, I know I've heard him say that would come down to about two or three thousand bucks.

Q. Let's take a look at the article.

If you look down at the bottom of the article it says, "Lipkis said the cost of installing similar recycling systems could be reduced to about $10,000 per home if a manufacturer can be found to mass produce the cisterns."

Does that refresh your recollection?

A. No. I've talked to him subsequent to that and he thought it would come down dramatically even more, but he's not here to verify.

Q. So you don't agree with the number that's in this newspaper article.

A. It's not what Andy has told me.

Q. Okay.

A. I would like to reiterate that the design of this was not just for stormwater purposes. It was also water conservation purposes and that was really one of the major points of the system was to reduce water --

Q. You understand that the cost is being attributed direct to what Mr. Lipkis said; correct? The $10,000 is being attributed to what Mr. Lipkis said.

A. Right, two years ago.

Q. Is it true that the three quarters of an inch standard was developed by the NRDC and the County of Los Angeles?

MR. HELPERIN: Objection. Calls for speculation. Lack of foundation. Dr. Gold has no basis for knowing that.

MR. MONTEVIDEO: If you don't know, just tell me, Dr. Gold.

CHAIRMAN BAGGETT: Can you answer the question?

THE WITNESS: I don't know. I'm not sure if that's exactly where it was determined.

Q. BY MR. MONTEVIDEO: Let me see if I can refresh your recollection. This is an article that showed up. It's a part of the administrative record. I believe it was also submitted. In addition to being part of the administrative record, I believe it was also submitted as part of the NRDC's documentation. It has your name at the end as the co-author?

A. Right.

Q. Did you co-author the article?
A. Yes.
Q. Do you recall when you wrote this article?
A. I don't recall the exact date. I'm sure it's on there somewhere.
Q. I just don't see it, so I'm asking.
A. Sometime in January.
Q. Of this year?
A. Yeah.
Q. Okay. Do you see the reference to the proposal before the Board is based on one developed by the Natural Resources Defense Council and Los Angeles County to address the pavement equals pollution reality? Do you see that?
A. Which paragraph? I'm sorry. Yeah, I see it.
Q. Does that refresh your recollection on who developed the three-quarter-inch standard?
A. No. That refreshes my memory on what's in the article. That might be an overly simplistic assessment. I'm not really sure where it was exactly developed since I'm not a party to the lawsuit.
Q. So you didn't necessarily draft that particular part of the article?
A. No, actually I didn't.
Q. Okay. I don't know unless I ask the question, Dr. Gold. You drafted other parts but not that part?
A. I -- yes. Just yes. Yes, I did not write that part.

Q. "Yes" is good. Is it true that the three-quarter-inch standard was the standard that in your discussions with Mr. Dickerson -- let's back up.

You did have discussions with Dennis Dickerson, the Executive Officer of the Regional Board, about the three-quarter-inch standard; correct?

A. Among many other things in relation to stormwater issues, yes.

Q. Is it true in your discussions that you informed Mr. Dickerson that you would not go below three quarters of an inch of rain?

A. Yes, that's true.

Q. Is it --

A. And the rationale was because the environmental community unanimously agreed that a three-quarter-inch storm was already a compromise and all of us wanted at least a one-inch standard.

Q. So because of that, you refused to go below three quarters of an inch of rainfall.

A. Because the precedent had been set with the L.A. County already agreeing to the standard.

Q. Is it true that this standard came out with settlement discussions with the county as far as you know?

MR. HELPERIN: Objection.

MR. MONTEVIDEO: Again, I'm just asking for his knowledge, Mr. Chair. If he doesn't know, he can tell me.

THE WITNESS: I really don't know.

Q. BY MR. MONTEVIDEO: Do you recall attending a meeting with Mr. Dickerson -- by the way, for the record, what I have on the screen right now is a series of one page of notes dated 10-1-99. It says with NRDC SUSMPs. These notes came directly out of the administrative record. They are identified as tab 5 or something in that range of Volume 2 of the administrative record.

Do you recall having a meeting with Mr. Dickerson sometime in October where you were discussing the SUSMP that was in issue?

A. I don't recall. I'm seeing names like Rich Horner, et cetera. I don't know who was at the meeting. I meet with Dennis and can attest to I'm at the Regional Board pretty much twice a week. I'm not sure. I probably did or didn't.

Q. You should work there, I guess. You see the reference to the three-quarter-inch standard -- three quarters of an inch was reached after settlement discussions closed. Do you see that right here?

A. I see that on the screen.

Q. Do you recall any discussions of that nature in your meetings with Mr. Dickerson?

A. I don't recall.

Q. Okay. Is it your opinion that the same standard that applies to regular development should be the standard that should be applied to all redevelopment within the subcategories, that is you think there shouldn't be any distinction between the standards used for new development versus redevelopment?

A. Using the definition of redevelopment that exists within the SUSMP, yes. Not all of it. There was a lot of discussion about redevelopment and if someone added just a little porch or something, that that obviously wouldn't constitute redevelopment. There was a great deal of discussion on what actually redevelopment was.

Q. Well, if somebody added a porch on a hillside home, would that constitute new development?

MR. HELPERIN: Objection. Vague and ambiguous. Is Mr. Montevideo asking if that would constitute new or redevelopment under the permit, which would call for a legal conclusion, or is he asking if that is the definition that Dr. Gold was using when he made his prior statement?

CHAIRMAN BAGGETT: Sustained. Would you rephrase.

Q. BY MR. MONTEVIDEO: When you made your prior statement that putting in a porch was not redevelopment, what is that based on?

A. What I was stating was, just to refresh your memory, was that there was a great deal of discussion of what redevelopment was. And in fact, if I'm not mistaken, there might have been a change the day of the hearing or a couple days before the hearing on what redevelopment was.

R0073877

So the point was that your general initial question, which was do you think it should apply to all development and redevelopment, I was just trying to get a clarification on redevelopment.

Q. Understood. But then you made the comment about the porch. Was that based on your understanding of the SUSMP definition of redevelopment?

A. It was in the discussion 50 percent of -- I can't remember exact off the top of my head, but something like 50 percent of the whole developed area or something like that being impermeable.

Q. It's your opinion the standard should be the same regardless of whether it's new development or redevelopment?

A. Right. New development, significant redevelopment, correct.

Q. Is it your opinion that that's consistent with what's happening across the rest of the country?

A. I would not be able to answer that question. I don't know.

Q. Again, Mr. Gold, if you don't know, just tell me.

A. That's what I did.

Q. Okay. But your counsel keeps jumping up and down.

MR. HELPERIN: That's fine. There is a principal about laying a foundation before you ask a question. If Dr. Gold has no reason to believe it, I'm going to object on foundation. He can also say that he doesn't know.

CHAIRMAN BAGGETT: You'll have an opportunity to address the legal questions to the legal witnesses tomorrow, so if you could.

Q. BY MR. MONTEVIDEO: Do you -- is it your opinion, Dr. Gold, that -- there's been a lot of discussion today about some hypotheticals and some actual realtime examples, but I want to get your technical opinion on whether somebody living, for example, in the city of Rancho Palos Verdes puts on a new roof should have to comply to the same standard as a new gasoline station going in around the corner from that home. Is that your opinion?

A. I think -- are you asking a regulatory opinion? What are you asking?

Q. Technically do you believe that somebody putting in a new roof in an environmentally sensitive area should have to comply with the same technical standard that a new gas station going in around the corner should?

A. But you're asking me to make the presumption that somebody putting on a new roof and lives on a hillside that's going to be applicable to, and that's hard for me to believe.

Q. Assume that the SUSMP is applicable to that scenario.

A. I can't make that assumption. That's not how I read it.

Q. I'm asking your technical opinion on whether or not you think, in fact -- do you have the same concerns with pollutants from a hillside residence who's putting in a new roof versus a gasoline station going around the corner?

A. They would be different pollutants but the concerns I would have for a hillside development would depend on where, if it's in an ESA, depending on the slope of that particular house and the pad in which it is, it could cause significant erosion and sedimentation problems in downstream habitat. It could be sensitive habitat. So that would be a concern there.

At gasoline stations, I would be much more concerned about contaminants that are gasoline or automotive repair related which are more things like PAHs and metals and those sorts of things.

Q. So you have greater concerns with the gasoline service station?

A. No. I have different concerns, not greater.

Q. Would you apply -- do you think the same standard should be applied?

MR. HELPERIN: Objection. Vague. When you say "the same standard," there are lots of different types of standards. Are you talking about the numerical standard? Are you talking about what types of BMPs should be applied?

MR. MONTEVIDEO: Numerical.

MR. HELPERIN: Numerical. Numerical sizing standard? Numerical for effluent limits? What kind of numerical standards?

CHAIRMAN BAGGETT: Sustained as vague. Clarify.

Q. BY MR. MONTEVIDEO: In your opinion, you believe the same .75 numerical design standard as referred to in the L.A. SUSMP should be applied?

A. Yes, I do. But the beauty of the standard is that it doesn't say thou shalt only infiltrate, thou shalt only treat. It gives you an option there, not to mention it gives you a list of literally a couple of dozen, if not more, BMPs that are designed to basically remove different sorts of pollutants and that's really the flexibility that one would use in deciding what to put on that particular development.

Q. So I own a home. It's 2,000 square feet. It's on a 5,000 square foot lot. It's primarily all hardscape. How do I comply with the SUSMP program?

A. The beauty is I don't think you have to.

MR. HELPERIN: Objection. How would you comply with the SUSMP calls for a legal conclusion.

MR. MONTEVIDEO: Mr. Chairman, I would like to hear the testimony of Dr. Gold.

CHAIRMAN BAGGETT: I would sustain that. I wish you would get an opportunity to the legal witnesses tomorrow. You're dealing with a biologist who is an expert and stated his expertise.

MR. MONTEVIDEO: I believe this is a technical issue. I'm really trying to figure out --

CHAIRMAN BAGGETT: It's an engineering issue.
MR. MONTEVIDEO: If Dr. Gold can't answer it --
Q. If you can't answer it, then just say so.
A. I'm a water quality expert. I actually did in my sort of flippant manner. You basically gave me a single-home scenario that just doesn't -- I don't see in the permit.
Q. I'm the homeowner. I've been told it has to apply. How do I comply with the standard? Just help me out.
MR. HELPERIN: Objection.
THE WITNESS: It's the same thing again.
CHAIRMAN BAGGETT: It's the same.
MR. MONTEVIDEO: Mr. Chair, with all due respect, it is really a technical issue. If he doesn't know how to comply --
THE WITNESS: I'm saying it's not applicable.
CHAIRMAN BAGGETT: He's answering the question. I don't know what else you want.
MR. MONTEVIDEO: It is a hypothetical. I've asked him to effectively assume that it will apply, and I'm asking him how he will apply the standard. So for purposes of a hypothetical --
CHAIRMAN BAGGETT: I'll sustain the objection. Let's move on.
Q. BY MR. MONTEVIDEO: You're a UCLA graduate?
A. Three times over.
Q. Three times over. Did Mr. Swamikannu also go to

UCLA?
A. Yes.
Q. Did you happen to be schoolmates?
A. Yes, we were.
Q. And you mentioned Dr. Stenstrom.
A. Yes.
Q. Was Dr. Stenstrom your professor at the time?
A. He was a professor.
Q. One of your professors?
A. One of my professors, one of many.
Q. Was he also one of Mr. Swamikannu's professors?
A. Yes.
Q. How long ago -- how far back do the three of you go?
A. About a dozen years or more. 12, 14 years.
Q. Is your relationship with Mr. Swamikannu pretty strong?
MR. HELPERIN: Objection.
THE WITNESS: I'm married with three kids. I don't know.
MS. JENNINGS: I don't think there's any probative value. I'm sure 27,000 other people went to UCLA, too.
CHAIRMAN BAGGETT: What is the objection?
MR. HELPERIN: Relevance.
CHAIRMAN BAGGETT: I would concur.
Q. BY MR. MONTEVIDEO: Let me ask you this, Dr. Gold. I presume you have a very good working

R0073883

relationship with Mr. Swamikannu that goes back to your school days; is that correct?

A. It's pretty good.

Q. And it goes back a ways?

A. Yes.

Q. Does he often rely upon your work in his work?

A. No, as a matter of fact. That's something I've talked to him about.

Q. You've got to get that straightened out, don't you. Do you know if he relied upon your work in connection with this three-quarter-inch standard?

A. I can say unequivocally he did not.

Q. He just happened to come up with the same standard on his own?

A. You're going to have to ask him.

MR. MONTEVIDEO: That's all I have.

CHAIRMAN BAGGETT: Thank you.

Mr. Welch.

MR. WELCH: A couple of questions.

CROSS-EXAMINATION

BY MR. WELCH:

Q. Mr. Gold, are you aware of any studies that have compared the cost-effectiveness of implementing the source control and structural control BMPs such as in the task force BMP guide for gasoline stations to the treatment BMPs that the SUSMP would require?

A. Not laid out like that. The most recent study

R0073884

that I'm aware of was the USEPA funded ASEE work that was done basically looking at a wide variety of BMPs in a wide variety of different sources, looking at basically pollutant removal and efficiency. The cost data on that was just pretty poor.

Q. And you also mentioned a study by Dr. Stenstrom relating to filters?

A. Yes.

Q. You didn't participate in that study; did you?

A. No.

Q. You don't have a copy of that study here today; do you?

A. No, I do not.

Q. Are you familiar with it?

A. It was done under the auspices I think partially under the Santa Monica Bay Restoration Project, if I'm not mistaken, but I know most recently the County Department of Public Works has been using it a lot to make determinations on which BMPs would make the most sense for new development and redevelopment.

Q. Are you familiar with the November 1999 study that was done for the Sacramento Stormwater Management Program relating to filters?

A. No, I'm not.

MR. WELCH: Mr. Chairman, at this time in rebuttal I would offer the Sacramento Stormwater Management Program November 1999 report in rebuttal to the testimony of Mr. Gold's UCLA study. And I have

copies here. I've made copies for the Board.
MS. JENNINGS: Is that by Larry Walker?
MR. WELCH: Yes. It is Larry Walker Associates.
MS. JENNINGS: Just to let the Board Members know -- we should hear from the other people. That is something that we certainly have and I don't know the value, but I think it is probably something we already have and wouldn't have a problem with it.
CHAIRMAN BAGGETT: Is it in the records someplace?
MS. JENNINGS: I don't think it's in the record, but it's sort of widely known. Anyway --
MR. HELPERIN: I'll object to the extent that's not already in the record, the introduction of exhibits that were not in the record.
MR. LEON: I would object on the matter that he hasn't clarified at exactly what point or points Mr. Gold has spoken to that this would rebut. Is it just in general throw it into the package or what?
MR. WELCH: Certainly I can clarify that Mr. Gold testified and referred to a study by Dr. Stenstrom at UCLA on the effectiveness of filter inserts in controlling stormwater run-off pollution. I believe he testified that they had 80 to 85 percent effectiveness. The November 1990 study that I referred to, it was done for the Sacramento Stormwater Management program, evaluated the effectiveness and data that existed for a number of different types of these filters

and found that the data that is in existence did not support the claims that were made by the manufacturers of the filters and for the efficiency of removal and found that none of the filters that were available to test on the market were considered acceptable.

THE WITNESS: I haven't reviewed that study, so I can't really say anything about it.

CHAIRMAN BAGGETT: I'll allow its admission into evidence.

THE WITNESS: I was going to say one thing. The field has changed dramatically on that particular BMP in the last few years. So that's something you should be apprised of.

MR. WELCH: I'll distribute copies of the study. It's a November 1997 study.

CHAIRMAN BAGGETT: Thank you, Mr. Welch.

Mr. Leon.

MR. LEON: Thank you.

CROSS-EXAMINATION

BY MR. LEON:

Q. Mr. Gold, I'm Jorge Leon, the Regional Board's counsel.

A. Greetings.

Q. How are you?

A. Fine.

Q. We've heard some testimony earlier that oil and grease in stormwater is not an environmental concern. Do you have any comments on that?

A. Oil and grease is often used during monitoring really as a surrogate for PAHs poly (inaudible) hydrocarbons, which are a major concern in stormwater. They have very, very high toxicity. They're carcinogens. Many of the PAHs and some of the hot spots and some of the impaired waters are listed near storm drains because of PAHs. So I think they are indeed a very significant concern.

Q. Thank you. We also heard that the numerical mitigation measure will address the issue of beach closures which result from pathogens in dry weather flow. Do you have any comments on that?

A. I think to some extent they will and not necessarily -- not the closures -- if you're familiar with L.A. County and their closure policy and with AB 411 and the State Health Department standards, there's really only a mandatory closure in the event of a sewage spill, but what you have in essence is permanent postings because of high bacteria counts in the surf zone. And with obviously more development, there's a lot more pets that people aren't cleaning after, a lot more restaurants where you have restaurants mats that are being hosed down and all the high bacteria counts that are associated with that.

So increased urbanized areas usually lead to much, much higher bacteria counts. As a matter of fact, if you look at the monitoring of L.A. County beaches over the last 10 years, invariably the most polluted beaches are adjacent to storm drains.

MR. LEON: Thank you. No further questions.

CHAIRMAN BAGGETT: Thank you, Dr. Gold.

I would prefer -- I think I would propose to counsel that we go to redirect and recross and allow 10 minutes for closing statements tomorrow. Is there objection to that? That will be the ruling.

Second issue tomorrow, the way I see we've got an hour and 30 minutes of cases-in-chief, we've got 40 minutes in closing statements. That's a little over two hours. We still have two other cross-examinations potentially. What we could do is we could try to get started at 8:00 if you want to guarantee that we will be out by lunch. Is there a preference to the parties to accommodate?

MR. LEON: We would prefer 9:00.

MR. HELPERIN: We would prefer later.

CHAIRMAN BAGGETT: Also I would prefer -- we need to have a closed session tomorrow.

MR. MONTEVIDEO: My only concern with starting at 9:00, if the Board is planning on finishing at noon regardless of what happens, then I --

CHAIRMAN BAGGETT: We've come all the way down here. That's why we're going late. We're trying to accommodate. We will have enough time. 9:00, 9:30 is that easier for traffic? 9:00?

MR. LEON: Everyone is saying on this side of the table 9:30 would be a little better because we're going to have to deal with setting up the tables again.

MS. JENNINGS: I think we can leave the tables.

MR. MONTEVIDEO: It would be nice to finish up as soon as possible, I guess.

CHAIRMAN BAGGETT: We will go with 9:00 because it's noticed. We have one last witness who will not be here tomorrow?

MR. MONTEVIDEO: Dee Zinke will not be here tomorrow.

CHAIRMAN BAGGETT: Do any of the parties have questions or anything else?

MR. MONTEVIDEO: Also, Mr. Chair, I should point out I did not catch Ms. Ferraro. She was our last witness. She was here for a minute ten seconds roughly. I'm going to have to attempt to make calls.

CHAIRMAN BAGGETT: Is that a problem?

MR. HELPERIN: Who was the witness?

CHAIRMAN BAGGETT: Mrs. Ferraro.

MR. MONTEVIDEO: Do you have any cross-examination?

CHAIRMAN BAGGETT: Does she need to return tomorrow?

MR. FLEISCHLI: We do have just a few questions.

MR. MONTEVIDEO: I didn't catch her before she left and I don't know if I can get her back tomorrow or not.

MR. HELPERIN: It's not critical.

CHAIRMAN BAGGETT: With that, let's continue so we can get -- I would like to leave in 15 minutes myself.

DEE ZINKE,

recalled for cross-examination, was examined and testified further as follows:

CROSS-EXAMINATION

BY MR. FLEISCHLI:

Q. Steve Fleischli, Santa Monica BayKeeper.
A. Pleased to meet you.
Q. Pleased to meet you. I wanted to ask you a couple of simple questions and they will not be nearly as arduous as DDT.
A. Good, since I'm not a Ph.D. in anything.
Q. Fair enough. You're here representing the Building Industry Association?
A. Yes, sir.
Q. Excuse me?
A. Yes, I am.
Q. Can you tell me, is the Building Industry Association a trade group?
A. Yes. It is a non-profit trade association for the construction industry.
Q. Can you tell me how many members of BIA you represent or how many construction companies or builders BIA represents?
A. I represent one chapter of the BIA Southern

California and that chapter has about 400 company members which equates to about 12,000 active volunteers.

Q. And do you know in terms of those 400 company members what the gross revenues are for those organizations?

A. No, I don't. In fact, it is an extremely wide variety. About 10 percent of our members are in the development end of the process. We go all the way down to individual interior design shops, banking, plumbers, subcontract roofers. It's a very huge disparity in our membership.

Q. In terms of the overall total that you represent, not each particular one of the 400, is there any --

A. I don't have a number off the top of my head, no.

Q. So you would not have a number of the net profits of those organizations?

A. No, I would not.

MR. FLEISCHLI: Fair enough. I'm done.

CHAIRMAN BAGGETT: Any other?

MR. LEON: No.

CHAIRMAN BAGGETT: Mr. Welch.

MR. WELCH: No.

CHAIRMAN BAGGETT: Any other? If not, we are recessed until tomorrow morning at 9:00 where the Regional Board will be up.

CHAIRMAN BAGGETT: We're back in session. Where we left off was the Regional Board's case-in-chief.

MR. LEON: Good morning, Chairman Baggett and Board Members.

We will go ahead and start off today with testimony from Dennis Dickerson and then I will follow with some legal comments, coverage of some of the legal issues that have been discussed in the petition.

We'll start off with testimony from Dennis Dickerson, the Executive Officer, and he will talk about the development of the SUSMP and many other issues related to the issuance of the document. I will cover legal issues and Dr. Xavier Swamikannu will follow me discussing the technical basis of the SUSMP. Following him will be our Chairman, Mr. David Nahai, with the Board Member perspective.

With that, we'll start off with Dennis Dickerson.

DENNIS DICKERSON,

having been previously sworn, testified as follows:

STATEMENT OF DENNIS DICKERSON

MR. DICKERSON: Thank you and good morning, Mr. Chairman, Members of the State Board.

For the record, I am Dennis Dickerson, Executive

Officer of the Los Angeles Regional Water Quality Control Board.

Last January the Regional Board adopted a proposal for controlling the pollutants contained in stormwater run-off. Aspects of the plan are now being challenged, and today's hearing will consider the basis on which our Regional Board took action.

As we go through this hearing, please keep in mind this appeal does not represent all the cities who are permittees. Indeed, it does not represent the principal permittee, the County of Los Angeles, nor the largest municipality, the City of Los Angeles, and I should note that I personally appeared before the City of Los Angeles, before the Council, to argue the need for the SUSMP and they wholeheartedly agreed with that proposal. Nor does it consider the next largest, the City of Long Beach. With the City of Long Beach we entered into a long series of negotiations with respect to the resolution to litigation. They had appealed the first permit, the '96 permit, and as a result of some very difficult negotiations, we ended up with the City of Long Beach adopting even the more stringent permit than you are considering through the SUSMP here today.

Of 86 permittee cities, only 33 representing about 18 percent of the Los Angeles County population chose to challenge the plan. The remainder are pursuing the necessary steps to implement the plan by October 8th, 2000, and in particular I would like to point out tomorrow there's going to be a workshop sponsored by the County of Los Angeles Department of Public Works to specifically discuss the implementation of the SUSMP that you're considering today. It's my understanding that there are some 400 people who are scheduled to participate in that workshop to talk about the technical aspects of the SUSMP proposal. I'm going to skip that slide.

When you view the Los Angeles basin from above, you see a vast expanse of developed lands. The buildings, roads, parking lots and sidewalks all serve to convey stormwater to the ocean as quickly as possible, altering the natural system that once allowed for infiltration and the wetlands that acted to delay the passage of fresh water to the ocean. The 10 million people who now live and work in the L.A. basin today knowingly or unknowingly contribute to the detritus of urban life which contaminates our stormwater. This contamination is a serious problem that threatens the public health and the environment.

To begin, we would not be here were it not for the serious problem southern California faces regarding stormwater pollution. We know from monitoring data that urban land uses generate large loadings of pollutants including toxic metals which in turn form toxic hot spots and sediments. Litter is ever present and at times is discharged in volumes in huge floating rafts of litter that repeatedly soil our beaches.

Oil drippings from cars, fine copper dust from the wearing away of auto brake pads, wastes in every description, unless intercepted, all find their way to the storm drain system, our rivers, and ultimately our beaches and the ocean. This fact we cannot escape.

The urbanization of land is inherently polluting. More development, absent the mitigation measures before you, will inevitably result in greater pollutant loading.

Monitoring data from Los Angeles County clearly identifies the problem of incredible magnitude. Here we see that average seasonal loadings of critical pollutants from the City of Los Angeles are measured not in pounds but in tons. The City of Los Angeles represents 29 percent of the pollutant load. The remaining jurisdictions contribute an additional 71 percent of the total, dramatically increasing the loading of these critical pollutants.

A recent report by the Southern California Coastal Water Research Project documents impacts of stormwater run-off on the receiving waters of Santa Monica Bay, and this particular report was introduced to you yesterday briefly.

The study reviewed data from 1996 through 1998 with a focus on Ballona and Malibu Creeks. Key results from the study show that stormwater plumes persist up to three days, show product toxicity in nearly every sample collected, and is toxic up to two miles offshore and that zinc and copper are the contaminants most responsible for that toxicity.

In addition to the immediate effects that contaminated water cause, offshore sediments are also contaminated with various pollutants and this is documented more than one mile offshore. And here on the next slide you see a cloud of surface layer toxicity extending outward from Ballona Creek nearly two kilometers following a storm event that occurred on or shortly before December 10th, 1996. The area shown in red portrays the areas most affected by chronic toxicity.

The study also shows that the results of stormwater pollution can be seen for months and years following discharge as contaminants become trapped in offshore sediments. The SCCWRP study documented sediment contamination more than one mile offshore.

Litter is also a significant pollutant and is so prevalent that this region has invoked enforcement of the notice to meet and confer provision over the Los Angeles County municipal stormwater permit finding that the existing stormwater management plans are inadequate to resolve this problem. We are using the notice to meet and confer provision of the permit as intended, to address violations of receiving water standards and to address a serious condition of nuisance.

Not surprisingly, many of our waters are listed on the federal 303-D list of impaired waters. There are hundreds of individual listed impairments. Coliform, litter and heavy metals and various organic compounds have found their way onto this list. Here you see a few of the specific impairments that apply to the L.A. River, Ballona Creek, the Long Beach Harbor and Santa Monica Bay.

Southern California's beaches are world class. They are part of our state and national cultural heritage. Millions visit our beaches each year and our coastal economy is valued at over $2 billion each year. Sadly, the value of beaches is best understood when they are no longer available for use. Last year's crisis with the polluted Huntington Beach highlights the serious impacts that stormwater and urban run-off can have on the local economy. People do get ill when they swim in contaminated waters.

Recently the southern California beach crisis has reached such a level of concern that it has reached the editorial page of the newspapers and editorial cartoons.

So do we need to do something to address this problem? Clearly the answer is yes, and I find it lamental that the penalty for being engaged in a dialogue, trying to work with people and trying to find a solution and being open and responsive is thrown back, taken out of context, and used as a rally device to suggest that our proposal has no credibility.

As you know, the mechanism for addressing the stormwater problem is the Los Angeles County Municipal

Stormwater and Urban Run-off Permit. This permit is found (inaudible) contained in the Clean Water Act amendments of 1987 and recognize the need to address stormwater by creating a current process in which each municipality would be obligated to control stormwater pollutants to the maximum extent practicable.

The obligation to address new development is clear and it's a clear requirement of federal law and regulation. We must have a plan in the permit that addresses this topic. The current permit was adopted in 1996 and built on an earlier permit adopted in 1990.

It is now ten years after the first permit was adopted, and the time has clearly arrived for the development community to share in contributing to the solution of stormwater pollution as envisioned by the 1987 Clean Water Act.

Within the findings of Board Order 96-054 is a clear statement of purpose that BMPs be required to be used that reduce pollutants so that the discharge of stormwater will not cause violations of water quality objectives nor create conditions of nuisance. We know that run-off of existing developed areas do not meet this criteria.

Our expectation is that new development will apply mitigation measures to limit the contribution of additional pollutant loadings to the maximum extent practicable. The SUSMP's content is prescribed by the permit which sets clear expectations for what a SUSMP will cover. Significantly it clearly states that it be designed to reduce run-off volume and that developed land retain, where practicable, permeable surfaces.

Additionally, stormwater controls are to be identified. Stormwater filtration and storage are to be maximized using a variety of techniques, and parking lot pollution is expressly required to be minimized in that definition.

Development controls to address stormwater pollution are necessary and essential to minimize the additional pollution that would be inevitable if new practices and designs are not adopted. Development controls reduce the need for costly downstream solutions, are consistent with our requirement to allocate our loads to non-point sources through the TMDL program, and are consistent with the State Board's recently adopted non-point source pollution control plan.

Page 117 states in part before development occurs, a number of pollution prevention and treatment options such as setbacks, buffers or open space requirements can provide treatment of the inevitable run-off and associated pollutants.

The SUSMP is one of the means by which the non-point source plan is to be implemented in the Los Angeles region. As approved, the SUSMP contains specific requirements for various categories of development shown here on this slide. The SUSMP affects new and substantial redevelopment, the latter being triggered by a 5,000 square foot threshold. It establishes a fundamental principle that run-off on newly disturbed land shall not result in an increase in run-off that would increase erosion and natural drainages.

This was an item that was contested yesterday, but I would like to note that that is the language that was submitted by the permittees themselves. We have not altered that in the final document. The SUSMP applies to the maximum extent practicable federal standard for reducing pollutants of concern.

As approved, the SUSMP contains provisions for parking lots and environmentally sensitive areas. As I noted, parking lots were expressly included in the SUSMP definition. Their absence in the original proposal submitted by the permittees required their inclusion in the December draft the Regional Board staff issued.

Environmentally sensitive areas are also added as a category. Please note the permit does not preclude additional development categories from being listed in the SUSMP, and it is clear that discharges from developments into these areas pose special obligations and concerns.

The SUSMP also contains design criteria for BMPs which requires those best management practices to mitigate pollutants from the specified volume of water. While several options are provided to calculate this volume of run-off, for developed areas this translates to three quarters of inch of run-off in a 24-hour period.

It is important to note that the run-off volume is dependent upon the amount of land developed versus that which is left in a natural state.

The intent is to ensure that run-off from impervious areas is adequately managed to remove pollutants. If more land is left permeable, the lesser volume of run-off is required to be managed. The lesson is clear. The more the land is altered, the greater the responsibility of the developer to ensure the project is inherently controlling the pollutants.

It is important to note that the Regional Board has not ordered the use of any specific BMP. What the Board has done is to say that the most polluted stormwater run-off must be subjected to some form of mitigation to reduce its pollutant loading. The Board separately adopted a list of BMPs that can be used to fulfill this requirement. What was lacking at that time was a design criteria; that is, to say how much water must the BMP be able to mitigate to be effective.

If you know what your most polluted run-off will be, or rather if you know that your most polluted run-off will be the first flush, which we generally agree to be the case, it is only common sense to make a BMP large enough to address that portion of run-off which is most polluted. Higher volumes will contribute more pollutants, that's sure, especially litter and sediments, yet these higher volumes are expressly allowed by the SUSMP to pass through.

A limit of three-quarter-inch volume criteria is well within the maximum extent practicable criteria that we must apply. Further, as you have already heard, even more stringent criteria are in use in other jurisdictions.

Much has been made about the retention capture consequences of the SUSMP. Let's remember that capture is only one option. Filtration is also an option that obviates the need to hold large amounts of water and the costs associated with that approach.

The Board carefully considered and included provisions that allowed design criteria to be waived under certain conditions which would make their application impracticable. These include limitations of adequate space, unfavorable or unstable soils, risk of groundwater contamination, or any other reason upon approval of the Executive Officer. I would like to really emphasize that point because it provides a great deal of flexibility to the SUSMP.

The waiver provision provides that appropriate flexibility and recognizes the existence of conditions where the design criteria structural or treatment BMPs are not appropriate. Additionally, the SUSMP allows permittees to accept a registered P.E. or licensed architect certification that the development plan design meets SUSMP criteria. This substantially reduces the cost of implementation and allows for in essence a system that is transparent in implementing permittees.

There is no unfunded mandate imposed on cities by this program. Because of its long-term vision, the payoff from investing in the SUSMP approach would be realized mostly in the future as the relative percentage of affected property increases over time. I've called the SUSMP to be designed for the future because pollution control benefits will mostly be realized as new and redeveloped property reduces, but certainly not eliminates, stormwater loadings. The SUSMP provisions will mean that our future communities will be inherently less polluted as compared to today.

Perhaps most telling of the petitioners' mind set is the offer made in good faith to include a rooftop exemption. My hope in proposing the idea was to offer a compromise. The rooftop exemption would have, in effect, dramatically reduced the effect and size of the three-quarter-inch design criteria. By excluding a substantial portion of run-off volume from a given area, run-off that should arguably contain fewer pollutants, the BMPs could be smaller and so less costly.

Even so, even this concept was not embraced by the petitioners, and absent my strong endorsement -- absent rather any strong endorsement at the public hearing, was not carried into the final SUSMP as approved. So I asked if even this approach was unacceptable to the petitioners, would any design criteria be acceptable to them? I think you heard their answer yesterday.

So in the final analysis, what is a BMP? It is a fiction or a reality? To be the latter for a BMP to be effective, it must meet some objective design standard.

The Regional Board and its staff have invested a large amount of time for consideration in this matter. In addition to the formal process outlined here, we held numerous meetings with petitioner cities, the BIA, in formal and semi-formal settings to explore the issues associated with the SUSMP. These meetings were augmented with many phone calls and formal conversations. Any suggestion that adequate public notice was not offered is without merit.

While it is suggested that the design criteria were the result of last-minute changes, they were fully discussed at the September 16th Regional Board hearing, discussed in meetings with permittee and BIA representatives, and noticed in the December SUSMP draft proposal. It should also be noted that an early draft prepared by the permittees themselves contained numerical design criteria for BMPs.

The Regional Board SUSMP adoption process was offered. The permit expressly allows for the Regional Board to approve elements of the permit at a public hearing affording public review and comment. This provision supersedes the authority for approval of a SUSMP by the Executive Officer and clearly establishes the finalcy of the Regional Board over the modification of plans which become an enforceable element of the permit.

As early as April 1999, the Regional Board asserted its interest in and intention to be engaged in the SUSMP provisions. Here I would just like to diverge for a moment and clarify one point that was made yesterday having to do with the submission of a SUSMP proposal to the Regional Board at the last minute as was argued.

There was a change sheet that was provided to the Board the day of the hearing and that was in response to many comments that we received, and often we received comments at the very last minute and up against the gun, trying to get those changes in place. In that particular instance there was so many changes, mostly minor in context, but we wanted to make sure the Board had a document, a strike-out version that showed what those changes were rather than having to flip back and forth and figure that out. So that particular document was provided to the Board. It was not provided to everyone else in the audience. We simply didn't have time to pull that together. So that explains what that document was.

One thing I really do want to note is that it appears to me, at least, the petitioners accepted the primacy of the Regional Board's action by appealing the Regional Board's decision within the statutory 30-day window allowed for such appeals, and our legal counsel will be addressing that and other issues shortly.

The Regional Board did modify the SUSMP from that submitted by the permittees. Rather than being inappropriate, that is exactly the authority that is invested in the Board for them to exercise. In contrast, the permittees believe it is necessary to reach consensus and what should be required of them is permanent. The petitioners assert that they, not the Regional Board, determined what criteria meet the maximum extent practicable language and consequently what the permit requires. That result is demonstratively wrong.

Now Dr. Xavier Swamikannu will follow me and provide technical information with respect to the program.

CHAIRMAN BAGGETT: We have a couple of questions.

BOARD MEMBER FORSTER: When I ask questions, it doesn't count. Well, I agree with you, Dennis, about why you probably had to redo a document so the people could understand. We all are also subject to people giving us things at the last minute, and trying to incorporate them into big decisions is nearly impossible. You have my sympathy.

A couple of things, Dennis. I remember at your hearing, since I sat in the audience, that you had some exemptions that were proposed and they weren't well received by some of the interested parties, but I don't remember what those exemptions were.

MR. DICKERSON: I think the principal exemption was the rooftop exemption, and the effect of the rooftop

R0073912

exemption really would have been to reduce the three quarters standard significantly because what you would have done is you have taken that portion of surface area from the rooftop, and provided you had a situation, and this is written in the proposal, that you were able to take that run-off from the roof and run it directly into a storm drain, which would not have affected any erosion issues such as we have in L.A., you can run it right to a storm drain and released any increased volume into the channels. It wouldn't flow over a parking lot, it wouldn't pick up additional contaminants.

That was the idea and that would have dramatically reduced the need to design bigger BMPs. I should note, though, that since actually that hearing, I did attend a meeting where some results of a deposition study were discussed and that that study we talked about or it was relayed to us the aerial deposition perhaps is having a much more significant effect. So I think in hindsight it's something that might not have been pursued so aggressively on my part.

Another provision that is in there with the waivers, those waivers allow for quite a bit of flexibility on the part of the permittees and it especially addresses groundwater that has come up in discussions here. The whole purpose is to avoid that exact issue.

BOARD MEMBER FORSTER: Did the cities -- in the original proposal, did the cities have the power of a waiver and then the Board requested it review instead of the cities?

MR. DICKERSON: The waiver has -- the waiver has two provisions in it, and I probably need to go back exactly, but I think there was some waiver provisions plugged in automatically which the cities can adopt now. And there are provisions, additional provisions, which they can come to the executive board's, or rather the Executive Officer, and say here's a good case for an additional waiver and give us the authority to do it and that's provided.

BOARD MEMBER FORSTER: My only concern with that is that it would be easier for the public to be able to get a waiver directly from the city when they're doing a plan than to have to just stand in line and wait until you could get to them.

I have a little sympathy for -- I was a Planning Commissioner for people who go get a loan, want to build something and have to wait for all the permits and are paying on the loan. I'm just looking for what is the most efficient way to help a member of the public get a waiver if they're entitled to a waiver. This is not to dilute the purpose of what you're doing, it's just to make things more efficient.

MR. DICKERSON: We really did build in quite a bit of flexibility for the local community to address that.

BOARD MEMBER FORSTER: The last question I have is did you -- did you -- how did you go about redevelopment, in-fill low income housing? Did you labor over that like how would you trade off the unintended consequence of trying to redevelop in areas where it's very low socioeconomic and you're trying to keep the cost of houses down and trying not to add any additional expenses?

MR. DICKERSON: With regard to redevelopment, there's a provision in the permit, or rather the SUSMP, that talks about 5,000 foot threshold. So really what you're talking about there are properties that are really quite significant in terms of how much redevelopment is going on. And I think that particular notion would really exclude a large portion of that affect on lower population or lower income areas.

It was of great concern to the Board. The Board transcript, which I reviewed again this morning, the Board talked about affordable housing, how they affect that area, and they were very concerned and wanted to address that.

BOARD MEMBER FORSTER: Thank you.

BOARD MEMBER BROWN: Dennis, the concern I have is that we don't trade one problem for another. I understand that containment facilities, really cisterns or otherwise, to help knock the peak off storm falls and reduce velocities through channels, downstream erosion in downstream locations, but obviously single-family homes and individual homes it is a very expensive way of doing that and it's probably not the main purpose of why we're doing this, I would suggest. Maybe I ask.

Assuming that the main concern that we have is water quality and not the responsibility of water quantity peak flows, if the concern is water quality, that can be divided up into two major concerns, suspended solids and dissolved solids. The suspended solids can obviously go without being taken care of and that's one concern, but the more major concern that I have is the copper, the zinc and the benzene and MTBE and the materials that are dissolved in which filtration, as you know, will not have any affect at all, and if we are constructing containment zones or infiltration zones or percolate this as some of the BMPs, then the concern I have is that we're trading a surface quality problem for an eventual groundwater quality problem.

I'm trying to visualize in my mind what BMPs at a service station, as an example, other than the prevention of bad things happening, what BMPs can we go ahead and request or require that they do that would not swap the surface water problem for an eventual problem. That's one question. Let me ask a couple more. Go ahead and respond to that.

MR. DICKERSON: Thank you. I think the most critical facet of the whole system program is flexibility. We are not prescribing what BMP is used under any specific situation; neither is the Regional Board prescribing what the effectiveness of the BMP should be.

The assumption is that there is -- by allowing developers really to review common practices, by going to workshops like tomorrow, they are going to be able to identify what are the best BMPs to apply in a given situation. We don't get into that. We allow them to make those judgments and decisions based on best engineering practices and we don't even presume to get into that.

BOARD MEMBER BROWN: My background is in civil engineering. I worked for over 30 years. I'm just having trouble from that experience and trying to visualize something that we could force upon the proprietor that would not, as I say, swap one problem for another other than retention and reduction of the peak flows. You can do that and that's a concern, but that's a minor concern compared to the dissolved chemicals, benzenes and MTBE and such that we are faced with. Granted, something needs to be done.

I just want to make sure that what we're asking people to do is the right thing to do. It's a lot of money. I don't have the comfort feeling that we're there yet and what we're requesting or how we're requesting it could be accomplished. Something needs to be done, yes, but is your comfort level to the point that where we really know what needs to be done and we can start forcing the public to regulation to make these kinds of expenditures?

MR. DICKERSON: We know that, for example, sediments carry along with them a large portion of metals that we're concerned about, and so filtration really is going to address the large particle problem.

BOARD MEMBER BROWN: Granted the suspended solids, yes, and that's of a concern, but of a magnitude greater is dissolved.

MR. DICKERSON: I don't think there's any question about that, but we do not mandate through the SUSMP that that dissolved portion necessarily be the BMP or BMP be selected to address that problem. Any BMP that helps to deal with the problem overall is acceptable.

BOARD MEMBER BROWN: Well, no. No, it isn't. BMP, as an example, one of them is the containment or the filtration percolation. That's a BMP. And as an example, to me filtration and percolation would not be acceptable on a service station site. Period.

MR. DICKERSON: If it's not appropriate to be used, that's at the discretion of the developer.

BOARD MEMBER BROWN: That's different.

MR. DICKERSON: To say that's not appropriate for that spot.

BOARD MEMBER BROWN: I agree, but that's different than your statement previously was that any BMP would be beneficial. So my point is that we need to know which ones are appropriate and which ones are not. That's part of the issue. Single-family homes for retrofit and rehab, how do you feel about exempting those as a start? You can always add them later and see how the program addresses that, but there was some pretty good testimony. And regardless of whether you're low income or medium income or, I guess, high income, what's your feeling as far as exempting single-family homes?

MR. DICKERSON: Any exemption of any particular category is always an option and that was something that was before the Board for consideration. The real magnitude of some of the issues that we're looking at clearly do call for BMPs and I think that's a judgment call that really has to be made.

BOARD MEMBER BROWN: Thank you.

BOARD MEMBER FORSTER: One more question. I don't understand the discretionary, non-discretionary. I don't know if you're the one to answer that or Jorge or Xavier. So I guess what I don't understand is was discretionary and non-discretionary there from the beginning of your SUSMP that you modified and proposed to the Board? Was it added that day? I don't know what it means. I know what discretionary means, but I don't know what non-discretionary means.

MR. DICKERSON: I was looking at the transcript this morning and the non-discretionary, discretionary issue was addressed by the Board at the hearing, so it was part of the proposal. In essence we're talking about this morning, and it appears that really we don't have any substantial effect because of the categories we're talking about. The categories are such a magnitude really that they're almost all discretionary. I'm not sure it's a distinction with a great difference, an initial reaction.

BOARD MEMBER FORSTER: Well, I think the thing I heard yesterday was -- it was the porch example. If somebody wanted to add a porch they had to do something, and it was my opinion that is not what our goal is.

MR. DICKERSON: Right. And I think we were shaking our heads saying, "What's going on with that? That doesn't sound right."

BOARD MEMBER FORSTER: Okay. So maybe we have to look at that non-discretionary and define it better that we don't mean porches. That's all I have for right now. Betsy will help me. Maybe somebody else can bring that into their discussion.

MS. JENNINGS: I'm not sure if my questions are really for you, Dennis, or I can certainly defer them, but I think along the same lines when you got into discussions of things like porches, and I know you all were shaking your heads and saying no, we didn't mean that. I'm a little confused by two areas of definitions and I would like to have that addressed as to at least what you meant and whether it says what you meant.

The first is redevelopment. You just a few minutes ago indicated about 5,000 square feet. I have to say when I read this it seems to say creation of 5,000 square feet or 50 percent impervious surface, I guess regardless of the size, or making improvements to 50 percent of the existing structure. I don't know if that means increasing the land or just doing something to 50 percent, it could be all indoors. I think it's important for this Board to know at least what you intended and then maybe deal with what it actually says.

I guess the other aspect of that was for the environmentally sensitive areas, and I think this is also where we got into the porch idea. What type of project in an environmentally sensitive area do you mean to talk about because it's location, which the petitioners' attorney brought up, rather than type. I don't think it's totally clear, at least to me at this point. Is there a threshold that you're talking about occurring in an environmentally sensitive area and did the Board have an intent on that and does the language used actually express that intent?

MR. DICKERSON: I'll defer both of those to Xavier and Jorge. I agree we're looking at that as well.

CHAIRMAN BAGGETT: I have three questions, and you can defer these if you feel it's appropriate.

Does the Long Beach -- how did the Long Beach plan deal with large areas of retail gas outlets?

MR. DICKERSON: The SUSMPs were incorporated into -- the SUSMPs that were adopted by the Board in January were incorporated into the Long Beach permit by reference. It was part of the settlement that we made with them. When the SUSMPs were adopted by the Board, they became effective for the City of Long Beach as well.

CHAIRMAN BAGGETT: So they accepted the December draft or were they aware of your final adopted SUSMP?

MR. DICKERSON: They were there.

CHAIRMAN BAGGETT: When they cut the deal.

MR. DICKERSON: They were aware of the final SUSMP at the time.

CHAIRMAN BAGGETT: Which was --

MR. DICKERSON: It was some months before, and we considered -- that was June 30th of '99 we actually had that permit before the Board so that the final SUSMP wasn't even -- even the draft hadn't been submitted.

CHAIRMAN BAGGETT: So Long Beach didn't really adopt the rooftop issue or RGO issue or they didn't really discuss the details of some of these issues.

MR. DICKERSON: It was the final, but Long Beach did participate in the final discussions that went on before the Board at the time the Board adopted the SUSMP in January.

CHAIRMAN BAGGETT: I think you just talked about the 5,000 square foot threshold. I had questions on those. And I guess the remodel standard you just talked about. What triggers the standard for the SUSMP's application in a remodel situation?

MR. DICKERSON: I think that's the same point Betsy raised.

CHAIRMAN BAGGETT: The same. Any other questions? 38 minutes. Next.

XAVIER SWAMIKANNU,

having been previously sworn, testified as follows:

STATEMENT OF XAVIER SWAMIKANNU

MR. SWAMIKANNU: Chairman Baggett, Members of the State Board, my name is Xavier Swamikannu. I'm the acting Chief of the L.A. Region Stormwater Program. I was also one of the original state team members who developed the statewide strategy to implement the stormwater program pursuant to the 1987 amendments of the Clean Water Act.

In the matter before you I worked directly with our Executive Officer to provide management and oversight of the Board's Municipal Stormwater Permit program. I provided the technical expertise to support the Standard Urban Stormwater Mitigation Plan that is at issue here.

The SUSMP contains a numerical design standard for the sizing of BMPs. This sizing criteria was developed on stormwater run-off data for the Los Angeles area and utilizes methods recommended by the American Society of Civil Engineers and the Water Environment Federation in their manual of engineering practice. The criteria is not at all arbitrary or unscientific as claimed by petitioners.

The three-quarter-inch design criteria is based not only on good science and engineering principles but also on the experience of other states and jurisdictions that have adopted even more stringent criteria. In developing the three-quarter-inch criteria, we started with an empirical equation.

Here we see that the relationship between efficient treatment volume for a desired treatment percent, say 85 percent, is given by percent treatment coefficient multiplied by the area run-off coefficient multiplied by the mean precipitation volume. For southern California that result can range between 0.12 to 0.86 inch of run-off. In highly paved areas such as L.A., the value is at the higher end. For less urbanized areas, the value will be lower.

The American Society of Civil Engineers water and volume federation method utilizes the idea that there is a certain volume of water that can be captured or treated based on the nature of precipitation. Small rainfall events are common, while extreme flow events are relatively rare. To ensure maximum flexibility, four equivalent design standards or mitigation criteria for new development and redevelopment projects were included in the SUSMP. The ASCE method is the primary method and directly determines the volume of run-off that can be cost-effectively treated for water quality purposes.

The second method is similar and is described in the California BMP handbook. It uses the annual run-off volume capture method to calculate the volume of run-off that is to be treated.

The third and fourth methods are essentially the same. The three-quarter-inch rainfall criteria is a more specific statement of the 85th percentile rainfall value and uses the principle of diminishing returns.

On this graph the vertical axis represents cumulative rainfall run-off volume in inches. The horizontal axis denotes 24-hour rainfall events in inches. The graph shows that the largest volume of rainfall run-off is produced by rainfall events of less than one inch. The data for the plot comes from 50 years of precipitation records for the LAX area.

This graph shows the three-quarter-inch numerical design standard derivation for the Los Angeles region. On the vertical axis you have the cumulative probability of rainfall. The horizontal axis denotes the 24-hour rainfall totals in inches. The probability of a rainfall event equal to or less than three quarter of an inch is about 85 percent. The 85th percentile is the midpoint of the mean of the curve. The top of the mean of the curve would be indicative of the point at which returns start to diminish. The bottom of the mean of the curve would be about .6 inch and would represent a minimal effort.

Data for this plot was obtained from hundred year rainfall records for the downtown Los Angeles Civic Center station. This station is a representative station for Los Angeles County. Rainfall total in the Los Angeles area varies with geography. The closer one is to the mountains, the greater is the rainfall. In this graph, you see that the 85th percentile value would be higher for coastal areas in Los Angeles. In this case it is 1.2 inches for west Los Angeles, thus the value of a three-quarter-inch for the Los Angeles region represents an average value. Cities in the watershed can elect a different value so long as they use one of the methods. It is not one-size-fits-all.

Several other states have adopted design criteria for BMPs. Here you see the criteria for new development and redevelopment thresholds for three of these states -- Washington, Florida and Maryland. These states have years of experience behind them. In addition to several states, many more municipalities including Denver, Portland, Austin, Santa Monica, Calabasas and unincorporated Los Angeles County have implemented BMP design criteria for new development.

In general, the water quality design criteria and other thresholds for the L.A. SUSMP are less stringent than the other states. Our rainfall criteria of .75 inch compared to 1.3 inches for Washington. Our rainfall criteria is the 85th percentile rather than the 90th percentile or better for these states.

The redevelopment threshold for L.A. is comparable. Our requirements apply to only nine categories of development rather than for all categories of development as in these states. It is also important to note that the SUSMP does not impose any particular treatment control BMP.

Here we note the BMPs that one might choose to satisfy stormwater treatment requirements of the SUSMP -- a swale along the parkway, a detention basin integrated into the development as a scenic lake, catch basin and storm drain inlets to capture trash, among others.

In practice, a developer would select the project's source control and structural BMPs. The project plan will also identify treatment control BMPs capable of mitigating stormwater run-off from .75 inch of precipitation from the development after construction is complete. By mitigation I mean infiltration, capture or treatment. The selection of BMPs is left to the developer's discretion and the municipalities.

I will next address the cost analysis that staff conducted. The implementation of a federal regulation by a Regional Board does not require that a separate cost analysis be done. Nevertheless, staff worked with the City of Los Angeles staff to determine the cost of compliance for the design standards for a typical project, a five-acre $6.5 million dollar commercial development in downtown Los Angeles. The mitigation costs of the detention basin based on the numerical design standard worked out to less than one percent of the project cost. Details on the cost estimation are found in the administrative record.

Petitioners's testimony yesterday questioned the $33 cost figure for maintenance and cleanup. This is what it costs the City of L.A. Even if we increase the cost by a hundred times, it would still be less than one percent of the project cost.

In the second example for the same project, we evaluated costs for non-capture BMPs such as infiltration and vegetative swales. Again, cost including the design construction and maintenance amounted to less than one percent of the project cost. It is generally understood that water quality mitigation costs may reach about five percent of the project cost.

Our estimates were validated by testimony presented at the January 26th hearing by representatives of the environmental groups and the documentation that we included in the administrative record.

Designing for the future and for the environment can be cost-effective. Here we see a chart that identifies these cost savings. The vertical axis on the chart represents the percent change for conventional designs of a residential home subdivision. On the horizontal axis is the parameter of interest. As shown, the open space design reduces run-off by 25 percent and nutrient export by 40 to 50 percent. Development cost savings are from less piping, less concrete pavement, less street paving, less grading and similar infrastructure and development outlay savings.

Of special note, the Center for Water Protection in Maryland has prepared open space designs for residential development to reduce development cost by about 12 percent as opposed to the conventional design, and those references are included in the administrative record.

Similarly, the cost for development of a commercial shopping center using an innovative design as compared to a conventional design can lower the development costs as well. The innovative design achieves substantial reduction in impervious cover, surface run-off, and pollutant export. These designs are referenced in the administrative record and summary papers have been included in the Regional Board's exhibit supplement.

The Director for the Center for Watershed Protection previously submitted a comment letter to the Regional Board which is part of the administrative record on the subject of numerical design standards. The comment letter he writes that the design standards for L.A. are a fair, equitable and achievable threshold.

With respect to the experience of other states, we posed a series of questions to the stormwater program managers for the states of Florida, Maryland and Washington. One question was do water quality design standards impose undue burden and unsupportable costs. The Florida Department of Environmental Protection, which has the longest history of implementation, says it has not. The Maryland Department of the Environment adds the burden was primarily start-up costs that were to be expected. The Washington Department of Ecology comments that the cost of compliance was only incremental to development costs.

Another question we posed was have there been noticeable improvements to water quality as a result of implementation of standards and controls for new development.

The Florida Department of Environmental Protection responds that Florida's rule was substantially responsible for the reduced water quality impact on growth on receiving water quality in that state. Maryland answered that modest improvements in water quality were observed and expects more improvements once definite requirements are imposed with the new standards now. The state of Washington, the newest of the three, has of this time anecdotal evidence of improvements to water quality.

In summary, water quality BMP design standards and other SUSMP requirements for new development are founded on well established engineering principles and sound science. The ~~early~~ L.A. region's SUSMP requirements are not arbitrary and capricious as plaintiffs claim.

Several other states have clearly led the way, as has the County of Los Angeles and several L.A. municipalities. These municipalities, such as Santa Monica, have been implementing design criteria for new development BMPs for sometime. We should remember that the MS-4 program is a permit program with a clear statutory standard for compliance to reduce pollutants to the maximum extent practicable.

A consensus plan it is not, nor is it a

voluntary one. The burden of proof of compliance is on the petition, not the Regional Board. State Board Counsel Jennings' own memo on MEP discusses the comparative effectiveness burden of proof that petitioners must make, yet petitioners reject treatment control BMPs outright and attempt to shift the burden of proof to the Regional Board. None of petitioners have come up with a better document for scientific design standard for water quality other than challenging as unscientific that adopted by the Regional Board.

I am completed.

CHAIRMAN BAGGETT: Questions? Pete.

BOARD MEMBER SILVA: This is a question in follow-up to what Mary Jane asked earlier. I'm also concerned about the fact that lots of different cities try to implement the BMPs and getting back to design criteria but also some concepts like you have here. I notice your quotes about a manual and whether you had thought about perhaps having a manual put together by the different cities and then delegated authority for approval to them so we wouldn't get into this burden that we talked about earlier about the EO having to sign off on all these different exemptions. I was wondering if you had thought about that, was that included.

MR. SWAMIKANNU: There are a couple issues that you have raised. The first one is the idea of a manual developed by the Regional Board. What I do expect is probably similar to what has gone on in other municipalities like Denver where the design criteria, say 90th percentile or one inch, is developed and then the BMPs that ought to be considered are sized for that design standard. They are all put together in a manual.

In Los Angeles, as Dennis indicated, there's a workshop tomorrow and the intent is exactly that. We have not (inaudible) but engineers come there and explain how they would comply, what kind of BMPs, how they would be sized to meet this criteria. We have thought through that process.

I think what we are doing is basically committing the Regional Board to develop the manual. My understanding is that the County of Los Angeles, being the principal permittee, being committed to the three quarter of an inch will develop that manual and tomorrow's workshop begins that process.

The second question which you asked about these waivers request coming to Dennis and whether we really would be a bottleneck in the process, the permit itself has three or four specific situations like limited space, risk of groundwater contamination, and a couple of others where the waiver authority is already given to the cities, so long as that's the explanation and all BMPs are considered. The city then can issue the waiver right there. It doesn't have to come to the Board.

The situation where it comes to the Board is a situation where it's a condition that nobody has anticipated. So there was a request that that be a public process. One party might think it deserves a waiver, another might not. So in that situation that request is to come before the Regional Board. The Regional Board then can make a decision as to whether there's a sufficient condition for waiver and then release that authority to the Executive Officer and further transfer that authority back to the city so the next time around in the similar situation it will not come to the Regional Board.

BOARD MEMBER BROWN: I'll ask you the same question I asked Dennis with the concerns of the dissolved chemicals, zinc, copper, benzene, MTBE, the concern being that we don't swap one problem for another. Give me a couple of examples of BMPs that would raise the comfort level that we're not swapping a surface water problem for an eventual groundwater quality problem.

MR. SWAMIKANNU: I'll try and address it in three different ways. The first is the risk of groundwater contamination has been evaluated by the EPA and there's a document which says when is the risk high, when you should not infiltrate. We referenced a document in our report to say that's first we have to look at and clearly infiltration is not the solution.

The second aspect is for years the petroleum industry and consultants have argued that ~~when~~ you infiltrate in an area where the soil is favorable to microorganisms degrading petroleum hydrocarbon products, that's in use in some circumstances we're concerned with hydrocarbons. In some situations natural attenuation has been proven, so that's an option.

The third one is there are systems for dissolved, one example comes to mind is called storm ~~receptor~~ treat, and because the quantity of water we're talking about is not flood~~ing,~~ event it's the more common event that systems like that might -- that storm -- the simplest explanation is wetlands in a box. It's something used to remove dissolved. So if you design it for this criteria, it might affect dissolved components.

Remember, we aren't making the choices here. We're just saying when you have to clean up stormwater, what portion of stormwater, how much stormwater should you cost-effectively design a BMP for, and I think that's the design criteria for ~~solid wastes.~~ storm water

BOARD MEMBER FORSTER: Do you want to talk at all about the discretionary, non-discretionary?

MR. SWAMIKANNU: I was thinking whether I or Jorge should address it, but Jorge said he would.

BOARD MEMBER FORSTER: Do you want to talk about the threshold in the environmentally sensitive areas?

MR. SWAMIKANNU: The environmentally sensitive areas is the recognition that these areas are not designated by the Regional Board but by the State Board, the California Resources Agency or the County Planning Department. So the issue then is ~~is~~ should it be location driven. The answer is yes. Is ~~that~~ there a threshold? There's nothing in the permit, but what I would submit, I have had some discussions with ~~the~~ a city that they can define, it gives them the opportunity to define which projects in an environmentally sensitive area need to meet SUSMP requirements. That's not defined now but it's basically a location issue. Is it every project? No. Is it these nine categories? Definitely. Is it more than that? Yes.

I think that's where there's some room for defining what other projects in an environmentally sensitive area might need to have some kind of ~~an order~~ control to ensure that the sensitiveness of the environment is protected.

BOARD MEMBER FORSTER: So am I to understand that you're leaving that up to the cities to define?

MR. SWAMIKANNU: Yes. Not define environmentally sensitive areas but what projects beyond these nine categories need to be addressed because we did not discuss what additional projects. We think it has to be -- it is more than these nine categories, but specific projects are open to discussion. I'm not a planner, so I do not know what they would be.

CHAIRMAN BAGGETT: Questions from the staff.

MS. JENNINGS: I'm not sure -- are you saying that that's an idea you have now or do you think that the statement you just made with the cities can decide which projects in an ESA have to meet the SUSMPs, do you feel that's expressed right now in the SUSMP or something you're thinking about changing?

MR. SWAMIKANNU: I'm not saying that I'm changing. I think what's expressed in the SUSMP is -- if it's an environmentally sensitive area and you go before the Planning Commission, they have certain codes for stormwater. Now, the question is that every project that comes before planning? The answer is no. It's not called out in the permit. It's not -- I have not evaluated all the projects.

I think you have to think about how this process is going to work. Once the SUSMP is approved, the municipalities change their codes to make this happen. During that code change process, they can define what additional projects in environmentally sensitive areas would be subject to the requirements. So I'm leaving it up to the cities at this point because I don't have the expertise.

CHAIRMAN BAGGETT: Thank you. You have 24 minutes remaining.

JORGE LEON,

having been previously sworn, testified as follows:

STATEMENT OF JORGE LEON

MR. LEON: Thank you, Mr. Chairman. I was going to go ahead and talk a little bit about the environmentally sensitive areas, and the only thing I really want to add to what Xavier said is that the Board found itself sort of between a rock and a hard place because while the environmentally sensitive area was not in the permit as one of the originally listed categories, we thought about it and realized that the locations where these things were, these areas, where these categories are, that's what makes them receptive to special attention.

We had to apply the more stringent standards because they are environmentally sensitive areas. So the categories that are listed in the permit are by project type but this, of course, is a category created and characterized by the fact that it's an area that requires stringent attention.

The permit itself does not limit the categories. It says at a minimum the categories that are listed in the permit. You know, every once in a while the speakers bounce back and forth between the terminology in the SUSMP, and I hope you're keeping up with the fact that sometimes we've been using those words interchangeably.

The permit is the stormwater permit which created the requirement for the development of the SUSMP. I guess it's a little late to try to set terminology, but I hope it's been clear for you.

With respect to waivers, I'll try to respond to some of the questions that came up. I did want to tie the questions that Mr. Silva asked along with the questions that Mr. Brown asked and the answers to those questions because the waiver provision that's in the SUSMP does specifically name possibility of groundwater contamination as one of the grounds for the applicability of the waiver. So the SUSMP does give the cities the discretion to create a SUSMP waiver. When we run into the situation Mr. Brown has talked about, there is concern about transferring one problem to another problem.

CHAIRMAN BAGGETT: Does that apply to RGOs, gas stations, or can it?

MR. LEON: It can. It's up to the --

CHAIRMAN BAGGETT: Their engineer design by the permittees?

MR. LEON: Yes.

BOARD MEMBER FORSTER: On the more conservative side, what if all the -- there's a lot of groundwater basins in the L.A. area. How do we -- how do we monitor that the cities don't just decide that oh, that will contaminate? Are we going to have a criteria or something that protects a rampant amount of waivers where they're not justified?

MR. LEON: That's a very good point. The waiver provision does talk about a means of expanding the waiver capability, but it doesn't talk about sort of drawing back the authority once it's been issued, and what -- I'm glad you raised it because it's something that we need to think about.

Maybe we need to make clear that the proposed ordinances are reviewed by the Regional Board before they are issued and adopted so that there's some type of means of protecting against rampant waiver issuance in cases where it's not justified.

Another couple of questions that came up had to do with redevelopment clarification of the language regarding the development. I don't believe it was the intent of the Regional Board on the development in developing the SUSMP to require in that example, sort of a far-fetched example, but it's a legitimate question about if you just reroof your house and not adding anything on, does that create the responsibilities.

At the table this morning we talked about it and we do believe it will probably have to make some kind of a clarification on that issue because currently it could be read a couple of different ways.

Finally on the note of the issue of discretionary versus non-discretionary, discretionary is the term, as Mr. Montevideo pointed out in one of the overheads from the permit, that's used in the permit. The permit does talk specifically about discretionary projects but the permit itself didn't define discretionary projects. There's no clause that includes a description of discretionary projects, and the Board inherently in its authority has the authority to change the terms of the permit.

When the Board reviewed the SUSMP proposal, the Board determined that if we used discretionary projects only as the category that is made a part of the SUSMP impacts, then what we're doing is perhaps leaving a gaping loophole out there because perhaps more projects that people work on out there in developments and redevelopments are non-discretionary. So the Board was concerned about leaving that big loophole where activities and construction projects are occurring that need be administerial non-discretionary, and if that's the case where we're still having the same water quality impacts of the stormwater discharge from those properties, and so the Board took it upon itself to make the modification and expansion from the list of impacted sites as listed in the permit and added in the SUSMP non-discretionary projects.

BOARD MEMBER FORSTER: I want to ask another question. For me it's better to ask as you go instead of trying to pull it all together at the end. I think that there's an interesting point to consider here. I want to see if it's your opinion.

I still don't understand what non-discretionary projects are versus discretionary. I don't understand what discretionary means, CEQA and all of that, and what non-discretionary means and the homeowner who comes in to add a room on for the new baby. I don't understand the difference and I'm wondering if there's compromise -- as you're looking through your stuff, I'm wondering if there's a compromise the permit says discretionary, the permit is renewed in 18 months, if that's where you add non-discretionary.

I just need a better understanding of that myself. I'm just not satisfied that I understand it.

MR. LEON: Right. I guess it's sort of -- to paraphrase the question, your concern is whether perhaps this was the better way to go at this time or wait until we get to the permit reissuance phase to take care of several issues.

BOARD MEMBER FORSTER: No. My question is there's the big picture that we're trying to do here in stormwater control, new development and just, you know, the next category of the Clean Water Act. The big picture, the goal, the target. Then there's this micropicture and I'm wondering if the micropicture is the non-discretionary, that the unintended consequences of going into a fully developed city where somebody is coming in to do something to improve their home and all of a sudden they're under this permit. And I know about the 5,000 square foot threshold, but in some of the older communities they were lucky enough in the old days to have a decent sized lot. They're not all arm length apart.

So I'm just trying to justify in my mind what are you getting at with non-discretionary. If you're getting at that little homeowner, I'm not sure that's equitable. If it's something bigger that I don't understand, then maybe it's equitable.

MR. LEON: I'll take a stab at it, but I would also invite my colleagues at the table to take a stab at it too because I do understand that you're looking at

R0073941

what is the impact on that smaller homeowner.

My perspective of it is that the Board was trying to accomplish two things at the same time -- accomplish capturing those projects that legitimately create water quality concerns for the stormwater and, therefore, ought to be all-inclusive and brought in the non-discretionary projects, but at the same time didn't want to create the inequity that you're talking about and has left that issue to a great degree to the permittees to decide upon the waiver provision.

In fact, if studies bear out that there are impacts on, for example, low income housing, on smaller projects where somebody is trying to regroup or build a small porch, the cities can come to the Board, if they haven't already adopted it themselves, and ask for the acknowledgement and approval of such a waiver.

My outlook is that the Board has done what it can based on the information that it has to address the water quality issues in a more conservative way but has built in some mechanicism to try to avoid --

CHAIRMAN BAGGETT: Maybe this will clarify. I'm under the assumption you're talking about a discretionary permit or non-discretionary permit by the jurisdiction that's issuing that permit.

MR. LEON: Right.

CHAIRMAN BAGGETT: Non-discretionary permit would be non-discretionary permits the jurisdiction gives, they don't vote yes or no they're within the

R0073942

setback limits. You have a building permit. You want to build a house. It's within the prescribed setbacks, prescribed design for that area. They have to issue a permit. It's non-discretionary on the agency, I assume.

MR. LEON: That's correct.

CHAIRMAN BAGGETT: A discretionary permit would be say you go in and apply. Say it's a ten-foot setback. You apply for a five-foot set back. The Planning Commission has discretion under certain rules in certain jurisdictions, depending on what the code is for that city, to allow under their discretion to issue that permit.

That's what's triggering these requirements in the SUSMP. It's the permit is required by that jurisdiction. There's may be some jurisdictions I assume without uniform building and planning requirements. This is an administrative -- no matter what happens, this is not a simple thing because you've got all these different jurisdictions, different planning codes and building codes. And that's what triggers discretionary or non-discretionary, not the EOs.

MR. LEON: That's correct.

CHAIRMAN BAGGETT: I think that's where the confusion is coming from. It's like the term "permit" versus the term "SUSMP."

MR. LEON: Permit or local permit or the --

CHAIRMAN BAGGETT: Are you talking about EPA's permit for MS-4, are we talking about -- we're throwing around terms here that can be very confusing. But that's where the discretion is. The discretion is at the local level, not what triggered this depending on --

MR. LEON: I apologize for the lack of clarity. We at the Regional Board have been involved in this for so long, we have a pretty clear idea of what we mean by discretionary, non-discretionary.

CHAIRMAN BAGGETT: It's planning talk.

MR. LEON: We use planning talk.

CHAIRMAN BAGGETT: It's not law and engineering, it's planning.

MR. LEON: What I would like to do now is cover the major legal issues that have arisen, the petition as in our discussion yesterday and today, and in a nut shell, of course we have two sort of major categories. We have the category procedural issues. The Regional Board, it has adopted the SUSMP process and the petitioners have alleged that we've adopted using the wrong process and that we haven't stuck by the procedural rules that are applicable. And the other major category has to do with substance and I'll try to cover both of those or at least highlight the major ones. Some of these I'll skip through quickly and some I'll cover a little bit more fully.

One of the arguments that I would like to cover in some depth has to do with the administrative review process that's set forth in the permit. The administrative review process is at Section two, Roman

3-A or .A, and it is a process that's set forth in the permit.

The permit was created by the Regional Board. The Regional Board has authority to make modifications to its permits and to make changes in the requirements of permits. It created it. It can change it. The administrative review process doesn't take away that authority that the Board enjoys. And in fact, in this case, as this slide points out, the Board did take over, so to speak, the development of the SUSMP process by several actions that occurred.

First, in April of '99 -- it's not shown up there on that slide, but in April you heard that the Board approved the list of BMPs that are applicable to this area. Then in July the deadline for implementation of BMPs and the development of this SUSMP passed. Again, in September the Board had another hearing where the Board entertained that SUSMP proposal. At that time the Board made very clear to the Executive Director that the Board wanted to create the SUSMP proposal itself.

There's a big distinction in the administrative review process between development of the review process and enforcement of the SUSMP. Mr. Montevideo has made extensive argumentation about the Board's process and indicated that it's the permittees' view that the Regional Board was somehow locked into a process that's set forth in the administrative review process.

It's our view that the Board really wasn't locked into that process once those certain things that I talked about on the previous slide occurred -- the passage of the deadline, the fact that the Board indicated to the Executive Officer that it wanted to review the SUSMP material and act on it, and also the fact that the actual conduct of the parties was such that it became fairly clear that we were going to miss the deadlines on getting implementation to occur. It also was very clear that we were, in fact, running into the deadline for reissuance of the permit itself which was adopted in 1996.

The target that the compliance component of what we're talking about would still be subject to the administrative review process. In other words, if we decided to take some kind of action, we would then be required to invoke the notice to meet and confer process and move forward because that's explicitly what the process says. The Board made no mention ever of changing that part of the administrative review process, but it did take over the process in terms of adoption of the limits of the SUSMP. And in fact, as you've already seen, the Board decided to make several modifications to the proposal that was brought before by the Executive Officer.

Now, even if the petitioners were to succeed in their argument that the administrative process applies in a strict fashion, it's argued that the administrative review process was satisfied because the elements that are discussed in the administrative review process were all met. The parties got the protection that they were looking for in terms of due process. They got notification that the Board was not satisfied with the proposals that they put forward in July and August of 1999. They had opportunity to respond to the Board's proposal in July and August of 1999. In fact, they did. The July proposal was rejected, the August proposal was rejected, and it was replaced with a proposal from the Executive Officer and the Regional Board.

Now, the petitioners characterize that as having basically something shoved down their throat, but that's not at all what happened if you look at the actual process that's described in the record of this proceeding. Was there a meet and confer? There were many discussions. There was a workshop in August of '99 with this staff. It wasn't a Board workshop. The staff did participate along with the parties in a lengthy workshop where the details of the specifics of the cities' proposals were discussed. So the first three elements were covered. There was submittal of proposal and there was public review.

Was there Executive Officer response? There was. I don't know how the petitioners can stand up here before you and tell you that those proposals were ignored. Those were the very words used. They were not ignored. They were acted upon. They were reviewed, considered very seriously. They were amended and given back as a proposal for a Regional Board proposal.

Was there Executive Officer acceptance and rejection? Yes, there was. We just discussed that. The only thing that is missing perhaps is a 120-day notification of enforcement. We haven't got into that stage yet. It's premature to worry about that particular aspect of it.

Now, if we were to accept the petitioners' argument that we need to stick to the process, what are we doing? We're making sure that there's delayed implementation, buying into the petitioners' arguments that basically they need to have the last say in how the SUSMP is prepared and we're not moving along with the timing that's set forth in the petition for implementation of SUSMP protections.

More than that, in terms of the process, we're giving them an opportunity to give us an unending proposal, rejection, proposal, rejection, proposal rejection. That's not what we intended, that's not what the Environmental Protection Agency intended. And in fact, they provided several comments to us, particularly in the MPDS program review to say this is not acceptable. You can't keep going on this way. We do have to put a limit on this back and forth and move forward with the adoption of a SUSMP.

Ms. Forester, did you have a question?

The question has been raised whether the Regional Board exercised proper authority under the federal law and state law in adopting the SUSMPs and yes, it did. There is ample authority that's briefed in our response to the petition and also briefed by the environmental organizations that appear today as co-respondents, and we rely on the provisions that are set forth on the slide above and also upon (inaudible) versus USEPA, '92, and the Defenders of Wildlife versus Browner, a '99 decision which gives the Regional Board and the State Board, all the states that have delegated programs, substantial authority, substantial leeway in determining what it is that needs to be done in these programs.

The next several slides will discuss and point out what the changes are that were made at the January 26th, 2000 board meeting. As a board yourself, you appreciate that every once in a while you get a matter before you that can't be adopted exactly as it is but could be perhaps considered with some changes.

Some of the changes that were made were a little bit more significant than the others, and in my years of experience with the Regional Board, we have many instances -- I throw out a number something like maybe 50 percent of the actions that the Board actually considers in a hearing where we have to make some kind of change on the fly, so to speak, at the hearing itself.

Now, many changes that are made by a board at the hearing can be subject to an objection that there has not been adequate public notification. We're generally concerned but we have to make a call which of those are subject to more notice and which ones are not. It's my view that each of the changes that was made was the logical outgrowth of those draft SUSMPs that had been prepared earlier and distributed to the parties for their comments. That is the standard that's applied by the Regional Board to the State Board and administrative agencies in two contexts, in rulemaking and in adjudicative proceedings on permits.

The basis for using the logical output test is you don't want to have to go back and delay implementation for regulation or a permit merely because there was not enough notice to the public of a change that is seen to be insignificant. Of the changes that were made to this permit were items that were all noticed. For example -- let's see if I can find one here -- the applicability of the SUSMP is one of the first ones we have on the board, and here we raise that question about discretionary versus non-discretionary categories.

This gives me an opportunity to make a clarification with respect to the applicability of the discretionary and non-discretionary projects, again using those terms as defined at the local planning level. The SUSMP applies to non-discretionary permits if those non-discretionary permits are an enumerated item as this change makes clear. There was a final version of the SUSMP, with changes that were made, issued by the

Executive Officer in March of this year. That includes this very text and the text that will be shown in the next several slides.

There was a little bit of discussion about the applicability of the categories to the City of Long Beach. As you recall, City of Long Beach had to be treated separately and made a couple of changes at the hearing that made clear the appropriate applicability of the categories and the language to the City of Long Beach.

Here's a slide talking about the definition of the environmentally sensitive areas and elimination of the rooftop exemption. Some of these benefit the petitioners. Some of these, I guess, are seen as a little bit more arduous in terms of what the contents of the final SUSMP are.

I would like to digress to make a point here that I wanted to discuss. As was mentioned by Dennis Dickerson during his presentation, there was a change sheet that was distributed to the parties and -- I'm sorry. It was distributed to the Board Members at the January 26th meeting. Some of the arguments that are made by the petitioners have to do with somehow a non-fair process of a distribution of the changes. Sometimes that's just the best we can do, and that being the adjudicative hearing.

When changes are proposed at the last minute, the Regional Board is responding to comments that are being submitted by the parties, and while the parties did not receive a copy of the change sheet that the Board Members had in their hand throughout the proceeding, if you take a look at the transcript it was made clear to the parties through sort of an interpreter, Dennis Dickerson and myself tried to keep the audience up as to which changes were being made when the changes were occurring.

Here's a couple of the other changes having to do with limited exclusion for small restaurants and the waiver provision, a statement with respect to the effective date of the SUSMPs and there had been discussion about that. There had been discussion of the next one, the commercial development. So these were all subjects of logical outgrowth of what had been noticed before.

This is another topic now that we're moving on to. The petitioners argue that the SUSMP somehow needs to be subject to the Administrative Procedures Act with respect to issuance of regulations. As it turns out, there is a specific code provision and that's Government Code Section 11352 which says the following: The issuance, denial or revocation of waste discharge requirements or permits pursuant to Section 13263 and 13267 of the Water Code and waiver is issued pursuant to Section 13269 of the Water Code are excluded from the EPA provisions.

It's an APA process which culminates in a lengthy process that includes notice to the public, comment period, responses, and finally approval by the Office of Administrative Law. That process was never meant to apply to permits and is specifically excluded. The SUSMP is a creature of the permit and so it is exempt from the APA provisions.

This is the unfunded mandate argument. There are provisions that specifically say that if you have a federal law that's being implemented, it's not an unfunded mandate that you have to deal with.

Did the Board have authority to implement and adopt the SUSMP? It did. And I'll move on since that's briefed in our submittal.

This just sort of summarizes the process that occurred and the adoption process and it was the applicable procedural process. Real quickly touching on CEQA, there's an argument that CEQA applies. Well, I would suggest that it does not simply because again, there's an exemption since this is a part of the permit, 13389 says it doesn't have to be applied. Also I would note that I believe the cities probably didn't go through a CEQA process when they provided their proposal to us.

There's an argument that the process was unscientific and arbitrary, and I think that Mr. Swamikannu's statements and Mr. Dickerson's presentation has made clear that certainly it was not unscientific or unarbitrated.

13360 says that we can't tell them how to conform to the requirements. We didn't do that. We gave them choices. The permittees had choices, so we don't run afoul of 13360.

In conclusion, the Board properly adopted the SUSMP both procedurally and substantively.

Thank you. Any questions?

Thank you.

DAVID NAHAI,

having been previously sworn, testified as follows:

STATEMENT OF DAVID NAHAI

MR. NAHAI: Good morning, Mr. Chairman, Members of the Board. I'm David Nahai. I serve as the Chair of the Los Angeles Regional Water Quality Control Board. I want to thank you for this opportunity to make my presentation to you. My presentation as you know is in the nature of a summation. It isn't strictly testimony. I recognize that, but I've been grateful for the weight that you think my comments will merit. I'm going to thank you also for focusing attention again on really a problem in our region that is absolutely undeniable.

I'm not going to go back into the issue of run-off problem that you've heard a great deal about, and the petitioners don't deny it, don't attempt to deny it. Instead Mr. Montevideo is clearly saying that everybody recognizes that we have an urgent urban run-off need in this region that must be addressed and the reasons for the pollution are fairly clear. The chief factor urbanization, or one of the chief factors in any event. And what has happened with this region as urbanization has progressed, we have developed such vast areas of impervious surfaces that they act as a conduit for stormwater to end up at the ocean. It's estimated that 50 percent of our rainfall runs off into the ocean. In an area so heavily dependent on water, that is really a giant waste. But not only is it wasted, it provides a rapid delivery system for carrying the whole array of toxic contaminants to the ocean.

Now, the need to deal with run-off, with urban run-off, has been recognized for many years. This is nothing new. It was statutorily mandated in the Clean Water Act. The first municipal permit was issued ten years ago and in 1996 the permit was reissued. So I'd like to step back for a second and just take a look at the statutory framework that we have. It's all in place already.

The 1996 permit mandates the adoption of SUSMPs in the seven categories. To try to talk now about regional solutions or what may have been done on a regional basis in another jurisdiction is, I would submit, a luxury that we don't have. The 1996 permit as we have it mandates the adoption of SUSMPs for at least seven categories and that's where we have to start.

The issue before you is whether the Regional Board acted properly on January 26th, not on whether we're going to revisit the issue of at least a minimum seven categories that we have to address here. On that basis, just a couple of other things I would like to mention just to give you my perspective.

The petitioners themselves submitted SUSMPs. They complied with that process. To now come before you and throw out really what are red herrings such as CEQA or the APA or the unfunded mandate argument, if all of these were legitimate arguments they should have been addressed with the 1996 permit, not now when we're talking about implementation of a subset of permits. If these arguments really have any merit, why was it these were not raised when the petitioners submitted their own SUSMPs.

Their SUSMPs didn't have a rooftop exemption, didn't talk about vector control, didn't talk about the parade of horribles that have been marched before you today such as affects possibly on affordable housing and so forth. It's telling that just because the Regional Board added two categories and imposed a numeric standard that now all of a sudden CEQA is to be discussed and the APA, and all of these really don't have applicability here and I think we need to be careful about the red herrings that have been thrown out.

The small homeowner, let me please address my understanding of it. We have nine categories. One category affects the homeowner who's building a house. That is if that person is building a house on a hillside or possibly if they are located within an environmentally sensitive area. We don't have a situation where every homeowner who wants to build a house on a lot is going to have to go out and comply with the list of BMPs, and the example about what if I want to replace my sink in my shed, where am I going to put my SUSMP, let's try to really deal with reality here and not speculate in wild hypotheticals that don't have any application.

Mr. Leon talked about the whole issue of all of the discussions that were held and dealt with the various procedural challenges which the petitioners have advanced, but as a Board Member I really find it hard to believe how we could have had more scrutiny of this matter. We had two full hearings, board hearings, a full-day workshop. There were a whole bunch of meetings and telephone calls and formal and informal meetings with the petitioners and their representatives, and there's a record that I understand is so voluminous as something to fill an entire box.

The petitioners may disagree with the results, but they can't claim they weren't heard. I sat here yesterday and listened to everybody's presentation and it was deja vu, as they say, all over again because there really wasn't anything new that was offered.

After all of that consideration and all of the deliberations, we adopted a set of regulations. Some have described those regulations as being called little steps with little feet. In other words, there are many,

many people who consider what we have done is relatively modest given the problem we have to deal with. But apart from that, the truth is what we've known is not revolutionary and not radical and not new.

We've heard testimony of all the jurisdictions way ahead of us by years who have adopted regulations, seven states, not to mention all the municipalities, three within our jurisdiction. Florida's regulations go back to 1982. Santa Monica's regulations back to 1992.

Now, what we haven't heard in the last day or so has been any record or any evidence from any of these jurisdictions that the dire consequences which the petitioners predict have come true. No mass bankruptcies, no flight of capital, no explosion in property prices, no giant mosquitoes taking George Bush hostage.

So you know, I mean -- so when you look at the experience that a state like Florida has had over 20 years, I would really submit to you that we must let experience override speculation. We have examples to follow. We're not inventing the wheel all over again in connection with these regulations.

The petitioners try to portray the SUSMPs as being somehow anti-growth. I would submit that the intent is exactly the opposite. This is an attempt to facilitate growth, to accommodate it. If we don't take these as has been described little steps with little feet, at this time we may even have to resort to much more drastic measures in the future, drastic measures which will have a true detrimental impact on our residents, on affordable housing and what's more on future generations of builders.

I would suggest that the SUSMPs really embody the principle that the future need of the many should outweigh the present interests of the few.

Just a couple more comments. I think it's worth emphasizing that roughly two thirds of the permittees did not join in this petition. The two thirds that didn't join in this petition represent 82 percent of the population of this region. What you have before you is really in comparison a handful of cities representing just 18 percent of the population in this region. I think that majority, and you can call them the side of majority if you like, by not joining in this petition have really given a vote of confidence to what the Regional Board has done.

They're really telling us they're willing to go along with this, that they understand how important it is, that they're willing to invest in the future of this area. They think that a $2 billion coastal economy is worth protecting.

Finally -- and I have to say this. The very fact that we have these cities and this building trade association allied here in this way represented by one lawyer advocating an identical position before you really convinces me that the numeric standard that we imposed is not only appropriate, it's absolutely essential.

And the final thing that I would like to do is to just read from one sentence, actually two sentences that came in from the letter of the state of California. It says, "Complying with Florida's stormwater rule is a way of life that does not impose undue burdens on local governments or the private sector." The second sentence reads, "We have no doubts that the implementation of Florida's stormwater treatment program has greatly reduced the effects of growth in Florida on water quality and is a major reason why this state has so few truly impaired waters." I wish we could claim the same.

Thank you very much.

CHAIRMAN BAGGETT: Any questions.

BOARD MEMBER FORSTER: I have one, not of your commentary. Yesterday, David, the representative of -- one of the representatives from the building industry asked if the Regional Board would consider an advisory in looking at some of these issues and it would be a group, a committee, made up of the different interested parties. And since time goes quickly and your permit will be up again, I'm wondering if you're open to that. I think it would be what we -- what our acting Chair has done up at the State Board. We have a committee on TMDLs that was recommended through the new Chaney bill, where we might have a committee on water transfers.

We're going back to when I was on the Regional Board we did this to Region 9. We had a committee on dairies and one of the Board Members tried to sit in on that. When you have these emerging or issues that have been around but just haven't gotten as ripe as they're supposed to and you brainstorm and bring together people that want to come to some -- not a consensus. You can't get consensus per se, but some technical collaboration on best things to do.

You know, it's my opinion that that's beneficial and you know it would be up to the Chair to decide or the Board Members that they think that's valuable, as our Chair has decided.

MR. NAHAI: I'm not sure whether it's up to the Chair to decide. Let me offer this as an example.

There comes some point in connection with any kind of public policy setting where one has to take a look at the amount of discussion that's already occurred and the arguments which have already been submitted and just what extent it's been examined.

When we take a look at the state of affairs that we have here, we have to remember, for instance, that the seven categories that were already mandated in the 1996 permit. For someone to try to open that up again under some kind of guise I think would be really inadvisible. That's already part of the law. To talk about whether we have a run-off problem in Los Angeles is, you know -- those things are clear to everybody.

If somebody wants to have a discussion about whether the redevelopment clause is clear enough, I think yes, that can be discussed, of course. If somebody wants to talk about when we talk about projects within the ESA exactly what projects are we talking about, I think that can be discussed. But as I say, after all of the hearings, and this will be almost two days of hearings before you, and given the fact that we have such extensive experience on the part of other jurisdictions, to allow the problem now to just get worse while we continue to talk about it I think may be a mistake that we'll regret.

There is no argument about a 100,000 square foot commercial development having to comply. Why -- nobody here has appeared to say that that kind of project should be exempt. Why delay moving forward on that front while we discuss whether Mr. Montevideo's sink replacement in his shed is something that's subject to these regulations?

BOARD MEMBER FORSTER: I didn't want to interrupt you because you're so eloquent. That's not what I meant. I didn't mean --

MR. NAHAI: I wish you had interrupted me.

BOARD MEMBER FORSTER: I just don't know how many opportunities we'll get to talk again. I'm just bringing it up as something you might consider as you prepare for the -- not this. The Board will go through -- we'll have a process and we'll come out with a response to this petition. I'm talking about life after this particular issue. I'm talking about preparing for the reauthorization of the permit. I just think that was a good -- I'm sure you had them before and just because I don't know about it, I'm sure you had them. I'm just suggesting you might want to --

MR. NAHAI: I thoroughly agree with you. As a matter of fact, one of the priorities that this Board has set year after year is the outreach priority and to try as much as possible to get consensus, but there comes a time where you have to make a decision. We've got a responsibility to make a decision.

BOARD MEMBER FORSTER: We agree.

BOARD MEMBER BROWN: David, your summary was very powerful. There's a time that you personally have spent on this and the Board and has not gone unnoticed or unappreciated and thanks.

MR. NAHAI: Thank you very much.

CHAIRMAN BAGGETT: Any questions? If not, let's take a ten-minute break and come back with NRDC and spend 28 minutes and see where we go from there.

(Recess taken)

CHAIRMAN BAGGETT: Back in session. Let's begin to do cross-examinations before NRDC et al. finishes their cases.

Mr. Nahai.

MR. MONTEVIDEO: Thank you, Mr. Chair.

CROSS-EXAMINATION

BY MR. MONTEVIDEO:

Q. Good morning, Mr. Nahai.
A. Good morning.
Q. First I also want to express my appreciation for your time; not only today and yesterday but the time that you've put into this. I generally believe that you are very sincere in your beliefs in what you're trying to do, and the only thing I would ask is that you give us some credence for what our beliefs and our concerns are.
You had raised some issues with respect to the issues that we're raising now were not raised before and that these are, in fact, red herrings or some language to that effect is what you used, and that we're really trying to cloud the issues at this point.
Do you agree there are significant differences between the SUSMP program as submitted by the permittees versus the SUSMP program your Board actually approved?
A. There are differences, of course.
Q. The one primary difference we've talked about the last two days is the .75 standard. Isn't that true that wasn't in the permittees submittal?
A. That's true.
Q. Secondly, there's been a lot of discussion about discretionary versus non-discretionary. Again, the SUSMP program that was submitted by the permittees did not apply to non-discretionary projects; correct?
A. I don't know that that's correct. I think the issue here is that the 1996 permit didn't have a definition of what's discretionary. So you would have to

resort to CEQA or other statutes in order to draw that line.

Since it didn't have -- and I'm just talking for myself as one Board Member now. Since the issue of discretionary versus non-discretionary as far as the 1996 permit was concerned, was something that wasn't quite clear, I think the Board's thought was that there's really no difference in terms of water quality impact between a discretionary project and a non-discretionary project, and we shouldn't have a loophole in which projects could be labeled non-discretionary for SUSMP purposes particularly.

Q. And maybe, Mr. Chair, it's a question of having an understanding or as to what it means to have a discretionary project versus a non-discretionary project.

A. If your question is is it true that the word "discretionary" appeared in the permit and that the Board's decision applies the SUSMP in the nine categories to all projects that fit within the nine categories, I think the answer to that is yes.

Q. And similarly, it was your intent and the Board's intent to apply their SUSMP program to all projects including non-discretionary projects.

MR. LEON: Excuse me. I'm going to object. You asked whether it was the Board's intent as well as the Chairman's intent. We either need to limit that or I'm going to interpose an objection having to do with the limited process questions.

MR. MONTEVIDEO: Mr. Chair, that was my objection yesterday morning. His testimony -- the deliberative process objection goes to the relevancy of my question, but that was my whole objection yesterday, the Board's testimony is irrelevant. Because he has been permitted to testify, hopefully I'm allowed to cross-examine him on the issues he's testified to.

THE WITNESS: Can I just -- you --

MR. MONTEVIDEO: Let me ask it this way. I'll withdraw the question.

CHAIRMAN BAGGETT: You're going to retract the question.

MR. MONTEVIDEO: Yes.

Q. Mr. Nahai, do you agree that the program that was adopted by the Board applies to non-discretionary projects?

A. Within the nine categories only.

Q. Yes. Understood. Within the nine categories.

Now, doesn't the SUSMP that you actually adopted include a definition for discretionary projects?

A. Yes.

Q. Okay. You're looking at the definition right now; correct?

A. Yes.

Q. "A project which requires the exercise of judgment or deliberation when the public agency or body decides to approve or disapprove a particular activity as distinguished in situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances or regulations."

Would you agree the latter part of that definition is non-discretionary projects?

A. Are you asking me for a legal opinion?

Q. You're a lawyer; are you not?

A. I'm not here in my capacity as a lawyer.

Q. Well, I'm just trying --

A. Why don't you tell me what your interpretation is.

Q. That's my interpretation.

A. I accept your answer for the record.

Q. Your point was -- I thought your point that you just made was well, it's not defined in the permit so we really don't --

A. Again, you see, this is where the confusion comes up. It's not defined in the permit. This is the SUSMP.

Q. Correct.

A. So when I say it's not defined in the permit, I'm referring to the 1996 stormwater permit.

Q. Understood, but the fact that you have a definition for discretionary but at the same time you have the SUSMP applying to all projects, either discretionary or non-discretionary, doesn't that tell us at least what discretionary means here? Doesn't that than also tell us that non-discretionary is everything other than discretionary projects?

A. Let me answer your question this way. The SUSMP was presented at the hearing. There were a number of changes that were made. The fact that a discretionary project may have remained in the final draft, the fact that this definition is there, it's there; but if your question is does the SUSMP apply to all projects within the nine categories, I keep wanting to emphasize that so that we don't go back into the sink in your shed or whatever your example was. If you want to point out the fact that this definition is there, I'll acknowledge it's there.

Q. And doesn't the definition, the fact that it's there, indicate that somebody knew within the Regional Board staff what discretionary was?

A. I think --

Q. You made the comment. I'm sorry. You made the comment that it's in the permit but there's no definition, so I presume you meant nobody really knew what it meant, but you have a definition here; right?

A. Is that the point you were trying to make?

Q. One of them. We have more.

A. You have more? Maybe I should wait until you make your various points. I'm just trying to point out that at the end of the hearing on January 26th, the Board made the decision that within the nine categories there shouldn't be a distinction and that there wasn't really a meaningful water quality distinction between what someone might call discretionary and someone else might call non-discretionary.

Q. I understand that now, but let's talk about that.

MR. LEON: Mr. Montevideo, just to maybe move past this, I will offer on behalf of respondents that this definition has no meaning for the permit. It was a carryover from previous drafts.

MR. MONTEVIDEO: The fact that it's in the SUSMP program still has no meaning.

MR. LEON: The definition.

CHAIRMAN BAGGETT: Continue with the cross-examination.

MR. MONTEVIDEO: Thank you.

Q. You're talking about loopholes and avoiding loophopes. Do you believe that somebody coming to the city, going to the counter at city hall, asking for a permit, an electrical permit, do you believe that that would be a discretionary permit or non-discretionary permit?

MR. LEON: That's irrelevant.

THE WITNESS: How do I know whether under a particular city's regulations asking for an electrical permit is discretionary or not? Mr. Montevideo, please.

Q. BY MR. MONTEVIDEO: Mr. Nahai, in all fairness, the cities then have to apply what you don't know to their citizens. So if the city says it's a non-discretionary project for somebody to come into city hall and ask for a permit, for an electrical permit or for some plumbing work that's being done, we have a non-discretionary project; correct?

A. What we're talking about are nine categories of development. We're not talking about electrical permits or sinks in sheds or anything like that. I understand that it's part of your purpose to cloud the issues and sow confusion, but I've got to go back to the fact that what the SUSMPs cover are nine categories of development.

There is no way that applying for an electrical permit would add impervious surface or result in the SUSMP provisions becoming applicable. So if you'd like to give me a realistic example, I'll try to respond to you as much as I can.

Q. Okay.

A. But I also don't want to go down the road of speculation and hypotheticals and stuff like that with you.

Q. I'm talking about real issues in real terms that the cities have to deal with. This is not speculation. These are issues that the cities are going to have to deal with every day because of this edict that your Board adopted. So that's what we're concerned about here. Let's talk about your real concern for real situations. You have a definition of redevelopment?

A. Yes. We've talked about that today.

Q. We have and do you think that this definition is limited to the addition of impervious surface?

A. I believe that, first of all, the definition is limited to the nine categories. And to the extent that there may be questions about this particular clause, I think that that can be discussed.

Q. But shouldn't the time to have discussed that been prior to the Board's adoption of the SUSMP program?

A. Maybe, or maybe there are issues that come up with statutes and laws and decrees all the time that are then gone back, reexamined in the light of events and looked at again. So I think the other thing is that we do have in terms of cities implementing regulations similar to this. We have cities within our own jurisdiction that have done it, apparently quite painlessly. We have states that have done it, again apparently quite painlessly. I don't think this is inventing the wheel over again.

Q. First, do you agree the definition of redevelopment could use some work?

A. No. I don't know what that means, could use some work. If you want to suggest specific language that you think would clarify it, I would be willing to tell you whether I think it's good language or not, but I don't know what you mean "do you think it could use some work."

Q. Do you agree that the definition of redevelopment applies whether or not impervious surfaces have been added?

A. No because it also talks about making improvements to 50 percent or more of an existing structure.

Q. Redevelopment means an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces, or the creation or addition of 50 percent or more of impervious surfaces or the making of improvements to 50 percent or more of the existing structure.

Redevelopment includes but is not limited to: The expansion of a building footprint or addition or replacement of a structure, structural development including an increase in gross floor area and/or exterior construction, or remodeling. There are a number of "ors" in there.

When you look at all those "ors" and put them together, somebody goes in and remodels their house and affects 50 percent or more of the interior of their house and they live in an environmentally sensitive area, do you agree this SUSMP would apply to them?

A. As I said, first it would have to be within the nine categories.

Q. It's an environmentally sensitive area.

A. With respect to this whole environmentally sensitive area, which is something you've made a great deal of throughout these hearings, let's not forget that there is a waiver provision in the permit which even allows the Board to delegate to the EO the right to waive entire categories of development.

So the necessary flexibility is there with respect to environmentally sensitive areas, to examine matters and take suggestions from cities as to whether there should be waivers, in addition to the particular waivers that are already within the city's jurisdiction such as a danger to groundwater or unstable soil conditions or size limitations and so on.

I would argue that the necessary flexibility is there as far as environmentally sensitive areas is concerned.

Q. But in answer to my question, do they have to comply with the SUSMP program?

A. What I don't want to get into testimony here as to whether in a particular circumstance a particular homeowner, or a particular commercial developer for that matter, may have to comply or not. I don't think that's a fair question to put to me.

Q. Five minutes ago you told me you wanted a real situation so I gave you the real situation.

A. I take it back. I hereby retract that suggestion. I should have known with you not to do it.

Q. May I at least have an answer to the question? There's been a lot of discussion about how broad this thing is and we say one thing and they refuse to answer questions --

MS. JENNINGS: Could I make a comment? I feel that you've asked the question. You've gotten answers you're going to get. You're basically getting into argument, which I this think is appropriate in your closing statements. I think it's also clear that the Regional Board has indicated they see the need for some revision of that. To continue just arguing with the witness I don't think forwards our process.

MR. MONTEVIDEO: This is the third person I've asked a question about the application of this thing, and every time I ask the question I'm told, "I can't answer it and I don't agree with the hypothetical," and objections come in.

THE WITNESS: The question is inappropriate, Mr. Montevideo. It's not an appropriate question.

MS. JENNINGS: My point is I feel like you've gotten -- it's been asked and answered and it's become argumentative and that the record is complete at this point.

MR. MONTEVIDEO: Fair enough. Fair enough.

Q. Mr. Nahai, do you agree that the definition of redevelopment that is in the Regional Board's SUSMP program was not in the permittees' SUSMP program?

A. I don't know that. I don't recall that.

Q. But you agree that the location of or the description of environmentally sensitive areas in that new location or area was not in the permittees' SUSMP program.

A. That new category was added by the Regional Board, yes.

Q. And as far as you know, the issue of applying it to non-discretionary approvals was added by the Regional Board?

A. Didn't you ask that question already? Are you going to go down that road?

Q. I'm not sure I got an answer.

A. There's no point in me answering the question.

CHAIRMAN BAGGETT: It's already been answered.

MR. MONTEVIDEO: Can somebody tell me what the answer was because I frankly --

THE WITNESS: I'm sure you can have the transcript played back.

Q. BY MR. MONTEVIDEO: I'm sure I can, too. Do you remember your answer?

A. No, I don't.

Q. Do you remember if you gave me an answer?

A. I believe I did.

Q. And what was it?

MR. LEON: Excuse me.

CHAIRMAN BAGGETT: This has been a long day.

MR. MONTEVIDEO: You're right. I'm just a little frustrated. It's been a long morning.

Chairman, I did have a few more questions for Chairman Nahai.

CHAIRMAN BAGGETT: Try to get to the point.

Q. BY MR. MONTEVIDEO: Chairman Nahai, you've talked about the fact there was only a handful of petitioners here and you've made some comments about the fact that the County of Los Angeles isn't part of this group and apparently is accepting the SUSMP program. You made a similar comment about the City of Long Beach.

The County of Los Angeles has a settlement agreement that effectively requires that they implement a program similar to this; correct?

A. I don't know. I wasn't -- I know of it but I can't testify as to it.

Q. Okay. You've mentioned --

A. It's my understanding there is a settlement.

Q. Yes. And you mentioned something about a Long Beach settlement agreement?

A. I didn't.

Q. Maybe it was Mr. Dickerson. You indicated that Long Beach had gone along with this; did you not?

A. I don't know whether I said that or Mr. Dickerson said that.

MR. LEON: It was Mr. Dickerson and I also mentioned it.

MR. MONTEVIDEO: Okay.

Q. Well, rather than go back, let me talk about the other programs that you've mentioned throughout the state. You talked about the Florida SUSMP program; right? You said Florida has been doing this, it works, and you even read a statement from their program.

A. What I said was that Florida has had stormwater regulations, I understand, since 1982 and I read two sentences from their letter.

Q. Do you know how many drafts of those regulations

R0073976

Florida had put together before they ended up with their final?

A. No, I don't.

Q. Do you know how many years the Florida regulation was in the making?

A. No.

Q. Do you know how many meetings of their Technical Advisory Committee they've gone through to arrive at their regulations?

A. No, I don't.

Q. Do you agree that your Board is understaffed and underfunded?

A. That's been a point that you've made and I think many governmental entities are pushed for resources. Our Board may be.

Q. Do you agree that it takes a lot of resources to put together a program of this nature?

MR. LEON: Objection. Vague.

THE WITNESS: That's not a question I can answer.

Q. BY MR. MONTEVIDEO: Okay. Do you remember Mr. Dickerson's plea to you at the time of the hearing the staff issue, I do hope you'll recognize that everything we've done is on the basis of one individual working full-time, already overburdened, already spending, diverting resources away from things that we should be doing just to focus on this issue --

CHAIRMAN BAGGETT: I think he can read.

THE WITNESS: Is this cross-examination to be used --

MR. MONTEVIDEO: Well, the issue --

THE WITNESS: Excuse me. Used as a device for him to make his final argument here? Is this just rehashing of the opening statement that you made?

MS. JENNINGS: I thought there was an agreement, too, among the counsel and our Chair about limiting the amount of time for cross-examination of witnesses and you had an agreement. In fact, Ms. Forster just mentioned that this comment was actually directed to herself as a State Board Member, not to the Regional Board.

I'm just failing to see the relevance. If you want to say the fact that they can only collect $10,000 from all of the cities because the legislature limits them to $10,000, yes, correct. It just seems we're trying to move this hearing ahead, and to be argumentative with the Chair of the Regional Board, it's your choice how you use up your hour, but it's not getting very far.

MR. MONTEVIDEO: This is my last question, Mr. Chair.

Q. The only point here was Florida and the other states have spent a lot of time, Chairman Nahai, and a lot of money and have a lot of staff to do this, and I guess the question is don't you feel you can use more resources and more time to get the job done?

A. I just answered that.

CHAIRMAN BAGGETT: He just answered that question.

THE WITNESS: I would like you to tell me how much time and how much money Florida spent.

MR. MONTEVIDEO: I can tell you they spent more than $10,000.

MS. JENNINGS: $10,000, just for the help of the Board Members here, is unfortunately what the legislature limits in fees and I think we estimate --

CHAIRMAN BAGGETT: We're aware of that. Can we move on? The witness is excused. Thank you.

THE WITNESS: Thank you.

CHAIRMAN BAGGETT: We have one other witness who was also requested, Mr. Wilkness.

Mr. Helperin, you had questions?

MR. HELPERIN: I will limit it.

RON WILKNESS,

having been previously sworn, was recalled for examination and testified as follows:

CROSS-EXAMINATION

BY MR. HELPERIN:

Q. Good morning, Mr. Wilkness.

A. Good morning.

Q. My understanding is your testimony is that you categorically rejected the idea of infiltration at retail gasoline outlets as an appropriate stormwater BMP; is that correct?

A. That's not entirely correct. My objection to infiltration is that at a gasoline station there is the real risk of a gasoline spill, and I don't have a comment on the wisdom of infiltrating water, but I do think that if you have infiltration it cannot distinguish between stormwater or liquid gasoline and it does seem highly inadvisable to allow liquid gasoline to penetrate directly into the soil.

Q. So you are concerned that if there were infiltration at a gasoline station there would be the potential risk that gasoline would infiltrate?

A. Yes.

Q. So you admit that run-off from retail gasoline stations does contain contaminants that are of concern?

A. No. What I'm saying is that the spillage of gasoline at a gasoline station is not unknown, an unknown occurrence, and there are a variety of reasons that could result in spillage. If the spillage is retained on an impervious surface it can be cleaned up.

Q. So if the -- if it were cleaned up and it was only the run-off from the station after the cleanup that was infiltrated, there wouldn't be a problem with infiltration; is that correct?

A. I think that if we were talking about only water, I'm not so sure there would be a problem, no.

Q. So infiltration is a possibility if you have good enough source control because as you've suggested, your BMP guide provides to ensure that there's no polluted run-off from the site, then the clean run-off could be infiltrated.

A. The BMP guide produced by the California Stormwater Task Force was undertaken basically at our initiative in consideration of the potential that a gas station poses to contaminated stormwater run-off. The BMP guide itself doesn't really preclude spillage. Spillage can be the result of a variety of occurrences --

Q. I see.

A. -- that are unrelated.

Q. So even if the source control recommended by the BMP guide were implemented, you agree that there would still be spills, that those source controls would not necessarily be effective enough or reliable enough to ensure that the run-off from the gasoline station wouldn't still contain contaminants.

A. No. That's not entirely correct either because within the task force BMPs there are statements that spills are to be cleaned up immediately using dry absorbents. There's also a discussion about stations operating -- excuse me, maintaining spill control plans and training their employees on the development of those plans.

Q. Then we're back where we started. If you can control it that well and you could infiltrate the remaining -- the actual run-off after a spill had been controlled and prevent it from mixing with the inflow.

A. The problem, sir, is that if there is a gasoline spill, it could run in any direction.
Q. I see. So it could escape?
A. Well, it could certainly reach -- in my view, there are certainly circumstances where a spill of gasoline could reach the site where permeable soil or permeable pavement has been installed.
Q. So then wouldn't treatment control devices at gas stations be a good idea to -- as a backstop for that gasoline that might escape and run in any direction and get off the site?
A. No because there's a problem with treatment controls. May I ask if you have a particular treatment control in mind?
Q. I'm trying to establish either your source controls are effective enough that there's no danger of contaminants leaving the site or they're not. If they are, you shouldn't have a problem with infiltration. If they're not, you should be willing to have a treatment control backup device; isn't that right?
A. I think the issue -- no. The issue I think is really this. What we're saying is that there is a risk of pollution at service stations caused by, among other things, the spillage of gasoline.
What we're saying is that this task force BMP guide that was produced by the group consisting primarily of representatives from regulatory agencies is viewed as a slate of best management practices that reduces the

discharge of pollutants to the maximum extent practicable.

Q. Is it foolproof?

A. I'm not aware of anything that's foolproof, but it does, in our view, result in run-off that poses no significant adverse risk. And what I have said all along is that we have not seen any data to suggest that if these BMPs are utilized at a station that there is a residual problem that we have to deal with, either through treatment or infiltration.

Q. Okay. Thank you. Here's a copy of your Exhibit B from your testimony. If you could please read me -- if you could turn to page IV, Roman numeral 4, and read me the sentence in the second paragraph.

A. Based on the results.

Q. That's right.

A. "Based on the results of several stormwater studies, it does not appear that the water quality of stormwater run-off from properly operated and maintained RGOs is appreciably different than water quality from a number of other sources, including parking lots and roads."

Q. Including parking lots and roads. So your own exhibit in your own testimony is that even a well-maintained RGO, even the kinds that implements all of the source control BMPs that you're recommending, the water quality from that well-maintained RGO is nevertheless similar to that of parking lots, which were specifically called out by the Regional Board as a type of land use that needed special attention because of the potential for pollutant run-off, and that was specifically mentioned by Dr. Horner as a particularly problematic land use. You're saying that run-off from well-maintained RGOs is similar to parking lots and roads.

A. There's one very important fact that I'd like to call to your attention. The date of this study is January 12th, 1996. The date of publication of the task force RGO BMPs is April 23rd, 1997, more than a year later. Although we stand behind the statement, I think it has to be taken within the context of time.

What I've been suggesting is that the criteria for deeming a station well-maintained really should now be -- or as of 1997, should be whether or not the site has implemented the task force BMPs.

Q. So it's your testimony your exhibit is no longer applicable.

A. This study was actually performed by Geomatrix and by Tim Simpson, and I think that he's probably more familiar with this study than I am.

Q. I'll pose the question to him. Thank you.

A. Perhaps he could address it.

Q. Let me ask you another question about your source controls. You said earlier that you think your source controls control pollutant run-off to the extent they are no danger to -- I'm sorry I don't remember your exact words, but you said it was sufficient to -- so that the run-off would not be of any concern. Would -- would WSPA be willing to accept numerical effluent limits on its run-off assuming these BMPs were implemented then?

A. I think there's significant problems in dealing with the numerical limit for service stations. Number one, service stations for very good reasons are extensively paved with impervious surface. I'm an engineer but not a civil engineer. I don't know by what means you would avoid the difference in run-off from an unimproved site to a site that has service station on it. So I don't think a numerical limit would be applicable, but I don't think it's necessary either.

Q. I'm sorry. I didn't quite understand your answer. The difference between an improved and unimproved site is what? How is that relevant?

A. I think what we're talking about is that the BMPs -- excuse me. The SUSMP applies to new or remodeled sites.

Q. I'm not talking about the SUSMP. I'm sorry if I was unclear. If we could apply all of the BMPs in your BMP guide, the BMP guide that was developed by the task force --

A. Yes.

Q. -- you seemed earlier to be confident the run-off would then not be of concern. Would WSPA be willing to accept the application of that BMP guide and the simultaneous application of numerical effluent limits?

A. Application of the BMP guide, not application of a numerical effluent limit. Excuse me. Let me make sure that I clearly understand your question.

Q. Please.

A. When you talk about a numerical effluent limit, are we talking about the numerical design standard or are we talking about a mass effluent limit?

Q. I'm talking about a mass concentration effluent limit on the run-off or the discharge from the RGO.

A. It seems that we might ultimately have that anyway with the TMDL process.

Q. We may indeed, but I was asking if you were confident in the source controls in your BMP guide that you would be willing to accept those effluent limits if the BMP guide were implemented as well.

A. I'm not sure I fully appreciate the implications of your question, so I don't know that I can intelligently answer.

Q. Okay. Let me ask you this: There's been a lot of concern about contamination of groundwater. Do you think if you were to -- if an RGO were to channel the run-off to a catch basin with an insert and then from there out into the storm drain system, do you think that would pose a threat to groundwater?

A. No.

Q. And do you think that if an RGO were to channel its run-off into a storm ceptor and from there to the

storm drain, would that present a threat to groundwater?
A. Not a threat to groundwater.
Q. If were you to channel the run-off from an RGO to a sand filter, would that be a threat to groundwater?
A. Once again, not a threat to groundwater.
Q. So there are many BMPs that are authorized by the SUSMP that have no threat to groundwater; is that right?
A. That's correct, but there are many other risks imposed by some of the BMPs that are contained as optional remedies within the SUSMP.
Q. Let's turn to your BMP guide for a moment. Who did you say developed that?
A. I'm sorry. I was distracted. Would you mind repeating the question?
Q. The BMP guide for RGOs, who developed that?
A. California Stormwater Quality Task Force.
Q. And who are they?
A. California Stormwater Quality Task Force, actually it might be convenient for me if I can find the applicable paragraph here in the document itself. Two sentences that, as I recall, I read in my testimony yesterday. I have in my hand a copy of the stormwater BMP guide produced by the California Stormwater Quality Task Force, and in a cover letter from the Chairman at the time, Robert Hale, I think this is responsive to your question. The guide was produced and published by the California Stormwater Quality Task Force, an advisory

body of municipal agencies complying with stormwater regulations.

Q. Great. Thanks. Here's Exhibit A to your testimony. If you could turn to page 1 of Exhibit A. Looking at the disclaimer, if you could please read the first sentence of the disclaimer.

A. "The statements and conclusions of this guide are those of the California Stormwater Quality Task Force (task force) and not necessarily those of the state of California."

Q. Thank you. If you could also read me the first two sentences of the second paragraph.

A. "The guide was produced and published by the California Stormwater" -- even though it's not highlighted?

Q. That's fine.

A. Let me start over. "The guide was produced and published by the California Stormwater Quality Task Force, an advisory body of municipal agencies regulated by the stormwater program."

Q. And the next sentence.

A. "This guide is not a publication of the State Water Resources Control Board or any Regional Water Quality Control Board, and none of these Boards has specifically endorsed the contents thereof."

Q. Thank you. So this guidance that you're saying the Regional Board should have adopted is really just the recommendation of a group of municipalities and not endorsed by any of the regulatory agencies of the state of California.

A. What I said is that the Los Angeles Regional Board actually did adopt these requirements in the permit that was issued to the City of Long Beach in June of 1999. This whole comment was incorporated by reference as I recall.

Q. Could you also read the last sentence in the disclaimer?

A. "Implementation of these best management practices cannot be construed as compliance with all other applicable regulations, including local requirements."

Q. So there are other requirements in addition to these that were anticipated even in this document?

A. Yes.

Q. You said there were two types of treatment that were available to gas stations, filtration and gravity separation; is that right?

A. Yes.

Q. But as we've heard -- I don't think we have it. That's okay -- from Dr. Horner, there are many different types of filtration and many types of gravity separation; isn't that right?

A. I believe that's correct.

Q. And just sticking to the two that you mentioned, I think, which was catch basin inserts and oil water separators, you said the filters plug rapidly and have

other problems. Is that true of vegetative filters?
A. I don't know that a vegetative filter has ever been applied to a service station.
Q. How about a sand filter?
A. Once again, I'm not aware of the applicability of sand filters to a service station. There is one categorical sort of problem with devices that involve an underground structure and that is the problem of gasoline and gasoline vapors in a confined space, and if you have some sort of a conveyance that would lead a spill into one of these underground structures, that same sort of conveyance will send vapors back up to a spot where they could conceivably be ignited.
Q. All I'm trying to establish is that the two types of BMPs that you discussed as being problematic, those problems don't necessarily apply to many of the other types of BMPs that are available to an RGO; is that right?
A. Those particular problems, yes.
Q. Thank you. And with respect to gravity separation, I think in your testimony you said that requires constant flow; is that correct?
A. Controlled flow, yes.
Q. Isn't it true that though higher rates of flow can produce problems such as washing out the materials in a gravity separating device, that lower flows would not present a problem?
A. Yes.

R0073990

Q. So couldn't you just have a bypass system so that higher flows would bypass the system and the lower flows would be fine and the flows it was designed for would be fine, and the higher flows would bypass?

A. Could, but I can't understand why you would want to introduce a bypass if you're trying to control pollution.

Q. Because there's a size limit.

Just one other thing I would like to ask you to read. That's the slide that we had up just a moment ago. You note that the BMP guide emphasizes use of infiltration but the BMP guide emphasizes the use of impervious surface.

Infiltration -- can you just please read me the -- I didn't highlight it here. I apologize. Actually, never mind. Let's take this one down. It's not the slide I wanted. That's fine.

MR. HELPERIN: I have nothing else.

Thank you.

MR. LEON: May I ask a couple of questions of Mr. Wilkness?

CHAIRMAN BAGGETT: I asked earlier and you didn't, but you do now?

MR. LEON: Something came up that he mentioned during cross-examination that I have to get clear.

CHAIRMAN BAGGETT: You can do it quick.

MR. LEON: Very quickly.

CROSS-EXAMINATION

BY MR. LEON:

Q. Mr. Wilkness, good noon. Jorge Leon with the Los Angeles Regional Board.

A. Yes, sir. Good afternoon.

Q. You mentioned that the BMP guide produced by the California Stormwater Task Force had been adopted by the Los Angeles Regional Board. Do you recall stating that?

A. I'm not sure exactly what words I used.

Q. Those were the words I heard. I need to get it clarified. Let me ask you a question to lead you on the correct path, I think.

It's my understanding that it was listed as an included reference. Is that your recollection?

A. No.

Q. What is your recollection?

A. My recollection is that again, to set the chronology straight, in June of 1999 the L.A. Regional Board adopted -- again I want to make -- my understanding is, and I don't want to use inappropriate terminology, but the essence was that the L.A. Regional Board adopted an order that was imposed upon the City of Long Beach and was a municipal MPDS permit. Am I right so far, Mr. Leon?

Q. They adopted a permit for stormwater --

A. Among the requirements in that permit for service stations, and this requirement was basically added at my suggestion and at my request, was incorporation by reference of the entire California Stormwater Task Force BMP guide. That was -- it was included in the order as the -- maybe that's a bad choice of words, but compliance was to be determined on the basis of adopting a site using these task force BMPs.

Q. Thank you very much.

A. I'm sorry. I didn't say that very well.

Q. I won't ask any more questions, but I will offer in the record to indicate --

CHAIRMAN BAGGETT: You can address that in your summation.

MR. LEON: Thank you. Thank you, sir.

THE WITNESS: Thank you.

MR. WELCH: Thank you, Mr. Chairman, for accommodating Mr. Wilkness.

CHAIRMAN BAGGETT: Let's do the last 20 minutes and decide where we have to go from there.

MR. HELPERIN: Mr. Perkins does have to --

CHAIRMAN BAGGETT: We'll finish your case-in-chief and we'll allow the cross-examination, assuming there are questions of the witnesses.

You have 28 minutes remaining.

MR. HELPERIN: 28 minutes? All right.

ALEX HELPERIN,

having been previously sworn, testified as follows:

STATEMENT OF ALEX HELPERIN

MR. HELPERIN: You've seen two pieces of our presentation already, unfortunately, but we had Dr. Gold yesterday afternoon who described the severity of the stormwater problem in southern California and you heard the testimony of Dr. Horner yesterday morning regarding how effective programs like this can be, in combatting the problem how common these problems are all across the country. The remainder of our program was to be in four discreet segments, and I think I'm going to cut back as the Regional Board has already addressed some of those issues.

CHAIRMAN BAGGETT: Appreciate it.

MR. HELPERIN: I was going to briefly expand on the legal underpinnings of the SUSMP, but I think that's pretty clear in both state and federal law. So I'll jump right to talking about the practical aspects of the SUSMP itself, how effective it will be, how much it will cost, how easy it will be to implement. Some of that I'll refer back to the testimony of Dr. Horner, and we also have to speak to you today Craig Perkins of Santa Monica who is uniquely qualified on these issues with his real-world experience in implementing the Santa Monica development program. And third, I'm going to need to take a few moments just to clarify some of the myriad of misrepresentations that were before this Board yesterday because there have been several statements about the implications and the application of the SUSMP that are simply false and have perhaps led this Board down the wrong path in understanding what the implications of the denial of this petition would mean. Finally, time permitting, I'll review some of the petitioners' legal arguments, God willing.

CHAIRMAN BAGGETT: You will have a summary also later.

MR. HELPERIN: Let me jump, if I may, very quickly to the wealth of data that there really is to support this kind of a program. You've seen already reports of BMP effectiveness in the record from industry, from the American Society of Civil Engineers, from academia, from Dr. Horner and others from government and other areas. There really is an enormous amount of data on these going back over 30 years.

As Dr. Horner testified, this EPA summary sheet is indicative of the types of results that he has seen in many studies with efficient pollution removal ratings well into the 50 to 80 percent cases in many of the BMPs that we're talking about here.

As EPA has noted, there are two separate groups that have developed complete databases on the issue of BMP effectiveness. Watershed Protection has a database with over 123 structural BMPs, American Society of Civil Engineers has a developed what EPA refers to as a comprehensive database on BMP performance. The allegation that these are not effective or that we don't know if they will do any good is simply not true. The evidence is overwhelming from all sectors of society about the effectiveness of these BMPs.

It's also true as you saw from Dr. Horner's testimony and many people have stated, but this is being done all over the country in much more aggressive programs than what we're talking about implementing here in Los Angeles.

The cost issues come up a lot. EPA and others have also done studies on that, and you can see here is a summary of what EPA considers to be the base costs for typical applications of stormwater BMPs. The numbers in the second column there are in terms of dollars per cubic foot of water treated, and if you run the numbers on these you'll see, for example, for a one-half acre site, assuming 100 percent impervious surface, we're only running from about $675 to $8,000 given these numbers, these ranges. Even on a ten-acre site, the numbers could be as low at $13,000, very high end about $150,000 to $160,000 for a very large 10-acre development.

Because of economies of scale those numbers are even smaller, so EPA did a study studying the actual capital construction costs for completed BMPs. These two slides are backwards. This is what we should have been looking at before. These are the dollars per cubic foot of water treated. This shows the total amounts. I apologize.

Just with that background, I wanted to then introduce Craig Perkins to talk about again the real-world application of this sort of program in Santa Monica.

CRAIG PERKINS,

having been previously sworn, testified as follows:

STATEMENT OF CRAIG PERKINS

MR. PERKINS: Good afternoon, or late morning, whatever it is. My name is Craig Perkins. I'm the Director of Environmental and Public Works Management for the City of Santa Monica. I've held that position for the last seven years. I've worked for Santa Monica for a total of 17 years. Prior to my current position I was Environmental Programs Manager and held various other positions with the city including Budget Director at one point in time.

I'm here today to talk about my city's program for stormwater mitigation, as well as our views on the SUSMP which is the basis of the discussion over the last couple of days. During the testimony yesterday that I heard I was not sure whether I was in a stormwater hearing or a bad novel at times. Could it be possible the proposed stormwater mitigations will be single-handedly responsible for the destruction of affordable housing in the region, the bankrupting of local governments and the pollution of precious drinking water aquifers, as well as the mosquito population.

Last night I had a fitful sleep as nightmarish visions passed before me, visions of displaced low income citizens chasing me down the storm drain channel as the main person responsible for compelling them out of their affordable housing because of stormwater mitigations. Joining the pursuit were the noble groundwater protectors from the Western States Petroleum Association astride their brave, red flying horses. Meanwhile, swarms of BMP-bred mosquitoes swooped down from the sky to block my retreat. Mercifully, I finally awoke in a cold sweat and realized it had all just been one bizarre hallucination.

So in the bright light of the new morning, how do we separate the real from the unreal as it pertains to the SUSMP? First of all, you should know that the stormwater mitigation requirements that Santa Monica has had for the last seven years are very similar to the SUSMP requirements. During those seven years, approximately 400 projects have complied with our municipal requirements. These projects have included single-family, multi-family, commercial, institutional and city projects.

Has one single project not been built in Santa Monica because of the severity of these restrictions? No. In fact, many developers have wanted to do more than the minimum requirements. Has the city granted any full or partial waivers to the requirements due to technical or economic infeasibility? Yes, we have, but less than a dozen in seven years.

Do we know about how much it costs to comply with the city's requirement? Yes, about one percent of the total construction cost on average, often times much less than that, but to our knowledge never greater than three percent of total construction cost. For example, our new $43 million health and safety facility, which is complying with our requirements is, in fact, going beyond our requirements. The stormwater compliance cost for that facility are about $200,000 or about one half of one percent of the construction costs.

Have these stormwater requirements caused a fiscal burden on city staff for administration, inspection and enforcement? No. I have one dedicated stormwater management position who is responsible for many more tasks than just oversight of our municipal ordinance. All of the tasks have been incorporated into the ongoing work load of existing permitting and planning staff, no different than any other city within this region does for every other building code requirement which may be new from time to time, year to year.

Has our board been responsible for a decrease in affordable housing construction in Santa Monica? Absolutely not. Santa Monica has the strongest commitment to affordable housing of any city in this region. Increased property costs and a lack of political will are the enemies of affordable housing, not stormwater pollution control regulations.

Are we concerned about groundwater pollution in gasoline stations? We are very concerned about soil and groundwater contamination at gasoline stations. What causes groundwater contamination at gasoline stations is leaking underground storage tanks and pipes, not BMPs. The City of Santa Monica has a little bit of experience with this as it pertains to the gasoline additive MTBE.

Let's face the facts. The risk of contaminated stormwater infiltration to cause groundwater problems at gasoline stations compared to the risks from leaks in gasoline tanks and pipelines is so minuscule that it doesn't even merit a debate. Isn't it interesting that the Western States Petroleum Association is so concerned about stormwater BMPs contaminating gasoline station sites when they were adamantly in favor of the proposed Lawrence Livermore study recommendations in 1995 that directed the state's Regional Boards to stop worrying about cleaning up gasoline contaminated soil because it posed no risk to groundwater. Maybe WSPA has now had an epiphany, maybe not.

Finally has Santa Monica been plagued with ravenous mosquitoes in the last seven years? No. I can roll up my sleeves and show you there are no red bumps due to those mosquito bites.

So, what is this appeal all about? It is about some people do not want to accept that we have to change the way we deal with stormwater run-off. The SUSMP is more than good common sense policy. We do not live in a perfect world and the SUSMP is not a perfect document, but the only way at this point that we can move forward in my opinion is to start the implementation process because it's during the implementation process the creativity of the design and development community will come to the fore, and that's what we've seen time and time again in Santa Monica.

Certainly we will need to improve the SUSMP down the line, but let's get started. By the year 2020, a population increase equal to an additional L.A. County will need to be absorbed into the state. We can either deny, deflect, delay or defer the stormwater measures that have to be adopted to cope with this future or we can have the courage and vision to do what we know is right.

I thank you very much for your time today, and I brought copies of our brochure which explains the specifics of our stormwater ordinance if you have more details that you need on that.

MR. HELPERIN: Thank you. I'd like to take just a moment now to clarify some of the misrepresentations, unfortunately. As I was saying earlier, there was a great deal of misinformation yesterday which was at best out of ignorance.

MR. MONTEVIDEO: Mr. Chair, I'm sorry. On that submittal, it is untimely. We would object on that basis.

CHAIRMAN BAGGETT: Unless it's in the record someplace.

MS. JENNINGS: I don't think it's evidence. I think it's just a brochure.

CHAIRMAN BAGGETT: I sustain the objection. I'm sure it will be -- it's a public document and we'll see it later.

FURTHER STATEMENT OF ALEX HELPERIN

MR. HELPERIN: So as I was saying, I'm going to go through some of the claims that were made yesterday with the possible exception that I'm Joe McCarthy and try to respond to each of them in turn.

First of all, what does this SUSMP not apply to? It does not apply to replacing roofs. Replacing roofs is not redevelopment under the definition in the SUSMP. It does not apply to retaining wall additions. Additions of retaining walls are not redevelopment under the SUSMP. Rewiring and replumbing and repainting a house are not redevelopment under the SUSMP.

The standard for redevelopment, if we have it, as you've seen is the creation or addition of at least 5,000 square feet of impervious surfaces, 50 percent or more of the impervious surface or improvements to 50 percent or more of the existing structure. I can't even imagine what an existing structure would look like if a retaining wall were to add 50 percent of the impervious surface or be 5,000 square feet or the addition a roof.

Similarly, single-family homes are not for the most part a subject of this SUSMP. Single-family homes may be the subject of it if they are on a hillside development or they're part of a 10 or more home subdivision, but you don't see a lot of poor homes being built on the hillside areas around Los Angeles and you don't have the cost of ten-plus home family subdivisions imposed on individual homeowners.

Those are collective costs. So the parade of the horrors that the petitioners have raised to these sorts of redevelopment or these sorts of initial developments are simply red herrings and you should put them out of your minds when you consider the efficacy of this SUSMP.

The next thing I wanted to discuss was the flexibility issue. Petitioners talked about the fact that the SUSMP requires them to contain or to infiltrate three quarters of an inch of run-off. That is again simply not true. The SUSMP requires few minor specific BMPs with respect to specific types of development, things like with respect to gas stations putting canopies over fueling stations. Beyond that, the BMPs are, as you've heard, completely at the discretion of the developers and the city planning approvers to decide what's the most effective and the most appropriate BMP. So they don't necessarily have to infiltrate anything at all.

In fact, there's the specific waiver provision in the SUSMP that you've seen that alleviates that requirement if there's any threat to groundwater, nor do they have to contain anything at all because all the water can be sent through a flow-through BMP. So the idea that you have to worry about how are they going to contain three quarters of an inch of rain or how are they going to infiltrate is another red herring that should be stricken from your minds when you consider whether this SUSMP is appropriate.

Third, you've heard people say that this won't clean up the beaches and keep the beaches open. That's true. No one claims this is going to clean up the beaches. There's a fundamental distinction here and a legal distinction that's being missed by the parties and that is the distinction between technology-based standards in order to control pollution to the maximum extent practicable on the one hand and water quality-based effluent limits on the other. We have to keep that distinction clearly in our minds.

The SUSMP is not a water quality-based effluent limitation. It's not designed to (inaudible) our water quality standards and it likely won't. It's a first step. It's a step that's required by the technology-based aspects of the Clean Water Act that say you have to implement the controls that are technologically available to control pollution to the maximum extent practicable, and the fact that this is being done by hundreds of municipalities all over the country should in and of itself be enough evidence that this is within the bounds of practicability, and whether it will get us to our water quality standards or not and whether it will keep beaches open is again a red herring and not relevant to the validity of this SUSMP.

Fourth, predevelopment run-off. There's been statements that the SUSMP will require that predevelopment run-off be kept below -- that post-development run-off will be kept below the predevelopment run-off. Again, that's false. The SUSMP does not say that. What it says is that the peak flows off of developed land can't exceed the peak flows from the predeveloped land, and that's to protect downstream areas from erosion and other areas of habitat degradation. That does not mean that the flow that comes off a post-development site is necessarily going to be lower than the predevelopment site. It only applies to those highest volume flows.

I've skipped through some of my slides here because I'm trying to hurry and I don't have a lot of time. I'm going to jump to some of the petitioners' claims with respect to the permit.

Mr. Montevideo's testimony yesterday focused almost exclusively on the argument that the Regional Board had violated its own permit. First of all, I would like to just point out that argument is entirely based on the assumption that the Regional Board can violate its own permit, and as we've pointed out in our briefs the Board can't -- well, it's based on the assumption that if the Board were to deviate at all from its permit that would be a violation.

As we've pointed out in our brief by the citations of the Smith V. Santa Barbara case and the Morrison case, it's not true the Regional Board can limit itself that way because an agency cannot limit itself in its ability to comply with the federal mandate to control pollution to the maximum extent practicable. So if this input requires the Regional Board, this SUSMP, if this is the way to get to MEP, then regardless of what the permit said that would not be a violation of it. That's an aside and I'm not going to dwell on that.

The fact is the Board did not deviate from this permit. The first provision of the permit that Mr. Montevideo claims was violated was the requirement that was -- the first claim that Mr. Montevideo has with respect to the permit violation was that the Board violated it by imposing requirements beyond that which the petitioners in their submittal had offered.

Clearly the Board has the authority to implement changes other than what the petitioners submitted. If it didn't have that authority, the entire review process would be meaningless. There would be no purpose for the Regional Board's review if they couldn't make changes.

Now, perhaps what Mr. Montevideo is saying there is that the Regional Board shouldn't have made the change itself. It should have simply sent the permit back to petitioners to have the petitioners make the changes. That kind of argument is the ultimate elevation of form over substance. It simply makes no sense. If Mr. Montevideo is saying that the Regional Board had to continually send the permit back over and over again, saying this is still not good enough, make these changes, this is still not good enough, make these changes, rather than making the changes itself and moving on with the program, then to honor that sort of procedural argument would be to completely cripple this program and make it impossible for the program to ever move forward.

Mr. Montevideo also claimed the Executive Officer should have followed the administrative review procedure. The administrative review procedure set up in the permit clearly has two separate sections -- first, a procedure for reviewing separate reports (phonetic) of documents; and separately, in addition, a method to resolve differences prior to initiating enforcement action. Those are two separate requirements. The first one is outlined here in section one, and the second one in section two.

The notice to meet and confer that Mr. Montevideo points to is only with respect to enforcement actions. There have been no enforcement actions begun here. This permit procedure is not applicable to the SUSMP. What is applicable is that the permittees have to submit the document to the Executive Officer. As you've seen, not only did they submit it but they submitted several versions. The Board was more than patient in accepting version after version that were not compliant with their demands before they eventually stepped in to make the corrections that needed to be made.

The Executive Officer notified the permittees of the results of that review, either approval of disapproval, which I think the fact that the Regional Board on September 16th said this isn't going to work, we're going to take this back and see what needs to be fixed, it was pretty clear they disapproved the permit. If that's not an explicit disapproval, then certainly a constructive disapproval.

The final claim related to this procedural issue is kind of a general due process claim the permittees didn't have sufficient opportunity to engage with the Regional Board and to discuss the various proposals.

As you can see, there were multiple -- you've seen this on other slides -- opportunities. There was a workshop, there were two separate hearings, there was public comment before the Board. It's my information that Mr. Dickerson and Mr. Swamikannu had approximately 50 informal meetings with various members of the permittees prior to the December release of the renewed version of the SUSMP.

We can see that there were at least seven different drafts of this SUSMP that were circulated before we came to the final one. There were early drafts circulated in early 1999. In May, the Los Angeles County SUSMP came out and what they called the final draft of their model SUSMP under the permit. In July they submitted their official proposed model SUSMP. It was again revised in August and then was submitted to the Board with changes recommended by staff on August 16th.

Finally, the other issue that Mr. Montevideo raised with respect to permit compliance was whether the SUSMP substantively met the requirements of the permit. Here is the language of the permit.

The two things they point to as being violative are the fact that cost-effectiveness, ease of maintenance and consistency with other environmental mandates were not explicitly considered allegedly. As I pointed out earlier, that requirement is within section B of the permit. It applies to the list of recommended development and the list of recommended BMPs. That process took place earlier and was completed in April of 1999. The SUSMP process down here is a separate process which is not limited by that requirement.

And the second claim they make is that the as-final SUSMP was not allowed to include two additional categories of environmentally sensitive areas and parking lots, but as you can see the language within the section C on SUSMPs says "at the minimum SUSMPs and guidelines shall be prepared for the following development categories." The permit explicitly made provision for an SUSMP that was broader than these seven categories. Nowhere in the permit does it say "at the minimum the SUSMP will include these categories and if it goes beyond that those must also be developmental categories." It doesn't say that. It doesn't say anything about going beyond this.

This is simply a minimum set of types of development to which it must apply. Beyond that, the "at a minimum" leaves it open to the Board in their discretion to determine what other types of categories are applicable or it should be applicable to.

I'm sure I'm almost out of time here, but I did want to address some of the legal arguments that petitioners made with respect to CEQA, unfunded mandates, Water Code, 13360, and just about anything else you can think of. I think I'll just pass on that because I'm out of time. How much time do I have?

CHAIRMAN BAGGETT: Three minutes.

MR. HELPERIN: Three minutes? Let's just go through very quickly, then.

CHAIRMAN BAGGETT: You don't have to use them.

(Laughter)

MR. HELPERIN: With respect to 13360, this again gets into the issue of the difference between a water quality-based effluent limit and technology-based standard. What the SUSMP is is a statutorily mandated compilation of required practices and minimum performance levels. It is very similar to the type of run-off limits that were approved in the Tahoe-Sierra case. In the Tahoe-Sierra case it construed Section 13360 in saying what it prevents is a regulation that prescribes the manner in which compliance may be achieved.

The SUSMP does not prescribe the manner in which compliance may be achieved and does not prescribe the manner to comply with the discharge standard because it's not a discharge standard. It's not a water quality-based effluent limit. It is again a technology-based standard, so there's no discharge standard per se in the SUSMP at all. There's no limit on what you can discharge and so 13360 isn't applicable.

Furthermore, even if that were to be interpreted as applying, the Clean Water Act, as you've seen from the other presentations, explicitly requires the use of SUSMPs in the statute and in the federal regulations, and the Water Code provides for overriding of 13360 if the federal act requires it. It says notwithstanding any other provision of Porter-Cologne, the Regional Board shall issue waste discharge requirements compliant with the Clean Water Act. So the Water Code explicitly says that even if 13360 were otherwise to be interpreted to being relevant, it's overruled.

Here's just an example of one of the places in the Clean Water Act where BMPs are specifically required and defined to include maintenance procedures, treatment requirements and operating procedures. So if there be any confusion about the existence of the mandate required by the Clean Water Act, this is required by the Act.

With respect to CEQA, as you've already heard there's an exemption under 13389 that this doesn't require the waste discharge requirement. That exemption doesn't apply.

There is an argument made by WSPA that this is not required based on the Defenders of Wildlife case. This is once again a confusion between the distinction of water quality-based effluent limits and technology-based standards. What Defenders of Wildlife said was that for municipal stormwater permits you don't necessarily need to have numerical effluent limits. That did not apply to technology-based best management practices. In fact, at the end of the case it explicitly approved the use of best management practices.

Finally, the unfunded mandates claim and APA claim. With respect to unfunded mandates, the requirement to reimburse local agencies for the state mandated costs does not apply to NPDES permits issued by the Regional Board. That's a quote from this State Board's opinion in 1990. Furthermore, Government Code sections explicitly exclude orders issued by the Regional Board pursuant to the Porter-Cologne Act for the requirement of reimbursement.

And finally, with respect to underground regulations, first of all the SUSMP is not a regulation as defined by the APA. Secondly, even if it were, there is again explicit exclusion for the issuance of waste discharge requirements and permits pursuant to 13363. Again, since the SUSMPs are part of a waste discharge requirement, this isn't applicable.

BOARD MEMBER FORSTER: You had five seconds.

MR. HELPERIN: I'm done.

CHAIRMAN BAGGETT: I would like to take a couple minute recess to meet with the parties up here, if I could, so we can discuss how we're going to proceed. Ten-minute recess.

(Recess taken)

CHAIRMAN BAGGETT: We're back in session briefly. We will go into closed session for about ten minutes, try to define the issues and then come back, and we want to do cross-examination and closing statements and work straight through until we're done.

We're recessed into closed session.

(Closed session held)

CHAIRMAN BAGGETT: Let's begin. It's 1:00.

Just for the record, the parties have agreed we've limited the cross-examination to two specific issues that the Board is particularly interested in hearing more about. That is the definition and the issue of redevelopment in the SUSMP permit and what language is pertinent in the modification proposed; the second area is of redevelopment and the three-quarter-inch design factor, whether that's applicable basinwide, should it be a different number, is that number correct, on what basis is it correct, the discussion of three quarter inches.

Then we will go to 15 minutes per party to cross-examine on whatever they want and do closing statements, however you want to spend that five minutes or thereabouts, and make a summation and close. That can be on anything the parties feel is relevant and that the

Board should consider.

It should be pointed out the testimony is quite voluminous and the record is quite broad. The Board is familiar with it and will become much more familiar with it in the coming month and a half as we have many executive sessions to deliberate the evidence and work among ourselves to craft a solution or make a decision on how we'll find.

With that, let's begin with NRDC, any witnesses -- NRDC et al., any witnesses you wish to cross-examine. If the witnesses could also sit up at the table, we think that makes more sense and have the attorneys approach and use the lectern.

MR. HELPERIN: Desi Alvarez.

MS. JENNINGS: Tell me all the people and they could be ready.

MR. HELPERIN: I'm going to just be calling three witnesses, Desi Alvarez, Dennis Dickerson and Xavier Swamikannu.

DESI ALVAREZ,

having been previously sworn, was recalled for cross-examination and testified as follows:

CROSS-EXAMINATION

BY MR. HELPERIN:

Q. Just two questions for you, Mr. Alvarez. To begin, the definition of redevelopment, you're familiar

with it?
A. I am.
Q. And do you know how it was developed?
A. There was a lot of discussion about the definition of redevelopment. This last definition of redevelopment I think was a surprise to us when we actually saw it in writing, the final final version, and that it would be all-inclusive because it tends to capture a lot more projects than I think anybody intended to capture.
Q. The first sentence of the definition has a three-part disjunctive which it says redevelopment means creation or addition of at least 5,000 square feet of impervious surface, creation or addition of 50 percent or more of impervious surface, and thirdly, making improvements to 50 percent or more of the existing structure.
The third part of that disjunctive, making improvements to 50 percent or more of the existing structure, is that particular phrase familiar to you?
A. Yes, it is.
Q. Do you know where that language came from?
A. Not specifically, but generically that was language that was discussed amongst all of us.
MR. HELPERIN: Thank you.
Dennis Dickerson, please.

DENNIS DICKERSON,

having been previously sworn, was recalled for cross-examination and testified as follows:

CROSS-EXAMINATION

BY MR. HELPERIN:

Q. How do you interpret this definition of redevelopment? Do you interpret it to apply to the addition -- or reroofing of a single-family home?

A. No.

Q. Do you interpret it to apply to the addition of a retaining wall?

A. No.

Q. Do you interpret it to apply to rewiring, replumbing or painting of a house?

A. No.

Q. And with respect to the third disjunctive that I was asking Mr. Alvarez about, can you tell us how that language got into this definition?

A. Yes. At the board meeting on January 26th, the Board entered into, at the end of the process of the day, a series of discussions about the nature of the changes that would be appropriate for -- to be in the final approved draft or final approved document.

On page 304 of the transcript, if the Board later wants to look at it, there is a discussion by our Chair where he's outlining a scenario that he wanted to make sure he captured within the context of the definition, and it really was applying to a fairly major kind of redevelopment. And so this is something that in terms of the final writing perhaps is not as perfect in its definition as it should be.

Now, along that line, we're more than willing and indeed I think had -- had we not gone through this entire process, a change of this sort would have been made much earlier as a result of normal discussions that go on, but unfortunately we've been deflected from that. I think it would be an easy matter to make a modification to provide that clarification to this particular definition.

Q. You agree that third disjunctive has some ambiguity in it?

A. Yes.

Q. And you're willing to clarify that?

A. Yes.

Q. And the rest of the definition, do you think it is clear?

A. Yes.

MR. HELPERIN: I have nothing more for Mr. Dickerson.

Mr. Swamikannu please.

XAVIER SWAMIKANNU,

having been previously sworn, was recalled for cross-examination and testified as follows:

CROSS-EXAMINATION

BY MR. HELPERIN:

Q. Is it true that you were -- that you developed the .75 inch numerical design standard that's in the current SUSMP?

A. I developed several options to treat basically the cost-effective volume of stormwater to remove pollutants. The three quarters of an inch standard is something that I looked at because L.A. County had considered that. But at the same time when I looked at what the basis was and the basis is based on the precipitation patterns in Los Angeles, using the concept of diminishing returns, when you plot the values you find a range where the mean starts to break and .75 for a representative station is in the middle of that break.

As I indicated in my testimony before, for coastal areas, even within Los Angeles, that pattern might be different, meaning the midpoint of the mean might be higher than .75.

Q. It seems a little odd perhaps that .75 is the exact same number that the County of Los Angeles has in its program. Isn't it true that during the Long Beach hearing there was suggestion that .75 inch design standard be inserted into the Long Beach permit -- that was back I think in July of 1999 -- in part based on the fact that the County already had a .75 inch standard?

A. When you consider the Long Beach permit, we looked at the share of new development and appropriate controls for new development, and one of the important things that came out was the necessity for some kind of design standard to limit the size of BMPs so that it's not costly. And I remember Dr. Gold asking the Board to impose a .75 standard at that time, to which I responded that we had not had the time to independently make our judgment on what an appropriate standard was, and so the Board at that time deferred the decision for a design standard to consideration when the SUSMP for L.A. County came up for review.

Q. So you had the option of adopting the .75 inch standard and deferred it so that you could independently review it and determine if it was the appropriate number?

A. That's correct.

Q. What was the model or the approach or the manner in which you determined it was the appropriate number?

A. The problem you're trying to address really is actually run-off. What's contaminated is not rainfall but more so run-off. And the presumption is that if it's totally impervious, all the precipitation ends up in run-off, but that's not generally the case.

So when I looked at the national models, they had different methods of calculating run-off and when I looked at the WUFAFC manual, there was a process that was laid out to calculate the run-off that needs to be treated based on this efficient model.

For Los Angeles, given the fact that much of the area is impervious, that value then is closer to .75

rather than somewhere lower like .3. Let me add that for a region like San Diego, the 85th percentile would be .6 and not .75, but the principle is the same.

Q. So you actually used these nationally accepted models and figures that represent local hydrologic characteristics in calculating the number?

A. That's correct. That's the independent judgment that I sought to bring to the process.

Q. And is there any variability or is it truly just .75?

A. It was variable because it depends on the rainfall pattern for each location.

Q. In the SUSMP there are other ways to calculate it?

A. I'm sorry. In the SUSMP there are four different approaches and when I looked at the four different approaches, the .75 is the easiest for anybody to understand because it's a fixed value to the rainfall precipitation. All the others involved some form of computation.

When I actually did the analysis of the four methods, and that is calculations in the administrative record, the values that come out of the four different methods are within ten percent of each other which means the .75 value is basically -- even though it might have been discussed with NRDC, it is a scientific approach to trying to address the design standard that is appropriate for BMPs.

Q. Just one last question. What about the fact that there are many different sources of stormwater pollution and different types of land uses and different types of contaminants that are of concern? Might it not be the case that you would want a different standard based on land use?

A. What we are talking about here is a design standard to address the most efficient volume of precipitation. We are not looking at pollutants. So I think if you're trying to address the difference in land uses within a particular area, you will be looking at the types of BMPs, not really the design standard because the design standard is based on the precipitation pattern, not the objective to remove any particular pollutant.

Q. One final question. What's wrong with .6?

A. .6 really, as I indicated, it's an average, .75 is an average for L.A. County. .6 was proposed initially in the draft by the permittees. The problem with .6 is that it's the low end of the mean, and perhaps we believe in averages and the average in this case is .75. For example, .75 would not be enough or would not be sufficient effort for west L.A.

Q. So .6 being the low end of the mean meaning that you still have an area on the curve where you could increase a little bit in terms of size and get a lot of bang for your buck.

A. The optimum really is the point at which the mean starts to level off. That's where the cutoff should be, and the cutoff usually is 90th percentile, which is what you see in other jurisdictions.

Q. 90th percentile?

A. 90th.

Q. What percentile are you using?

A. We are using 85th percentile.

MR. HELPERIN: I have nothing further.

CHAIRMAN BAGGETT: Any questions of the Board or any other parties?

MR. LEON: Thank you, Mr. Chairman.

CHAIRMAN BAGGETT: Do you have other witnesses or these are the witnesses?

MR. LEON: These are the ones.

(Laughter)

CHAIRMAN BAGGETT: This is the cast of characters.

MR. MONTEVIDEO: Mr. Chair, he shouldn't be able to cross his own witnesses again. That's really direct testimony.

CHAIRMAN BAGGETT: I would concur.

MR. LEON: The difficulty I have is that there was a misstatement I tried to correct through one of the other witnesses and has to do with the adoption of the BMP guide.

CHAIRMAN BAGGETT: In your summation you can summarize.

MR. LEON: All right.

CHAIRMAN BAGGETT: Do you have any witnesses you wish to call on cross-examination?

MR. LEON: No. I would have to call one of these guys. Thank you.

CHAIRMAN BAGGETT: Mr. Welch, do you have any witnesses you would like to call? I think this party is dismissed.

MR. WELCH: I may have just a couple of questions of these witnesses.

CHAIRMAN BAGGETT: Do you have any additional witnesses?

MR. WELCH: Mr. Dickerson and Mr. Xavier.

First, Mr. Dickerson.

CROSS-EXAMINATION

BY MR. WELCH:

Q. You mentioned -- you testified about the waiver provisions that are contained in the SUSMP?

A. Yes.

Q. And you said they would be appropriate in cases where there's limited space or potential for groundwater contamination?

A. I think I need to see a copy, if I may, so I make sure I'm accurate.

Q. Of the final SUSMP?

A. Yes.

Q. I'm handing you a copy.

A. Thank you. Okay. Right there are three specifics, extreme limitations of space for treatment, unfavorable or unstable soil conditions and site potential infiltration, groundwater contamination, risk of groundwater contamination because of unconfined land surface or an existing potential of ground -- do you want me to read them?

Q. Where in the record are you referring to?

A. On page 14 of 25 of the SUSMP document.

Q. And is that the section that outlines the appropriate circumstances for a waiver?

A. Yes.

Q. Would it be appropriate for one of the city permittees to grant a blanket waiver to retail gasoline outlets from compliance with the .75 design treatment standard recognizing the concerns of groundwater impact and limited space that apply for retail gasoline stations?

A. It would have to be based upon the fact that it's been considered and rejected as infeasible. That's the criteria. That's the initial criteria.

Q. And if a city permittee considered that and did reject the application of the .75 criteria as being infeasible for retail gasoline stations, would that be compliant with the SUSMP?

A. I think it would have to be based upon the specific -- the site-specific conditions as opposed to a category exemption. That's really what the waiver is about.

Q. So are you saying --

A. There's still the option for a permittee to come to us and submit an additional justification for impracticability. That's still something that's out there and that could be considered. I think that was where we were talking earlier about the categorical approach.

I would like to note that also on page 15 of 25, on the next page there's a limitation on the use of infiltration BMPs which deals with potential to contaminate groundwater. So that's also a consideration that should be taken into account.

Q. So for a gas station to comply with the SUSMP, you're saying that to obtain an exemption each individual city permittee would need to come forward and ask for a categorical exemption?

MR. LEON: Excuse me. I apologize. I'm going to object because this line of questioning appears to be seeking a concession on the applicability of the permit and it's beyond the scope of the two issues that we all agreed would be covered in the cross-examination.

MR. WELCH: Just in response, this is relevant to his testimony on direct and does --

CHAIRMAN BAGGETT: Proceed. Overruled. Proceed. Try to narrow to the two areas. It would be appreciated by the Board.

Q. BY MR. WELCH: Mr. Dickerson, again focusing on the .75 design standard, how would a city permittee be able to grant an exemption to retail gasoline stations?

A. The only thing I take question with is your using it in the plural, and here we're really talking about situations which are enumerated items here are very clear to site specific conditions. Now, if there was something of impracticability that was associated to a category, then you anticipate a permittee would need to submit that with justification. We certainly haven't seen any justification for that at the present time.

It would be very presumptive of me to make any judgment calls on that at this time. It's conceivable it could be done.

Q. If one of the city permittees came to that conclusion that it was infeasible for a retail gasoline station to comply with the .75 design treatment requirement, would it then be able to grant a blanket waiver to retail gasoline stations?

A. It would have to come to the Regional Board for review and we would have to evaluate that. It's what are the other justifications of impracticability, but there is a procedure that is allowed by the SUSMP for that to occur. Whether it would occur, I couldn't begin to judge.

MR. WELCH: Thank you.

CROSS-EXAMINATION

BY MR. WELCH:

Q. Mr. Swamikannu, are you a licensed engineer?

A. No.

Q. You testified earlier that there were some different ways that a gas station could comply with the .75 treatment requirements. Do you recall that testimony? You mentioned infiltration and storm ceptor and kind of a wetland in the box.
A. I provided some examples of situations.
Q. And those are examples of a way that a gas station might comply with the .75 standard?
A. The question was how do you dissolve contaminants as opposed to suspended, and I provided a couple of BMPs that address dissolved pollutants.
Q. And those different types of BMPs could be used to comply with the .75 design standard; right?
A. Yes. They could be used at gas stations, at municipal vehicle maintenance facilities, a whole series of establishments where there's vehicular activity.
Q. And you mentioned infiltration as a potential; is that right?
A. Infiltration is one option.
Q. And wouldn't infiltration raise a concern of potential groundwater contamination from a gas station?
A. In the SUSMP document that Dennis Dickerson referred to, there is a limitation on infiltration. There's also reference to an EPA document which clearly defines the conditions under which infiltration are not recommended and that document is referenced in the SUSMP. So that would be a basis to decide when is infiltration proper and when not.

Q. Can you say it's a blanket overall statement whether infiltration is appropriate for use in complying with the .75 standard for retail gasoline stations?

A. Please repeat that question.

Q. Can you say as a blanket statement whether infiltration can ever be appropriate for retail gasoline stations to comply with the .75 design standard?

A. The focus really should be on what is being infiltrated. Clearly if it's petroleum hydrocarbons, if you're talking about the area where spillage occurs, that particular area should be segregated. That should not be infiltrated.

Infiltration removes pollutants associated with heavy traffic that goes on at gas stations. Those can be retained in the first few inches of soil, and so perhaps by even modifying landscaping on a gasoline station you might be able to address that component. So I see a mixture of BMPs, not necessarily one that is the master solver of the problem.

Q. But if I understand what you were saying about gas stations, you would have a separation between the fuel area where there's a potential for spill and then a different grading for areas where the cars would drive onto the station; is that right?

A. That's right.

Q. And isn't that the type of structural control that's contained in the California Stormwater Quality Task Force BMP guide?

A. The structural control that's contained is a canopy over the area that you have fuel pumps. I'm not sure whether the document addresses run-off from the access roads to the gas station where you find heavy metals and others associated with automobiles.

Q. Let me point you to page 7 of the BMP guide. Doesn't that contain a discussion of grading similar to what you were talking about earlier as a structural control to prevent stormwater contamination from the gas station?

A. Are you talking about under the paragraph "fuel dispensing areas"?

Q. Yes.

A. That's correct. There's a discussion on grading. There's a description of preferred slopes and grading to keep run-on away from the fueling areas.

Q. Okay. And you participated in the working group that developed the California Stormwater Task Force BMP guide for the retail gas stations; correct?

A. That's correct.

Q. And that task force guide does not contain the .75 design standard that's contained in the SUSMP?

A. That's correct.

MR. WELCH: Thank you. I have nothing further.

CHAIRMAN BAGGETT: Any other witnesses you want to cross-examine?

MR. WELCH: No.

CHAIRMAN BAGGETT: Thank you.

The witnesses are excused unless you're going to call them.

MR. MONTEVIDEO: No, these gentlemen need to stay up here.

(Laughter)

CHAIRMAN BAGGETT: Is there anyone else you would like to hear from?

MR. MONTEVIDEO: Possibly Mr. Leon, but if I can wait and see. Thank you, Mr. Chair and Members of the Board.

CROSS-EXAMINATION

BY MR. MONTEVIDEO:

Q. Mr. Swamikannu, just a few questions for you, particulary on the .75 standard.

Based on your most recent testimony, it's my understanding that you started with the .75 standard because it was a standard that was utilized by the County; correct?

A. That's correct.

Q. Then --

A. But that is not the only standard.

Q. I understand. I understand. You have different ways to come up with a number and they're all within 10 percent?

A. Right.

Q. Okay. But you started with that approach because in effect it was in the settlement agreement with the County.

A. There are two other jurisdictions within L.A. County that already had numbers as well, so the three numbers I looked at. Three numbers I looked at. One is L.A. County and the other is Calabasas and the third was Santa Monica.

Q. Your starting point was the .75 as you calculated it?

A. Yes.

Q. And then you proceeded to do additional work to see if that was supportive?

A. I -- basically I wanted to understand the basis of .75 and so I investigated what the approach is for design criteria around the nation.

Q. Okay. I received some submittals earlier this week and there's been some discussions about those submittals. We received some documentation from your office on the state -- on the program in the state of Maryland, the state of Florida, and I think the state of Washington.

Those documents that were just recently submitted to us, is it accurate to say that you only just received those documents as well?

A. No.

Q. So you had copies or maybe it was a questionnaire that you received responses to?

A. Yes. The questionnaire was responded to in response to questions that I had to my counterparts in these states.

Q. Would it have been helpful to you to have had those questions responded to back in January prior to the time that the Board had looked at the issue?

A. Before we went for the board hearing, I was in contact with my counterparts in these states. If you look at the administrative record, the documents that are referenced are in the administrative record. For example, Washington's draft document, Maryland's draft document, the revised document.

Similarly, I downloaded information from the Florida program and reviewed these before I made the recommendation to the Regional Board.

Q. So it was the questionnaire -- it was actually getting written responses that you received recently that you didn't have before?

A. That's correct.

Q. When you look at those other states, what they have done in other states, is it correct to say that other states have applied different standards depending on the type of development, at least in some cases?

A. Yes and no.

Q. Please explain.

A. The criteria is applied to all development categories, 5,000 or more in two of those three states. In Florida it's 4,000 or more. The different criteria that Florida applies in some situations is simply because there is a threat to a sensitive environmental body where the threshold then is raised to 95 percent instead of the 90th percentile.

Q. Doesn't Florida recognize that there are different types of pollution, pollutants in different loads that come from different developments?

A. As I mentioned before, I talked to Eric Livingston from Florida and the issue raised is they have design criteria which BMPs are sized for, but they also have performance standards. And I think you're talking about performance standards as both criteria.

Q. When you combine those two, does it result in an overall different set of BMPs that may be available to one type of land use versus another type of land use?

A. The BMPs itself are specific to the kind of pollutants you're trying to address so your statement is correct. There are different kinds of BMPs for different places.

Q. Would you agree the other, particularly Florida, is more flexible in terms of the standards to be applied depending on the particular use?

A. No, because Florida has a minimum threshold and minimum is 80 percent removal of TSS, period. That's a performance standard. Anything else is simply more regional determination of how much more do we need to do as opposed to having total flexibility in terms of what needs to be done.

Q. So your testimony is that they have no more flexibility than you have?

A. They have a higher minimum threshold than we have.

Q. Okay. Florida has some -- has a different definition for redevelopment, do they not, than the Regional Board has adopted?

A. From my understanding -- I'd have to look at the document because I don't have my focus on that aspect.

Q. Okay. There are others as well. I think Washington, and if it's not Florida it may be Maryland, but my understanding of at least two of those programs is that they have a definition for redevelopment that is limited to the increase of 5,000 square feet of additional impervious surface.

Would you agree with that?

A. It appears correct.

Q. Okay. The definition of redevelopment that we have here is far broader than that. Would you agree?

A. I just have a suggestion. I think Dennis responded to that issue, so I would like him to respond to that issue.

Q. I appreciate that. You have more knowledge of the technical requirements and some of the other programs. That's why I'm directing it to you. I'm not sure Dennis has that much information about the other states. So in comparing what the other states have done versus what we have done, vis a vis the definition of redevelopment, it appears to me that our definition is much broader than what other states have done.

A. I can understand how one might interpret that to mean it's much broader.
Q. I'm just trying to understand whether or not you agree with that or not.
A. Part of the problem with writing definitions is that you get with what's suggested to you. In my understanding of the three-pronged definition here, the second and third prong was provided by the permittees to us. And so I think that's what the confusion is and I think what Dennis indicated is we might able to clarify so that our definition of redevelopment is consistent with that from other states.
Q. Then how would you clarify it? Would you give me a suggestion? Really I'd like to -- if you don't know, that's fine.
A. Basically this is -- I'm not committing my Board to anything. I'm not committing my Executive Officer to anything. I'm providing my opinion. In my opinion the definition could be addition of 5,000 square feet of impervious area.
Q. Period. End of sentence.
A. Yes.
Q. Okay.

CROSS-EXAMINATION

BY MR. MONTEVIDEO:
Q. Dennis, I didn't want to you think I forgot about you.

A. I was hoping.

Q. The definition of redevelopment, does the redevelopment threshold apply whether or not the particular project is discretionary or non-discretionary?

A. I think you would have to go back to the discussion that we had earlier on that. The Board, when it directed me to finalize the document, wanted us to include non-discretionary. So I would assume that it applies to non-discretionary and discretionary at this point.

Q. Okay. And obviously it depends whether or not you are in an environmentally sensitive area or a hillside development or one of those nine categories; correct?

A. It applies to those categories only.

Q. Okay. Now, help me out here. I'm trying to understand because there's been a lot of discussion about whether it applies to a single-family residence or not, a condominium project or not, or just some work that's being done.

Let me pick the example of Mayor Pro Tem Larry Forester in Signal Hill. He has a condo. It's on a hillside. He was remodeling. The example he gave was he was remodeling the inside of his home. If I remodel the inside of my home and I have to get electrical permits or plumbing permits or what have you and it's more than 50 percent of the interior of his home, as I read it, it seems like it applies to that situation along with a number of other situations. Do you read it in that same fashion or am I missing something when I'm reading these definitions?

A. I think I made it clear earlier in response to some questions that that particular definition probably does need to be looked at with respect to item number three or the third element of the definition. And as I made clear, the Board transcript -- what we were trying to do is take the concept from the Board transcript that our Chair wanted us to address, and it appears to be imperfect so we would have to go back and correct that.

Q. Isn't that problem compounded when you combine it with the application to non-discretionary projects?

A. I don't know for sure, but I'm going to have a guess here or at least a reasonable judgment call. Non-discretionary, as it applies to the categories, in my opinion probably is going to be a very unlikely event in the sense that we're looking at very specific thresholds or involvement here, especially with redevelopment, and I don't think you're going to have situations very often where that's even going to matter.

I think what the Board was trying to do was to close some kind of perceived loophole that could exist that they couldn't anticipate by including that in. They just wanted to make sure they weren't missing some big project that otherwise wouldn't have been addressed.

Q. Maybe it's just a fundamental disagreement or difference of opinion on what non-discretionary project means in cities. That's a very definitive term and it basically applies to all projects that need permits if you don't have to go to a planning commission or city council. Let me stop there and move on to the .75 standard for a minute.

The permit talks about different types of developments in developing -- using different BMPs depending on the type of developments. Consideration should be given to the type of development and the potential for stormwater pollution. I'm reading from the top of page 34. Do you see that?

A. I see the page. I can read it.

Q. Is it true that the .75 standard, and I know it can be calculated in different ways, is going to be the standard that's the standard that's the standard irrespective of which development you're talking about in these nine categories? That is, the same .75 standard is going to apply to a hundred-plus homes, 100,000 square feet of commercial development or a single-family residence on a hillside?

A. It applies to the categories I can see on page 34 of the permit as well as the other categories that the Board added to it, two other categories.

Q. Do you agree that the permit clearly allows the application of different standards? It almost implies it by Standard Urban Stormwater Mitigation Plans. Am I missing something? It doesn't allow for the application of different standards?

A. It certainly could be an option.
Q. Should we look at a different standard if you're talking about a single-family home or an in-fill project versus 100,000 square feet of commercial development? Wouldn't it make sense to give consideration to the fact there might not be sufficient space to address that standard?
A. If you're suggesting that the petitioners could have come to us at any time in this process and offered specific numerical standards for us to consider for each of those categories, we would be happy to do so. I don't believe they did.
Q. Part of the problem is getting beyond the battle over whether a standard, a specific standard, should apply, but in terms of moving forward on coming up with a number, does it make sense to try to bring the parties together to the table to try to look at whether a different standard or standards may apply to the various categories?
A. We tried very -- let me just say that we had an awful lot of discussions with not only the petitioners you represent but others as well who have not joined in this, and really I don't recall very much conversation in any substantive fashion through all those discussions about different kinds of standards for different areas.
Q. But putting aside where we've been, I guess where we're going to go, do you agree that would make sense to bring all the parties collectively together to

see if they can come up with a set of standards or a standard that would work for Los Angeles County?

A. From my position right now, we already have a standard in place.

CHAIRMAN BAGGETT: Are you about --

MR. MONTEVIDEO: Yes.

Q. Let me show you one other slide.

CHAIRMAN BAGGETT: Last slide then.

Q. BY MR. MONTEVIDEO: The state of Florida had recognized that the issues in terms of trying to address stormwater run-off were issues that involve a lot of different parties, and they actually did their best to attempt to build a consensus among the parties. Not that you can accomplish a consensus, but doesn't it make sense here to at least attempt to do that, to not have 40 different cities saying there's a problem here with other entities, saying let's see if we can work out something that makes sense for the different developments?

A. I think we did that very much in the process that we entered into in developing the current SUSMP, and I would also comment that we really, I think, have benefited greatly by the experiences of these other states and all the hours that they spent in coming up with standards that we then could refer to. So I think that's all been very helpful.

Q. Outside the public workshops, you had everybody at the same table? Did you have the environmental organizations with the cities and the planners and the developers at one table?

A. I think it's been referred to earlier as a certain amount of shuttle diplomacy that went on.

MR. MONTEVIDEO: Very good. Thank you.

CHAIRMAN BAGGETT: Thank you. With that we will have the five-minute summations and closing statements. We'll begin with respondents. NRDC.

We'll have a brief recess.

(Recess taken)

CHAIRMAN BAGGETT: Let's go back in session. The paper is changed. With that, we'll begin with NRDC and then the Regional Board, WSPA, and then the cities, et al.

MR. FLEISCHLI: Good afternoon. Steve Fleischli with the Santa Monica BayKeeper. My close will be brief.

I think one Board Member pointed out that the issues here were ripe for decision within the state of California. I would suggest they're not only ripe but they're rotten at this point because we are so far behind in terms of where we are in the state of California. I think that's been very, very clear with all the evidence in the record, in terms of the massive amounts of numbers, in terms of the numbers of other states that are moving forward with this. Let's move forward.

We've been working on this, at least in terms at the level of the Regional Board, for over a year now. It's almost exactly a year now. Every single time we've heard presentations from the municipalities at issue here that have petitioned, it's the same issues. It's the same discussion. There is no factual or scientific or legal or economic basis for what they're saying. They never come up here, they never come up and put up substantive information that will overturn what the Regional Board has done here, that will counter-weigh the massive amount of information that has already been provided in the record to support not only the .75 inch standard but the entire SUSMP proposal itself.

There may be some confusion about a few of the sections, the redevelopment section in particular. That does not seem like an insurmountable problem. If it wasn't always such extreme responses from some of these municipalities about the problems with the SUSMP, maybe we could have talked through some of these issues, especially the very minor ones that seem to be causing some confusion for people as to whether this applies to single-family housing with sinks and other issues like that and roofs. It doesn't really seem like that should be the focus of what the Board is looking at.

It comes down to the .75 standard. The .75 standard is uncontroverted. Experts from around the country have said that that is justified. Our own expert, Dr. Richard Horner, said that in his opinion, his technical expert opinion of working on these issues for several decades, that for Los Angeles at least one inch would be justified in this instance. It's preposterous to think we should go any lower than .75.

Lastly, I -- just to wrap up and maybe express the sentiments of David Nahai on this issue, and you might recall the Board itself did struggle with this long and hard. We had a meeting in September. They considered this issue. They didn't feel at that point in time that they could render a decision and they wanted to give the cities more opportunity to provide information, additional opportunity above and beyond what Dennis Dickerson had already provided to them. So they didn't make a decision until January of this year, nearly a year after this process had started and was already due in terms of a resolution by the terms of the permit.

So I would conclude by saying let's move forward to protect water quality in Los Angeles. The impairments are uncontroverted, whether it's heavy metals, whether it's fecal contamination, whether it's trash. It's all from new development projects. This is not the panacea to solve all our problems but it will help prevent it from getting worse.

Thank you.

CHAIRMAN BAGGETT: Thank you. Regional Board.

MR. LEON: Thank you very much.

We just want to close by thanking the Board Members for coming down to southern California to conduct this hearing. We very much appreciate your time and attention. Even having said that, I look forward to heading home to Sacramento right along with you.

There is one very minor housekeeping item that I would like to cover and that is the statement made by Ron Wilkness, a person who testified on behalf of WSPA. He made the statement that the California Stormwater Task Force had created a BMP guide that had been adopted by the Regional Board. In fact, it had not. If you think it's important, we would like leave to submit a copy of the Long Beach permit just to put that into the record.

MR. WELCH: We would have no objection to that.

CHAIRMAN BAGGETT: Would the other parties have an objection?

MR. MONTEVIDEO: No objection.

CHAIRMAN BAGGETT: It will be submitted for the record. Thank you.

MR. LEON: Thank you very much.

CHAIRMAN BAGGETT: Mr. Welch.

MR. WELCH: Thank you, Mr. Chairman and Members of the Board. I also thank you for your time and effort here yesterday and today. This is a very important issue for WSPA.

The Pollution Prevention Act of 1990 declares it's a national policy of the United States to prevent pollution at the source where possible and that treatment should be used only as a last resort. Here with the adoption of SUSMPs we find that the gun is being jumped and treatment is being required without even looking at whether it's necessary or appropriate.

As you've heard, we have put our scientific evidence into the record that shows that well-maintained retail gasoline stations do not cause significant stormwater problems or pollution when they're well-maintained. That's supported by our 1996 study.

Further, the California Stormwater Quality Task Force best management practice guide for retail gasoline stations, which we've also provided, sets out a number of source control and structural best management practices that can be implemented for retail gasoline stations.

It's our belief that if the California Stormwater Task Force BMPs are implemented, they will result in a far more effective control of stormwater pollution from retail gasoline stations because they wouldn't only apply to new and modified developments, but they apply to all of the existing retail gasoline stations.

The main difference between what the Stormwater Quality Task Force put together as best management practices and what's being required here in the SUSMP is the requirement for treatment, and that requirement is being applied to the retail gasoline stations even though the scientific evidence shows that from infiltration there's a risk of groundwater contamination, which I think is well-recognized, and for the other types of treatment devices we've shown the evidence just isn't there to show they're effective in treating the types of pollution that occur in the real world gasoline station.

We've also heard today that although there's this waiver provision in the rule, that the practicability of using that waiver option to work with the gasoline stations, it's just not practicable or feasible. If this SUSMP regulation goes forward, you'll have a number of different cities applying different requirements to gasoline stations. Some may try and apply waivers, some may not. All of this, any kind of waiver would have to go before the Regional Board and create numerous work.

What we've been trying to do at WSPA is prepare a statewide approach that will result in the most effective control of stormwater pollution from gasoline stations, and we believe that the work that was done by WSPA and then later by the members of the California Stormwater Quality Task Force, the work group which included representatives from the Regional Board and also from the State Board, we believe that that BMP guide has developed what will result in the most effective control of pollution.

We would submit to you that as part of your decision here with respect to requirements for retail gasoline stations that you direct the Regional Board to apply the best management practice guide to the retail gasoline stations. It makes sense to have one rule that applies across the board to all gasoline stations. It will result in the most effective control of stormwater pollution from gasoline stations.

I thank you for your time.

MR. MONTEVIDEO: Good afternoon again, Mr. Chair and Members of the Board. I also want to thank you for your patience throughout these last two days. It has been a long and arduous hearing and you have your work cut out for you. So I don't envy you, but I do appreciate your time and your efforts and your future efforts.

I want to end this where I began by saying this is not a question of who's in favor of water quality and or whether or not we have a water quality problem. Clearly we do. The issue frankly is how to best go about addressing the water quality problem that we have. There's been a lot of discussion about well, we have a process and the cities keep saying that the process hasn't been followed. We kind of followed it.

Congress has looked at this issue. They adopted and amended the Clean Water Act in 1987. They gave us guidelines to follow when they did that. They had reasons for doing that. Our state legislature followed by saying we're going to have you apply these same standards that Congress has laid down because we think this process needs to be followed because it's going to result in something that hopefully will work.

The process is an important part of what we're talking about today, and it's not just about the .75 standard. I wish I could say it was. The problem is that it's not only that standard that was not included in the permittees' SUSMP, there are some other issues, other items that maybe will make the application of the .75 so global that it will economically impractically burden the residents of the County of Los Angeles, particularly when you throw in and combine the .75 standard along with the definition of redevelopment, and you combine that with their last-minute addition of non-discretionary, and you combine that with their addition of environmentally sensitive areas. Those three combinations make for disastrous results.

When you ask the Regional Board about what this means, they're not really sure. That turns into our problem, not their problem because at the end of the day it's the cities that are going to have to deal with the lawsuits that will undoubtedly follow because we didn't apply it correctly or interpret it correctly.

We need to have provisions that are clear so that we first can implement them appropriately and second so that we can tell our citizenry what they really have to do, and finally so we can know that the actions that we're taking are in compliance with the Clean Water Act.

We've asked for clarification of these standards and of these particular provisions and we really haven't been able to obtain it today. And the reason I think we haven't been able to obtain it is because they thought they were doing one thing and thought they were doing another thing and they didn't look at the cumulative impact of what they really did and they didn't fully understand each step of what they really did.

Now, we need to have standards. We need to know what we're going to be doing and be able to apply that to our residents. The argument is well, we followed a process. Well, frankly, the process that was laid down in the permit would have resulted in a different result and a different SUSMP. The argument is well, you were not prejudiced because that process was not followed.

Then they go on to explain that by saying you weren't prejudiced because you simply would have submitted, resubmitted and resubmitted. We would have rejected, you would have submitted, we would have rejected, you would have resubmitted. By definition, that's prejudging what we would have submitted. They're telling you that regardless of what we submitted, they were going to reject it. That's the definition of prejudicial, prejudging.

We had a specific process in the permit. The process would have provided for us to meet and confer approaches to come up with the solution that would make sense for Los Angeles County and specifically to come up with the SUSMP program that would work. Had that process been followed, we would not have ended up with a SUSMP program with all these ambiguities and the problems with the application to in-fill projects and single-family homes. I feel confident we would have come up with a program that would have worked for the county if you put in -- if you brought to the table planners with builders with councilmembers with the environmental organizations. We could have come up with a program that would have worked. Unfortunately, we didn't.

We would ask the process be followed. You have 40 cities that are effectively taking issue with the action that was taken by the Regional Board, along with the building industry and even WSPA. Under your authority in the 13320, you have the ability to do several things or a combination of those several things. One, you can direct that appropriate action be taken. Obviously we think that makes sense. Two, you can take the appropriate action yourself. Three, you can refer the matter to another state agency. Four, you can do a combination of things.

In this case, we would suggest the following: We have a SUSMP program that technically under the permit because we were not provided the appropriate due process, our SUSMP program is in place or should be in place by law. This permit is only valid for another year. Let's have that program apply for the next year.

In the meantime, have this Board exercise its discretion to put together a panel, a committee, a task force, whatever you believe the appropriate name should be and the appropriate participants that should attend should be. We would suggest that committee be made up of not only representatives of Los Angeles County because other counties are waiting in the wings. We've heard testimony that San Diego put off their hearing. We heard testimony that Ventura has put off their determination pending what happens before this State Board in connection with the L.A. permit.

We would suggest, as was suggested in the state of Florida, that program implementation be shared by partnership involving all appropriate levels of government together with the public sector and all citizens. Cooperation and coordination among all of the partners involved in program implementation are cornerstones of a successful program.

Thank you.

CHAIRMAN BAGGETT: Thank you.

With that, does the Board have any comments? I'll just conclude before we close the hearing. I think it truly is a very important issue and I think the fact that our Board and staff came out here shows our dedication and interest to the issue, not just the State Board but for the people of the state of California.

A couple housekeeping issues. We will allow for closing briefs without new evidence. We will mail questions out by Monday, June 12th to the parties, specific questions that are of interest to the Board. There will be a ten-page limit. The list of specific issues of interest which will undoubtedly include the three-quarter-inch issue of the numeric standard and redevelopment language and possibly a couple other issues. The parties are not limited to commenting on those issues, but you are limited to ten pages.

The deadline for those written briefs will be July 7th, 5:00 p.m. due in the State Board's office in

Sacramento by that deadline if they're to be considered. The Board will adjourn to a closed session at some point after the briefs have been received in July to consider the material presented here today and the evidence in the record as well as the arguments made in the closing briefs.

We have options that range from uphold, deny, upholding the petition, denying the petition, remanding it back or modifying. So we have quite a range and we will be discussing that in executive session.

As Chair, I certainly appreciate the parties' patience and flexibility in this hearing. This is a new venture for this Board. I also appreciate Bruce, Marianne and Betsy's efforts in the journey they've made to come down and work with us. I also would like to thank my colleagues for their indulgence in embarking on this and willingness to travel to Torrance to conduct this hearing as a group.

With that, if there's no further business.

MS. JENNINGS: One last thing. I wanted to thank the Regional Board staff who did all of the set-up here and made it possible for us to all travel down here.

CHAIRMAN BAGGETT: With that, this hearing is a adjourned.

STATE OF CALIFORNIA

I, Terri Emery, CSR No. 11598, a Certified Shorthand Reporter in and for the State of California, do hereby certify:

That, prior to being examined, the witness named in the foregoing deposition was by me duly sworn to testify the truth, the whole truth, and nothing but the truth;

That said deposition was taken down by me in shorthand at the time and place named therein and was thereafter transcribed under my supervision; that this transcript contains a full, true and correct record of the proceedings which took place at the time and place set forth in the caption hereto.

I further certify that I have no interest in the event of this action.

EXECUTED this 7th day of July, 2000.

Terri Emery

This report is one in a series of volumes published by the United States Environmental Protection Agency (EPA) to provide information of general interest regarding environmental issues associated with specific industrial sectors. The documents were developed under contract by Abt Associates (Cambridge, MA), Science Applications International Corporation (McLean, VA), and Booz-Allen & Hamilton, Inc. (McLean, VA). A listing of available Sector Notebooks is included on the following page.

Obtaining copies:

Electronic versions of all sector notebooks are available via Internet on the Enviroene World Wide Web at ***www.epa.gov/oeca/sector***. Enviroene is a free, public, environmental exchange system operated by EPA's Office of Enforcement and Compliance Assurance and Office of Research and Development. The Network allows regulators, the regulated community, technical experts, and the general public to share information regarding: pollution prevention and innovative technologies; environmental enforcement and compliance assistance; laws, executive orders, regulations, and policies; points of contact for services and equipment; and other related topics. The Network welcomes receipt of environmental messages, information, and data from any public or private person or organization. Direct technical questions to the "Feedback" button on the bottom of the web page.

Purchase printed bound copies from the **Government Printing Office (GPO)** by consulting the order form at the back of this document or order via the Internet by visiting the on-line GPO Sales Product Catalog at ***https://orders.access.gpo.gov/su_docs/sale/prf/prf.html***. Search using the exact title of the document "Profile of the XXXX Industry" or simply "Sector Notebook." When ordering, use the GPO document number found in the order form at the back of this document.

Complimentary volumes are available to certain groups or subscribers, including public and academic libraries; federal, state, tribal, and local governments; and the media from EPA's National Service Center for Environmental Publications at **(800) 490-9198.** When ordering, use the EPA publication number found on the following page.

The Sector Notebooks were developed by the EPA's Office of Compliance. Direct general questions about the Sector Notebook Project to:

I. INTRODUCTION TO THE SECTOR NOTEBOOK PROJECT

I.A. Summary of the Sector Notebook Project

Integrated environmental policies based upon comprehensive analysis of air, water and land pollution are a logical supplement to traditional single-media approaches to environmental protection. Environmental regulatory agencies are beginning to embrace comprehensive, multi-statute solutions to facility permitting, enforcement and compliance assurance, education/outreach, research, and regulatory development issues. The central concepts driving the new policy direction are that pollutant releases to each environmental medium (air, water and land) affect each other, and that environmental strategies must actively identify and address these inter-relationships by designing policies for the "whole" facility. One way to achieve a whole facility focus is to design environmental policies for similar industrial facilities. By doing so, environmental concerns that are common to the manufacturing of similar products can be addressed in a comprehensive manner. Recognition of the need to develop the industrial "sector-based" approach within the EPA Office of Compliance led to the creation of this document.

The Sector Notebook Project was originally initiated by the Office of Compliance within the Office of Enforcement and Compliance Assurance (OECA) to provide its staff and managers with summary information for eighteen specific industrial sectors. As other EPA offices, states, the regulated community, environmental groups, and the public became interested in this project, the scope of the original project was expanded to its current form. The ability to design comprehensive, common sense environmental protection measures for specific industries is dependent on knowledge of several inter-related topics. For the purposes of this project, the key elements chosen for inclusion are: general industry information (economic and geographic); a description of industrial processes; pollution outputs; pollution prevention opportunities; federal statutory and regulatory framework; compliance history; and a description of partnerships that have been formed between regulatory agencies, the regulated community and the public.

For any given industry, each topic listed above could alone be the subject of a lengthy volume. However, in order to produce a manageable document, this project focuses on providing summary information for each topic. This format provides the reader with a synopsis of each issue, and references where more in-depth information is available. Text within each profile was researched from a variety of sources, and was usually condensed from more detailed sources pertaining to specific topics. This approach allows for a wide coverage of activities that can be further explored based upon the citations and references listed at the end of this profile. As a check on the

information included, each notebook went through an external review process. The Office of Compliance appreciates the efforts of all those that participated in this process who enabled us to develop more complete, accurate and up-to-date summaries. Many of those who reviewed this notebook are listed as contacts in Section IX and may be sources of additional information. The individuals and groups on this list do not necessarily concur with all statements within this notebook.

I.B. Additional Information

Providing Comments

OECA's Office of Compliance plans to periodically review and update the notebooks and will make these updates available both in hard copy and electronically. If you have any comments on the existing notebook, or if you would like to provide additional information, please send a hard copy and computer disk to the EPA Office of Compliance, Sector Notebook Project (2223-A), 1200 Pennsylvania Avenue, NW, Washington, DC 20460. Comments can also be uploaded to the Enviroene World Wide Web for general access to all users of the system. Follow instructions in Appendix A for accessing this system. Once you have logged in, procedures for uploading text are available from the on-line Enviroene Help System.

Adapting Notebooks to Particular Needs

The scope of the industry sector described in this notebook approximates the national occurrence of facility types within the sector. In many instances, industries within specific geographic regions or states may have unique characteristics that are not fully captured in these profiles. The Office of Compliance encourages state and local environmental agencies and other groups to supplement or repackage the information included in this notebook to include more specific industrial and regulatory information that may be available. Additionally, interested states may want to supplement the "Summary of Applicable Federal Statutes and Regulations" section with state and local requirements. Compliance or technical assistance providers may also want to develop the "Pollution Prevention" section in more detail. Please contact the appropriate specialist listed on the opening page of this notebook if your office is interested in assisting us in the further development of the information or policies addressed within this volume. If you are interested in assisting in the development of new notebooks for sectors not covered in the original eighteen, please contact the Office of Compliance at 202-564-2310.

II. INTRODUCTION TO THE AGRICULTURAL CHEMICAL INDUSTRY

This section provides background information on the size, geographic distribution, employment, production, sales, and economic condition of the fertilizer, pesticide, and agricultural chemical industry. Facilities described within this document are described in terms of their Standard Industrial Classification (SIC) codes whenever possible.

II.A. Introduction, Background, and Scope of the Notebook

The scope of this Sector Notebook covers the manufacturing and production of fertilizers, the formulation of pesticide chemicals (both agricultural and non-agricultural) manufactured at separate facilities, and the production of other miscellaneous agricultural chemicals. It does not include the use, sale, distribution, or storage of such chemicals.

The Fertilizer, Pesticide, and Agricultural Chemical Industry is classified by the Office of Management and Budget (OMB) under Standard Industrial Classification (SIC) Industry Group Number 287. This classification corresponds to SIC codes which were established by the OMB to track the flow of goods and services within the economy. Industry Group Number 287 includes SIC codes:

2873-- Nitrogenous Fertilizers
2874-- Phosphatic Fertilizers
2875-- Fertilizers, Mixing Only
2879-- Pesticides and Agricultural Chemicals, Not Elsewhere Classified (n.e.c)

This notebook covers both fertilizer manufacturing and formulating operations including ammonia synthesis, nitric and phosphoric acid production, and the mixing, preparing, and packaging of nitrogenous and phosphatic fertilizers. Establishments engaged in manufacturing fertilizer materials or mixing fertilizers produced at the same establishment are classified under SIC codes 2873 and 2874. Mixing of fertilizer materials, such as compost, potting soil, and fertilizers made in plants not manufacturing fertilizer materials, is classified under SIC code 2875. This notebook does not include the mining or grinding of phosphate rock, which is classified under SIC code 1475, and it also does not include the use or application of fertilizers.

SIC code 2879, pesticides and agricultural chemicals not elsewhere classified (n.e.c.), hereafter referred to as pesticides and miscellaneous agricultural chemicals, covers only the formulating, preparing, and packaging of ready-to-use agricultural and household pest control chemicals. This industry code also includes establishments primarily engaged in the manufacturing or

R0074068

formulating of agricultural chemicals, not elsewhere classified, such as minor or trace elements and soil conditioners. This notebook does not discuss the use or application of pesticide products. Establishments primarily engaged in the manufacturing of basic or technical agricultural pesticides are classified in Industry Group 281 if the chemicals produced are inorganic or Industry Group 286 if the chemicals produced are organic. This notebook also does not cover the agricultural supply sector, SIC 5191, which is engaged in the wholesale and distribution of various agricultural supplies including fertilizers and pesticides. Also, there is little discussion of the potassium fertilizer industry as potash is classified under SIC 2819, Inorganic Chemicals n.e.c.

Federal government agencies, including United States EPA, are beginning to implement an industrial classification system developed by OMB to replace the SIC code system. The new system, which is based on similar production processes, is called the North American Industrial Classification System (NAICS). In the NAIC system, the manufacturing of nitrogenous fertilizers (SIC 2873) is classified as NAIC 325311, phosphatic fertilizers (SIC 2874) as NAIC 325312, and fertilizer mixing only (SIC 2875) as NAIC 325314. Pesticide formulating and agricultural chemicals n.e.c. (SIC 2879) is classified under NAIC 32532. Because EPA databases, and other databases used in this document, are still using the SIC system, the industry sectors described in this Sector Notebook are described in terms of their SIC codes.

II.B. Characterization of the Fertilizer, Pesticide, and Agricultural Chemical Industry

As the world population increases, crop lands are unable to meet the growing demand for food without employing some method of crop enhancement. There are five common practices used to meet the growing demand:

- increasing tilled acreage
- improving plant strains
- introducing or expanding irrigation
- controlling pest by chemical or biological methods
- initiating or increasing fertilizer usage

Increased utilization of the last two methods has created a large agrichemical industry which produces a wide variety of products designed to increase crop production and protect crops from disease and pests (Kent, 1992). Together, the production of fertilizers and the formulation of pesticides was a $18.8 billion industry in 1992, employing over 40,000 people (USDOC, 1995).

Plants require 18 elements to grow, the most important being oxygen, carbon, hydrogen, nitrogen, phosphorous, and potassium. Oxygen, carbon, and hydrogen are obtained from the atmosphere and water, while nitrogen, phosphorous, and potassium are naturally obtained from soil. However, under current high yield production methods, soils are stripped of the essential nutrients, requiring the addition of fertilizers (primarily consisting of nitrogen, phosphorous, and potassium) to resupply the land. The additional 12 essential nutrients are generally maintained in soil at sufficient levels for plant growth, but they may be added to some fertilizers (Kent, 1992).

Even before the addition of nutrients to farm lands, farmers were forced to protect their crops against pests with chemicals. References to pesticide usage date back to 1000 B.C. Pests are continuously adapting to pesticide chemicals requiring new pesticides and the usage of multiple chemical agents. The industry is rapidly changing due to biological adaptation of pests, laboratory discoveries, and government regulation (Kent, 1992). The pesticide industry is faced with the need for new formulations and the abundance of possible combinations, but restricted by cost factors and a sometimes lengthy registration process.

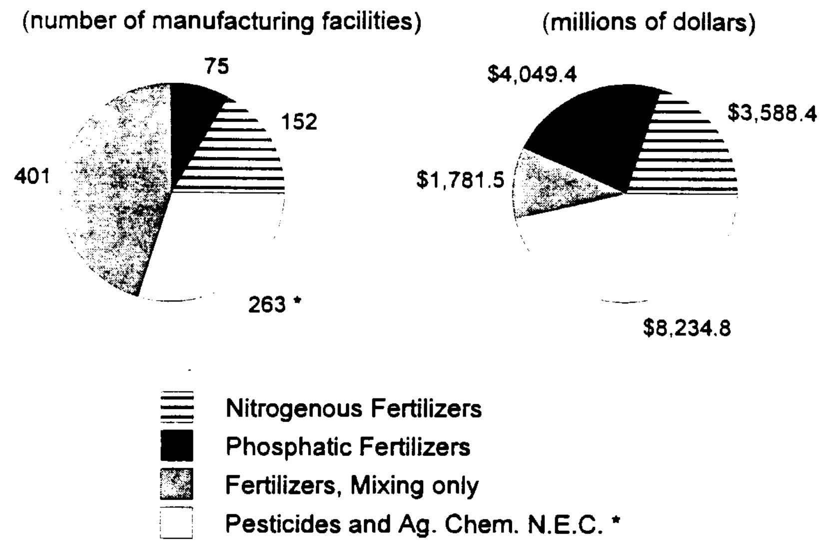
Pesticides are applied on about three-quarters of United States farms and households. Farmers' expenditures on pesticides were equal to 4.6 percent of total farm production expenditures in 1995, up from 3.9 percent in 1993. About one billion pounds of active ingredient of conventional pesticides are used annually in the United States; this usage involves about 21,000 pesticide products (including non-agricultural products) and 875 active ingredients registered under the Federal Pesticide Law, according to the *1994 and 1995 Market Estimates for Pesticides Industry Sales and Usage* (Aspelin, 1997).

II.B.1. Product Characterization

This notebook covers all aspects of fertilizer production and pesticide formulating and packaging. However, because the industrial processes, pollutant outputs, economics, size, and geographic distribution of the two industries are different, they are dealt with separately throughout the notebook.

Figure 1 compares the number of manufacturing facilities and value of shipments for each of the major sectors within the Fertilizer, Pesticide, and Agricultural Chemical Industry, as reported by the United States Bureau of Census. The figure shows that the fertilizer mixing industry has the largest number of facilities but the smallest value of shipments. This reflects that, compared to other sub-sectors within the Fertilizer, Pesticide and Agricultural Chemical Industry, these facilities produce a relatively small volume of product and sell a relatively low value product. Phosphatic fertilizer producers, on the other hand, comprise the smallest number of facilities but have a relatively large share of the industry's value of shipments, reflecting that individual facilities produce a relatively large volume of product.

Figure 1: Number of Facilities and Value of Shipments of the Fertilizer, Pesticide, and Agricultural Chemical Manufacturing Industry



Source: 1992 Census of Manufacturers, Industry Series: Agricultural Chemicals, United States Department of Commerce, Bureau of the Census, May 1995.
** United States EPA has identified over 8,000 establishments that could fall within this SIC code as it is defined by the OMB. See discussion in text below.*

The Census of Manufacturers reports 263 establishments that can be defined as producing pesticides and miscellaneous agricultural chemicals. These establishments reportedly account for almost half of the value of shipments for the sector. There are over 8,000 establishments identified by the United States EPA that manufacture, formulate and package pesticides and other agricultural chemicals and that could fall within OMB's SIC code definition for this sector. Many of these are small establishments and establishments that have a primary line of business other than producing pesticides and other miscellaneous agricultural chemicals. The Census only counts those facilities which report an SIC code as their primary line of business, thus the number of facilities shown above is not inclusive of all facilities involved in agricultural chemical production. Under the "Pesticides and Miscellaneous Agricultural Chemicals" heading later in this section, other pesticide producing establishment counts are presented based on EPA estimates and reporting under section 7 of the Federal Insecticide, Fungicide, and Rodenticide Act.

R0074071

Nitrogenous Fertilizers

The nitrogenous fertilizer industry includes the production of synthetic ammonia, nitric acid, ammonium nitrate, and urea. Synthetic ammonia and nitric acid, however, are used primarily as intermediates in the production of ammonium nitrate and urea fertilizers. Table 1 lists specific products classified as nitrogenous fertilizers by OMB.

Table 1: Nitrogenous Fertilizer Products (SIC 2873)

Urea
Source: Standard Industrial Classification Manual, Office of Management and Budget, 1987.

Synthetic Ammonia

Synthetic ammonia refers to ammonia that has been synthesized from natural gas. In this process, natural gas molecules are reduced to carbon and hydrogen. The hydrogen is then purified and reacted with nitrogen to produce ammonia. Approximately 75 percent of the synthetic ammonia produced in the United States is used as fertilizer, either directly as ammonia or indirectly after fertilizer synthesis into urea, ammonium nitrate, and monoammonium or diammonium phosphates. One-third of the fertilizer nitrogen is applied directly to the land as anhydrous ammonia. The remaining 25 percent of ammonia produced in the United States is used as raw material in the manufacture of polymeric resins, explosives, nitric acid, and other products (USEPA, 1993a).

Nitric Acid

Nitric acid is formed by concentration, absorption, and oxidation of anhydrous ammonia. About 70 percent of the nitric acid produced is consumed as an intermediate in the manufacture of ammonium nitrate (NH_4NO_3), which is primarily used in fertilizers. Another 5 to 10 percent of the nitric acid produced is used in adipic acid manufacturing, an intermediate in nylon production. Explosive manufacturing utilizes nitric acid for organic nitrations to produce nitrobenzene, dinitrotoluenes, and other chemical intermediates. Other end uses of nitric acid are gold and silver separation, military munitions, steel and brass pickling, photoengraving, and acidulation of phosphate rock (USEPA, 1993a).

Ammonium Nitrate

Ammonium nitrate is produced by neutralizing nitric acid with ammonia. Approximately 15 to 20 percent of ammonium nitrate is used for explosives and the balance for fertilizer. Ammonium nitrate is marketed in several forms, depending upon its use. Liquid ammonium nitrate may be sold as a fertilizer, generally in combination with urea. Liquid ammonium nitrate may also be concentrated to form an ammonium nitrate "melt" for use in solids formation processes. Solid ammonium nitrate may be produced in the form of prills, grains, granules or crystals. Prills, round or needle-shaped aggregates, can be produced in either high or low density form, depending on the concentration of the melt. High density prills, granules and crystals are used as fertilizer, grains are used solely in explosives, and low density prills can be used as either fertilizer or explosives (USEPA, 1993a).

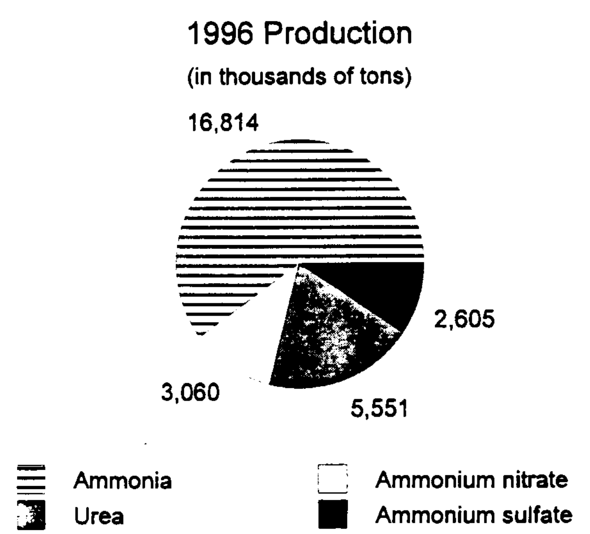
Urea

Urea, also known as carbamide or carbonyl diamide, is produced by reacting ammonia with carbon dioxide. Eighty-five percent of urea solution produced is used in fertilizer mixtures, with three percent going to animal feed supplements and 12 percent is used for plastics and other uses. Urea is marketed as a solution or in solid form. Most solids are produced as prills or granules for use as fertilizer or protein supplement in animal feed, and in plastics manufacturing (USEPA, 1993a).

Ammonium sulfate

It is not economically feasible to produce ammonium sulfate for use as a fertilizer. However, ammonium sulfate is formed as a by-product of other process such as acid scrubbing of coke oven gas, synthetic fiber production, and the ammoniation of process sulfuric acid (Hoffmeister, 1993). Therefore, the production of ammonium sulfate is not described in this notebook.

Figure 2: Product Distribution for SIC 2873, Nitrogenous Fertilizers



Source: Fertilizer Institute data as reported in Chemical and Engineering News, June 23, 1998. Figures are based on Fertilizer Institute surveys and may not represent the entire industry.

Phosphatic Fertilizers

The phosphatic fertilizer industry can be divided into three major segments: phosphoric acid, granular ammonium phosphate, and normal and triple superphosphate. Table 2 lists these, and a few additional, less common products classified as phosphatic fertilizers by OMB.

Table 2: Phosphatic Fertilizer Products (SIC 2874)
Ammonium phosphates Calcium meta-phosphates Defluorinated phosphates Diammonium phosphates Fertilizers, mixed, produced in phosphatic fertilizer plants Phosphoric acid Plant foods, mixed in phosphatic fertilizer plants Superphosphates, ammoniated and not ammoniated
Source: Standard Industrial Classification Manual, Office of Management and Budget, 1987.

R0074074

Phosphoric Acid

Phosphoric acid (H_3PO_4) can be manufactured using either a wet or a thermal process to react phosphate rock with sulfuric acid. Approximately 96 percent of the phosphoric acid produced in the United States is produced using the wet process. Wet process phosphoric acid has a phosphorous concentration typically ranging from 26-30% as phosphorous pentoxide (P_2O_5) and is used in the production of ammonium phosphates and triple superphosphates. Thermal process phosphoric acid is commonly used in the manufacture of high grade chemicals requiring a much higher purity.

Ammonium Phosphates

Ammonium phosphate ($NH_4H_2PO_4$) is produced by reacting phosphoric acid with anhydrous ammonia. Both solid and liquid ammonium phosphatic fertilizers are produced in the United States The most common ammonium phosphatic fertilizer grades are monoammonium phosphate (MAP) and diammonium phosphate (DAP). DAP has become one of the most commonly used fertilizers because it provides a large quantity of plant food, is compatible with most mix fertilizer ingredients, and is nonexplosive. It may be directly applied or used in irrigation systems as it is completely soluble in water. DAP is also preferred over MAP because it is capable of fixing twice as much ammonia per phosphorous pentoxide in solid form (Nielson, 1987.) MAP contains a higher concentration of phosphorous pentoxide than DAP. It is favored for use with alkaline soils and may be applied either directly or in a dry blend.

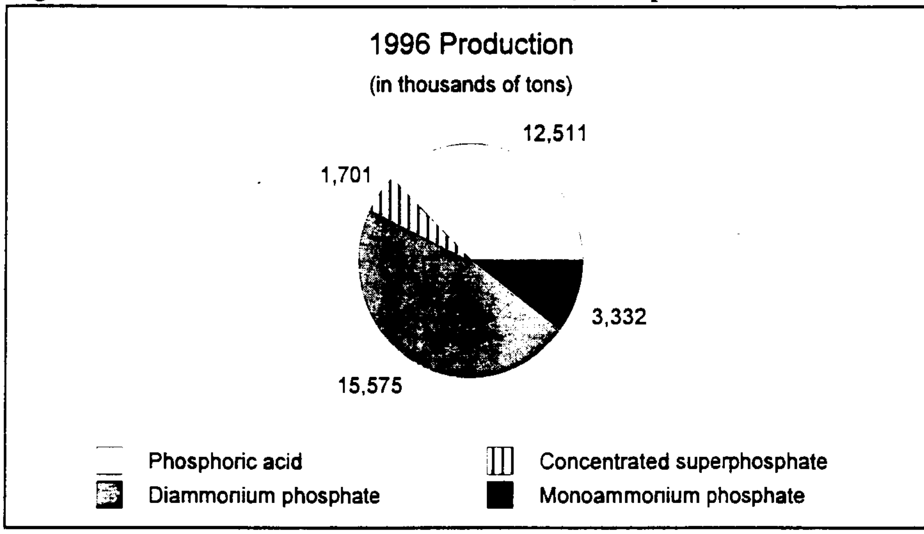
Normal Superphosphates

Like phosphoric acid, normal, or "ordinary," superphosphate fertilizers are produced by reacting phosphate rock with sulfuric acid. However, normal superphosphate (NSP) retains calcium sulfate which forms by the reaction between phosphate rock and sulfuric acid. For this reason NSP retains its importance wherever sulphur deficiency limits crop yields (UNEP, 1996). NSP refers to fertilizer material containing 15 to 21 percent phosphorous as phosphorous pentoxide (P_2O_5). As defined by the Census Bureau, NSP contains not more than 22 percent of available P_2O_5 (USEPA, 1993a). Production of NSP has given way to the higher-yielding triple superphosphates and ammonium phosphates. In 1990, production of NSP accounted for only one percent by weight of the phosphorous fertilizer industry. Because of its low P_2O_5 concentration, shipping can be prohibitively expensive due to the large volumes required. NSP is favored in low cost Nitrogen-Phosphorous-Potassium (NPK) mixes because it is a less expensive form of phosphorous, however, it is unacceptable for higher-grade mixes (Kent, 1992).

Triple Superphosphates

Triple superphosphates (TSP) are produced by reacting ground phosphate rock with phosphoric acid. Triple superphosphate is also known as double, treble, or concentrated superphosphate. The phosphorus content of triple superphosphates is over 40 percent, measured as phosphorus pentoxide (P_2O_5), which is its main advantage over other phosphatic fertilizers (USEPA, 1993a). TSP began to be produced in large quantities when wet process phosphoric acid production became available commercially. It is commonly produced along with phosphoric acid near phosphate rock supplies. TSP may be applied directly or as a bulk blend (Kent, 1992).

Figure 3: Product Distribution for SIC 2874, Phosphorous Fertilizers



Source: Chemical and Engineering News, June 23, 1998. Figures are based on Fertilizer Institute surveys and may not represent the entire industry.

Fertilizers, Mixing Only

A significant part of the fertilizer industry only purchases fertilizer materials in bulk from fertilizer manufacturing facilities and mixes them to sell as a fertilizer formulation.

Phosphorous is the single nutrient most likely to be applied in a fertilizer mixture, as seen in Table 3.

R0074076

Table 3: 1990 Direct vs Mixed Application of Primary Fertilizer Nutrients

Nutrient	Method, % applied	
	Direct	Mixtures
Nitrogen	80	20
Phosphorous	8	92
Potassium	65	35
TOTAL	61	39

Source: Hoffmeister, G., "Fertilizers," Kirk-Othmer Encyclopedia of Chemical Technology, V. 10, 1993.

Although the Bureau of the Census only counts 401 facilities reporting the SIC code for fertilizer mixing (2875) in 1992, other sources estimated the true number of fertilizer mixing facilities to be closer to five or six thousand in 1984 (Adrilenas and Vroomen, 1990). About half of applied fertilizers are bulk blends. Fertilizer mixing facilities generally serve a small area such as farms within a ten to fifty mile radius. The processes involved are simple and relatively little value is added to the raw materials purchased by mixing facilities. Nevertheless, there are many of these facilities and volume of production results in a $1.8 billion industry (value of annual shipments). The industrial process is simple and resembles that of the pesticide formulating sector. A brief discussion of fertilizer mixing processes is included in this notebook.

Pesticides and Miscellaneous Agricultural Chemicals

The pesticides and agricultural chemicals n.e.c. (referred to here as pesticides and miscellaneous agricultural chemicals) industry group (SIC 2879) formulates and prepares ready to use agricultural and household pesticides and other agricultural chemicals. The manufacture of pesticide active ingredients is classified under either Industry Group 281 for inorganic chemicals or 286 for organics which are not covered by this notebook. *(See Profile of the Inorganic Chemicals Industry and Profile of the Organic Chemicals Industry Sector Notebooks.)* In the United States, over 850 different pesticide formulations and preparations are produced. In 1995, 31 new active ingredients were registered in the United States (Aspelin, 1997). Most of these pesticides can be classified as either insecticides, herbicides, or fungicides, although many other minor classifications exist. Also included

R0074077

in this category are blends of fertilizers and pesticides produced at pesticide formulating and mixing facilities. Table 4 lists the pesticides and other products included in SIC 2879.

Table 4: SIC 2879 Pesticides and Miscellaneous Agricultural Chemicals, List of Products

Agricultural disinfectants	Insecticides, agricultural and	Poison, household
Agricultural pesticides	household	Pyrethrin
Arsenates and arsenites	Lime-sulfur, dry and solution	Rodenticides
Bordeaux mixture	Lindane, formulated	Rotenone
Cattle dips and sheep dips	Moth repellants	Soil conditioners
DDT	Nicotine and salts	Sulfur dust
Defoliants	Paris green	Thiocyanates
Fly sprays	Pesticides, household	Trace elements
Fungicides	Phytoactin	(agrichemical)
Growth regulants	Plant hormones	Xanthone
Herbicides		

Source: Standard Industrial Classification Manual, Office of Management and Budget, 1987.

In 1995, 77 percent (by volume) of all pesticides were used for agriculture, 12 percent for industrial, commercial, or governmental lands or facilities, and 11 percent for homes and gardens (Aspelin, 1997). Non-agricultural pesticides and miscellaneous agricultural chemicals are included in the data presented for sales, production, waste management, and enforcement and compliance. However, since they represent a relatively small part of the industry and cover a wide range of chemicals and production processes, these products are not covered in the Industrial Processes and Pollutant Outputs sections of this document.

Herbicides

Herbicides (in both value and quantity) are the largest class of pesticides used in the United States, as well as in the world. This class of pesticides, which accounts for approximately fifty percent of the value of aggregate world pesticide usage, is used to destroy or control a wide variety of weeds and other unwanted plants. Because of its demonstrated farm labor savings, nearly all the agricultural land in the United States is currently being treated with some type of herbicide. In recent years, approximately fifty percent of total United States pesticide consumption (by value) was herbicides (USITC, 1994).

Insecticides

Insecticides are the second largest pesticide category (by value) used in the United States and in the world. In the early 1990s, insecticides accounted for approximately twenty-nine percent of the total value of United States pesticide consumption. Historically, the category of synthetic organic insecticides has been divided into one of four major chemical groups:

- organochlorines (e.g., DDT and chlordane)
- organophosphates (e.g., parathion and diazinon)
- carbamates (e.g., carbaryl)
- pyrethroids (e.g., natural and synthetic)

Several compounds, discovered during the 1950s, found widespread use in agriculture because of their high toxicity to a variety of insects. However, the qualities that made these chemicals so desirable also led to their eventual removal from the market, as these products also proved harmful to humans and to the environment. Spurred in part by increased environmental concern, researchers developed a new series of less toxic synthetic compounds called pyrethroids. These compounds are based on the natural pyrethroids, which are found in such plants as the chrysanthemum (USITC, 1994).

Fungicides

In recent years, fungicides accounted for approximately ten percent of the value of total United States pesticide consumption. Fungicides are used today primarily to protect agricultural crops and seeds from various fungi; farmers previously used inorganic products, such as elemental sulfur and copper sulfate. Initially, synthetic products were commercially unsuccessful, because of their high manufacturing costs. By the 1940s, however, newer, less expensive products became commercially successful. Today, fungicides are manufactured from a variety of chemical classes. Commercially, the most important fungicides are halogenated compounds, the carbamates and dithiocarbamates, and organophosphates (USITC, 1994).

Other Pesticides

Although small in total quantity consumed, a number of other classes of pesticide products are on the market. Some of these pesticides are not covered by this Notebook.

- **Biological pesticides**, also known as biopesticides, include true biological agents, living or reproduced biological entities such as viruses or bacteria, and naturally occurring biochemicals such as plant growth regulators, hormones, and insect sexual attractants (pheromones) that function by modes of action other than innate toxicity. At the end of 1998, there were approximately 175 registered biopesticide active ingredients and 700 products. Generally, biological pesticides pose little or no risk to human health or the environment. Accordingly EPA generally requires much less data to register a biopesticide than to register a conventional pesticide (USEPA, 1999). To further facilitate the registration of biopesticides, in 1994, EPA established the Biopesticides and Pollution Prevention Division in the Office of Pesticide Programs.

- **Plant growth regulators** have been developed by many companies to improve crop production. Plant growth regulators are produced for a

R0074079

variety of purposes, including loosening ripened fruits for faster harvest; controlling the size and firmness of fruits; and regulating the size of a plant to increase branching. These products account for a small portion of world and United States usage. Future development will probably be directed toward selected crops for which the application of these specialty products is found to be the most cost effective (USITC, 1994).

- **Sex attractants** may be used to attract insects to traps or to confuse specific male insects, making it difficult to locate females for mating. Commercially available sexual attractants are synthetically produced compounds. Insect growth regulators, such as juvenile growth hormones, are synthetic compounds similar to the natural chemicals that regulate insect growth.

- **Genetically modified plants** are plants developed through the use of biotechnology. There are three types of plants that are relevant to pest control: herbicide-tolerant plants (which can tolerate certain types of herbicides), insect-resistant plants (which can withstand attacks by certain insects), and virus- and other pest-resistant plants (which are immune to some types of plant viruses and other plant pests). As of September 1994, several genetically modified plants had been commercialized and had elicited optimism that genetically modified plants would become an important new approach to controlling pests (USDA, 1995).

The environmental benefits of reduced use of chemical pesticides are also significant. Environmental side effects of traditional pesticides include the cost of providing alternative sources of drinking water, increased treatment costs for public and private water systems, lost boating and swimming opportunities, worker safety concerns, exposure to nearby residents, increased exposures for farm children, possible loss of biodiversity, pressure on threatened and endangered species, and damage to recreational and fishery resources (USDA, 1995).

Pesticide Formulations

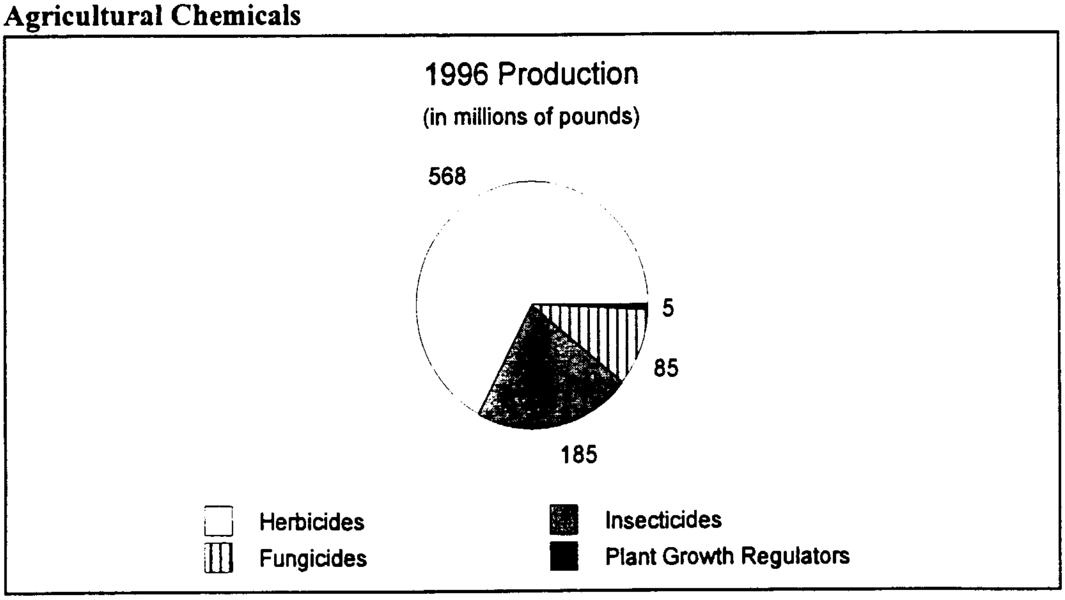
Pesticide formulations may exist in any of the three following physical states: liquid, dry, and pressurized gas. The liquid formulation may be applied directly in liquid form or propelled as an aerosol. Some common dry-based formulations are dusts, wettable powders, granules, treated seed, bait pellets, encapsulated, and cubes. Pressurized gas formulations are used primarily for soil fumigation (USEPA, 1996). Gaseous pesticides can be subjected to high pressures which often convert the formulation to a liquid which can be stored, transported and applied from gas cylinders.

Repackaging of pesticide formulations is common when materials are to be transferred from bulk storage to a smaller scale of packaging for use by a consumer. Products are typically repackaged in smaller containers and consumer-specific labeling is added (USEPA, 1996).

In 1995, roughly 79 percent of all pesticides were used on agricultural cropland. The remainder were used in private homes and gardens and on commercial and industrial property (Aspelin, 1997). Therefore, although non-agricultural pesticides are included in SIC code 2879 and thus the notebook. the specific packaging or formulating requirements of those products are not included. However, the sales, production, pollutant releases, and enforcement and compliance data reflect non-agricultural pesticides as well as agricultural pesticides.

The majority of pesticides were used on only a few major crops: cotton, corn, soybeans, and apples. The major pesticide chemicals used in United States agricultural crop production are atrazine, metolachlor, metam sodium, methyl bromide[1], and dichloropropene (Aspelin, 1997).

Figure 4: Product Distribution for SIC 2879, Pesticides and Miscellaneous Agricultural Chemicals



Source: American Crop Protection Association, as reported in Chemical and Engineering News, June 23, 1998.

[1] Production and importation of methyl bromide is currently being phased out. It will be reduced from 1991 levels and will be completely phased out in 2005.

R0074081

Establishment Reporting Under FIFRA Section 7

Information reported under section 7 of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) is another source of facility level data for the pesticides industry. All establishments that produce pesticides in the United States or that import pesticides into the United States are required to register and report their production volume to the EPA. These data differ from the Census of Manufacturers data presented above for the agricultural chemical industry as a whole. The Census of Manufacturers data only covers facilities that are manufacturing these products, while the FIFRA data system more broadly includes establishments that "produce" these products. The term. "produce" has been defined under FIFRA and 40 CFR Part 167 to mean "to manufacture, prepare, propagate, compound, or process any pesticide. including any pesticide produced pursuant to section 5 of FIFRA, any active ingredient, or device, or to package, repackage, label, relabel, or otherwise change the container of any pesticide or device." Repackaging or otherwise changing the container of any pesticide or device in bulk amounts constitutes pesticide production. Under FIFRA section 7, products are reported under one of four product types:

1) Technical material or active ingredient
2) End-use blend, formulation, or concentrate
3) Repackaged or relabeled product
4) Device

The total number of establishments, domestic and foreign, that reported to EPA under FIFRA section 7 are presented in Table 5. Although there are approximately twelve to thirteen thousand Active Registered Pesticide-Producing Establishments, table 5 below only lists establishments that reported actual production for the calender year 1996. The establishments that reported either zero production or who were non-reporters for calender year 1996 are not included in the establishment number totals in the table. The significant difference between the pesticide producing establishment counts as reported under section 7 (8,612) and the pesticide and agricultural chemical manufacturers n.e.c. reported by the Census (263) can be attributed to the section 7 broad inclusion of producers vs. the relatively narrow, Census inclusion of manufacturers. In addition, the Census of Manufacturers uses SIC code definitions which lump many pesticide active ingredient manufacturers into SIC codes that represent organic or inorganic chemicals. Establishments classified under the first product type, as well as some of the second, may include facilities classified under the chemical manufacturing SIC codes 286 or 281. Also, the Census only counts a facility in an SIC code if they report a product in that SIC code as their primary line of business. Therefore, facilities producing a variety of products might not be classified under all applicable SIC codes. For example, a facility which produces many different types of fertilizers as well as some pesticides might only be counted under the fertilizer SIC codes by the Census Bureau to avoid double counting of facilities.

Table 5: Establishment Counts Based on Product Type*

Type	Product	Total	Domestic	Foreign
1	Technical Material, Active Ingredient	555	410	145
2	End-Use Blend, Formulation, Concentrate	2,590	2,454	136
3	Repackaged or Relabeled Goods	5,267	5,243	24
4	Devices	200	166	34
	Total	8,612	8,273	339

R0074083

II.B.2. Industry Size and Geographic Distribution

Table 6 lists the facility size distribution within the nitrogenous fertilizer, phosphatic fertilizer, fertilizer mixing, and pesticide and agrichemical formulating industries. For each industry code, the majority of facilities employ less than 50 people.

Table 6: Facility Size Distribution for the Fertilizer, Pesticide, and Agricultural Chemical Manufacturing Industry

	FERTILIZERS						PESTICIDES

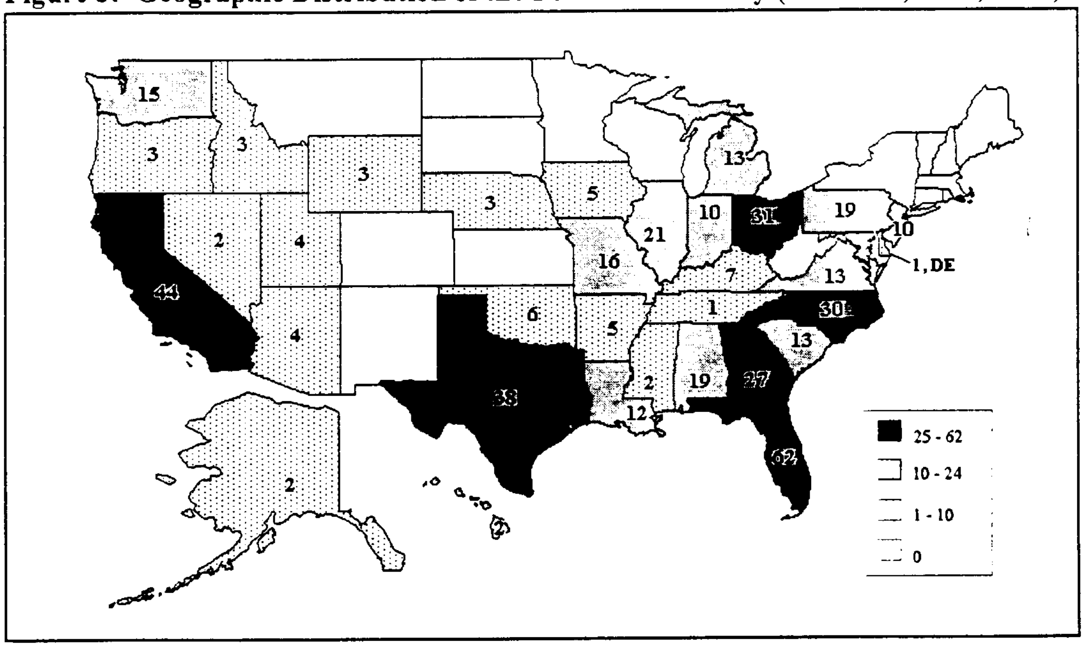
Note: 1992 Census of Manufacturers data are the most recent available. Changes in the number of facilities, location, and employment figures since 1992 are not reflected in these data.

* *United States EPA has identified over 8,600 registered pesticide producing establishments. The SIC code as it is defined by the OMB only includes 263 of those establishments.*

R0074084

Figure 5 shows the United States distribution of fertilizer manufacturing and mixing facilities. The geographic distribution of nitrogenous and phosphatic fertilizer manufacturers is determined by natural resources and demand. Seventy percent of synthetic ammonia plants in the United States are concentrated in Louisiana, Texas, Oklahoma, Iowa, and Nebraska due to abundant natural gas supplies. The majority of nitric acid plants are located in agricultural regions such as the Midwest, South Central, and Gulf States in order to accommodate the high volume of fertilizer usage. Florida has the largest phosphate rock supply in the United States, thus phosphoric acid manufacturing is concentrated primarily in Florida and spreads into the Southeast.

Figure 5: Geographic Distribution of the Fertilizer Industry (SIC 2873, 2874, 2875)



Source: 1992 Census of Manufacturers, Industry Series: Agricultural Chemicals, United States Department of Commerce, Bureau of the Census, May 1995.

R0074085

Table 7 further divides the geographic distribution of fertilizer manufacturing and mixing facilities. The top states in which the nitrogenous fertilizer, phosphatic fertilizer, and fertilizer mixing industries are concentrated are given along with their respective number of establishments. Florida's supply of phosphate rock causes a concentration of phosphatic and mixed fertilizer facilities, while nitrogenous fertilizer plants are often located near sources of raw materials.

Note: Not all sales can be attributed to the companies agricultural chemical operations.

Dun & Bradstreet's *Million Dollar Directory*, compiles financial data on United States companies including those operating within the Fertilizer, Pesticide, and Agricultural Chemical Industry. Dun & Bradstreet ranks United States companies, whether they are a parent company, subsidiary or division, by sales volume within their assigned 4-digit SIC code. Readers should note that: (1) companies are assigned a 4-digit SIC code that resembles their principal industry most closely; and (2) sales figures include total company sales, including subsidiaries and operations (possibly not related to agricultural chemicals). Additional sources of company specific financial information include Standard & Poor's *Stock Report Service, Ward's Business Directory of United States Public and Private Companies,* Moody's Manuals, and annual reports.

The Bureau of the Census publishes concentration ratios, which measure the degree of competition in a market. They compute the value of shipments percentage controlled by the top 4, 8, 20, and 50 companies in a given industry. Within the agricultural chemical industry, the phosphatic fertilizer industry had the highest concentration ratio for the top four companies in 1992, 62 percent. The pesticide and other agricultural chemicals, nitrogenous fertilizers, and fertilizer mixing industries' concentration ratios were 53, 48, and 19 percent respectively.

II.B.3. Economic Trends

The United States is a major producer and exporter of agricultural chemicals. It is the largest producer of phosphatic fertilizers and pesticides and the second largest producer of nitrogenous fertilizers in the world (USDOC, 1998).

Domestic Market Trends

The majority of important crops, such as corn and soybeans, are grown using fertilizers and pesticides. As a result, year-to-year changes in the domestic demand for agrichemicals reflect the level of planted acreage, which in turn is affected by grain prices and weather conditions. Increases in planted acreage of corn, feedgrains and other crops in recent years have resulted in increased demand and production of agrichemicals in the United States. Industry shipments of agricultural chemicals should show modest annual growth through the end of the decade (USDOC, 1998).

The Federal Agricultural Improvement and Reform Act of 1996 could have a major long-term impact on the agricultural chemical industry. This law gives farmers greater flexibility in making planting decisions and allows them to rely more on the marketplace as a guide for crop plantings. The bill eliminates the annual acreage set-aside program, thus potentially boosting the levels of crop acreage (USDOC, 1998).

Agricultural chemical production showed little change between 1995 and 1996. Total production was approximately 103 million pounds each year. However, experts claim that due to lower dosage requirements for pesticides, agrichemical demand is actually higher than it would appear. Pesticides saw a six percent rise in production from 1995 to 1996. Nitrogenous fertilizer production was up approximately seven percent, and phosphate production increased slightly except for its major product, diammonium phosphate. Prices for agricultural chemicals rose three percent from 1995 to 1996, while the number of production workers fell two percent (USDOC, 1998).

International Market Trends

The United States accounts for more than 50 percent of world trade in phosphatic fertilizers, with a two-thirds share of total trade in DAP (diammonium phosphate), the principal phosphatic fertilizer product.

Exports generally account for about half of total shipments for the United States phosphatic fertilizer industry, with about half of all exports going to China.

International markets, especially less developed nations in Asia and Latin America, hold greater market potential for the agrichemicals industry as population levels grow, income levels rise, and demands for better standards of living and diets increase the need for grain production. From the current level of about 5.8 billion, the world population is expected to increase by about 80 million each year between 1996 and 2000. Developing nations are becoming more sophisticated in agricultural practices, thus increasing their usage of fertilizers and pesticides to improve production (USDOC, 1998).

The United States has been a net exporter of pesticide chemicals, and this is expected to continue through the turn of the century. Exports of pesticides accounted for about 25 percent of United States pesticide production in 1994, according to The American Crop Protection Association. United States pesticide producers benefit from a highly developed chemical sector and strong demand from developing regions of the world. Nevertheless, export opportunities are being restrained by industry-wide globalization as producers are choosing to site facilities closer to end-use markets. In addition, regulatory reforms in Western Europe, such as the competitive access provider plan, are expected to limit prospects in that region, currently the largest destination for United States produced pesticides (USDOC, 1998).

International competition for the United States phosphatic fertilizer industry generally comes from countries with phosphate rock reserves and capacity to convert rock into phosphate chemicals. Diammonium phosphate imports are expected to account for most of the growth in world trade, thus giving the United States a promising outlook for this product. Morocco possesses at least 50 percent of the world's rock reserves and is the largest phosphate rock exporter. China and Russia are also major phosphate rock and fertilizer producers, with Russia also a leading exporter of phosphate chemicals. In the world pesticide markets, major competitors are companies based in Germany, France, and Switzerland.

The United States is a net importer of nitrogenous fertilizers. Trinidad and Tobago and Canada are the leading United States suppliers of nitrogen due to their low-cost supplies of natural gas.

Agricultural biotechnology is beginning to play a major role in agricultural pest control, spurred on by government pesticide restrictions, increased insect resistance to pesticides, and farmers' demand for productivity gains. Genetically engineered plants will be higher yielding, more resistant to disease and insects, and tolerant to herbicides. A number of companies have received approvals for the use of genetically engineered seeds, including corn and cotton, that are resistant to insects and herbicide tolerant. Commercial usage should increase rapidly over the next few years (USDOC, 1998).

III. INDUSTRIAL PROCESS DESCRIPTION

This section describes the major industrial processes within the Fertilizer, Pesticide, and Agricultural Chemical Industry, including the materials and equipment used, and the processes employed. The section is designed for those interested in gaining a general understanding of the industry, and for those interested in the inter-relationship between the industrial process and the topics described in subsequent sections of this profile -- pollutant outputs, pollution prevention opportunities, and federal regulations. This section does not attempt to replicate published engineering information that is available for this industry. Refer to Section IX for a list of resource materials and contacts that are available.

This section specifically contains a description of commonly used production processes, associated raw materials, the by-products produced or released, and the materials either recycled or transferred off-site. This discussion, coupled with schematic drawings of the identified processes, provide a concise description of where wastes may be produced in the process. This section also describes the potential fate (via air, water, and soil pathways) of these waste products.

The three most important nutrients for plant growth are nitrogen, phosphorous, and potassium. However, the production of the major potassium fertilizer salts, or potash as they are commonly known, is typically considered an inorganic chemical process (SIC 2819). Therefore, the discussion of fertilizer production in this notebook is restricted to nitrogenous and phosphatic mixtures. The fertilizer, pesticide, and agricultural chemical industry can be divided into Nitrogenous Fertilizers, Phosphatic Fertilizers, Fertilizers (Mixing-only), and the formulating and preparing of pesticides and other agricultural chemicals. A detailed description of the production processes for nitrogenous and phosphatic fertilizers is presented here, along with brief descriptions of the fertilizer mixing and pesticide formulating and preparing industry.

III.A. Nitrogenous Fertilizers

The major nitrogenous fertilizers include synthetic ammonia, ammonium nitrate, and urea. The various industrial processes used to manufacture these products are described, as well as the production process for nitric acid, an important intermediate in nitrogenous fertilizer production.

III.A.1. Synthetic Ammonia

Synthetic ammonia (NH_3) is produced by reacting hydrogen with nitrogen at a molar ratio of three to one. Nitrogen is obtained from the air, which is primarily comprised of nitrogen (78 percent) and oxygen (21 percent) (Lewis, 1993). Hydrogen is obtained from either the catalytic steam reforming of natural gas (methane) or naptha, or as the byproduct from the electrolysis of brine at chlorine plants. In the United States, about 98 percent of the hydrogen used to synthesize ammonia is produced by catalytic steam reforming of natural gas, and only 2 percent is obtained from chlorine plants (USEPA, 1993a).

Six process steps are required to produce synthetic ammonia using the catalytic steam reforming method:

1) natural gas desulfurization
2) catalytic steam reforming
3) carbon monoxide shift
4) carbon dioxide removal
5) methanation
6) ammonia synthesis.

The first, third, fourth, and fifth steps remove impurities such as sulfur, CO, CO_2 and water from the feedstock, hydrogen and synthesis gas streams. In the second step, hydrogen is manufactured and mixed with air (nitrogen). The sixth step produces anhydrous ammonia from the synthetic gas. An anhydrous compound is inorganic and does not contain water either adsorbed on its surface or combined as water of crystallization. While almost all ammonia plants use these basic process steps, details such as operating pressures, temperatures, and quantities of feedstock vary from plant to plant. Figure 7 shows a simplified process flow diagram of a typical ammonia plant (USEPA, 1993a).

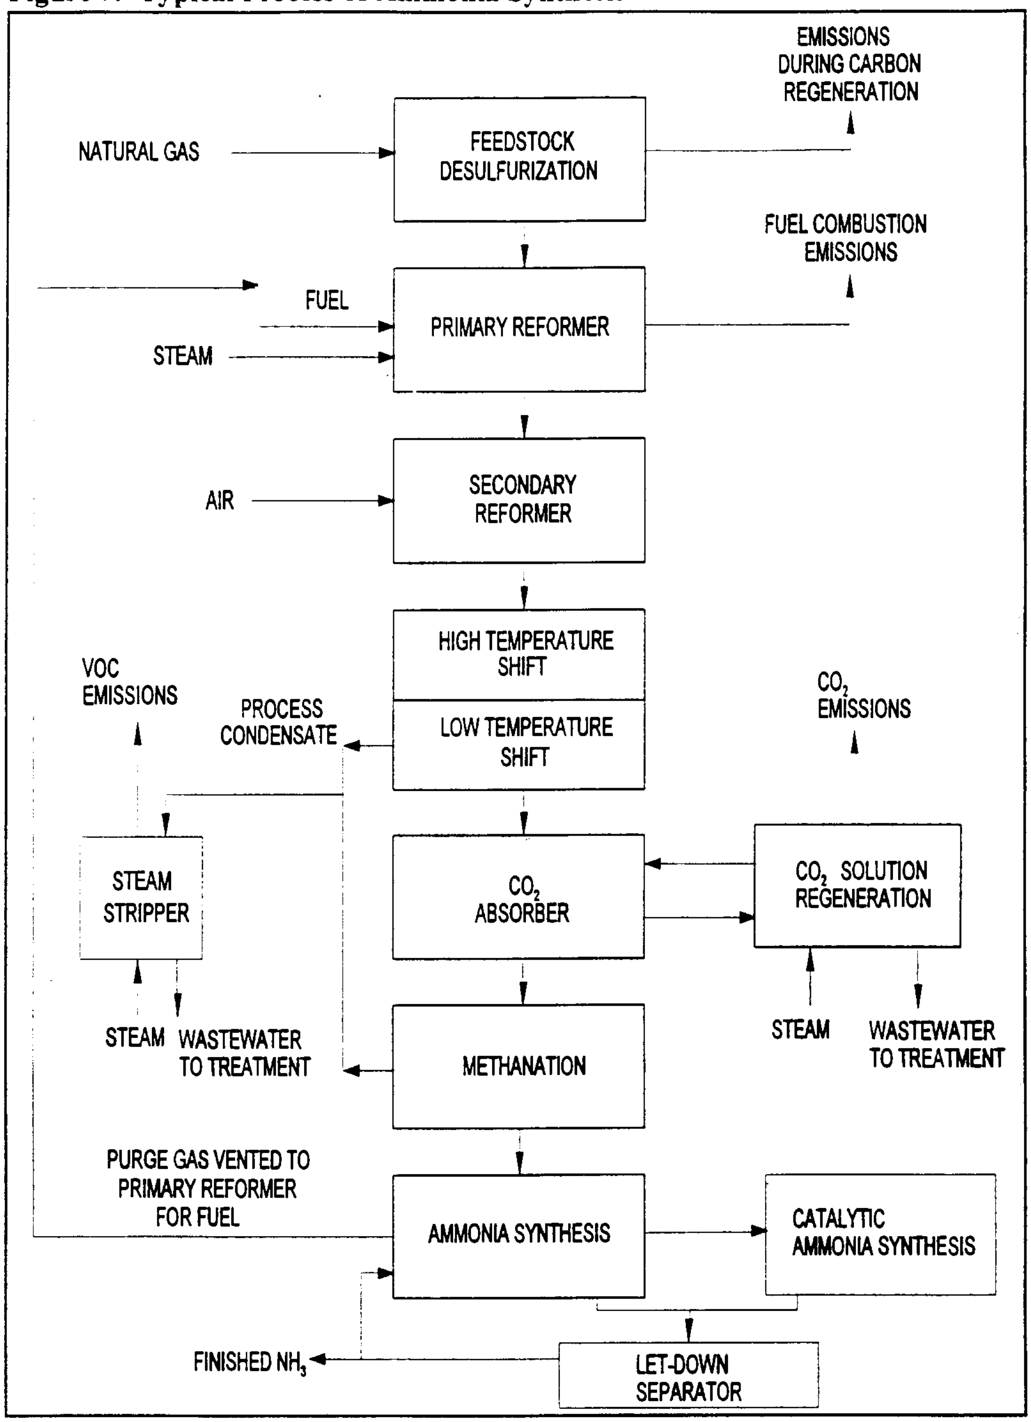
Natural gas desulfurization

In the natural gas desulfurization step, the sulfur content (primarily as H_2S) in natural gas feedstock is reduced to below 280 micrograms per cubic meter to prevent poisoning of the catalyst used in the catalytic steam reforming step. Desulfurization can be accomplished by passing the natural gas through a bed of either activated carbon or zinc oxide. In both systems, the hydrogen sulfide in the gas adsorbs to the surface of the activated carbon or zinc oxide medium and the desulfurized natural gas passes through.

Over 95 percent of the ammonia plants in the United States use activated carbon fortified with metallic oxide additives for feedstock desulfurization. After a certain amount of impurities adsorb to the activated carbon, its effectiveness is reduced and it must be regenerated by passing superheated steam through the carbon bed. The superheated steam strips out the sulfur impurities, is condensed, and sent to the wastewater treatment plant. One disadvantage of the activated carbon system is that some of the heavy hydrocarbons in the natural gas adsorb to the carbon, decreasing its effectiveness and lowering the heating value of the desulfurized gas.

The remaining five percent of plants use zinc oxide for desulfurization. The zinc oxide system is capable of absorbing up to 20 percent sulfur by weight

Figure 7: Typical Process of Ammonia Synthesis



Source: United States EPA, 1993a.

R0074094

(Hodge, 1994). Zinc oxide is replaced rather than regenerated, which lowers energy consumption and minimizes impact to the atmosphere. The higher molecular weight hydrocarbons are not removed; therefore, the heating value of the natural gas is not reduced. However, it is impractical and uneconomical to replace the zinc oxide beds so few plants use it (USEPA, 1993a).

Catalytic steam reforming

Next, the desulfurized natural gas is preheated by mixing with superheated steam. The mixture of steam and gas enters the primary reformer tubes which are filled with a nickel-based reforming catalyst, and the tubes are heated by natural gas or oil-fired burners. Approximately 70 percent of the methane (CH_4) is converted to hydrogen (H_2) and carbon dioxide (CO_2), according to the following reaction:

$$0.88CH_4 + 1.26air + 1.24\ H_2O \rightarrow 0.88\ CO_2 + N_2 + 3H_2$$

The remainder of the CH_4 is converted to H_2 and CO. This process gas is then sent to the secondary reformer, where it is mixed with compressed hot air at 540°C (1004°F). Sufficient air is added to produce a final synthesis gas having a hydrogen-to-nitrogen mole ratio of three to one. The gas leaving the secondary reformer (primarily hydrogen, nitrogen, CO, CO_2, and H_20) is then cooled to 360°C (680°F) in a waste heat boiler before being sent to the carbon monoxide shift (USEPA, 1993a).

Carbon monoxide shift

After cooling, the secondary reformer effluent gas enters a high temperature (350-400°C) CO shift converter which converts the CO to CO_2, followed by a low temperature (200-250°C) shift converter which continues to convert CO to CO_2 (Kroschwitz and Howe-Grant, 1992). The high temperature CO shift converter is filled with chromium oxide initiator and iron oxide catalyst. The following reaction takes place (USEPA, 1993a):

$$CO + H_2O \rightarrow CO_2 + H_2$$

The exit gas is then cooled in a heat exchanger before being sent to a low temperature shift converter for ammonia, amines, and methanol where CO continues to be converted to CO_2 by a copper oxide/zinc oxide catalyst (Kent, 1992). In some plants, the gas is first passed through a bed of zinc oxide to remove any residual sulfur contaminants that would poison the low temperature shift catalyst. In other plants, excess low temperature shift catalyst is added to ensure that the unit will operate as expected. Final shift gas from this converter is cooled from 210 to 110°C (410 to 230°F) and unreacted steam is condensed and separated from the gas in a knockout drum. The final shift gas then enters the bottom of the carbon dioxide absorption system. The condensed steam (process condensate) contains ammonium carbonate ($[(NH_4)_2 CO_3 \cdot H_2O]$) from the high temperature shift converter, methanol (CH_3OH) from the low temperature shift converter, and small amounts of sodium, iron, copper, zinc, aluminum and calcium. Process condensate is sent to the stripper to remove volatile gases such as ammonia, methanol, and carbon dioxide. Trace metals remaining in the process condensate are typically removed in an ion exchange unit (USEPA, 1993a).

Carbon dioxide removal

In this step, CO_2 in the final shift gas is removed. CO_2 removal can be done by using one of two methods: monoethanolamine ($C_2H_4NH_2OH$) scrubbing or hot potassium scrubbing. Approximately 80 percent of the ammonia plants use monoethanolamine (MEA) for removing CO_2. In this process, the CO_2 gas is passed upward through an adsorption tower countercurrent to a 15 percent to 30 percent solution of MEA in water fortified with corrosion inhibitors. After absorbing the CO_2, the amine-CO_2 solution is preheated and regenerated in a reactivating tower. The reacting tower removes CO_2 by steam stripping and then by heating. The CO_2 gas (98.5 percent CO_2) is either vented to the atmosphere or used for chemical feedstock in other parts of the plant complex. The regenerated MEA is pumped back to the absorber tower after being cooled in a heat exchanger and solution cooler (USEPA, 1993a).

Methanation

Carbon dioxide absorption is not 100 percent effective in removing CO_2 from the gas stream, and CO_2 can poison the synthesis converter. Therefore, residual CO_2 in the synthesis gas must be removed by catalytic methanation. In a reactor containing a nickel catalyst and at temperatures of 400 to 600°C (752 to 1112°F) and pressures up to 3,000 kPa (435 psia) methanation follows the following reaction steps:

$$CO_2 + H_2 \rightarrow CO + H_2O$$

$$CO + 3H_2 \rightarrow CH_4 + H_2O$$

$$CH_4 + 2H_2O \rightarrow CO_2 + 4H_2$$

Exit gas from the methanator is almost a pure three to one mole ratio of hydrogen to nitrogen (USEPA, 1993a).

Ammonia Synthesis

In the synthesis step, the hydrogen and nitrogen synthesis gas from the methanator is converted to ammonia.

$$N_2 + 3H_2 \rightarrow 2NH_3$$

First, the gas is compressed to pressures ranging from 13,800 to 34,500 kPa (2000 to 5000 psia), mixed with recycled synthesis gas, and cooled to 0°C

(32°F). This results in a portion of the gas being converted to ammonia which is condensed and separated from the unconverted synthesis gas in a liquid-vapor separator and sent to a let-down separator. The unconverted synthesis gas is further compressed and heated to 180°C (356°F) before entering a synthesis converter containing an iron oxide catalyst. Ammonia gas exiting the synthesis converter is condensed and separated, then sent to the let-down separator. A small portion of the overhead gas is purged to prevent the buildup of inert gases such as argon in the circulating gas system. Ammonia in the let-down separator is flashed to atmospheric pressure (100 kPa (14.5 psia)) at -33°C (-27°F) to remove impurities from the make-up gas. The flash vapor is condensed in a let-down chiller where anhydrous ammonia is drawn off and stored at low temperature (USEPA, 1993a).

Storage and Transport
Ammonia is typically stored at ambient pressure and -33°C (-28°F) in large 20,000 ton tanks. Some tanks are built with a double wall to minimize leakage and insulate. If heat leaks into the tank and ammonia is vaporized, the vapors are typically captured, condensed, and returned to the tank. Ammonia is mostly transported by barge to key agricultural areas, but there is also a small system of interstate ammonia pipelines (Kent, 1992).

III.A.2. Nitric Acid

Nitric acid (HNO_3) is produced by two methods. The first method utilizes oxidation, condensation, and absorption of ammonia to produce a "weak" nitric acid. Weak nitric acid has a concentration ranging from 30 to 70 percent nitric acid. The second method combines dehydrating, bleaching, condensing, and absorption to produce "high strength" nitric acid from weak nitric acid. High strength nitric acid generally contains more than 90 percent nitric acid (USEPA, 1993a). The following text discusses each of these processes.

Weak Nitric Acid Production

Nearly all the weak nitric acid produced in the United States is manufactured by the high temperature catalytic oxidation of ammonia as shown schematically in Figure 8. This process typically consists of three steps:

1) ammonia oxidation
2) nitric oxide oxidation
3) absorption.

Each step corresponds to a distinct chemical reaction.

Ammonia Oxidation
During ammonia oxidation, a one to nine ammonia to air mixture is oxidized

at a temperature of 750 to 800°C (1380 to 1470°F) as it passes through a catalytic converter, according to the following reaction:

$$4NH_3 + 5O_2 \rightarrow 4NO + 6H_2O$$

The most commonly used catalyst is made of gauze squares of fine wire constructed of 90 percent platinum and 10 percent rhodium. Under these conditions the oxidation of ammonia to nitric oxide (NO) proceeds in an exothermic reaction with 93 to 98 percent yield. Higher catalyst temperatures increase reaction selectivity toward nitric oxide (NO) production. Lower catalyst temperatures tend to be more selective toward nitrogen (N_2) and nitrous oxide (N_2O) (USEPA, 1993a). The nitric oxide then passes through a waste heat boiler and a platinum filter in order to recover the precious metal platinum (Kent, 1992).

Nitric Oxide Oxidation

The nitric oxide formed during the ammonia oxidation is further oxidized in another process step. The nitric oxide process stream is passed through a cooler/condenser and cooled to 38°C (100°F) or less at pressures up to 800 kPa (116 psia). The nitric oxide reacts noncatalytically with residual oxygen to form nitrogen dioxide and its liquid dimer, dinitrogen tetroxide:

$$2NO + O_2 \rightarrow 2NO_2 \rightarrow N_2O_4$$

(A dimer is a small polymer whose molecule is composed of two molecules of the same composition (Lewis, 1993).) This slow, homogeneous reaction is temperature and pressure dependent. Operating at low temperatures and high pressures promotes maximum production of NO_2 within a minimum reaction time (USEPA, 1993a).

Nitrogen dioxide absorption

The final step introduces the gaseous nitrogen dioxide/dimer mixture into an absorption process after being cooled. The mixture is pumped into the bottom of an absorption tower with trays, while liquid dinitrogen tetroxide (N_2O_4) is added at a higher point. Deionized water enters the top of the column. Both liquids flow countercurrent to the dioxide/dimer gas mixture. The exothermic reaction occurs as follows (USEPA, 1993a):

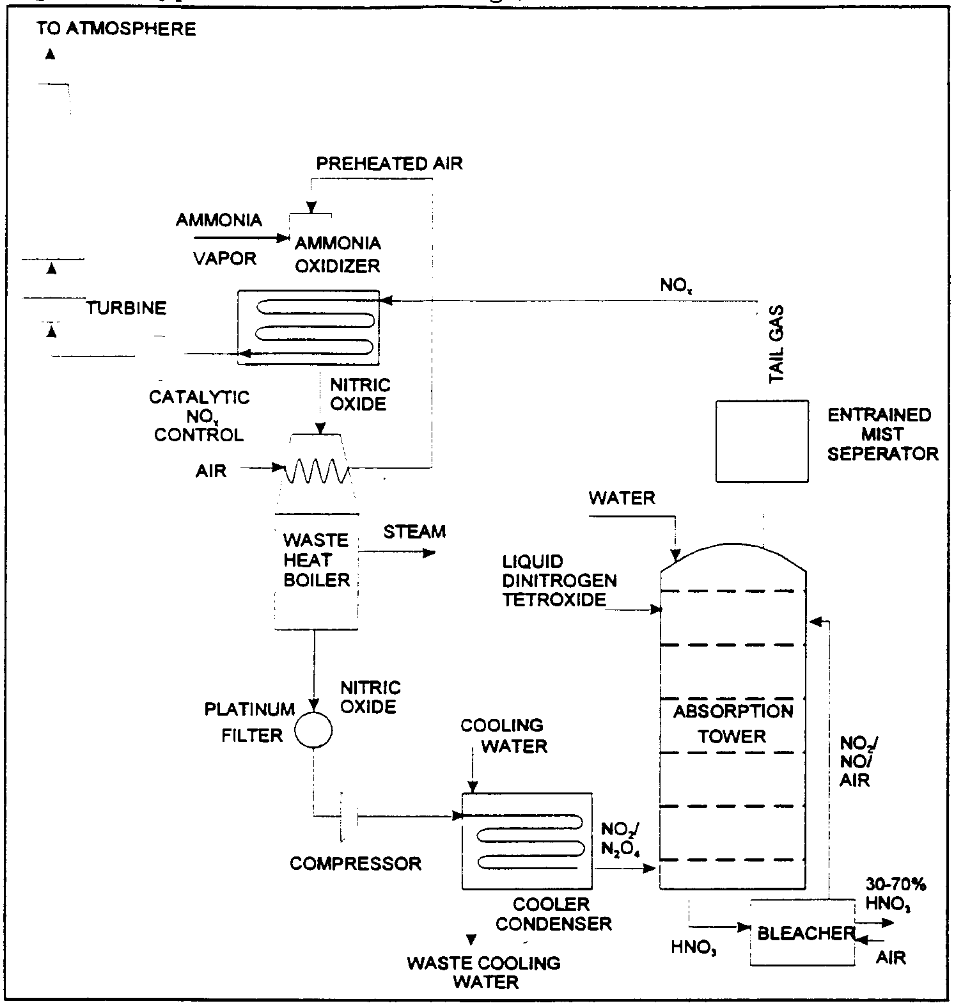
$$3NO_2 + H_2O \rightarrow 2HNO_3 + NO$$

A secondary air stream is introduced into the column to re-oxidize the NO that is formed. This secondary air also removes NO_2 from the product acid. Oxidation of NO to NO_2 takes place in the free space between the trays, while absorption of NO_2 into the water occurs on the trays. An aqueous solution of 55 to 65 percent (typically) nitric acid is withdrawn from the bottom of the tower. The acid concentration can vary from 30 to 70 percent nitric acid depending upon the temperature, pressure, number of absorption stages, and concentration of nitrogen oxides entering the absorber (USEPA, 1993a).

There are two variations of the process described above to produce weak nitric acid: single-stage pressure process and dual-stage pressure process. In the past, nitric acid plants have been operated at a single pressure, ranging from atmospheric pressure to 1400 kPa (14.7 to 203 psia). However, since the oxidation of ammonia is favored by low pressures and the oxidation of nitric oxide and the absorption of nitrogen dioxide are favored by higher pressures, newer plants tend to operate a dual-stage pressure system, incorporating a compressor between the ammonia oxidizer and the condenser. The oxidation reaction is carried out at pressures from slightly negative to about 400 kPa (58 psia), and the absorption reactions are carried out at 800 to 1,400 kPa (116 to 203 psia) (USEPA, 1993a).

In the dual-stage pressure system, the nitric acid formed in the absorber (bottoms) is usually sent to an external bleacher where air is used to remove (bleach) any dissolved oxides of nitrogen (NO, NO_2, etc.). The bleacher gases are then compressed and again passed through the absorber. The absorber tail gas (distillate) is sent to an entrainment separator for acid mist removal. Next, the tail gas is reheated in the ammonia oxidation heat exchanger to approximately 200°C (392°F). The gas is then passed through catalytic reduction units for NO_x emissions control. The final step expands the gas in the power-recovery turbine. The thermal energy produced in this turbine can be used to drive the compressor.

Figure 8: Typical Process of Dual-Stage, Weak Nitric Acid Production



Source: United States EPA, 1993a.

High Strength Nitric Acid

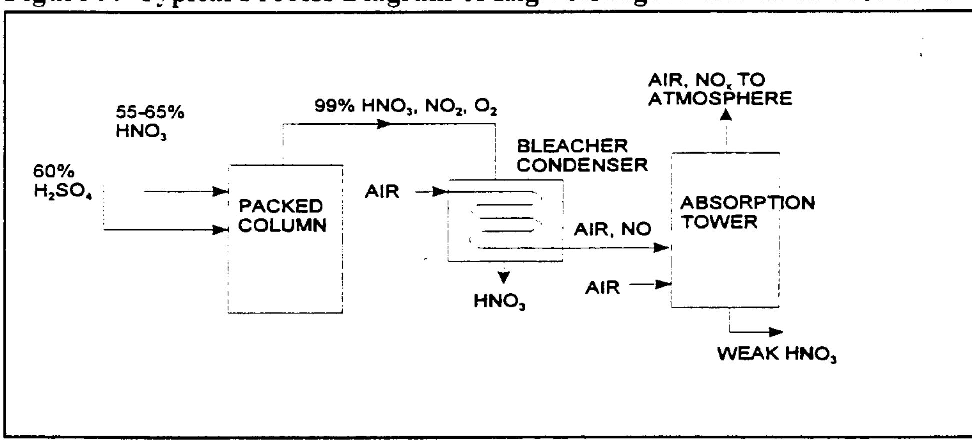
High strength nitric acid (98 to 99 percent concentration) can be obtained by concentrating weak nitric acid (30 to 70 percent concentration) using extractive distillation. Extractive distillation is distillation carried out in the presence of a dehydrating agent. Concentrated sulfuric acid (typically 60 percent sulfuric acid) is most commonly used for this purpose. The weak nitric acid cannot be concentrated by simple fractional distillation, in which acid is concentrated by removing water vapor in a column with trays or plates.

R0074100

The nitric acid concentration process consists of feeding strong sulfuric acid and 55 to 65 percent nitric acid into the top of a packed dehydrating column at approximately atmospheric pressure. The acid mixture flows downward and concentrated nitric acid leaves the top of the column as 99 percent vapor, containing a small amount of NO_2 and O_2 resulting from dissociation of nitric acid. The concentrated acid vapor then goes to a bleacher and a countercurrent condenser system to condense strong nitric acid and the separate out the oxygen and nitrogen oxide by-products. The bleacher uses air to strip nitrogen oxides out of the nitric acid and the countercurrent condenser system cools the vapor by flowing air through the vapor causing droplets to separate out.

These nitrogen oxide by-products then flow to an absorption column where the nitric oxide mixes with auxiliary air to form NO_2, which is recovered as weak nitric acid..Inert and unreacted gases are vented to the atmosphere from the top of the absorption column. Emissions from this process are relatively small compared to weak acid production (USEPA, 1993a). Figure 9 illustrates a typical high strength nitric acid production process.

Figure 9: Typical Process Diagram of High Strength Nitric Acid Production



Source: Adapted from United States EPA, 1993a.

III.A.3. Ammonium Nitrate and Urea

The manufacture steps for ammonium nitrate (NH_4NO_2) and urea ($CO(NH_2)_2$) are similar. In both cases, several major unit operations are involved, including:

1) solution formation
2) concentration
3) solids formation

R0074101

4) finishing
5) screening
6) coating
7) product bagging and/or bulk shipping.

These operations are shown schematically in Figure 10. Not all steps are always necessary depending on the end product desired. For example, plants producing ammonium nitrate or urea liquid solutions alone use only the solution formation, solution blending and bulk shipping operations. Plants producing a solid product may employ all of the operations.

Solution synthesis

Ammonium nitrate.

Ammonium nitrate plants produce an aqueous ammonium nitrate solution through the reaction of ammonia and nitric acid in a neutralizer where water is evaporated by the heat of the reaction as follows:

$$NH_3 + HNO_3 \rightarrow NH_4NO_3 + 26 \text{ kcal/g mol}$$

The temperature, pressure, and final concentration of the ammonium nitrate are interdependent. Higher temperatures and pressures can be used to produce a higher concentration of ammonium nitrate (Hodge, 1994); however, the temperature of the operation should be below 120°C (250°F) in order to prevent explosions. Up to 99.5 percent of the ammonia and nitric acid is typically converted to ammonium nitrate (Kent, 1992). Ammonium nitrate solution can then be used as an ingredient for nitrogen solution fertilizers or concentrated to a solid form.

Urea.

In the urea solution synthesis operation, ammonia (NH_3) and carbon dioxide (CO_2) are reacted to form ammonium carbamate ($NH_2CO_2NH_4$) as follows:

$$2NH_3 + CO_2 \rightarrow NH_2CO_2NH_4$$

Typical operating conditions include temperatures from 180 to 200°C (356 to 392°F), pressures from 14,000 to 25,000 kPa (140 to 250 psia), molar ratios of NH_3 to CO_2 from 3:1 to 4:1, and a retention time of twenty to thirty minutes. The ammonium carbamate is then dehydrated to yield 70 to 77 percent aqueous urea solution. This reaction follows: (USEPA, 1993a)

$$NH_2CO_2NH_4 \rightarrow NH_2CONH_2 + H_2O$$

Urea solution can be used as an ingredient of nitrogen solution fertilizers, or it can be concentrated further to produce solid urea.

Solids Concentration

Ammonium nitrate.

To produce a solid product, the aqueous ammonium nitrate solution is concentrated in an evaporator or concentrator. The resulting liquid "melt" contains about 95 to 99.8 percent ammonium nitrate at approximately 149°C (300°F). This melt is then used to make solid ammonium nitrate products (USEPA, 1993a).

Urea.

The three methods of concentrating the urea solution are vacuum concentration, crystallization, and atmospheric evaporation. The method chosen depends upon the level of biuret ($NH_2CONHCONH_2$) impurity allowable in the end product. Biuret can cause mottling in urea solutions, reducing the fertilizers effectiveness in foliar applications (Kent, 1992). Aqueous urea solution decomposes with heat to biuret and ammonia. Therefore, if only a low level of biuret impurity is allowed in the end product, the method with the least heat requirement will be chosen, such as crystallization and vacuum concentration (Kent, 1992). However, the simplest and most common method of solution concentration is atmospheric evaporation.

Solids Formation

Prilling and granulation are the most common processes used to produce solid ammonium nitrate and urea. Prills are round or needle-shaped artificially prepared aggregates of a material. To produce prills, concentrated melt is sprayed into the top of a prill tower. In the tower, melt droplets fall countercurrent to a rising air stream that cools and solidifies the falling droplets into prills. Prill density can be varied by using different concentrations of ammonium nitrate melt. Low density prills, in the range of 1.29 specific gravity, are formed from a 95 to 97.5 percent ammonium nitrate melt, and high density prills, in the range of 1.65 specific gravity, are formed from a 99.5 to 99.8 percent melt. Low density ammonium nitrate prills are used for making blasting agents because they are more porous than high density prills and will absorb oil. Most high density prills are used as fertilizers (USEPA, 1993a).

Granulated ammonium nitrate and urea are produced by spraying a concentrated melt (99.0 to 99.8 percent) onto small seed particles of ammonium nitrate or urea in a long rotating cylindrical drum. As the seed particles rotate in the drum, successive layers of the nitrogenous chemical are added to the particles, forming granules. Pan granulators operate on the same principle as drum granulators, except the solids are formed in a large, rotating circular pan. Pan granulators produce a solid product with physical characteristics similar to those of drum granules (USEPA, 1993a).

Although not widely used, additives such as magnesium nitrate or magnesium oxide may be injected directly into the melt stream. Additives can serve three purposes: to raise the crystalline transition temperature of the final solid product in order to retain its strength and density; to act as a desiccant, drawing water into the final product to reduce caking; and to allow solidification to occur at a low temperature by reducing the freezing point of molten ammonium nitrate. (Kent, 1992)

Solids Cooling

The temperature of the nitrogenous product exiting the solids formation process is approximately 66 to 124°C (150 to 255°F). To prevent deterioration and agglomeration, the product must be cooled before storage and shipping. Typically, rotary drums or fluidized beds are used to cool granules and prills leaving the solids formation process. Because low density prills have a high moisture content, they require drying in rotary drums or fluidized beds before cooling (USEPA, 1993a).

Solids Screening

Since the solids are produced in a wide variety of sizes, they must be screened for consistently sized prills or granules. After cooling, off size prills are dissolved and recycled back to the solution concentration process. Granules are screened before cooling. Undersize particles are returned directly to the granulator and oversize granules may be either crushed and returned to the granulator or sent to the solution concentration process (USEPA, 1993a).

Solids Coating

Following screening, products can be coated in a rotary drum to prevent agglomeration during storage and shipment. The most common coating materials are clays and diatomaceous earth. However, the use of additives in the melt before solidification may preclude the use of coatings.

The solid product is stored and shipped in either bulk or bags. The majority of solid product is bulk shipped in trucks, enclosed railroad cars, or barges, and approximately ten percent of solid ammonium nitrate and urea produced in the United States is bagged (USEPA, 1993a).

III.B. Phosphatic Fertilizers

The primary products of the phosphatic fertilizers industry are phosphoric acid, ammonium phosphate, normal superphosphate, and triple superphosphate. Phosphoric acid is sold as is or is used as an intermediate in producing other phosphatic fertilizers. Monoammonium phosphate is favored for its high phosphorous content, while diammonium phosphate is favored for its high nitrogen content. Normal superphosphate has a relatively low concentration of phosphorous, however it is used in mixtures because of its low cost. Triple superphosphate provides a high concentration of phosphorous, more than 40% phosphorous pentoxide. The industrial processes for each of these products are described below.

III.B.1. Phosphoric Acid (Wet Process)

In a wet process phosphoric acid facility (shown schematically in Figure 11), phosphoric acid is produced by reacting sulfuric acid (H_2SO_4) with naturally occurring phosphate rock. The phosphate rock is mined, dried, crushed until 60 to 70 percent of the rock is less than 150 μm in diameter, and then continuously fed into the reactor along with sulfuric acid (UNEP, 1996). The reaction also combines calcium from the phosphate rock with sulfate, forming calcium sulfate ($CaSO_4$), commonly referred to as gypsum. Gypsum is separated from the reaction solution by filtration.

R0074105

Facilities in the United States generally use a dihydrate process that produces gypsum in the form of calcium sulfate with two molecules of water ($CaSO_4 \bullet 2H_2O$ or calcium sulfate dihydrate). Japanese phosphoric acid facilities use a hemihydrate process which produces calcium sulfate with a half molecule of water ($CaSO_4 \bullet \frac{1}{2} H_2O$). This one-step hemihydrate process has the advantage of producing wet process phosphoric acid with a higher phosphate pentoxide (P_2O_5) concentration and less impurities than the dihydrate process. Due to these advantages, some United States companies have recently converted to the hemihydrate process. However, since most wet process phosphoric acid is still produced by the dihydrate process, the hemihydrate process will not be discussed in detail here.

A simplified reaction for the dihydrate process is as follows:

$$Ca_3(PO_4)_2 + 3H_2SO_4 + 6H_2O - 2H_3PO_4 + 3[CaSO_4 \bullet 2H_2O]\downarrow$$

To make the strongest phosphoric acid possible and to decrease evaporation costs, a highly concentrated 93 percent sulfuric acid is normally used. Because the proper ratio of acid to rock in the reactor is critical, precise automatic process control equipment is employed in the regulation of these two feed streams (USEPA, 1993a).

During the reaction, gypsum crystals are precipitated and separated from the acid by filtration. The separated crystals must be washed thoroughly to yield at least a 99 percent recovery of the filtered phosphoric acid. After washing, the slurried gypsum is pumped into a gypsum settling pond for storage. Water is siphoned off and recycled through a surge cooling pond to the phosphoric acid process. Depending on a variety of factors, such as average ambient temperature and annual rainfall, settling and cooling ponds may require between 0.25 and 1.0 acre for each ton of daily P_20_5 capacity (TFI, 1999).

Considerable heat is generated in the reactor when the sulfuric acid and phosphate rock react. In older plants, this heat was removed by blowing air over the hot slurry surface. Modern plants vacuum flash cool a portion of the slurry, and then recycle it back into the reactor.

Wet process phosphoric acid normally contains 26 to 30 percent P_2O_5. In most cases, the acid must be further concentrated to meet phosphate feed material specifications for fertilizer production. Depending on the types of fertilizer to be produced, phosphoric acid is usually concentrated to 40 to 55 percent P_2O_5 by using two or three vacuum evaporators (USEPA, 1993a). These evaporators operate with a forced circulation and generate a vacuum through vacuum pumps, steam ejectors, or an entraining condenser downstream of the evaporator. Figure 12 illustrates a vacuum evaporator.

III.B.2. Ammonium Phosphate

Diammonium phosphate (DAP) and monoammonium phosphate are the major types of ammonium phosphatic fertilizer. Ammonium phosphates are produced by reacting phosphoric acid with ammonia. The ammonium phosphate liquid slurry produced is then converted to solid granules. Approximately 95 percent of ammoniation-granulation plants in the United States use a rotary drum mixer developed and patented by the Tennessee Valley Authority (TVA).

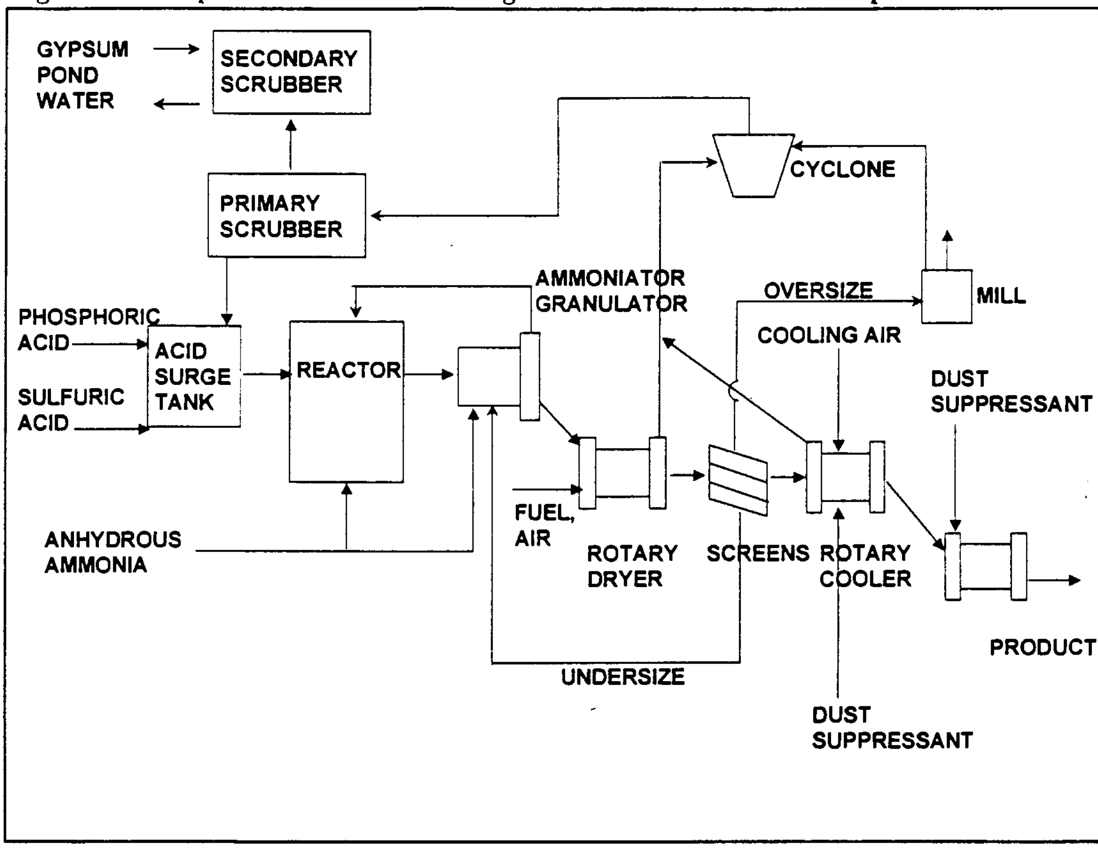
In the TVA DAP process, phosphoric acid is mixed in an acid surge tank with 93 percent sulfuric acid (H_2SO_4) and recycled acid from wet scrubbers. The mixed acids are then partially neutralized with liquid or gaseous anhydrous ammonia in a brick-lined acid reactor. All of the phosphoric acid and approximately 70 percent of the ammonia needed to complete the reaction are introduced into this vessel. A slurry of ammonium phosphate and 22 percent water are produced and sent through steam-traced lines to the ammoniator-granulator.

Slurry from the reactor is distributed in the rotary drum granulator, and the remaining ammonia (approximately 30 percent) is sparged under the slurry. The basic rotary drum granulator consists of an open-ended, slightly inclined rotary cylinder, with retaining rings at each end and a scraper or cutter mounted inside the drum shell. A rolling bed of dry material is maintained in the unit while the slurry is introduced through distributor pipes set lengthwise in the drum. Gravity forces the slurry to travel through the turning granulator to the lower end. Moist DAP granules are then discharged into a rotary dryer, where excess water is evaporated and the chemical reaction is accelerated to completion by the dryer heat. Dried granules are cooled and then sized on vibrating screens. The product ranges in granule diameter from one to four millimeters (mm). The oversized granules are crushed, mixed with the undersized, and recycled back to the ammoniator-granulator. Product-size DAP granules are allowed to cool, screened, bagged, and shipped. Before being exhausted to the atmosphere, particulate and ammonia rich off-gases from the granulator, cooler, and screening operations pass through cyclones and wet scrubbers (USEPA, 1993a).

TVA developed two minor modifications in their DAP process to produce Monoammonium Phosphate (MAP). In one, the phosphoric acid is ammoniated to an ammonia to phosphoric acid ratio of only 0.6 in the preneutralizer and then 1.0 in the granulator. This compares to a ratio of about 1.4 for DAP. With the second modification, the ammonium to phosphoric acid ratio is brought to 1.4 in the preneutralizer, then additional phosphoric acid is added in the granulator to bring the ratio back to 1.0. The second method is preferred by industry because higher temperatures may be used to dry the MAP, increasing production rates (Kent, 1992).

A schematic diagram of the ammonium phosphate process flow diagram is shown in Figure 13.

Figure 13: Simplified Process Flow Diagram of Diammnonium Phosphate Production



Source: U.S.EPA, 1993a and TFI, 1999

III.B.3. Normal Superphosphate

Normal superphosphates (NSP) are prepared by reacting ground phosphate rock with 65 to 75 percent sulfuric acid to produce a solid fertilizer material. NSP is most often used as a high-phosphate additive in the production of granular fertilizers. It can also be granulated for sale as granulated superphosphate or granular mixed fertilizer.

There are two primary types of sulfuric acid used in superphosphate manufacture: virgin and spent acid. Virgin acid is produced from elemental sulfur, pyrites, and industrial gases and is relatively pure. Spent acid is a

R0074109

recycled waste product from various industries that use large quantities of sulfuric acid. Problems encountered with using spent acid include unusual color, unfamiliar odor, and toxicity. An important factor in the production of normal superphosphates is the amount of iron and aluminum in the phosphate rock. Aluminum (as Al_2O_3) and iron (as Fe_2O_3) above five percent imparts an extreme stickiness to the superphosphate and makes it difficult to handle (USEPA, 1993a).

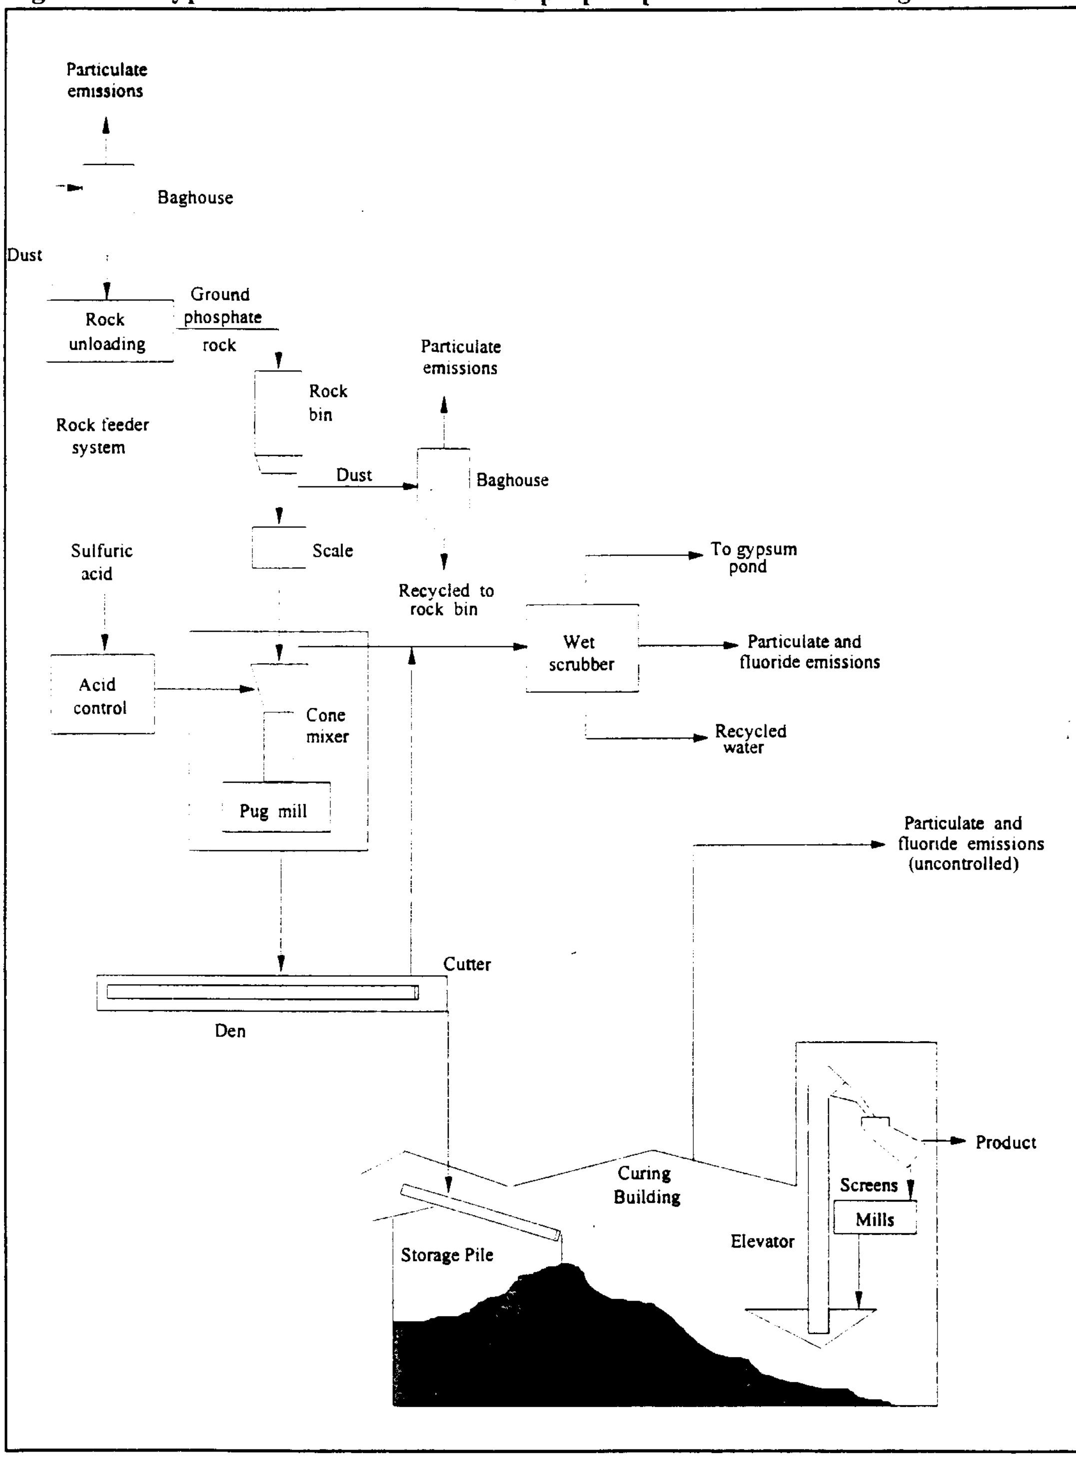
A generalized process diagram of normal superphosphate production is shown in Figure 14. Ground phosphate rock is weighed and mixed with sulfuric acid (H_2SO_4) and held in an enclosed area for about 30 minutes until the reaction is partially completed. The mixing may be done in a cone mixer, which relies on an inputted swirling motion of the acid to mix the rock and acid, a pug mill, which operates with one or two mixing shafts, or a pan mixer, which agitates the solution. The reaction is (AWMA, 1992):

$$Ca_{10}(PO_4)_6F_2CaCO_3 + 11H_2SO_4 \rightarrow 6H_3PO_4 + 11CaSO_4{*}nH_2O + 2HF + CO_2 + H_2O$$

The mixture is then transferred, using an enclosed conveyer known as the den, through the cutter which breaks up clumps, and finally to a storage pile for curing. Off-gases from the reactor are typically treated in a wet scrubber. Particulates throughout the process are controlled with cyclones and baghouses (USEPA, 1993a).

To produce granulated normal superphosphate, cured superphosphate is fed through a clod breaker and sent to a rotary drum granulator where steam, water, and acid may be added to aid in granulation. Material is processed through a rotary drum granulator, a rotary dryer, and a rotary cooler, and is then screened to specification similar to the process used for ammonium nitrate and urea. Finally, it is stored in bagged or bulk form prior to being sold (USEPA, 1993a).

Figure 14: Typical Process for Normal Superphosphate Manufacturing



Source: United States EPA, 1993a.

R0074111

III.B.4. Triple Superphosphate

Triple superphosphate provides a high concentration of phosphorous. Two processes have been used to produce triple superphosphate: run-of-the-pile (ROP-TSP) and granular (GTSP). GTSP yields larger, more uniform particles with improved storage and handling properties than ROP-TSP. At this time, no facilities in the United States are producing ROP-TSP, so only the GTSP process is described here.

Most GTSP material is made with the Dorr-Oliver slurry granulation process, illustrated in Figure 15. This process is similar to that for normal superphosphates with the major exception being that phosphoric acid is used instead of sulfuric acid. In this process, ground phosphate rock or limestone is reacted with phosphoric acid in one or two reactors in series (USEPA, 1993a). The reaction is:

$$Ca_5F(PO_4)_3 + 7H_3PO_4 + 5H_2O \rightarrow 5Ca(H_2PO_4)_2{\bullet}H_2O + HF$$

(Hodge, 1994) The phosphoric acid used in this process has a relatively low concentration (40 percent P_2O_5). The lower strength acid maintains the slurry in a fluid state during a mixing period of one to two hours. A small sidestream of slurry is continuously removed and distributed onto dried, recycled fines in a granulator, where it coats the granule surfaces and builds up its size.

Granules are then dried in a rotary dryer, elevated and passed through screens to eliminate oversize and undersize granules. Oversize granules are crushed and sent back to the first screen, while undersize ones are sent into the emission control systems. The granules within the size range of the product are then cooled and stored in a curing pile where the reaction is completed. Particulates from the rock handling, drying, screening, cooling, and storing processes are typically controlled with cyclones and bag houses and off-gases from the reactor, granulator, and cyclones and baghouses are typically treated with wet scrubbers (USEPA, 1993a).

R0074113

III.C. Fertilizer Mixing

A significant part of the fertilizer industry only purchases fertilizer materials in bulk from fertilizer manufacturing facilities and mixes them to sell as a fertilizer formulation. Fertilizer mixing facilities use many different materials in their blends. The most common granular fertilizer materials are listed in Table 9.

Table 9: Fertilizer Materials Used in Bulk Blends

	Typical Grade $N\text{-}P_2O_5\text{-}K_2O$	Percent of fertilizer plants using this material
Ammonium nitrate	31-0-0	41%
Urea	46-0-0	66%
Ammonium sulfate	21-0-0	22%
Diammonium phosphate (DAP)	18-46-0	95%
Monoammonium phosphate (MAP)	11-52-0	11%
Triple Superphosphate	0-46-0	78%
Normal superphosphate	0-20-0	4%
Potassium chloride	0-0-60	94%

Source: "Retail Marketing of Fertilizers in the United States," by Hargett, Norman and Ralph Pay, 1980.

DAP is favored for fertilizer mixing because of its ease in storage and handling, convenient low nitrogen and high phosphorous content, and compatibility with almost any other material. Granular triple superphosphate is also very popular, but is incompatible with urea, a common nitrogen source. Therefore, TSP is commonly used in no-nitrogen blends necessary for legumes. Ammonium sulfate has the lowest nitrogen content of the major nitrogen sources, however its production cost is quite low. Potassium chloride is the only major potassium source used in fertilizer blending. Additional materials may also be added to the blends, such as micronutrients and pesticides (Nielson, 1987).

R0074114

Inert ingredients may also be added to fertilizer mixtures to improve the consistency or ease of application. Inert ingredients include sands, clays, and water.

Fertilizer mixing plants consist of five primary phases:

1. mixing and storing
2. moving materials to mixers
3. proportioning of materials
4. mixing, and
5. moving the finished blend to holding bins or transport containers

Fertilizer materials may be mixed as bulk blends or formed into granulations by a variety of processes. Bulk blending is a dry process, where different fertilizers are combined. Materials are typically received by rail cars and transferred through elevators to storage areas. Front-end loaders then carry the materials to weighing hoppers which feed into the mixers. There are two types of mixers most commonly used: the horizontal axis rotary drum mixer and the inclined axis rotary drum mixer. The inclined axis mixer is similar to a cement mixer in design and appearance. Ribbon-type bulk-blend mixers are also used in some plants. A ribbon-type mixer has an axial shaft with mixing spokes radiating out of the shaft in a configuration which forces the blend to flow in a ribbon-like pattern through the mixture (Nielson, 1987).

After preparation and initial bulk blending of materials, granulation may be employed in order to form larger fertilizer particles with multi-nutrient compositions. Granulation of mixed fertilizers may be accomplished by steam granulation, slurry granulation, melt, or compaction granulation.

Steam granulation is primarily used in Europe and Australia. The process results in little chemical reaction in order to maintain the P_2O_5 content of the fertilizer. Plasticity and agglomeration of the fertilizer materials is promoted by the injection of steam into rotating pans, rotary drums, or pug mills. The particles are then dried with heated air in a rotary drum dryer and cooled in a rotary drum cooler. In some cases, particles may be coated with chalk or clay to prevent caking (Hoffmeister, 1993).

Slurry granulation is more commonly used in the United States The process involves a chemical reaction of the feed ingredients. In slurry granulation, one of the feed ingredients is prepared as a slurry and reacted with the others in a preneutralizer. The slurry is then fed to a granulator such as the ammoniator-granulator developed by the TVA. Fertilizer producers in the United States found that higher concentrations of acid could be fed to this preneutralizer-granulator process than to a granulator alone, thus increasing the grades of fertilizers and making the TVA process popular in the United States (Hoffmeister, 1993).

Another granulation process similar to slurry granulation is melt granulation. The slurry feed is replaced by a hot, concentrated, almost anhydrous melt of feed fertilizer, typically ammonium phosphate, prepared in a pipe reactor. The hot melt provides the plasticity necessary for granulation. The granules cool first in the granulator and then in the cooler, eliminating the need for a dryer.

Compaction granulation is based on the fact that most materials are semiplastic and when subjected to high pressures, the materials will compact, deform, and it is possible to roll them out into flat, stable sheets. These sheets are then cracked, forming granule-size chips which are most stable and less prone to caking than other granulations. This process has been successful for many fertilizer mixtures, particularly those including potassium chloride and ammonium phosphates and superphosphates. Ammonium sulfate, however, has limited crystal plasticity, making it unsuitable for compaction granulation (Hoffmeister, 1993).

The mixtures are then typically bagged in woven polypropylene bags for strength and resistance, with liner bags to prevent leaks. The bags are either clamped, tied, heat sealed, or sewn, sewing being the cheapest and most common method (Nielson, 1987).

III.D. Pesticide Formulating Processes

Pesticide formulation involves the process of mixing, blending, or diluting one or more pesticide active ingredients (AIs) and inert ingredients to obtain a product used for additional processing or an end-use (retail) product. Formulation does not involve an intended chemical reaction (i.e., chemical synthesis). AIs are produced at separate facilities not included in this notebook. Pesticide formulations take many forms: water-based liquid; organic solvent-based liquid; dry products in granular, powder, and solid forms; pressurized gases; and aerosols. The formulations can be in a concentrated form requiring dilution before application, or they can be ready to apply. The packaging of the formulated pesticide product depends on the type of formulation. Liquids generally are packaged into jugs, cans, or drums; dry formulations generally are packaged into bags, boxes, drums, or jugs; pressurized gases are packaged into cylinders; and aerosols are packaged into aerosol cans.

Formulating, packaging, and repackaging is performed in a variety of ways, ranging from very sophisticated and automated formulating and packaging lines to completely manual lines. Descriptions of liquid formulating and packaging, dry formulating and packaging, aerosol packaging, pressurized gas formulating and packaging, and repackaging operations are provided below.

III.D.1. Liquid Formulating and Packaging

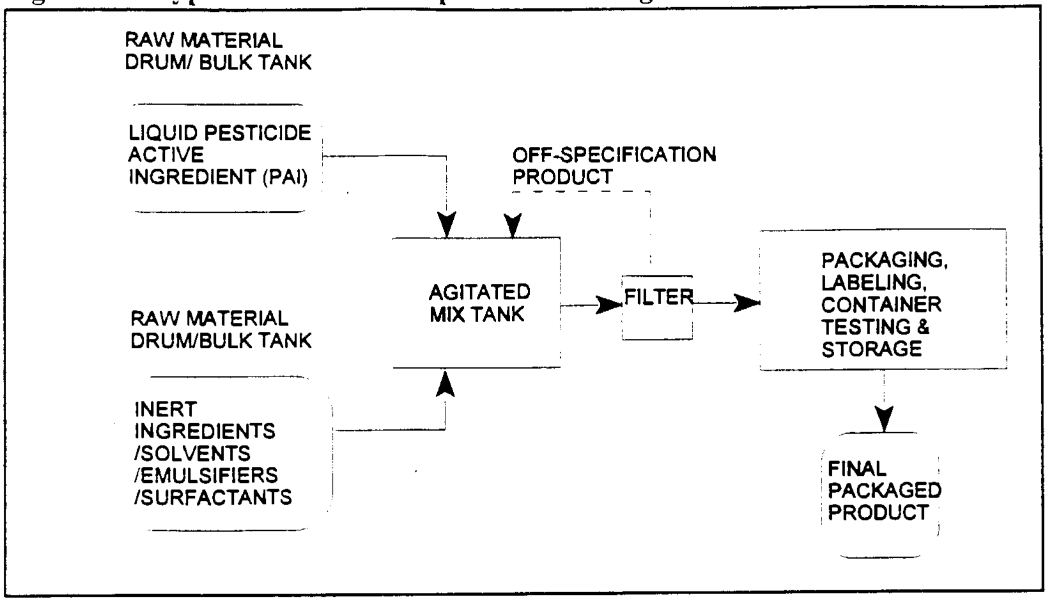
Liquid formulations contain mixtures of several raw materials, including AIs, inert ingredients such as base solvents, emulsifiers, or surfactants. The solvent must be able to dissolve the AIs and other ingredients. It may be water or an organic chemical, such as isopropyl alcohol or petroleum distillate. In some cases, the formulation is an emulsion and contains both water and an organic solvent. Solid materials, such as powders or granules, may also be used as part of a liquid formulation by dissolving or emulsifying the dry materials to form a liquid or suspension. The formulated product may be in a concentrated form requiring dilution before application, or may be ready to apply.

Typical liquid formulating lines consist of storage tanks or containers to hold active and inert raw materials and a mixing tank for formulating the pesticide product. A storage tank may also be used on the formulating line to hold the formulated pesticide product, prior to a packaging step. Facilities may receive their raw materials in bulk and store them in bulk storage tanks, or they may receive the raw materials in smaller quantities, such as 55-gallon drums, 50-pound bags, or 250-gallon minibulk refillable containers or "totes." These raw materials are either piped to the formulation vessel from bulk storage tanks or added directly to the vessel from drums, bags, or minibulks. Typically, water or the base solvent is added to the formulation vessel in bulk quantities (USEPA, 1996). A typical liquid formulating line is shown in Figure 16.

The formulating line may also include piping and pumps for moving the raw material from the storage tanks to the mixing tank, and for moving formulated pesticide product to the packaging line. Other items that may be part of the line are premixing tanks, stirrers, heaters, bottle washers, and air pollution control equipment. Some lines may also have refrigeration units for formulation and storage equipment, scales, and other equipment.

Many liquid formulations are packaged by simply transferring the final product into containers. Small quantities of product are often manually packaged by gravity feeding the product directly from the formulation tank into the product container. For larger quantities, the process is often automated. Formulated product is transferred to the packaging line through pipes or hoses, or is received from a separate formulating facility and placed in a filler tank. A conveyor belt is used to carry product containers, such as jugs, bottles, cans, or drums, through the filling unit, where nozzles dispense the appropriate volume of product. The belt then carries the containers to a capper, which may be automated or manual, and to a labeling unit. Finally, the containers are packed into shipping cases (USEPA, 1996).

Figure 16: Typical Process for Liquid Formulating



Source: United States EPA, 1996

III.D.2. Dry Formulating and Packaging

Dry formulations also contain active and inert ingredients. The final product may be in many different forms, such as powders, dusts, granules, blocks, solid objects impregnated with pesticide (e.g., flea collars), pesticides formed into a solid shape (e.g., pressed tablets), microencapsulated dusts or granules (AI coated with a polymeric membrane to prevent premature degradation), or encapsulated water soluble packaging. They are formulated in various ways, including:

- mixing powdered or granular AIs with dry inert carriers;
- spraying or mixing a liquid active ingredient onto a dry carrier;
- soaking or using pressure and heat to force active ingredients into a solid matrix;
- mixing active ingredients with a monomer and allowing the mixture to polymerize into a solid; and
- drying or hardening an active ingredient solution into a solid form.

These dry pesticide products may be designed to be applied in solid form or dissolved or emulsified in water or solvent prior to application (USEPA, 1996).

Because there are many types of dry pesticide products, dry pesticide formulating lines can vary considerably. In general, though, dry formulating

R0074118

lines have tanks or containers to hold the active ingredients and inert raw materials, and may include mixing tanks, ribbon blenders, extruding equipment, high pressure and temperature tanks for impregnating solids with active ingredient, vacuums or other types of drying equipment, tanks or bins for storage of the formulated pesticide product, pelletizers, presses, milling equipment, sieves, and sifters (USEPA, 1996).

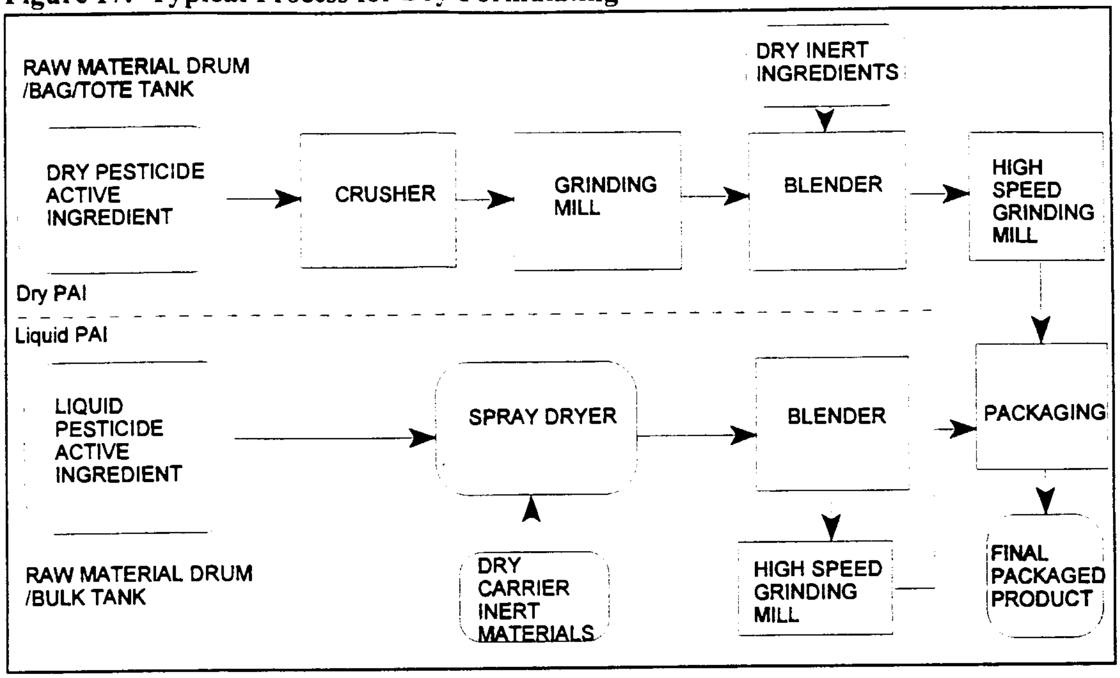
Raw materials for dry pesticide products may be liquid or solid. Liquid raw materials may be stored in rail tank cars, tank trucks, minibulks, drums, or bottles. Dry raw materials may be stored in silos, rail cars, tank trucks, minibulks, metal drums, fiber drums, bags, or boxes. Liquid raw materials may be pumped, poured or sprayed into formulation vessels, while dry raw materials are frequently transferred to formulation equipment by screw conveyors (consisting of a helix mounted on a shaft and turning in a trough), elevators, or by pouring.

Dry formulating lines may also include piping and pumps to move raw materials from storage tanks to the formulation equipment, and to move formulated pesticide product to the packaging equipment. Other items that may be included in the dry pesticide product line are premixing tanks, tanks for storing formulated product prior to packaging, stirrers, heaters, refrigeration units on formulation and storage equipment, scales, and air pollution control equipment (e.g., cyclones, filters, or baghouses) (USEPA, 1996).

Dry pesticide products may be packaged into rail tank cars, tank trucks, totes, and minibulks, but are typically packaged into bags, boxes, and drums. As with many liquid formulations, dry formulations are packaged by simply transferring the final product into boxes, drums, jugs, or bags. Small quantities or bags are typically packaged manually using a gravity feed from the formulating unit into the containers or bags. Larger quantities may be packaged on an automated line, similar to liquid packaging lines.

Figure 17 illustrates a dry pesticide formulation line.

Figure 17: Typical Process for Dry Formulating



Source: United States EPA, 1996

III.D.3. Aerosol Packaging

Some pesticide products (typically water-based or solvent-based liquids) are packaged as aerosols, which can be applied to surfaces or dispersed in the air. The product is placed in spray cans that are put under pressure and a propellant is added, which forces the product out of the can in an aerosol spray. An aerosol packaging line typically includes a filler, a capper, a propellant injector, and a United States Department of Transportation (DOT) test bath. In the filler, formulated pesticide product is dispensed into empty aerosol cans, in much the same way as the liquid packaging lines fill containers. The cans are then sent to the capper, where a cap with a nozzle is placed on the can. The can enters a separate room, where the propellent is injected into the can, a vacuum is pulled, and the cap is crimped to make the can airtight. In order to comply with DOT regulations on the transport of pressurized containers, each can must then be tested for leaks and rupturing in a DOT test bath. Test baths indicate leaks by the appearance of bubbles at the point of leakage on the cylinder. The aerosol packaging line may also include a can washer to remove residue from can exteriors prior to entering the test bath (to reduce contaminant buildup in the bath), a dryer to dry can exteriors, and machinery to package aerosol cans into boxes for shipment (USEPA, 1996).

R0074120

III.D.4. Pressurized Gas Formulating and Packaging

Some pesticide products are formulated and packaged as pressurized gases, primarily for the purpose of soil fumigation. Soil fumigation is used where the nematodic and fungal populations in soil prohibit successful seed planting. Volatile general toxicants, such as low molecular weight halogenated compounds, are typically injected into the soil before planting, but are also occasionally used once plants have reached maturity (Kent, 1992).

The active and inert ingredients are received as liquid, pressurized liquids, or gases, and are stored in tanks, tank trucks, rail cars, or minibulk storage containers. Liquid ingredients are placed in a holding tank prior to formulation. Formulating and packaging operations for these products usually occurs in one step in a closed-loop system. The ingredients are metered by weight through pressurized transfer lines into DOT-approved steel application cylinders. Other equipment that may be included in a pressurized gas line include pump and piping, and heating and refrigerating units to maintain gas pressures and temperatures in storage (USEPA, 1996).

The cylinders may be refilled at a later date, after they have been tested to ensure that they are still capable of containing pressurized fluids. DOT requires hydrostatic pressure testing, as well as visual examination of the cylinder (USEPA, 1996).

III.D.5. Repackaging

Repackaging operations are similar to packaging operations, except the "raw material" is an already formulated product that has been packaged for sale. Repackagers often purchase formulated pesticide products, transfer the product to new containers with customer-specific labeling, and sell them to distributors (USEPA, 1996).

A separate type of repackaging, called refilling, is usually performed by agrichemical facilities that transfer pesticide products from bulk storage tanks into minibulks. These refillable containers are typically constructed of plastic and typically have capacities ranging from 100 to 500 gallons. Minibulks may be owned by the refilling establishment, the pesticide registrant, or by the end user. Production lines usually consist of a bulk storage tank, a minibulk tank into which the product is repackaged, and any interconnecting hoses or piping. The bulk storage tanks may be dedicated by product and clustered together in a diked area. The products are dispensed to the minibulks by the use of manual system or a computer-regulated system of pumps and meters (USEPA, 1996).

III.E. Raw Material Inputs and Pollution Outputs

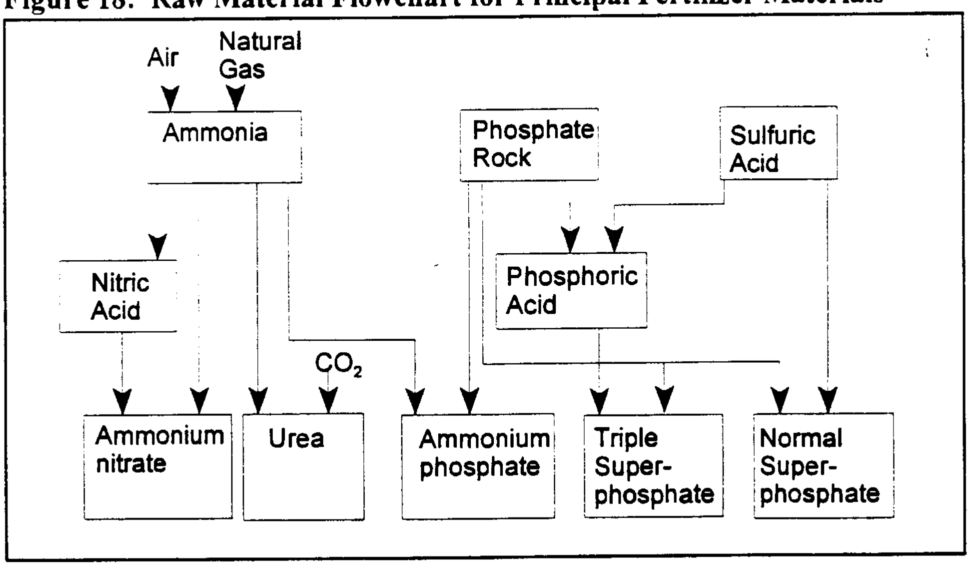
Raw material inputs and pollution outputs of fertilizer products and pesticide products differ considerably, and, therefore, are discussed separately below. The pollution outputs are discussed both specifically by product as well as generally by process since there are some similarities in the fertilizer and pesticide production processes and pollutant outputs.

III.E.1. Fertilizers

The primary raw materials for fertilizer manufacturing are phosphate rock, natural gas, sulfuric acid, and carbon dioxide. These materials are combined by several methods and in different proportions to produce a variety of fertilizer products, as described in section III.

Figure 18 summarizes the fertilizer material inputs for the principal fertilizer products.

Figure 18: Raw Material Flowchart for Principal Fertilizer Materials



Source: Adapted from Manual on Fertilizer Statistics, Food and Agriculture Organization of the United Nations, Rome 1991.

Because the basic fertilizer nutrients are found in many natural and manmade materials, raw materials for fertilizers can also be derived from sources other than the virgin materials described above. Common sources of fertilizer ingredients are sewerage treatment sludges and certain industrial wastes. Although these waste-derived fertilizers may contain essentially the same

R0074122

nutrients as fertilizers derived from virgin materials, they also may contain additional constituents that were present in the waste material and which may not be beneficial, or are potentially harmful to crops, human health, or the environment. Such constituents may enter the food chain or groundwater and could become concentrated in the soil after repeated use. Lead, cadmium and arsenic are some of the more common fertilizer ingredients that could be harmful if sufficient quantities are present. It should be noted, however, that fertilizers derived from virgin materials also have the potential to contain harmful levels of these constituents if significant quantities are naturally present in the raw materials.

One waste material input which has received some attention recently is cement kiln dust (CKD). Although there has been a considerable amount of research conducted on CKD use as a fertilizer, existing applications of CKD for this purpose have been mostly anecdotal, and there is only limited evidence that commercial CKD use as a fertilizer is growing significantly (USEPA, 1993b).

Like agricultural lime, CKD is alkaline and contains a number of essential plant nutrients. Because of these parallel characteristics, CKD has been used as an agricultural soil amendment. CKD possesses significant fertilizer potential, particularly because of its high potassium content. Soil scientists have also suggested that other key plant nutrients contained in CKD, such as calcium, phosphorous, and zinc, might be beneficial in some fertilizer applications. However, some concern has been raised over hazardous wastes in CKD (USEPA, 1993b).

Coal combustion by-products are also receiving attention for their potential agricultural benefits., including alleviating soil trace elemental deficiencies, modifying soil pH, and increasing levels of Ca and S, infiltration rates, depth of rooting, and drought tolerance. Flue gas desulfurization residues, which contain gypsum, have the potential to improve water use efficiency, product quality, and productivity of soil-crop systems. The short term benefits of coal combustion by-products usage has been demonstrated, however, long term effects have not been documented. Future hazards and benefits are yet to be determined (Korcak, 1995). Electric-arc furnace dust is also used as a fertilizer ingredient since it contains a number of trace elements required by plants, including zinc.

Pollution outputs are summarized in terms of air emission, wastewater, and residual wastes.

Air Emissions

Synthetic Ammonia

Air pollutants from the manufacture of synthetic anhydrous ammonia are emitted primarily from four process steps:

- regeneration of the desulfurization bed,
- heating of the catalytic steam,
- regeneration of carbon dioxide scrubbing solution,
- steam stripping of process condensate.

More than 95 percent of the ammonia plants in the United States use activated carbon fortified with metallic oxide additives for feedstock desulfurization. Vented regeneration steam contains sulfur oxides (SO_x) and hydrogen sulfide (H_2S), depending on the amount of oxygen in the steam. Regeneration may also emit hydrocarbons and carbon monoxide (CO). The reformer, heated with natural gas or fuel oil, may emit combustion products such as NO_x, CO, SO_x, hydrocarbons, and particulates (USEPA, 1993a).

Carbon dioxide (CO_2) is removed from the synthesis gas by scrubbing with monoethanolamine ($C_2H_4NH_2OH$) or hot potassium carbonate solution. Regeneration of this CO_2 scrubbing solution with steam produces emissions of water, NH_3, CO, CO_2 and monoethanolamine (USEPA, 1993a).

Cooling the synthesis gas after low temperature shift conversion forms a condensate containing NH_3, CO_2, methanol (CH_3OH), and trace metals. Condensate steam strippers are used to remove NH_3 and methanol from the water, and steam from this may be vented to the atmosphere, emitting NH_3, CO_2, and methanol (USEPA, 1993a).

Nitric Acid

Emissions from nitric acid manufacturing consist primarily of NO and NO_2 (which account for visible emissions), and trace amounts of HNO_3 mist and NH_3. The major source of nitrogen oxides is the tail gas from the acid absorption tower. In general, the quantity of nitrogen oxides (NO_x) emissions is directly related to the kinetics of the nitric acid formation reaction and absorption tower design. NO_x emissions can increase when there is:

- insufficient air supply to the oxidizer and absorber,
- low pressure, especially in the absorber,
- high temperatures in the cooler/condenser and absorber,
- production of an excessively high-strength product acid,
- operation at high throughput rates,
- faulty equipment such as compressors or pumps which lead to lower pressures, leaks, and reduced plant efficiency (USEPA, 1993a).

Comparatively small amounts of nitrogen oxides are also lost from acid concentrating plants. These losses (mostly NO_2) are from the condenser system, but the emissions are small enough to be controlled easily by absorbers.

Acid mist emissions do not occur from the tail gas of a properly operated plant. The small amounts that may be present in the absorber exit gas streams are typically removed by a separator or collector prior to entering the catalytic reduction unit or expander.

The acid production system and storage tanks can be a significant source of visible NOx emissions at nitric acid plants. Emissions from acid storage tanks are most likely to occur during tank filling (USEPA, 1993a).

Ammonium Nitrate

The primary air emissions from ammonium nitrate production plants are particulate matter (ammonium nitrate and coating materials), ammonia and nitric acid. Ammonia and nitric acid are emitted primarily from solution formation and granulators. Particulate matter (largely as ammonium nitrate) can be emitted from most of the process operations (USEPA, 1993a).

The emission sources in solution formation and concentration processes are neutralizers and evaporators, emitting nitric acid and ammonia. The vapor stream off the top of the neutralization reactor is primarily steam with some ammonia and NH_4NO_3 particulates present. Specific plant operating characteristics, however, make these emissions vary depending upon use of excess ammonia or acid in the neutralizer. Particulate emissions from these operations tend to be smaller in size than those from solids production and handling processes and generally are recycled back to the process (USEPA, 1993a).

Emissions from solids formation processes are ammonium nitrate particulate matter and ammonia. The sources of primary importance are prill towers (for high density and low density prills) and granulators (rotary drum and pan). Emissions from prill towers result from carryover of fine particles and fume by the prill cooling air flowing through the tower. These fine particles are from microprill formation, attrition of prills colliding with the tower or one another, and rapid transition of the ammonia nitrate between crystal states (USEPA, 1993a).

Microprill formation resulting from partially plugged orifices of melt spray devices can increase fine dust loading and emissions. Certain designs (spinning buckets) and practices (vibration of spray plates) help reduce plugged orifices and thus microprill formation. High ambient air temperatures can cause increased emissions because of entrainment as a result of higher air flow required to cool prills and because of increased fume formation at the higher temperatures (USEPA, 1993a).

Emissions from screening operations are generated by the attrition of the

R0074125

ammonium nitrate solids against the screens and against one another. Almost all screening operations used in the ammonium nitrate manufacturing industry are enclosed or have a cover over the uppermost screen. Emissions are ducted from the process for recovery or reuse (USEPA, 1993a).

Bagging and bulk loading operations are also a source of particulate emissions. Dust is emitted from each type of bagging process during final filling when dust laden air is displaced from the bag by the ammonium nitrate. The potential for emissions during bagging is greater for coated than for uncoated material. It is expected that emissions from bagging operations are primarily the kaolin, talc or diatomaceous earth coating matter. About 90 percent of solid ammonium nitrate produced domestically is bulk loaded. While particulate emissions from bulk loading are not generally controlled, visible emissions are within typical state regulatory requirements (below 20 percent opacity) (USEPA, 1993a).

Urea

Emissions from urea manufacture are mainly ammonia and particulate matter. Formaldehyde and methanol, hazardous air pollutants, may be emitted if additives are used. Formalin™, used as a formaldehyde additive, may contain up to 15 percent methanol. Ammonia is emitted during the solution synthesis and solids production processes. Particulate matter is emitted during all urea processes (USEPA, 1993a).

In the synthesis process, some emission control is inherent in the recycle process where carbamate gases and/or liquids are recovered and recycled. Typical emission sources from the solution synthesis process are noncondensable vent streams from ammonium carbamate decomposers and separators. Emissions from synthesis processes are generally combined with emissions from the solution concentration process and are vented through a common stack. Combined particulate emissions from urea synthesis and concentration operations are small compared to particulate emissions from a typical solids-producing urea plant. The synthesis and concentration operations are usually uncontrolled except for recycle provisions to recover ammonia (USEPA, 1993a).

Uncontrolled emission rates from prill towers may be affected by the following factors:

- product grade being produced
- air flow rate through the tower
- type of tower bed
- ambient temperature and humidity (USEPA, 1993a)

The total of mass emissions per unit is usually lower for feed grade prill production than for agricultural grade prills, due to lower airflows. Uncontrolled particulate emission rates for fluidized bed prill towers are higher than those for nonfluidized bed prill towers making agricultural grade prills, and are approximately equal to those for nonfluidized bed feed grade prills (USEPA, 1993a).

Ambient air conditions can affect prill tower emissions. Available data indicate that colder temperatures promote the formation of smaller particles in the prill tower exhaust. Since smaller particles are more difficult to remove, the efficiency of prill tower control devices tends to decrease with ambient temperatures. This can lead to higher emission levels for prill towers operated during cold weather. Ambient humidity can also affect prill tower emissions. Air flow rates must be increased with high humidity, and higher air flow rates usually cause higher emissions (USEPA, 1993a).

In the solids screening process, dust is generated by abrasion of urea particles and the vibration of the screening mechanisms. Therefore, almost all screening operations used in the urea manufacturing industry are enclosed or are covered over the uppermost screen. Emissions attributable to coating include entrained clay dust from loading, inplant transfer, and leaks from the seals of the coater (USEPA, 1993a).

Phosphoric Acid

Gaseous fluorides such as silicon tetrafluoride (SiF_4) and hydrogen fluoride (HF) can be major emissions from wet process acid production. Phosphate rock contains 3.5 to 4.0 percent fluorine. Part of the fluorine from the rock is precipitated with the gypsum, another part is leached out with the phosphoric acid product, and the remaining portion is vaporized in the reactor or evaporator. The relative quantities of fluorides in the filter acid and gypsum depend on the type of rock and the operating conditions. Final disposition of the volatilized fluoride depends on the design and operation of the plant (USEPA, 1993a).

The reactor in which phosphate rock is reacted with sulfuric acid is the main source of emissions. Fluoride emissions accompany the air used to cool the reactor slurry. Vacuum flash cooling has replaced the air cooling method to a large extent, since emissions are minimized in the closed system.

Acid concentration by evaporation is another source of fluoride emissions. Approximately 20 to 40 percent of the fluorine originally present in the rock vaporizes in this operation. Particulate matter containing fluorides can be emitted directly from process equipment. About three to six percent of the particulates can be fluorides, as measured at one facility (USEPA, 1993a).

Ammonium Phosphates

The major sources of air emissions from the production of ammonium phosphatic fertilizers include the reactor, the ammoniator-granulator, the dryer and cooler, product sizing and material transfer, and the gypsum pond.

The reactor and ammoniator-granulator produce emissions of gaseous ammonia, gaseous fluorides such as hydrogen fluoride (HF) and silicon tetrafluoride (SiF_4), and particulate ammonium phosphates. These two exhaust streams are generally combined and passed through primary and secondary scrubbers (USEPA, 1993a).

Exhaust gases from the dryer and cooler also contain ammonia, fluorides and particulates, and these streams are commonly combined and passed through cyclones and primary and secondary scrubbers. Particulate emissions and low levels of ammonia and fluorides from product sizing and material transfer operations are controlled the same way (USEPA, 1993a).

Normal Superphosphates

Sources of emissions at a normal superphosphate plant include rock unloading and feeding, mixing operations (in the reactor), storage (in the curing building), and fertilizer handling operations. Rock unloading, handling and feeding generate particulate emissions of phosphate rock dust. The mixer, den and curing building emit gases in the form of silicon tetrafluoride (SiF_4), hydrogen fluoride (HF) and particulates composed of fluoride and phosphate material (USEPA, 1993a).

Triple Superphosphates

Emissions of fluorine compounds and dust particles occur during the production of granulated triple superphosphate. Silicon tetrafluoride (SiF_4) and hydrogen fluoride (HF) are released by the acidulation reaction and they evolve from the reactors, den, granulator, and dryer. Evolution of fluoride is essentially finished in the dryer and there is little fluoride evolved from the storage pile in the curing building (USEPA, 1993a).

Sources of particulate emissions include the reactor, granulator, dryer, screens, cooler, mills, and transfer conveyors. Additional emissions of particulate result from the unloading, grinding, storage, and transfer of ground phosphate rock. Facilities may also use limestone, which is received in granulated form and does not require additional milling (USEPA, 1993a).

Wastewater

Wastewater from the fertilizer industry can be classified into four groups:

- process effluents resulting from contact with gas, liquids, or solids
- dedicated effluents which may be separated for use in one process or for recycling at a controlled rate
- effluents from general services such as cleaning or pretreatment
- occasional effluents such as leaks or spills

R0074128

A number of process wastewater streams from the nitrogenous fertilizer industry have been identified. Frequently these wastewaters contain high levels of nitrogenous compounds such as ammonia, nitrates, and organic nitrogen. In ammonia production, wastewater is generated from process condensate stripping. Ammonium nitrate manufacturing produces process wastewater in the neutralization process, the evaporation unit, and air cooling equipment. The vacuum condenser in urea plants is a source of wastewater. Most scrubbing operations are also a source of wastewater. Nitric acid production generates relatively little wastewater since there is no process wastewater source. Steam generated in nitrogenous fertilizer processing may contain dissolved and suspended solids, alkalinity, and hardness (USEPA, 1974).

The most common methods for removing nitrogenous compounds include:

- Biological nitrification/denitrification
- Air or steam stripping
- Ion exchange
- Breakpoint chlorination (Water Environment Federation, 1994).

The major source of wastewater from any phosphatic fertilizer manufacturing process is referred to as "pond water." Phosphoric acid production creates large quantities of pond water for cooling of the process, concentration of the product and for processing and storage of the gypsum byproduct. Gypsum slurry water is decanted from the top of the gypsum stacks and sent to the cooling pond through collection ditches (USEPA, 1993a). Through evaporation and recycling, contaminant concentrations in pond water can reach several grams per liter of phosphates and fluoride. Additional elemental contaminants in pond water which originate in phosphate rock are arsenic, cadmium, uranium, vanadium, and radium (USEPA, 1974).

The most common industry treatment for removing phosphorous is lime neutralization and settling.

Occasional wastewater is generated in any fertilizer production facility by leaks, spills, cleaning, maintenance, and laboratory tests. Cleaning of cooling and pollution control systems also produces process wastewater. Cooling water may contain ammonia, sulfate, chloride, phosphate, chromate, and dissolved solids which become concentrated through evaporation (USEPA, 1974). The laundry of workers' clothing is another source of wastewater originating outside the actual process.

Solid/Hazardous/Residual Wastes

One of the largest solid wastes in the fertilizer industry is phosphogypsum which is produced during phosphoric acid production. Approximately 1.5

tons of phosphogypsum is produced per ton of phosphate rock fed, or 5 tons per ton of phosphoric acid produced (expressed as P_2O_5). Gypsum (calcium sulphate dihydrate) is a mineral which also occurs in nature. Phosphogypsum is produced by the reaction of phosphate rock with sulphuric acid during the process of producing phosphoric acid. The term "phosphogypsum" is used to specify the particular gypsum arising from the acidulation of phosphate rock, because it contains trace amounts of many of the mineral impurities that accompany phosphate rock. One of these impurities is radium, the parent of radon. Other trace impurities found in phosphogypsum include arsenic, nickel, cadmium, lead, aluminum, fluoride, and phosphoric acid. Mainly because of the radium content, the EPA restricts use of phosphogypsum and stipulates that no phosphogypsum with radium over ten pCi/g can be removed from the stacks adjacent to the agricultural chemical plants (UNEP, 1996).

The use of waste phosphogypsum for other purposes has been widely encouraged, but economic and/or quality problems and/or the demand for the resulting products frequently inhibit or prevent this. These problems relate not only to the impurities in the gypsum, but also to its relatively high moisture content. Plasterboard, plaster, and cement are the main possibilities. It is also possible to recycle phosphogypsum in sulphuric acid production. The ready availability of natural gypsum and the high cost of gypsum-based sulphuric acid, as well as the presence of trace contaminants, are the main obstacles to its use (Miller, 1995). However, in countries where gypsum and other sulphurous raw materials are scarce, phosphogypsum has been successfully used for these purposes (UNEP, 1996).

Dumping gypsum on land is not possible everywhere because the material settles and dries slowly and requires an adequate land area and certain climatic and soil conditions where the stack is situated. Gypsum stacks are being increasingly regulated in terms of lining and cap systems to prevent contaminated leaching or runoff (UNEP, 1996).

All phosphate ores contain traces of radioactive elements and a number of metals. During processing, these are partitioned between beneficiation process wastes, the waste from the further processing into intermediate and finished fertilizer production, and some end up in the final product (UNEP, 1996).

Cadmium is a heavy metal which accumulates in living systems and can become toxic above certain limits. The quantity of cadmium contained in a phosphatic fertilizer depends on the source of the rock or waste material from which it was made. The cadmium content of phosphate rocks varies from almost zero to over 300 mg/kg P_2O_5. The acidulation of phosphate rock partitions the cadmium between the fertilizer product and the by-products, mainly the phosphogypsum arising from phosphoric acid production (UNEP, 1996).

The fertilizer industry has for some decades tried to develop cadmium separation processes. Processes studied so far have shown serious limitations and problems, with regard to safety, cost, energy consumption or environmental concerns. Currently available processes are expensive and are not economically viable except for phosphates destined for human or animal consumption, which have a greater added value. A process developed for removing cadmium from phosphoric acid, which is used in the production of many phosphatic fertilizers (except normal superphosphate), has shown promise on a laboratory scale, but needs further testing before being used on an industrial scale (UNEP, 1996).

Off-specification product, spills, and dusts collected in emission control systems are potential sources of residual wastes. Products are occasionally suspended or canceled, leaving stockpiles of residual product. Other possible sources of solid wastes are spent catalysts, spent containers, wastewater treatment sludges, and spent filters. Many of these wastes are transported off-site for disposal. However, with good housekeeping techniques and dedicated systems, some of these wastes may be recycled back into the process instead of being wasted.

Catalysts used in the steam reforming process need to be replaced every two to six years. Spent catalysts contain oxides of hexavalent chromium, zinc, iron, and nickel. They are typically returned to the manufacturer or other metal recovery companies for recycling and reclamation of valuable materials (UNEP, 1996).

III.E.2. Pesticide Formulating, Packaging, and Repackaging

As listed below, input raw materials include the pesticide concentrates from pesticide manufacturing plants as well as diluents and other chemical additives used in the formulating process:

- **Active Ingredients**
  Organic/inorganic pesticides: insecticides, herbicides, fungicides, and others. *(See Table 10.)*

- **Formulation and preparation materials**
  Dry formulations:
    organic flours, sulfur, silicon oxide, lime, gypsum, talc, pyrophyllite, bentonites, kaolins, attapulgite, and volcanic ash.

  Liquid formulations:
    Solvents: xylenes, kerosenes, methyl isobutyl ketone, amyl acetate, and chlorinated solvents.

Propellants: carbon dioxide and nitrogen.
Others: wetting and dispersing agents, masking agents, deodorants, and emulsifiers (USEPA, 1990).

In addition to pesticide materials, some facilities listed under SIC code 2879 produce fertilizer/pesticide blends. A variety of nitrogenous, phosphatic, and mixed fertilizers may be inputted into bulk blending tanks to produce these combinations.

Table 10: Approximate Quantities of Most Commonly Used Conventional Pesticides in United States Agricultural Crop Production

Chemical	1995 Consumption (Million pounds active ingredient)	Chemical	1995 Consumption (Million pounds active ingredient)
Atrazine	68-73	Chlorpyrifos	9-13
Metolachlor	59-64	Chlorothalonil	8-12
Metam Sodium	449-54	Copper Hydroxide	7-11
Methyl Bromide	39-46	Propanil	6-10
Dichloropropene	38-43	Dicamba	6-10
2,4-D	31-36	Terbufos	6-9
Glyphosate	25-30	Mancozeb	6-9
Cyanazine	24-29	Fluometuron	5-9
Pendimethalin	23-28	MSMA	4-8
Trifluralin	23-28	Bentazone	4-8
Acetochlor	22-27	Parathion	4-7
Alachlor	19-24	Sodium Chlorate	4-6
EPTC	9-13

Air Emissions

Air emissions can be generated throughout the pesticide formulating and packaging processes, mostly when fine particulates of pesticide dust become suspended in air while the materials are being moved, processed, or stored. Most dust or granule blending mills are equipped with vacuum systems, cyclones, and wet scrubbers to collect fugitive dust. Some vacuum systems are dedicated to certain processes to facilitate reuse of the dust. Other systems are used to collect dust from a number of areas (USEPA, 1990). Dust generated by pesticide formulation processes contain AIs which may be toxic to humans and the environment. Thus, they are important to contain.

Volatile organic compound (VOC) emissions such as xylene may also arise when solvent-based liquid formulations are produced. VOC emissions may also be generated during equipment cleaning with solvents.

Wastewater

Process wastewater is defined in 40 CFR 122.2 as "any water which, during manufacturing or processing, comes into direct contact with or results from the production or use of any raw material, byproduct, intermediate product, finished product, or waste product." Wastewater from the pesticide formulating industry is typically due to cleaning of equipment and related process areas and not the actual formulating processes (USEPA, 1996).

Cleaning and decontaminating blending and liquid pesticide mixing and storage equipment generates pesticide-contaminated wastewater or solvent, depending upon whether the equipment is used to formulate water or solvent-based pesticides. Decontamination is performed between batches of different types of formulations to prevent cross contamination of the subsequent batch. Decontamination is also performed prior to taking the equipment out of service for maintenance. The decontamination is commonly performed using high pressure water hoses equipped with spray nozzles, portable steam generators, or by running a batch of solvent through the formulating equipment (USEPA, 1990).

Active ingredient containers, such as 55-gallon drums, are often decontaminated by triple rinsing. The decontamination is usually performed using a high pressure water hose equipped with a spray nozzle or a portable steam jenny. The containers can then be sold or given to commercial recycling firms, depending on label directions (USEPA, 1990).

Floor, wall, and equipment exterior washing is typically performed using water hoses equipped with spray nozzles. It may also involve the use of mops and squeegees. Wastewater is also generated by clean-up of spills and leaks.

Wastewater from these operations typically contains AIs, solvents, and wetting agents (USEPA, 1990). Other sources of wastewater include:

- Pollution control scrubber water
- Department of Transportation leak test water
- Safety equipment wash water
- Laboratory equipment wash water

- Shower water
- Laundry water
- Fire protection test water
- Contaminated precipitation runoff (USEPA, 1996)

Solid/Hazardous/Residual Wastes

Residual wastes include containers and container liners potentially contaminated with pesticides, as well as off-spec product, dust collected from emission control equipment, and product spills. Contaminated laboratory equipment and protective workers clothing are other potential solid waste sources (USEPA, 1990).

Decontamination of the solid-based pesticide blending mills may generate solid diluent contaminated with pesticides. The diluent typically consists of clay for dust mills and sand for granule mills (USEPA, 1990).

In case of pesticide products which have been suspended or canceled, there may be existing stocks of these products remaining. EPA may allow the use of existing stocks or prohibit such use. State environmental agencies occasionally collect unusable pesticides.

Procedures for pesticide management have been proposed by EPA, as authorized under section 19 of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). For more details, refer to section VI.C on pending and proposed regulatory requirements.

Table 11: Summary of Potential Pollution Outputs for the Agricultural Chemical Industry

Process	Air Emissions	Process Wastewater	Residual Waste
Nitric Acid Absorption Tower	NO, NO_2, HNO_3 in tailgas	NA	Spent tower materials, trays
Solution Formulation and Granulation	NH_3, HNO_3 particulates	Condensed steam with NH_4NO_3 and NH_3	NA
Solids Formation	Particulates, NO_x, SiF_4, HF	NA	Dusts
Regeneration of Desulfurization and Filter Beds	Hydrocarbons, CO, NH_3, CO_2	Condensed steam, NH_3, CO_2	Spent bed material
Screening	Dust	NA	Mixed undersized captured dusts, used screens
Wet Process Phosphoric Acid Production	SiF_4, HF	Pond water	Gypsum
Unloading of materials into blending tanks	Dust/particulates released in transfer	NA	Leftover raw material containers
Open processing and storage equipment	VOC's	NA	NA
Equipment and facility cleaning	NA	Washwater, waste solvent	Waste sands and clays, used mops/ squeegees/etc.
Laboratory procedures	VOC's and dusts released	Washwater, lab testing water	Off-spec product used for testing/analysis
Spills and runoff	Dust/particulates released by spill	Contaminated rainfall/runoff	Contaminated solid product
Pollution control systems	NA	Contaminated scrubber water	Spent filter material

III.F. Management of Chemicals in Wastestream

The Pollution Prevention Act of 1990 (PPA) requires facilities to report information about the management of Toxic Release Inventory (TRI) chemicals in waste and efforts made to eliminate or reduce those quantities. These data have been collected annually in section 8 of the TRI reporting Form R beginning with the 1991 reporting year. The data summarized below cover the years 1995-1998 and are meant to provide a basic understanding of the quantities of waste handled by the industry, the methods typically used to manage this waste, and recent trends in these methods. TRI waste management data can be used to assess trends in source reduction within individual industries and facilities, and for specific TRI chemicals. This information could then be used as a tool in identifying opportunities for pollution prevention or compliance assistance activities.

While the quantities reported for 1995 and 1996 are estimates of quantities already managed, the quantities listed by facilities for 1997 and 1998 are projections only. The PPA requires these projections to encourage facilities to consider future source reduction, not to establish any mandatory limits. Future-year estimates are not commitments that facilities reporting under TRI are required to meet.

Fertilizers

Table 12 shows that the TRI reporting fertilizer manufacturing and mixing facilities managed about 566 million pounds of production related wastes (total quantity of TRI chemicals in the waste from routine production operations in column B) in 1996. From the yearly data presented in column B, the total quantity of production related TRI wastes decreased between 1995 and 1996. Production related wastes are projected to increase in 1997 and 1998. Note that the affects of production increases and decreases on the quantities of wastes generated are not evaluated here.

In 1996, about 84 percent of the industry's TRI wastes were managed on-site through recycling, energy recovery, or treatment as shown in columns C, D, and E, respectively. Most of these on-site managed wastes were recycled on-site. There is a negligible amount (<1%) of wastes being transferred off-site for recycling, energy recovery, or treatment. The remaining portion of the production related wastes (12 percent in 1995 and 16 percent in 1996), shown in column I, is either released to the environment through direct discharges to air, land, water, and underground injection, or is transferred off-site for disposal.

Table 12: Source Reduction and Recycling Activity for the Fertilizer Industry as Reported within TRI

[b] Total TRI transfers and releases as reported in section 5 and 6 of Form R as a percentage of production related wastes.

[c] Percentage of production related waste released to the environment and transferred off-site for disposal.

Pesticides and Miscellaneous Agricultural Chemicals

Table 13 shows that the TRI reporting pesticide and miscellaneous agricultural chemicals facilities managed about 252 million pounds of production related wastes (total quantity of TRI chemicals in the waste from routine production operations in column B) in 1996. From the yearly data presented in column B, the total quantity of production related TRI wastes increased between 1995 and 1996. Production related wastes were projected to continue to increase in 1997 and 1998. Note that the affects of production increases and decreases on the quantities of wastes generated are not evaluated here.

In 1996, about 95 percent of the industry's TRI wastes were managed on-site through recycling, energy recovery, or treatment as shown in columns C, D, and E, respectively. Most of these on-site managed wastes were recycled on-site. A small portion of the remaining wastes (4% in 1996) are transferred off-site for recycling, energy recovery, or treatment. The remaining one percent of the production related wastes, shown in column I, is either released to the environment through direct discharges to air, land, water, and underground injection, or is transferred off-site for disposal.

IV. CHEMICAL RELEASE AND TRANSFER PROFILE

This section is designed to provide background information on the pollutant releases that are reported by this industry in correlation with other industries. The best source of comparative pollutant release information is the Toxic Release Inventory (TRI). Pursuant to the Emergency Planning and Community Right-to-Know Act, TRI includes self-reported facility release and transfer data for over 600 toxic chemicals. Facilities within SIC Codes 20 through 39 (manufacturing industries) that have more than 10 employees, and that are above weight-based reporting thresholds are required to report TRI on-site releases and off-site transfers. The information presented within the sector notebooks is derived from the most recently available (1996) TRI reporting year (which includes over 600 chemicals), and focuses primarily on the on-site releases reported by each sector. Because TRI requires consistent reporting regardless of sector, it is an excellent tool for drawing comparisons across industries. TRI data provide the type, amount and media receptor of each chemical released or transferred.

Although this sector notebook does not present historical information regarding TRI chemical releases over time, please note that in general, toxic chemical releases have been declining. In fact, according to the 1996 Toxic Release Inventory Public Data Release, reported onsite releases of toxic chemicals to the environment decreased by 5 percent (111.6 million pounds) between 1995 and 1996 (not including chemicals added and removed from the TRI chemical list during this period). Reported releases dropped by 48 percent between 1988 and 1996. Reported transfers of TRI chemicals to off-site locations increased by 5 percent (14.3 million pounds) between 1995 and 1996. More detailed information can be obtained from EPA's annual Toxics Release Inventory Public Data Release book (which is available through the EPCRA Hotline at 800-535-0202), or directly from the Toxic Release Inventory System database (for user support call 202-260-1531).

Wherever possible, the sector notebooks present TRI data as the primary indicator of chemical release within each industrial category. TRI data provide the type, amount and media receptor of each chemical released or transferred. When other sources of pollutant release data have been obtained, these data have been included to augment the TRI information.

TRI Data Limitations

Certain limitations exist regarding TRI data. Within some sectors, (e.g. dry cleaning, printing and transportation equipment cleaning) the majority of facilities are not subject to TRI reporting because they are not considered manufacturing industries, or because they are below TRI reporting thresholds. For these sectors, release information from other sources has been included. In addition, many facilities report TRI more under than one SIC code reflecting the multiple operations carried out onsite whether or not the operation is the facilities primary area of business as reported to the U.S. Census Bureau. Reported chemicals are limited to the approximately 600 TRI chemicals. A portion of the emissions from agricultural chemical facilities, therefore, are not captured by TRI. Also, reported releases and transfers may or may not all be associated with the industrial operations described in this notebook.

The reader should also be aware that TRI "pounds released" data presented within the notebooks is not equivalent to a "risk" ranking for each industry. Weighting each pound of release equally does not factor in the relative toxicity of each chemical that is released. The Agency is in the process of developing an approach to assign toxicological weightings to each chemical released so that one can differentiate between pollutants with significant differences in toxicity. As a preliminary indicator of the environmental impact of the industry's most commonly released chemicals, the notebook briefly summarizes the toxicological properties of the top five chemicals (by weight) reported by each industry.

Definitions Associated With Section IV Data Tables

General Definitions

SIC Code -- is the Standard Industrial Classification (SIC) code, a statistical classification standard used for all establishment-based federal economic statistics. The SIC codes facilitate comparisons between facility and industry data.

TRI Facilities -- are manufacturing facilities that have 10 or more full-time employees and are above established chemical throughput thresholds. Manufacturing facilities are defined as facilities in Standard Industrial Classification primary codes 20-39. Facilities must submit estimates for all chemicals that are on the EPA's defined list and are above throughput thresholds.

Data Table Column Heading Definitions

The following definitions are based upon standard definitions developed by EPA's Toxic Release Inventory Program. The categories below represent the possible pollutant destinations that can be reported.

RELEASES -- are on-site discharges of a toxic chemical to the environment. This includes emissions to the air, discharges to bodies of water, releases at the facility to land, as well as contained disposal into underground injection wells.

Releases to Air (Point and Fugitive Air Emissions) -- include all air emissions from industry activity. Point emissions occur through confined air streams as found in stacks, vents, ducts, or pipes. Fugitive emissions include equipment leaks, evaporative losses from surface impoundments and spills, and releases from building ventilation systems.

Releases to Water (Surface Water Discharges) -- encompass any releases going directly to streams, rivers, lakes, oceans, or other bodies of water. Releases due to runoff, including storm water runoff, are also reportable to TRI.

Releases to Land -- occur within the boundaries of the reporting facility. Releases to land include disposal of toxic chemicals in landfills, land treatment/application farming, surface impoundments, and other disposal on land (such as spills, leaks, or waste piles).

Underground Injection -- is a contained release of a fluid into a subsurface well for the purpose of waste disposal. Wastes containing TRI chemicals are injected into either Class I wells or Class V wells. Class I wells are used to inject liquid hazardous wastes or dispose of industrial and municipal wastewaters beneath the lowermost underground source of drinking water. Class V wells are generally used to inject non-hazardous fluid into or above an underground source of drinking water. TRI reporting does not currently distinguish between these two types of wells, although there are important differences in environmental impact between these two methods of injection.

TRANSFERS -- are transfers of toxic chemicals in wastes to a facility that is geographically or physically separate from the facility reporting under TRI. Chemicals reported to TRI as transferred are sent to off-site facilities for the purpose of recycling, energy recovery, treatment, or disposal. The quantities reported represent a movement of the chemical away from the reporting facility. Except for off-site transfers for disposal, the reported quantities do not necessarily represent entry of the chemical into the environment.

Transfers to POTWs -- are wastewater transferred through pipes or sewers to a publicly owned treatments works (POTW). Treatment or removal of a chemical from the wastewater depends on the nature of the chemical, as well as the treatment methods present at the POTW. Not all TRI chemicals can be treated or removed by a POTW. Some chemicals, such as metals, may be removed but not destroyed and may be disposed of in landfills or discharged to receiving waters.

Transfers to Recycling -- are wastes sent off-site for the purposes of regenerating or recovery by a variety of recycling methods, including solvent recovery, metals recovery, and acid regeneration. Once these chemicals have been recycled, they may be returned to the originating facility or sold commercially.

Transfers to Energy Recovery -- are wastes combusted off-site in industrial furnaces for energy recovery. Treatment of a chemical by incineration is not considered to be energy recovery.

Transfers to Treatment -- are wastes moved off-site to be treated through a variety of methods, including neutralization, incineration, biological destruction, or physical separation. In some cases, the chemicals are not destroyed but prepared for further waste management.

Transfers to Disposal -- are wastes taken to another facility for disposal, generally as a release to land or as an injection underground.

IV.A. EPA Toxic Release Inventory for the Fertilizer, Pesticide, and Agricultural Chemical Industry

This section summarizes the TRI data of fertilizer manufacturing and mixing facilities reporting SIC codes 2873, 2874, or 2875 as their primary SIC code and of pesticide and miscellaneous agricultural chemicals formulating facilities reporting SIC code 2879 as their primary SIC code.

According to the 1995 Toxics Release Inventory (TRI) data, 190 fertilizer and pesticide facilities reporting SIC 2873, 2874, 2875, or 2879 released (to the air, water, or land) and transferred (shipped off-site or discharged to sewers) a total of 106 million pounds of toxic chemicals during calendar year 1996. This represents approximately 2 percent of the 5.6 billion pounds of releases and transfers from all manufacturers (SICs 20-39) reporting to TRI that year. The top two chemicals released by weight are ammonia and phosphoric acid (both from fertilizer manufacturing). These two account for about 89 percent (82 million pounds) of the industry's total releases. Xylene, methanol, and ethylbenzene are the three top chemicals transferred by weight (all from pesticide formulating). These three account for about 71 percent (9 million pounds) of the total TRI chemicals transferred by the industries. The variability in facilities' TRI chemical profiles may be attributed to the variety of processes and products in the industries. Eighty-seven percent of the 243 different chemicals reported were reported by fewer than 10 facilities.

Fertilizers (SIC 2873, 2874, 2875)

According to 1996 TRI data, fertilizer manufacturing and mixing facilities released and transferred approximately 93 million pounds of pollutants during calendar year 1996. One hundred and ninety facilities reported TRI emissions for 46 chemicals. Only 13 of the 46 chemicals (28 percent) were reported (as releases and/or transfers) by ten or more facilities, evidence of the diversity of the industry. Fertilizer facilities released an average of 481,000 pounds per facility and transferred an average of 8.000 pounds per facility. The high release per facility values are, in a large part, a result of significant releases for ammonia and phosphoric acid from seventy or more facilities.

Releases

Table 14 presents the number and weights of chemicals released by fertilizer manufacturing and mixing facilities reporting SIC 2873, 2874, and 2875 in 1996. The total quantity of releases was 91.3 million pounds or 98 percent of the total weight of chemicals reported to TRI by the fertilizer industry (i.e., releases and transfers). The top chemical released by this industry is ammonia, accounting for 54 percent of the total releases. Phosphoric acid is the next largest release at 35 percent of the total. Fifty-eight percent of all TRI releases in the fertilizer industry were air emissions, 53 percent as point source and 5 percent as fugitive. Ammonia accounts for 91 percent of air releases. The majority of the other releases were land disposed (32 percent) with phosphoric acid accounting for 99 percent of land disposals. The remaining nine percent was released as water discharges or underground injections.

Transfers

Table 15 presents the number and weights of chemicals transferred off-site by fertilizer manufacturing and mixing facilities reporting SIC 2873, 2874, or 2875 in 1996. The total amount of transfers was about 1.5 million pounds or only two percent of the total amount of chemicals reported to TRI by the fertilizer industry (i.e., releases and transfers). Transfers to recycling facilities accounted for the largest amount, 51 percent of the total transfers. The next greatest percentage went for disposal and the rest to treatment facilities. No energy recovery transfers were reported for this industry. Copper compounds, phosphoric acid, and zinc compounds represented the largest transfers (primarily to recycling), as 60 percent of the total transfers. Ammonia only accounted for 4 percent of the transfers compared to 54 percent of releases.

Pesticides and Miscellaneous Agricultural Chemicals (SIC 2879)

According to 1996 TRI data, pesticide formulating facilities released and transferred approximately 13 million pounds of pollutants during calendar year 1996. One hundred and ninety-three facilities reported TRI emissions for 197 chemicals in 1996. Only 18 (9 percent) of these chemicals were reported by ten or more facilities, evidence of the particularly diverse nature of the industry. Pesticide formulating facilities released an average of 10,000 pounds of pollutants per facility and transferred an average of 59,000 pounds per facility. The high average transfer per facility is due mostly to high average xylene, ethylbenzene, and methanol transfers.

Releases

Table 16 presents the number and weights of chemicals released by pesticide and miscellaneous agricultural chemicals formulating facilities reporting SIC 2879 in 1996. The total amount of releases was 2.0 million pounds or 15 percent of the total quantity of TRI chemicals reported by the pesticide and miscellaneous agricultural chemicals industry (i.e., releases and transfers). This is substantially less than the 98 percent of reported chemicals released by the fertilizer industry. The top two chemicals released by this industry are methanol (23 percent of releases) and dichloromethane (13 percent of releases).

About 69 percent (1.4 million pounds) of all the chemicals released by the pesticide industry were released to air in the form of point source emissions (50 percent) and fugitive air releases (19 percent). Air releases were primarily comprised of dichloromethane, carbon disulfide, and methyl isobutyl ketone. Approximately 29 percent of the releases were by underground injection, and the remaining releases were to water (2 percent) and land disposal (1 percent). The relatively large number of chemicals reported to TRI under SIC 2879 compared to the fertilizer industry illustrates the variety of chemical formulations produced by the pesticide industry.

Transfers

Table 17 presents the number and weights of chemical transfers by the pesticide and miscellaneous agricultural chemicals formulating facilities reporting SIC 2879 in 1996. The total amount of transfers off-site was 11.3 million pounds or 85 percent of the total amount of chemicals reported to TRI by the pesticide industry (i.e., releases and transfers). Xylene, methanol, and ethylbenzene accounted for 58, 12, and 10 percent, respectively, of the chemical TRI transfers. Transfers to recycling facilities accounted for the largest quantity (51 percent) although only eight facilities reported recycling transfers. Xylene accounted for 84 percent of all recycling transfers. Energy recovery and treatment accounted for 23 and 31 percent respectively. The remainder of transfers consisted of off-site disposals.

Table 14: 1996 TRI Releases for Agricultural Chemicals Facilities (SICs 2873,2874,2875) by Number of Facilities Reporting (Releases reported in pounds/year)

Chemical Name	# Reporting Chemical	Fugitive Air	Point Air	Water Discharges	Underground Injection	Land Disposal	Total Releases	Avg. Releases Per Facility

** Total number of facilities (not chemical reports) reporting to TRI in this industry sector.

R0074153

Top 10 TRI Releasing Agricultural Chemical Companies

The TRI database contains a detailed compilation of self-reported, facility-specific chemical releases. The top reporting facilities for the agricultural chemical industries are listed below in Tables 18,19, 20, and 21. Facilities that have reported the primary SIC codes covered under this notebook appear on Table 18 for fertilizers and Table 20 for pesticides and miscellaneous agricultural chemicals. Tables 19 and 21 contain additional facilities that have reported the SIC codes covered within this report, and one or more SIC codes that are not within the scope of this notebook. Therefore, the second list includes facilities that conduct multiple operations -- some that are under the scope of this notebook, and some that are not. Currently, the facility-level data do not allow pollutant releases to be broken apart by industrial process.

Table 18: Top 10 TRI Releasing Fertilizer Manufacturing and Mixing Facilities (SIC 2873, 2874, 2875)*

Rank	Facility	Total TRI Releases in Pounds
1	PCS Phosphate Co., Inc. - Aurora, NC	13,202,617
2	CF Ind. Inc. - Donaldsonville, LA	5,823,740
3	Unocal Agricultural Products - Kenai, AK	4,715,420
4	Terra Nitrogen - Catoosa, OK	4,147,000
5	PCS Nitrogen Fertilizer LP - Millington, TN	3,957,624
6	IMC Nitrogen Co. - East Dubuque, IL	3,954,025
7	IMC-Agrico - Uncle Sam, LA	3,570,548
8	Triad Chemical - Donaldsonville, LA	3,478,835
9	IMC-Agrico - Mulberry, FL	3,161,160
10	Farmland Ind. Inc. - Enid, OK	2,804,790
	Total	**45,615,759**

IV.B. Summary of Selected Chemicals Released

The following is a synopsis of current scientific toxicity and fate information for the top chemicals (by weight) that facilities within this sector self-reported as released to the environment based upon 1995 TRI data. Because this section is based upon self-reported release data, it does not attempt to provide information on management practices employed by the sector to reduce the release of these chemicals. Information regarding pollutant release reduction over time may be available from EPA's TRI and 33/50 programs, or directly from the industrial trade associations that are listed in Section IX of this document. Since these descriptions are cursory, please consult these sources for a more detailed description of both the chemicals described in this section, and the chemicals that appear on the full list of TRI chemicals appearing in Section IV.A.

The brief descriptions provided below were taken from the Hazardous Substances Data Bank (HSDB) and the Integrated Risk Information System (IRIS), both accessed via TOXNET.[2] The discussions of toxicity describe the range of possible adverse health effects that have been found to be associated with exposure to these chemicals. These adverse effects may or may not occur at the levels released to the environment. Individuals interested in a more detailed picture of the chemical concentrations associated with these adverse effects should consult a toxicologist or the toxicity literature for the chemical to obtain more information. The effects listed below must be taken in context of these exposure assumptions that are explained more fully within the full chemical profiles in HSDB. For more information on TOXNET, contact the TOXNET help line at 1-800-231-3766.

[2] TOXNET is a computer system run by the National Library of Medicine that includes a number of toxicological databases managed by EPA, National Cancer Institute, and the National Institute for Occupational Safety and Health. For more information on TOXNET, contact the TOXNET help line at 800-231-3766. Databases included in TOXNET are: CCRIS (Chemical Carcinogenesis Research Information System), DART (Developmental and Reproductive Toxicity Database), DBIR (Directory of Biotechnology Information Resources), EMICBACK (Environmental Mutagen Information Center Backfile), GENE-TOX (Genetic Toxicology), HSDB (Hazardous Substances Data Bank), IRIS (Integrated Risk Information System), RTECS (Registry of Toxic Effects of Chemical Substances), and TRI (Toxic Chemical Release Inventory). HSDB contains chemical-specific information on manufacturing and usage, chemical and physical properties, safety and handling, toxicity and biomedical effects, pharmacology, environmental fate and exposure potential, exposure standards and regulations, monitoring and analysis methods, and additional references.

Ammonia[3] *(CAS: 7664-41-7)*

Sources. Ammonia is the primary nitrogen source for all nitrogenous fertilizers and ammonium phosphatic fertilizers.

Toxicity. Anhydrous ammonia is irritating to the skin, eyes, nose, throat, and upper respiratory system.

Ecologically, ammonia is a source of nitrogen (an essential element for aquatic plant growth), and may therefore contribute to eutrophication of standing or slow-moving surface water, particularly in nitrogen-limited waters such as the Chesapeake Bay. In addition, aqueous ammonia is moderately toxic to aquatic organisms.

Carcinogenicity. There is currently no evidence to suggest that ammonia is carcinogenic.

Environmental Fate. Ammonia combines with sulfate ions in the atmosphere and is washed out by rainfall, resulting in rapid return of ammonia to the soil and surface waters.

Ammonia is a central compound in the environmental cycling of nitrogen. Ammonia in lakes, rivers, and streams is converted to nitrate.

Physical Properties. Ammonia is a colorless gas at atmospheric pressure, but is shipped as a liquefied compressed gas. It is soluble to about 34 percent in water and has a boiling point of -28 degrees F. Ammonia is corrosive and has a pungent odor.

Phosphoric Acid (CAS: 7664-38-2)

Sources. Phosphoric acid is the primary phosphorous source used for phosphatic fertilizers.

Toxicity. Phosphoric acid is toxic by ingestion and inhalation, and is an irritant to skin and eyes. The toxicity of phosphoric acid is related to its corrosivity as an acid, with ulceration of membranes and tissues with which it comes in contact. Because it is a source of phosphorous, an essential element for aquatic plant growth, phosphoric acid may contribute to eutrophication of standing or slow-moving surface water, particularly in phosphorous-limited waters such as the Great Lakes.

[3] The reporting standards for ammonia were changed in 1995. Ammonium sulfate is deleted from the list and threshold and release determinations for aqueous ammonia are limited to 10 percent of the total ammonia present in solution. This change will reduce the amount of ammonia reported to TRI. Complete details of the revisions can be found in 40 CFR Part 372.

Carcinogenicity. There is currently no evidence to suggest that phosphoric acid is carcinogenic.

Environmental Fate. The acidity of phosphoric acid may be reduced readily by natural water hardness minerals. The phosphate will persist until used by plants as a nutrient.

Physical Properties. Phosphoric acid is a thick, colorless, and odorless crystalline solid, often used in an aqueous solution. Its boiling point is 415° F and it is soluble in water.

Nitrate compounds

Sources. Many different nitrate compounds are formed during nitrogenous fertilizer production.

Toxicity. Nitrate compounds that are soluble in water release nitrate ions which can cause both human health and environmental effects. Human infants exposed to aqueous solutions of nitrate ion can develop a condition in which the blood's ability to carry oxygen is reduced. This reduced supply of oxygen can lead to damaged organs and death. Because it is a source of nitrogen, an essential element for aquatic plant growth, nitrate ion may contribute to eutrophication of standing or slow-moving surface water, particularly in nitrogen-limited waters, such as the Chesapeake Bay.

Carcinogenicity. There is currently no evidence to suggest that nitrate compounds are carcinogenic.

Environmental Fate. Nitrogen in nitrate is the form of nitrogen most available to plants. In the environment, nitrate ion is taken up by plants and becomes part of the natural nitrogen cycle. Excess nitrate can stimulate primary production in plants and can produce changes in the dominant species of plants, leading to cultural eutrophication and ultimately to deterioration of water quality.

Methanol (CAS: 67-56-1)

Sources. Methanol is generated in ammonia production. It is also used as a solvent and for equipment cleaning in pesticide formulations.

Toxicity. Methanol is readily absorbed from the gastrointestinal tract and the respiratory tract and is toxic to humans in moderate to high doses. In the body, methanol is converted into formaldehyde and formic acid. Methanol is excreted as formic acid. Observed toxic effects at high dose levels generally include central nervous system damage and blindness. Long-term exposure to high levels of methanol via inhalation cause liver and blood damage in animals.

Ecologically, methanol is expected to have low toxicity to aquatic organisms. Concentrations lethal to half the organisms of a test population are expected to exceed one mg methanol per liter water. Methanol is not likely to persist in water or to bioaccumulate in aquatic organisms.

Carcinogenicity. There is currently no evidence to suggest that methanol is carcinogenic.

Environmental Fate. Methanol is highly volatile and flammable. Liquid methanol is likely to evaporate when left exposed. Methanol reacts in air to produce formaldehyde which contributes to the formation of air pollutants. In the atmosphere it can react with other atmospheric chemicals or be washed out by rain. Methanol is readily degraded by microorganisms in soils and surface waters.

Physical Properties. Methanol is a colorless liquid with a characteristic pungent odor. It is miscible with water, and its boiling point is 147°F.

Sulfuric Acid (CAS: 7664-93-9)

Sources. Sulfuric acid is a raw material of most fertilizer products.

Toxicity. Concentrated sulfuric acid is corrosive. In its aerosol form, sulfuric acid has been implicated in causing and exacerbating a variety of respiratory ailments.

Ecologically, accidental releases of solution forms of sulfuric acid may adversely affect aquatic life by inducing a transient lowering of the pH (i.e., increasing the acidity) of surface waters. In addition, sulfuric acid in its aerosol form is also a component of acid rain. Acid rain can cause serious damage to crops and forests.

Carcinogenicity. There is currently no evidence to suggest that sulfuric acid is carcinogenic.

Environmental Fate. Releases of sulfuric acid to surface waters and soils will be neutralized to an extent due to the buffering capacities of both systems. The extent of these reactions will depend on the characteristics of the specific environment.

Physical Properties. Sulfuric acid is an oily, odorless liquid which can be colorless to dark-brown. It is miscible, and its boiling point is 554°F.

Sulfuric acid reacts violently with water with evolution of heat and is corrosive to metals. Pure sulfuric acid is a solid below 51 °F.

IV.C. Other Data Sources

The toxic chemical release data obtained from TRI captures only about 236 of the facilities in the Fertilizer, Pesticide, and Agricultural Chemical Industry. However, it allows for a comparison across years and industry sectors. Reported chemicals are limited to the approximately 600 TRI chemicals. A portion of the emissions from agricultural chemical facilities, therefore, are not captured by TRI. The EPA Office of Air Quality Planning and Standards has compiled air pollutant emission factors for determining the total air emissions of priority pollutants (e.g., total hydrocarbons, SOx, NOx, CO, particulates, etc.) from many chemical manufacturing and formulating sources.

The Aerometric Information Retrieval System (AIRS) contains a wide range of information related to stationary sources of air pollution, including the emissions of a number of air pollutants which may be of concern within a particular industry. With the exception of volatile organic compounds (VOCs), there is little overlap with the TRI chemicals reported above. Table 22 summarizes annual releases (from the industries for which a Sector Notebook Profile was prepared) of carbon monoxide (CO), nitrogen dioxide (NO_2), particulate matter of 10 microns or less (PM10), sulfur dioxide (SO_2), and volatile organic compounds (VOCs).

Table 22: Air Pollutant Releases by Industry Sector (tons/year)

Industry Sector	CO	NO_2	PM10	PT	SO_2	VOC

IV.D. Comparison of Toxic Release Inventory Between Selected Industries

The following information is presented as a comparison of pollutant release and transfer data across industrial categories. It is provided to give a general sense as to the relative scale of TRI releases and transfers within each sector profiled under this project. Please note that the following figure and table do not contain releases and transfers for industrial categories that are not included in this project, and thus cannot be used to draw conclusions regarding the total release and transfer amounts that are reported to TRI. Similar information is available within the annual TRI Public Data Release Book.

Figure 19 is a graphical representation of a summary of the TRI data for the Fertilizer, Pesticide, and Agricultural Chemical Industry and the other sectors profiled in separate notebooks. The bar graph presents the total TRI releases and total transfers on the vertical axis. Industry sectors are presented in the order of increasing SIC code. The graph is based on the data shown in Table 23 and is meant to facilitate comparisons between the relative amounts of releases and transfers both within and between these sectors. Table 23 also presents the average releases per facility in each industry. The reader should note that differences in the proportion of facilities captured by TRI exist between industry sectors. This can be a factor of poor SIC matching and relative differences in the number of facilities reporting to TRI from the various sectors. In the case of the Fertilizer, Pesticide, and Agricultural Chemical Industry, the 1995 TRI data presented here covers 236 facilities. These facilities listed SIC 2873, 2874, 2875, or 2879 as a primary SIC code.

Figure 19: Summary of 1995 TRI Releases and Transfers by Industry

V. POLLUTION PREVENTION OPPORTUNITIES

The best way to reduce pollution is to prevent it in the first place. Some companies have creatively implemented pollution prevention techniques that improve efficiency and increase profits while at the same time minimizing environmental impacts. This can be done in many ways such as reducing material inputs, re-engineering processes to reuse by-products, improving management practices, and substituting toxic chemicals with those less toxic. Some smaller facilities are able to actually get below regulatory thresholds just by reducing pollutant releases through aggressive pollution prevention policies.

The Pollution Prevention Act of 1990 established a national policy of managing waste through source reduction, which means preventing the generation of waste. The Pollution Prevention Act also established as national policy a hierarchy of waste management options for situations in which source reduction cannot be feasiblely implemented. In the waste management hierarchy, if source reduction is not feasible the next alternative is recycling of wastes, followed by energy recovery, and waste treatment as a last alternative.

In order to encourage these approaches, this section provides both general and company-specific descriptions of some pollution prevention advances that have been implemented within the Fertilizer, Pesticide, and Agricultural Chemical Industry. While the list is not exhaustive, it does provide core information that can be used as the starting point for facilities interested in beginning their own pollution prevention projects. This section provides summary information from activities that may be, or are being implemented by this sector. When possible, information is provided that gives the context in which the technique can be used effectively. Please note that the activities described in this section do not necessarily apply to all facilities that fall within this sector. Facility-specific conditions must be carefully considered when pollution prevention options are evaluated, and the full impacts of the change must examine how each option affects air, land and water pollutant releases.

The Fertilizer, Pesticide, and Agricultural Chemical Industry uses many pollution prevention (P2), recycle and reuse, and water conservation practices. Wastewaters are primarily generated not by the production or formulating processes themselves but by cleaning operations of the process areas and associated equipment. Because the wastewaters are mostly cleaning rinsates and not waters of reaction, the pollution prevention practices are not process-specific. There are many P2, recycle and reuse, and water conservation practices that are widely accepted and practiced by the Fertilizer, Pesticide, and Agricultural Chemical Industry today.

These pollution prevention, recycle and reuse, and water conservation practices fall into three groups: production practices, housekeeping practices, and practices that use equipment that, by design, promote pollution prevention. Some of these practices and equipment conserve water, others reduce the amount of fertilizer or pesticide product in the wastewater, and still others may prevent the generation of a wastewater altogether (USEPA, 1996). A number of common P2 practices are listed below.

Production practices include:

- triple-rinsing raw material shipping containers directly into the formulation
- scheduling production to minimize cleanouts
- segregating processing/formulating/packaging equipment by:
  - individual product
  - solvent-based versus water-based formulations
  - products that contain similar active ingredients in different concentrations
- storing interior equipment rinse waters for use in formulating the same product
- packaging products directly from formulation vessels
- using raw material drums for packaging final products
- dedicating equipment (possibly only mix tank or agitator) for "hard-to-clean" formulations

Housekeeping practices include:

- performing preventive maintenance on all valves, fittings, and pumps
- placing drip pans under leaky valves and fittings or under any valves or fittings where hoses or lines are routinely connected and disconnected
- cleaning up spills or leaks in outdoor bulk containment areas to prevent contamination of storm water

Equipment that promotes pollution prevention by reducing or eliminating wastewater generation includes:

- low-volume/high-pressure hoses
- spray nozzle attachments for hoses
- squeegees and mops
- low-volume/recirculating floor scrubbing machines
- portable steam cleaners
- drum triple rinsing stations
- roofs over outdoor tank farms (USEPA, 1996)

Table 24: Waste Minimization Methods for the Fertilizer, Pesticide, and Agricultural Chemical Industry

Waste Stream	Waste Minimization Methods
Equipment Cleaning Wastes	Maximize production runs. Store and reuse cleaning wastes. Use of wiper blades and squeegees. Use of low-volume, high-efficiency cleaning. Use of plastic or foam "pigs."
Spills and Area Washdowns	Use of dedicated vacuum system. Use of dry cleaning methods. Use of recycled water for initial cleanup. Actively involved supervision.
Off-Specification Products	Strict quality control and automation. Reformulating off-spec batches.
Containers	Return containers to supplier and or reuse as directed. Triple rinse containers. Drums with liners versus plastic drums or bags. Segregating solid waste.
Air Emissions	Control bulk storage air emissions. Dedicate dust collection systems. Use automatic enclosed cut-in hoppers. Eliminate emissions of ammonia from reaction of anhydrous ammonia and phosphoric acid.
Miscellaneous Wastewater Streams	Pave high spillage areas.

V.A. Equipment Cleaning

Shipping Container/Drum Cleaning Operations

Fertilizer and pesticide facilities frequently receive raw materials in containers such as 55-gallon plastic or steel drums or 30-gallon fiber drums. In some cases, the empty drums are returned to the supplier, but usually the facility is responsible for disposal of the drums. The simplest, most cost-effective, and best approach to prevent pollution associated with cleaning drums and shipping containers is to rinse empty drums prior to disposal to capture the raw material residue for direct reuse in future formulations of the same product. In this way, the facility not only eliminates a potential highly contaminated wastewater source, but is also able to recover the product value of the raw material and avoids costs associated with storage of the wastewater (USEPA, 1996). However, pesticide chemicals formulating and packaging facilities and pesticide repackaging and refilling facilities should consult the List of Pollution Prevention Alternative Practices and ensure compliance with the effluent guidelines and standards found in 40 CFR 455 Subparts C and E before implementing pollution prevention techniques listed in this section.

Rinsing procedures for pesticide drums are provided in 40 CFR Part 165. The most common method of drum rinsing in the agrichemical industry is triple rinsing. After a drum containing AIs or pesticide products is emptied, it should be triple rinsed with the solvent that will be used in the formulation. This method prevents the creation of a rinsate that cannot be added directly to the formulation (e.g., a facility will not create a water-based rinsate when producing a solvent-based product). Note in some cases the label may specify how to rinse.

Some facilities use a high-pressure, low-volume wash system equipped with a hose and a spray nozzle to triple rinse drums; volumes of five to fifteen gallons of water per drum have been reported. EPA has identified many facilities that reuse these rinsates directly in product formulations. Other facilities treat drum rinsate and reuse the effluent for further drum or equipment rinsing. If the rinsate cannot be reused directly in product formulations, another effective method to reduce wastewater generation during shipping container/drum cleaning processes is the use of drum rinsing stations (USEPA, 1996).

One facility uses a three-cell station for triple-rinsing drums. The water in the first cell is used for the first rinse, the water in the second cell is used for the second rinse, and the water in the third cell is used for the final rinse. The rinse water in the first cell is reused until it is visually too contaminated to effectively clean the drums. At that time, it is removed from the cell (for treatment) and the rinse water from the second cell is transferred into the first cell. The rinse water from the third cell is transferred into the second cell, and the third cell is refilled with treated effluent from their treatment system. Each cell contains approximately 100 gallons of water; approximately 70 drums can be rinsed before the first cell requires water changing (USEPA, 1996).

Another site uses a unique, closed-loop set-up for emptying and triple rinsing raw material drums. The system was designed by the facility for several purposes: to aid it in emptying and cleaning drums and performing the triple rinse, to eliminate the need for storage of the water (or solvent) for reuse, and to prevent mathematical errors by the operators during the weighing out of raw materials and water (or solvent). The system consists of two 55-gallon drums, a formulation tank, and connecting hoses. One of the drums is permanently fixed on top of the formulation tank. The formulation tank and drum are situated on a load cell (used for weighing). The second drum, which is full of raw material, is placed on the ground next to the formulation tank. One hose is used to vacuum out the raw material and transfer it to the drum on the formulations tank/load cell. The other hose is equipped with a doughnut-shaped nozzle that provides the triple rinse by spraying the interior of the now empty raw material drum. The rinsate that is created by the triple rinse procedure is automatically removed by the vacuum line and is transferred to the drum on the formulation tank/load cell.

The load cell can be used to weigh the amount of raw material and/or rinsate that is added to the formulation by zeroing out the weight of the tank and drum. This allows the volume of both raw material and rinse water (or solvent) to be factored into the total volume of water (or solvent) required in the formulation. The drum on top of the formulation tank is equipped with a spring-loaded valve that enables the operator to take weight measurements prior to emptying the contents of the drum into the mix tank. This set-up has almost completely eliminated operator math errors and related formulation specification problems.

Bulk Tank and Equipment Cleaning

Pesticide formulating and fertilizer mixing facilities sometimes produce large quantities of formulated pesticide and fertilizer products and receive large quantities of raw materials used to produce those products. Those products and raw materials are stored on site in bulk tanks. The tanks are typically rinsed only when it becomes necessary to use the tank to store a different material. Each time the facility switches the product stored in a bulk tank, the tank is rinsed. Bulk tanks are sometimes also rinsed at the end of a season as a part of general maintenance (USEPA, 1996). Pesticide formulating and fertilizer mixing facilities should consult the List of Pollution Prevention Alternative Practices and ensure compliance with the effluent guidelines and standards found in 40 CFR Part 455 Subparts C and E before implementing pollution prevention techniques involving bulk tank and other equipment cleaning.

Product changeover cleanings can be eliminated or greatly reduced by dedicating equipment to specific products or groups of products. Although entire lines are not generally dedicated, there are many facilities that dedicate tanks to formulation mixing only, thereby eliminating one of the most highly contaminated wastewater streams generated at pesticide formulating and packaging facilities. Facilities also dedicate lines to the production of a specific product type, such as water-based versus solvent-based products, thereby reducing the number of cleanings required, and allowing greater reuse of the cleaning water or solvent.

Another effective pollution prevention technique is to schedule production to reduce the number of product changeovers, which reduces the number of equipment interior cleanings required. Facilities may also reduce the number of changeover cleanings required or the quantity of water or solvent used for cleaning by scheduling products in groups. Products may lend themselves to a particular production sequence if they have common active ingredients, assuming the products also have the same solvent base (including water). Where other raw material cross-contamination problems are not a concern, no cleaning would be required between changeover. Facilities that have implemented this technique have conducted testing to ensure that product quality is not adversely affected (USEPA, 1996).

Scheduling production according to packaging type can reduce changeover cleanings of packaging equipment. Packaging lines are often able to handle containers of different sizes; a slight adjustment to one packaging line, such as adding a short length of hose, may prevent the use of an entirely different set of packaging equipment that would also require cleaning. Packaging can also be performed directly out of the formulation vessels to avoid using and subsequently cleaning interim storage tanks and transfer hoses.

Another effective pollution prevention and water conservation technique to minimize the quantity of rinse water generated by equipment interior cleaning is the use of water hoses equipped with hand-control devices (for example, spray-gun nozzles such as those used on garden hoses). This practice prevents the free flow of water from unattended hoses. Another technique to conserve water is the use of high-pressure, low-volume washers instead of ordinary hoses. One of the facilities visited indicated that, by using high-pressure washers, they reduced typical equipment interior rinse volumes from twenty gallons per rinse to ten gallons per rinse (USEPA, 1996).

Steam cleaning can also be a particularly effective method to clean viscous products that otherwise require considerable volumes of water and/or the addition of a detergent to remove. Many facilities have access to steam from boilers on site; however, if there is no existing source of steam, steam cleaning equipment can be purchased. Although steam generation can increase energy consumption and add NO_x and SO_x pollutants to the atmosphere, there are benefits to be gained. Facilities may end up creating a much smaller volume of wastewater and may potentially avoid the need to use detergents or other cleaning agents that could prevent product recovery. However, steam would be a poor choice for cleaning applications where volatile organic solvents or inerts are part of the product, as the steam would accelerate the volatilization of the organic compounds.

Facilities also clean equipment interiors by using squeegees to remove the product from the formulation vessel and by using absorbent "pigs" to clean products out of the transfer lines before equipment rinsing. These techniques minimize the quantity of cleaning water required, although they generate a solid waste stream requiring disposal. Regardless of whether or not residual product is removed from equipment interiors before rinsing, if certain conditions are met, equipment interior rinsate can typically be reused as make-up water the next time that a water-based product is being formulated with the same chemical (USEPA, 1996). Pesticide chemicals formulating and packaging facilities and pesticide repackaging and refilling facilities should consult the List of Pollution Prevention Alternative Practices and ensure compliance with the effluent guidelines and standards found in 40 CFR Part 455 Subparts C and E before implementing pollution prevention techniques involving bulk tank and other equipment cleaning.

One facility uses a unique method of cleaning to reduce the volume of water needed to clean equipment interiors. At this facility, the production lines are hooked to dedicated product storage tanks. Prior to rinsing these production lines, the facility uses air to "blow" the residual product in the line back to product storage. Not only will these lines require less water to clean, but the residual product that is blown back to storage is not diluted and should not affect the product specifications in any way.

Another facility drastically reduced dichloromethane usage at several plants by switching to soap and water for cleaning. This change enabled the facility to cut its target chemicals by two-thirds. The facility also reduced the release of carbon tetrachloride, and installed a closed-loop recycling system, to reduce water usage (CMA, 1993).

Aerosol Container Leak Testing

No method of eliminating wastewater from test baths has been identified. However, the volume of water used may be minimized by using a contained (or batch) water bath as opposed to a continuous overflow water bath. A contained water bath is completely emptied and refilled with water when required, based upon visual inspection by the operator. Therefore, the quantity of wastewater generated depends on the frequency of refilling and the volume of the bath (200 gallons is a typical volume of the contained water baths). One facility uses a contained water bath and heats the bath with steam to ensure that the temperature of the cans reaches 130°F. This facility indicated that steam condensation causes some overflow that exits the bath via a standpipe. A continuous overflow bath would probably generate more wastewater per production unit than a batch water bath (USEPA, 1996).

One facility has installed a diatomaceous earth filter on one DOT test bath. The facility recirculates the bath water through the filter to remove contaminants such as oil and grease and suspended solids. The filtered water is then reused in the bath, thereby extending the usefulness of the bath water. The facility anticipates they will dispose of the filter as nonhazardous waste.

Another facility uses a can-washing step prior to the DOT test bath, presenting an additional source of wastewater. This can washing is performed at the operator's discretion to reduce the quantity of contaminants entering the bath water. The effectiveness of this step has not been quantitatively determined (USEPA, 1996).

Laboratory Equipment Cleaning

Many pesticide formulating and packaging facilities operate on-site laboratories for conducting quality control tests of raw materials and formulated products. Wastewater is generated from these tests and from cleaning glassware used in the tests. One effective pollution prevention/reuse technique during laboratory equipment cleaning operations is to dedicate laboratory sinks to certain products, and collect any wastewater generated from the testing of those products either for reuse in the same product or for transfer back to the AI manufacturer or product registrant. In the cases where the facility uses solvents in conjunction with the quality control tests performed in the laboratory, the solvent-contaminated water may not be able to be reused in the process (USEPA, 1996).

V.B. Process Changes

Storage Tanks

One method to reduce the amount of wastewater from ammonium nitrate production is to incorporate a wastewater evaporator system which reduces the amount of contaminated cooling water discharge. The wastewater passes through a series of evaporation steps whereby the vapors are used as wash water in the calcium carbonate filters and the concentrated solution is pumped to the neutralizers where it is mixed with the acidic nitrogen-phosphate solution and used to regulate the nitrogen-phosphate nutrient ratio of the fertilizer. Through this modified technology, steam and electric energy consumption increases somewhat, but such increases are balanced by the more effective utilization of nitrogen and the reduction of wastewater. More information on this method can be found in "Waste Water Evaporation Process for Fertilizer Production Technology," *Compendium on Low and Non-waste Technology*, United Nations Economic and Social Counsel. (http://es.inel.gov/studies/cs244.html)

Many methods are available for reducing the amount of emissions resulting from fixed roof storage tanks. Some of these methods include use of conservation vents, conversion to floating roof tanks, use of nitrogen blanketing to suppress emissions and reduce material oxidation, use of refrigerated condensers, use of lean-oil or carbon absorbers, or use of vapor equilibration lines. When dealing with volatile materials, employment of one or more of these methods can result in cost savings to the facility by reducing raw material losses and improving compliance with local air quality requirements (USEPA, 1996).

Air Emission Control Systems

Agricultural chemical facilities often produce large quantities of dust which are collected from numerous sources. The chemical composition of the various dust sources can vary widely. Opportunities often exist to reduce waste generation through segregation of these waste dusts and particulates.

At Daly-Herring Co., in Kingston, NC, dust streams from several different production areas were handled by a single baghouse. Since all of the streams were mixed, none of the waste could be recycled to the process that generated them. By installing separate dedicated baghouses for each production line, all of the collected pesticide dust could be recycled. The initial investment for the equipment was $9,600. The payback period was only ten months. Daly-Herring saved over $9,000 per year in disposal costs and $2,000 per year in raw material costs (Hunt, 1989).

At FMC Corp. in Fresno, CA, common dust collectors were used by multiple production systems. Due to the cross contamination of materials, recycling was impossible. To promote recycling, the company compartmentalized the dust collectors with each compartment serving a single source. All collected materials are analyzed for cross contamination and if none exists, they are reused in the succeeding product batch. Other work involved the installation of self-contained dust collectors at each inlet hopper dump station so that captured dust can be returned to the system (USEPA, 1996).

Facilities may also use wet scrubbers to control air emissions. Some facilities may only need a wet scrubber on one particular process (i.e., a dedicated scrubber). These facilities have been able to reuse the scrubber blowdown or changed-out scrubber water as make-up water in the formulation of that particular product. Some facilities with nondedicated scrubbers have been able to use the scrubber blowdown or changed-out scrubber water for floor or equipment exterior cleaning (USEPA, 1996).

Microprill Formation

Microprill formation resulting from partially plugged orifices of melt spray devices can increase fine dust loading and emissions. Certain designs (spinning buckets) and practices (vibration of spray plates) help reduce microprill formation. Reducing the ambient air temperature reduces emissions because the air flow required to cool prills and the formation of fumes are decreased at lower temperatures.

V.C. Good Housekeeping

Floor/Wall/Equipment Exterior Cleaning

During processing, formulating, and packaging operations, the exteriors of equipment may become soiled from drips, spills, and dust (especially equipment located near dry lines). The floors in the area become dirty in the same manner and also from normal traffic. Facility workers clean the equipment exteriors and floors for general housekeeping purposes, and to keep sources of product contamination to a minimum. When water is used, these cleaning procedures become a source of wastewater.

Wastewater can again be minimized through the use of high-pressure, low-volume washers rather than ordinary water hoses. Additionally, some facilities practice steam cleaning rather than water cleaning of equipment exteriors to reduce the amount of wastewater generated (USEPA, 1996).

Instead of hosing down the exterior of a piece of equipment, some facilities wipe equipment exteriors with rags or use a solvent cleaner, such as a commercially available stainless steel cleaner. This practice avoids generating a wastewater stream, but does create a solid waste that, depending on the solvent used, could be considered a hazardous waste. Squeegees are also used to clean equipment exteriors and floors, and are not disposed of after single uses. It may be possible to dedicate squeegees to a certain line or piece of equipment, but using squeegees may still require using some water (USEPA, 1996).

Some facilities use automated floor scrubbers, which replace the practice of hosing down floors. Floor scrubbers are mechanical devices that continually recirculate cleaning water to clean flat, smooth surfaces with circulating brushes. During operation, the scrubber collects the cleaning water in a small tank that is easily emptied after the cleaning process, or at a later date. Using a floor scrubbing machine can require as little as five to fifteen gallons of cleaning solution (typically water) per use. A mop and a single bucket of water can also be used in place of a hose. Floor mopping can generate as little as ten gallons of water per cleaning depending on the size of the surface to be cleaned (USEPA, 1996).

A number of facilities reuse their floor wash water with and without filtering. One facility has set up its production equipment on a steel-grated platform directly above a collection sump. Following production, the equipment and the floor of the platform, on which the operator stands when formulating product, are rinsed and the water is allowed to flow into the sump. A pump and a filter have been installed in the sump area to enable the operator to transfer this rinsate back into the formulation tank for the next formulation. This sump is also connected to floor trenches in the packaging area for the same product. When the exterior of the packaging equipment and the floors in this area are rinsed, this water is directed to the trenches and eventually ends up in the collection sump for reuse (USEPA, 1996).

Leaks and Spills Clean-Up

Dry products that have leaked or spilled can be vacuumed or swept without generating any wastewater. Liquid leaks and spills can be collected into a trench or sump (for reuse, discharge, or disposal) with a squeegee, leaving only a residue to be mopped up or hosed down if further water cleanup is required. Liquid leaks and spills can also be cleaned up using absorbent material, such as absorbent pads or soda ash. For an acidic product, soda ash or a similar base material will also serve to neutralize the spill. If a residue remains, some water may be used for mopping up or hosing the area down, but methods to reduce floor wash should be implemented whenever possible. Many facilities clean up leaks and spills from water-based products with water and then solvent-based products with absorbent materials. Using an absorbent material may be the best practice for cleaning up small scale solvent-based leaks and spills; however, EPA does recognize that this material then needs to be disposed of (cross-media transfer). Therefore, good housekeeping practices may be even more important in the case of organic solvent-based product spills and leaks because, if not prevented, these spills and leaks may have to be cleaned up with absorbent material and disposed of (USEPA, 1996).

Direct reuse of products which have leaked or spilled is another possible pollution prevention technique. If drip pans or other containers are used to catch leaks and spills, the material (either water-based or solvent-based) can be immediately reused in the product being processed, formulated, or packaged, or stored for use in the next product batch. Collection hoppers or tubs can be installed beneath packaging fillers to capture spills and immediately direct the spills back to the fillers. Leaks or spills around bulk storage tanks can be contained by dikes, which, in fact, are often required by state regulations (USEPA, 1996).

Precipitation Runoff

Precipitation runoff includes all precipitation that falls on facility surfaces that are believed to be contaminated. Contaminated precipitation runoff can be prevented by bringing all operations indoors, as many facilities have done, or by covering outdoor storage tanks and dikes with roofs, which has also been done at many facilities. The roofs would ideally extend low enough to prevent crosswinds from blowing rain into spill-containment dikes. To prevent rainwater contamination, the drain spouts and gutters should conduct roof runoff to areas away from process operations, and the roofs should be kept in good repair (USEPA, 1996).

If operations remain outdoors, a transfer, or containment pad should be installed with a sump or other means of collecting rinse water. The pad should be constructed of asphalt or concrete and maintained with crack sealer and a top coat sealer to control infiltration. The pad should also be large enough to contain wind-blown particulates from dry materials. If pads are cleaned before a rainfall, then uncontaminated precipitation runoff may be directly discharged to surface drains (CFA, 1996). Facilities can also monitor the water in a containment system by periodically testing for a variety of contaminants.

It may be difficult for facilities that do not require large volumes of water to reuse all the precipitation collected in the containment system. These facilities could keep the containment system free of any spilled pesticides through good housekeeping practices so that precipitation falling into the containment system does not become contaminated. Some facilities house their pesticide bulk storage area inside a building or under a covered area to eliminate precipitation from collecting in the containment system, as well as to protect the area from vandalism and severe weather (USEPA, 1996).

Containment Pad in the Loading/Unloading Area

Agrichemical dealers sometimes install loading/containment pads in the operation area to contain and collect any product spills that may occur during pesticide loading operations. The pad is usually installed contiguous to the bulk storage tanks and the repackaging of products into smaller containers. Facilities may also conduct all their portable cleaning operations, such as rinsing minibulk containers, directly on the pad in order to contain and collect the rinsates.

The pad is normally constructed of concrete and is sloped to a sump area. Some facilities divide the sump area into individual collection basins so that the facilities can segregate wastewaters contaminated by different products and reuse these wastewaters for applications. For instance, facilities in the Midwest frequently have two collection basins; one basin collects wastewaters contaminated with corn herbicides and the other collects wastewaters contaminated with soybean herbicides. As part of this collection system, some facilities install one or more tanks to store wastewater until it can be applied to land, while other facilities use portable minibulk tanks to store the wastewater. When facilities collect wastewaters that must be segregated by different types of products, multiple storage tanks are used to avoid contamination (USEPA, 1996).

V. D. Energy Efficiency

Installation of a Feed-Gas Saturator

A mixture of steam and natural gas with a volumetric ratio of steam to carbon of about 3.5:1 is reacted in the primary reformer of reforming ammonia plants. Most of the steam is generated from heat sources within the plant, but the balance of the steam has to be produced in auxiliary boilers. This retrofit permits the use of low-level heat from the flue gases, which would otherwise be lost, to be used in saturating the feed natural gas with water. This generates extra steam which replaces some of the steam generated in the boiler (UNEP, 1996).

Modification of Convection Coils

As a result of other modifications, the temperature profile of the flue gases may change considerably in the cold-leg section of the primary reformer. This change can be compensated for by replacing the low steam superheat coil with a new one with additional rows of tubes and heavier fins on all tubes (UNEP, 1996).

Low-heat Removal of Carbon Dioxide

The traditional systems used for removal of carbon dioxide from the process steam uses hot potassium carbonate which requires heat for regeneration. This heat comes from process heat but needs to be supplemented with external steam. A new low-heat removal system is now available, which uses flashing for part of the regeneration process, and requires less external heat (UNEP, 1996).

Ammonia Synthesis Modifications

Ammonia Converter Retrofit

The vertical quench-type converters are changed from axial flow to radial flow, greatly decreasing the pressure drop across the converter which in turn allows the use of smaller size catalyst with a larger surface area. This improved catalyst yields a higher conversion per pass, generating a lower recycle volume. The lower recycle volume and the lower pressure drop result in reduced energy requirements. This modification yields an increase effective capacity of the ammonia converter of about 35 percent (UNEP, 1996).

Addition of Process Computer

A dedicated process computer can be installed along with other on-line analysis and control systems to monitor and control key variables. With this system, continuous set point changes are possible to optimize the operation of several plant areas such as hydrogen/nitrogen ratio, steam/carbon ratio, synthesis loop purge, methane leakage, converter control, and refrigeration purge (UNEP, 1996).

Hydrogen Recovery from the Purge Gas

Inert gases must be pumped from the plant to avoid their buildup in the system. This purge is carried out by removing a side stream of synthesis gas after recovering the ammonia. By installing the proper recovery system, the hydrogen in this gas mixture can be recovered decreasing the energy requirements of the process by about five percent or permitting an increase of about five percent in production capacity (UNEP, 1996).

VI. SUMMARY OF APPLICABLE FEDERAL STATUTES AND REGULATIONS

This section discusses the federal regulations that may apply to this sector. The purpose of this section is to highlight and briefly describe the applicable federal requirements, and to provide citations for more detailed information. The three following sections are included:

- Section VI.A contains a general overview of major statutes
- Section VI.B contains a list of regulations specific to this industry
- Section VI.C contains a general discussion on State regulation of pesticides
- Section VI.D contains a list of pending and proposed regulatory requirements

The descriptions within Section VI are intended solely for general information. Depending upon the nature or scope of the activities at a particular facility, these summaries may or may not necessarily describe all applicable environmental requirements. Moreover, they do not constitute formal interpretations or clarifications of the statutes and regulations. For further information, readers should consult the Code of Federal Regulations (CFR) and other state or local regulatory agencies. EPA Hotline contacts are also provided for each major statute.

VI.A. General Description of Major Statutes

Federal Insecticide, Fungicide, and Rodenticide Act

The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) was first passed in 1947, and amended numerous times, most recently by the Food Quality Protection Act (FQPA) of 1996. FIFRA provides EPA with the authority to oversee, among other things, the registration, distribution, sale and use of pesticides. The Act applies to all types of pesticides, including insecticides, herbicides, fungicides, rodenticides, and antimicrobials. FIFRA covers both intrastate and interstate commerce.

Establishment Registration
Section 7 of FIFRA requires that establishments producing pesticides, or active ingredients used in producing a pesticide subject to FIFRA, register with EPA. Registered establishments must report the types and amounts of pesticides and active ingredients they produce. The Act also provides EPA inspection authority and enforcement authority for facilities/persons that are not in compliance with FIFRA.

Product Registration
Under section 3 of FIFRA, all pesticides (with few exceptions) sold or

distributed in the United States must be registered by EPA. Pesticide registration is very specific and generally allows use of the product only as specified on the label. Each registration specifies the use site, i.e., where the product may be used, and amount that may be applied. The person who seeks to register the pesticide must file an application for registration. The application process often requires either the citation or submission of extensive environmental, health, and safety data.

To register a pesticide, the EPA Administrator must make a number of findings, one of which is that the pesticide, when used in accordance with widespread and commonly recognized practice, will not generally cause unreasonable adverse effects on the environment.

FIFRA defines "unreasonable adverse effects on the environment" as "(1) any unreasonable risk to man or the environment, taking into account the economic, social, and environmental costs and benefits of the use of the pesticide, or (2) a human dietary risk from residues that result from a use of a pesticide in or on any food inconsistent with the standard under section 408 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 346a)."

Under FIFRA section 6(a)(2), after a pesticide is registered, the registrant must also notify EPA of any additional facts and information concerning unreasonable adverse environmental effects of the pesticide. Also, if EPA determines that additional data are needed to support a registered pesticide, registrants may be required to provide additional data. If EPA determines that the registrant(s) did not comply with their request for more information, the registration can be suspended under FIFRA section 3(c)(2)(B) and section 4.

Use Restrictions

As a part of the pesticide registration, EPA must classify the product for general use, restricted use, or general for some uses and restricted for others (Miller, 1993). For pesticides that may cause unreasonable adverse effects on the environment, including injury to the applicator, EPA may require that the pesticide be applied either by or under the direct supervision of a certified applicator.

Reregistration

Due to concerns that much of the safety data underlying pesticide registrations becomes outdated and inadequate, in addition to providing that registrations be reviewed every 15 years, FIFRA requires EPA to reregister all pesticides that were registered prior to 1984 (section 4). After reviewing existing data, EPA may approve the reregistration, request additional data to support the registration, cancel, or suspend the pesticide.

Tolerances and Exemptions

A tolerance is the maximum amount of pesticide residue that can be on a raw product and still be considered safe. Before EPA can register a pesticide that is used on raw agricultural products, it must grant a tolerance or exemption from a tolerance (40 CFR sections 163.10 through 163.12). Under the Federal Food, Drug, and Cosmetic Act (FFDCA), a raw agricultural product is deemed unsafe if it contains a pesticide residue, unless the residue is within the limits of a tolerance established by EPA or is exempt from the requirement.

Cancellation and Suspension

EPA can cancel a registration if it is determined that the pesticide or its labeling does not comply with the requirements of FIFRA or causes unreasonable adverse effects on the environment (Haugrud, 1993).

In cases where EPA believes that an "imminent hazard" would exist if a pesticide were to continue to be used through the cancellation proceedings, EPA may suspend the pesticide registration through an order and thereby halt the sale, distribution, and usage of the pesticide. An "imminent hazard" is defined as an unreasonable adverse effect on the environment or an unreasonable hazard to the survival of a threatened or endangered species that would be the likely result of allowing continued use of a pesticide during a cancellation process.

When EPA believes an emergency exists that does not permit a hearing to be held prior to suspending, EPA can issue an emergency order which makes the suspension immediately effective.

Imports and Exports

Under FIFRA section 17(a), pesticides not registered in the United States and intended solely for export are not required to be registered provided that the exporter obtains and submits to EPA, prior to export, a statement from the foreign purchaser acknowledging that the purchaser is aware that the product is not registered in the United States and cannot be sold for use there. EPA sends these statements to the government of the importing country. FIFRA sets forth additional requirements that must be met by pesticides intended solely for export. The enforcement policy for exports is codified in sections 40 CFR sections 168.65, 168.75, and 168.85.

Under FIFRA section 17(c), imported pesticides and devices must comply with United States pesticide law. Except where exempted by regulation or statute, imported pesticides must be registered. FIFRA section 17(c) requires that EPA be notified of the arrival of imported pesticides and devices. This is accomplished through the Notice of Arrival (NOA) (EPA Form 3540-1), which is filled out by the importer prior to importation and submitted to the EPA regional office applicable to the intended port of entry. United States

Customs regulations prohibit the importation of pesticides without a completed NOA. The EPA-reviewed and signed form is returned to the importer for presentation to United States Customs when the shipment arrives in the United States NOA forms can be obtained from contacts in the EPA Regional Offices or www.epa.gov/oppfead1/international/noalist.htm.

Additional information on FIFRA and the regulation of pesticides can be obtained from a variety of sources, including EPA's Office of Pesticide Programs' homepage at www.epa.gov/pesticides, EPA's Office of Compliance, Agriculture and Ecosystem Division at http://es.epa.gov/oeca/agecodiv.htm, or The National Agriculture Compliance Assistance Center toll-free at 888-663-2155 or http://es.epa.gov/oeca/ag. Other sources include the National Pesticide Telecommunications Network toll-free at 800-858-7378 and the National Antimicrobial Information Network toll-free at 800-447-6349.

Clean Water Act

The primary objective of the Federal Water Pollution Control Act, commonly referred to as the Clean Water Act (CWA), is to restore and maintain the chemical, physical, and biological integrity of the nation's surface waters. Pollutants regulated under the CWA are classified as either "toxic" pollutants; "conventional" pollutants, such as biochemical oxygen demand (BOD), total suspended solids (TSS), fecal coliform, oil and grease, and pH; or "non-conventional" pollutants, including any pollutant not identified as either conventional or priority.

The CWA regulates both direct and "indirect" dischargers (those who discharge to publicly owned treatment works). The National Pollutant Discharge Elimination System (NPDES) permitting program (CWA section 402) controls direct discharges into navigable waters. Direct discharges or "point source" discharges are from sources such as pipes and sewers. NPDES permits, issued by either EPA or an authorized state (EPA has authorized 43 states and 1 territory to administer the NPDES program), contain industry-specific, technology-based and water quality-based limits and establish pollutant monitoring and reporting requirements. A facility that proposes to discharge into the nation's waters must obtain a permit prior to initiating a discharge. A permit applicant must provide quantitative analytical data identifying the types of pollutants present in the facility's effluent. The permit will then set forth the conditions and effluent limitations under which a facility may make a discharge.

Water quality-based discharge limits are based on federal or state water quality criteria or standards, that were designed to protect designated uses of surface waters, such as supporting aquatic life or recreation. These standards, unlike the technology-based standards, generally do not take into account technological feasibility or costs. Water quality criteria and standards vary from state to state, and site to site, depending on the use classification of the receiving body of water. Most states follow EPA guidelines which propose aquatic life and human health criteria for many of the 126 priority pollutants.

Storm Water Discharges

In 1987 the CWA was amended to require EPA to establish a program to address storm water discharges. In response, EPA promulgated NPDES permitting regulations for storm water discharges. These regulations require that facilities with the following types of storm water discharges, among others, apply for an NPDES permit: (1) a discharge associated with industrial activity; (2) a discharge from a large or medium municipal storm sewer system; or (3) a discharge which EPA or the state determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

The term "storm water discharge associated with industrial activity" means a storm water discharge from one of 11 categories of industrial activity defined at 40 CFR section 122.26. Six of the categories are defined by SIC codes while the other five are identified through narrative descriptions of the regulated industrial activity. If the primary SIC code of the facility is one of those identified in the regulations, the facility is subject to the storm water permit application requirements. If any activity at a facility is covered by one of the five narrative categories, storm water discharges from those areas where the activities occur are subject to storm water discharge permit application requirements.

Those facilities/activities that are subject to storm water discharge permit application requirements are identified below. To determine whether a particular facility falls within one of these categories, the regulation should be consulted.

Category i: Facilities subject to storm water effluent guidelines, new source performance standards, or toxic pollutant effluent standards.

Category ii: Facilities classified as SIC 24-lumber and wood products (except wood kitchen cabinets); SIC 26-paper and allied products (except paperboard containers and products); SIC 28-chemicals and allied products (except drugs and paints); SIC 29-petroleum refining; SIC 311-leather tanning and finishing; SIC 32 (except 323)-stone, clay, glass, and concrete; SIC 33-primary metals; SIC 3441-fabricated structural metal; and SIC 373-ship and boat building and repairing.

Category iii: Facilities classified as SIC 10-metal mining; SIC 12-coal mining; SIC 13-oil and gas extraction; and SIC 14-nonmetallic mineral mining.

Category iv: Hazardous waste treatment, storage, or disposal facilities.

Category v: Landfills, land application sites, and open dumps that receive or have received industrial wastes.

Category vi: Facilities classified as SIC 5015-used motor vehicle parts; and SIC 5093-automotive scrap and waste material recycling facilities.

Category vii: Steam electric power generating facilities.

Category viii: Facilities classified as SIC 40-railroad transportation; SIC 41-local passenger transportation; SIC 42-trucking and warehousing (except public warehousing and storage); SIC 43-U.S. Postal Service; SIC 44-water transportation; SIC 45-transportation by air; and SIC 5171-petroleum bulk storage stations and terminals.

Category ix: Sewage treatment works.

Category x: Construction activities except operations that result in the disturbance of less than five acres of total land area.

Category xi: Facilities classified as SIC 20-food and kindred products; SIC 21-tobacco products; SIC 22-textile mill products; SIC 23-apparel related products; SIC 2434-wood kitchen cabinets manufacturing; SIC 25-furniture and fixtures; SIC 265-paperboard containers and boxes; SIC 267-converted paper and paperboard products; SIC 27-printing, publishing, and allied industries; SIC 283-drugs; SIC 285-paints, varnishes, lacquer, enamels, and allied products; SIC 30-rubber and plastics; SIC 31-leather and leather products (except leather and tanning and finishing); SIC 323-glass products; SIC 34-fabricated metal products (except fabricated structural metal); SIC 35-industrial and commercial machinery and computer equipment; SIC 36-electronic and other electrical equipment and components; SIC 37-transportation equipment (except ship and boat building and repairing); SIC 38-measuring, analyzing, and controlling instruments; SIC 39-miscellaneous manufacturing industries; and SIC 4221-4225-public warehousing and storage.

Pretreatment Program

Another type of discharge that is regulated by the CWA is one that goes to a publicly owned treatment works (POTW). The national pretreatment program (CWA section 307(b)) controls the indirect discharge of pollutants to POTWs by "industrial users." Facilities regulated under section 307(b) must meet certain pretreatment standards. The goal of the pretreatment program is to protect municipal wastewater treatment plants from damage that may occur when hazardous, toxic, or other wastes are discharged into a sewer system and to protect the quality of sludge generated by these plants.

EPA has developed technology-based standards for industrial users of POTWs. Different standards apply to existing and new sources within each category. "Categorical" pretreatment standards applicable to an industry on a nationwide basis are developed by EPA. In addition, another kind of pretreatment standard, "local limits," are developed by the POTW in order to assist the POTW in achieving the effluent limitations in its NPDES permit.

Regardless of whether a state is authorized to implement either the NPDES or the pretreatment program, if it develops its own program, it may enforce requirements more stringent than federal standards.

Wetlands

Wetlands, commonly called swamps, marshes, fens, bogs, vernal pools, playas, and prairie potholes, are a subset of "waters of the United States," as defined in section 404 of the CWA. The placement of dredge and fill material into wetlands and other water bodies (i.e., waters of the United States) is regulated by the United States Army Corps of Engineers (Corps) under 33 CFR Part 328. The Corps regulates wetlands by administering the CWA section 404 permit program for activities that impact wetlands. EPA's authority under section 404 includes veto power of Corps permits, authority to interpret statutory exemptions and jurisdiction, enforcement actions, and delegating the section 404 program to the states.

EPA's Office of Water, at (202) 260-5700, will direct callers with questions about the CWA to the appropriate EPA office. EPA also maintains a bibliographic database of Office of Water publications which can be accessed through the Ground Water and Drinking Water Resource Center at (202) 260-7786.

Oil Pollution Prevention Regulation

Section 311(b) of the CWA prohibits the discharge of oil, in such quantities as may be harmful, into the navigable waters of the United States and adjoining shorelines. The EPA Discharge of Oil regulation, 40 CFR Part 110, provides information regarding these discharges. The Oil Pollution Prevention regulation, 40 CFR Part 112, under the authority of section 311(j) of the CWA, requires regulated facilities to prepare and implement Spill Prevention Control and Countermeasure (SPCC) plans. The intent of a SPCC plan is to prevent the discharge of oil from onshore and offshore non-transportation-related facilities. In 1990, Congress passed the Oil Pollution Act which amended section 311(j) of the CWA to require facilities that because of their location could reasonably be expected to cause "substantial harm" to the environment by a discharge of oil to develop and implement Facility Response Plans (FRP). The intent of a FRP is to provide for planned responses to discharges of oil.

A facility is SPCC-regulated if the facility, due to its location, could reasonably be expected to discharge oil into or upon the navigable waters of the United States or adjoining shorelines, and the facility meets one of the following criteria regarding oil storage: (1) the capacity of any aboveground storage tank exceeds 660 gallons, or (2) the total aboveground storage capacity exceeds 1,320 gallons, or (3) the underground storage capacity exceeds 42,000 gallons. The 40 CFR section 112.7 contains the format and content requirements for a SPCC plan. In New Jersey, SPCC plans can be combined with DPCC plans required by the state provided there is an appropriate cross-reference index to the requirements of both regulations at the front of the plan.

According to the FRP regulation, a facility can cause "substantial harm" if it meets one of the following criteria: (1) the facility has a total oil storage capacity greater than or equal to 42,000 gallons and transfers oil over water to or from vessels; or (2) the facility has a total oil storage capacity greater than or equal to 1 million gallons and meets any one of the following conditions: (i) does not have adequate secondary containment, (ii) a discharge could cause "injury" to fish and wildlife and sensitive environments, (iii) shut down a public drinking water intake, or (iv) has had a reportable oil spill greater than or equal to 10,000 gallons in the past 5 years. Appendix F of 40 CFR Part 112 contains the format and content requirements for a FRP. The FRPs that meet EPA's requirements can be combined with United States Coast Guard FRPs or other contingency plans, provided there is an appropriate cross-reference index to the requirements of all applicable regulations at the front of the plan.

For additional information regarding SPCC plans, contact EPA's RCRA, Superfund, and EPCRA Hotline, at (800) 424-9346. Additional documents and resources can be obtained from the hotline's homepage at www.epa.gov/epaoswer/hotline. The hotline operates weekdays from 9:00 a.m. to 6:00 p.m., EST, excluding federal holidays.

Safe Drinking Water Act

The Safe Drinking Water Act (SDWA) mandates that EPA establish regulations to protect human health from contaminants in drinking water. The law authorizes EPA to develop national drinking water standards and to create a joint federal-state system to ensure compliance with these standards. The SDWA also directs EPA to protect underground sources of drinking water through the control of underground injection of fluid wastes.

EPA has developed primary and secondary drinking water standards under its SDWA authority. EPA and authorized states enforce the primary drinking water standards that are contaminant-specific concentration limits that apply to certain public drinking water supplies. Primary drinking water standards consist of maximum contaminant level goals (MCLGs), which are non-enforceable health-based goals, and maximum contaminant levels (MCLs), which are enforceable limits set generally as close to MCLGs as possible, considering cost and feasibility of attainment.

The SDWA Underground Injection Control (UIC) program (40 CFR Parts 144-148) is a permit program which protects underground sources of drinking water by regulating five classes of injection wells. The UIC permits include design, operating, inspection, and monitoring requirements. Wells used to inject hazardous wastes must also comply with RCRA corrective action standards in order to be granted a RCRA permit, and must meet applicable RCRA land disposal restrictions standards. The UIC permit program is often state/tribe-enforced, since EPA has authorized many states/tribes to administer the program. Currently, EPA shares the UIC permit program responsibility in seven states and runs the program in 10 states and on all tribal lands.

The SDWA also provides for a federally-implemented Sole Source Aquifer program, which prohibits federal funds from being expended on projects that may contaminate the sole or principal source of drinking water for a given area, and for a state-implemented Wellhead Protection program, designed to protect drinking water wells and drinking water recharge areas.

The SDWA Amendments of 1996 require states to develop and implement source water assessment programs (SWAPs) to analyze existing and potential threats to the quality of the public drinking water throughout the state. Every state is required to submit a program to EPA and to complete all assessments within 3 ½ years of EPA approval of the program. SWAPs include: (1) delineating the source water protection area; (2) conducting a contaminant source inventory; (3) determining the susceptibility of the public water supply to contamination from the inventories sources; and (4) releasing the results of the assessments to the public.

EPA's Safe Drinking Water Hotline, at (800) 426-4791, answers questions and distributes guidance pertaining to SDWA standards. The Hotline operates from 9:00 a.m. through 5:30 p.m., EST, excluding federal holidays. Visit the website at http://www.epa.gov/ogwdw for additional material.

Resource Conservation and Recovery Act

The Solid Waste Disposal Act (SWDA), as amended by the Resource Conservation and Recovery Act (RCRA) of 1976, addresses solid and hazardous waste management activities. The Act is commonly referred to as RCRA. The Hazardous and Solid Waste Amendments (HSWA) of 1984 strengthened RCRA's waste management provisions and added Subtitle I, which governs underground storage tanks (USTs).

Regulations promulgated pursuant to Subtitle C of RCRA (40 CFR Parts 260-299) establish a "cradle-to-grave" system governing hazardous waste from the point of generation to disposal. RCRA hazardous wastes include the specific materials listed in the regulations (discarded commercial chemical products, designated with the code "P" or "U"; hazardous wastes from specific industries/sources, designated with the code "K"; or hazardous wastes from non-specific sources, designated with the code "F") or materials which exhibit a hazardous waste characteristic (ignitability, corrosivity, reactivity, or toxicity and designated with the code "D").

Entities that generate hazardous waste are subject to waste accumulation, manifesting, and recordkeeping standards. A hazardous waste facility may accumulate hazardous waste for up to 90 days (or 180 days depending on the amount generated per month) without a permit or interim status. Generators may also treat hazardous waste in accumulation tanks or containers (in accordance with the requirements of 40 CFR section 262.34) without a permit or interim status.

Facilities that treat, store, or dispose of hazardous waste are generally required to obtain a RCRA permit. Subtitle C permits for treatment, storage, or disposal facilities contain general facility standards such as contingency plans, emergency procedures, recordkeeping and reporting requirements, financial assurance mechanisms, and unit-specific standards. RCRA also contains provisions (40 CFR Part 264 Subparts I and S) for conducting corrective actions which govern the cleanup of releases of hazardous waste or constituents from solid waste management units at RCRA treatment, storage, or disposal facilities.

Although RCRA is a federal statute, many states implement the RCRA program. Currently, EPA has delegated its authority to implement various provisions of RCRA to 47 of the 50 states and two United States territories. Delegation has not been given to Alaska, Hawaii, or Iowa.

Most RCRA requirements are not industry specific but apply to any company that generates, transports, treats, stores, or disposes of hazardous waste. Here are some important RCRA regulatory requirements:

- **Criteria for Classification of Solid Waste Disposal Facilities and Practices** (40 CFR Part 257) establishes the criteria for determining which solid waste disposal facilities and practices pose a reasonable probability of adverse effects on health or the environment. The criteria were adopted to ensure non-municipal, non-hazardous waste disposal units that receive conditionally exempt small quantity generator waste do not present risks to human health and environment.

- **Criteria for Municipal Solid Waste Landfills** (40 CFR Part 258) establishes minimum national criteria for all municipal solid waste landfill units, including those that are used to dispose of sewage sludge.

- **Identification of Solid and Hazardous Wastes** (40 CFR Part 261) establishes the standard to determine whether the material in question is considered a solid waste and, if so, whether it is a hazardous waste or is exempted from regulation.

- **Standards for Generators of Hazardous Waste** (40 CFR Part 262) establishes the responsibilities of hazardous waste generators including obtaining an EPA ID number, preparing a manifest, ensuring proper packaging and labeling, meeting standards for waste accumulation units, and recordkeeping and reporting requirements. Generators can accumulate hazardous waste on-site for up to 90 days (or 180 days depending on the amount of waste generated) without obtaining a permit.

- **Land Disposal Restrictions** (LDRs) (40 CFR Part 268) are regulations prohibiting the disposal of hazardous waste on land without prior treatment. Under the LDRs program, materials must meet treatment standards prior to placement in a RCRA land disposal unit (landfill, land treatment unit, waste pile, or surface impoundment). Generators of waste subject to the LDRs must provide notification of such to the designated TSD facility to ensure proper treatment prior to disposal.

- **Used Oil Management Standards** (40 CFR Part 279) impose management requirements affecting the storage, transportation, burning, processing, and re-refining of the used oil. For parties that merely generate used oil, regulations establish storage standards. For a party considered a used oil processor, re-refiner, burner, or marketer (one who generates and sells off-specification used oil directly to a used oil burner), additional tracking and paperwork requirements must be satisfied.

- **Tanks and Containers Standards** (40 CFR Part 264-265, Subpart CC) contains unit-specific standards for all units used to store, treat, or dispose of hazardous waste. Tanks and containers used to store hazardous waste with a high volatile organic concentration must meet emission standards under RCRA. Regulations require generators to test the waste to determine the concentration of the waste, to satisfy tank and container emissions standards, and to inspect and monitor regulated units. These regulations apply to all facilities who store such waste, including large quantity generators accumulating waste prior to shipment offsite.

- **Underground Storage Tanks** (USTs) containing petroleum and hazardous substances are regulated under Subtitle I of RCRA. Subtitle I regulations (40 CFR Part 280) contain tank design and release detection requirements, as well as financial responsibility and corrective action standards for USTs. The UST program also includes upgrade requirements for existing tanks that were to be met by December 22, 1998.

- **Boilers and Industrial Furnaces** (BIFs) that use or burn fuel containing hazardous waste must comply with design and operating standards. BIF regulations (40 CFR Part 266, Subpart H) address unit design, provide performance standards, require emissions monitoring, and, in some cases, restrict the type of waste that may be burned.

EPA's RCRA, Superfund, and EPCRA Hotline, at (800) 424-9346, responds to questions and distributes guidance regarding all RCRA regulations. Additional documents and resources can be obtained from the hotline's homepage at http://www.epa.gov/epaoswer/hotline. The RCRA Hotline operates weekdays from 9:00 a.m. to 6:00 p.m., EST, excluding federal holidays.

Comprehensive Environmental Response, Compensation, and Liability Act

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), a 1980 law commonly known as Superfund, authorizes EPA to respond to releases, or threatened releases, of hazardous substances that may endanger public health, welfare, or the environment. The CERCLA also enables EPA to force parties responsible for environmental contamination to clean it up or to reimburse the Superfund for response or remediation costs incurred by EPA. The Superfund Amendments and Reauthorization Act (SARA) of 1986 revised various sections of CERCLA, extended the taxing authority for the Superfund, and created a free-standing law, SARA Title III, also known as the Emergency Planning and Community Right-to-Know Act (EPCRA).

The CERCLA hazardous substance release reporting regulations (40 CFR Part 302) direct the person in charge of a facility to report to the National Response Center (NRC) any environmental release of a hazardous substance which equals or exceeds a reportable quantity. Reportable quantities are listed in 40 CFR section 302.4. A release report may trigger a response by EPA or by one or more federal or state emergency response authorities.

EPA implements hazardous substance responses according to procedures outlined in the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (40 CFR Part 300). The NCP includes provisions for cleanups. The National Priorities List (NPL) currently includes approximately 1,300 sites. Both EPA and states can act at other sites; however, EPA provides responsible parties the opportunity to conduct cleanups and encourages community involvement throughout the Superfund response process.

EPA's RCRA, Superfund and EPCRA Hotline, at (800) 424-9346, answers questions and references guidance pertaining to the Superfund program. Documents and resources can be obtained from the hotline's homepage at http://www.epa.gov/epaoswer/hotline. The Superfund Hotline operates weekdays from 9:00 a.m. to 6:00 p.m., EST, excluding federal holidays.

Emergency Planning and Community Right-To-Know Act

The Superfund Amendments and Reauthorization Act (SARA) of 1986 created the Emergency Planning and Community Right-to-Know Act (EPCRA, also known as SARA Title III), a statute designed to improve community access to information about chemical hazards and to facilitate the development of chemical emergency response plans by state and local governments. Under EPCRA, states establish State Emergency Response Commissions (SERCs), responsible for coordinating certain emergency response activities and for appointing Local Emergency Planning Committees (LEPCs). EPCRA and the EPCRA regulations (40 CFR Parts 350-372) establish four types of reporting obligations for facilities which store or manage specified chemicals:

- **EPCRA section 302** requires facilities to notify the SERC and LEPC of the presence of any extremely hazardous substance at the facility in an amount in excess of the established threshold planning quantity. The list of extremely hazardous substances and their threshold planning quantities is found at 40 CFR Part 355, Appendices A and B.

- **EPCRA section 303** requires that each LEPC develop an emergency plan. The plan must contain (but is not limited to) the identification of facilities within the planning district, likely routes for transporting extremely hazardous substances, a description of the methods and procedures to be followed by facility owners and operators, and the designation of community and facility emergency response coordinators.

- **EPCRA section 304** requires the facility to notify the SERC and the LEPC in the event of a release exceeding the reportable quantity of a CERCLA hazardous substance (defined at 40 CFR Part 302) or an EPCRA extremely hazardous substance.

- **EPCRA sections 311 and 312** require a facility at which a hazardous chemical, as defined by the Occupational Safety and Health Act, is present in an amount exceeding a specified threshold to submit to the

R0074194

SERC, LEPC and local fire department material safety data sheets (MSDSs) or lists of MSDSs and hazardous chemical inventory forms (also known as Tier I and II forms). This information helps the local government respond in the event of a spill or release of the chemical.

- **EPCRA section 313** requires certain covered facilities, including SIC codes 20 through 39 and others, which have ten or more employees, and which manufacture, process, or use specified chemicals in amounts greater than threshold quantities, to submit an annual toxic chemical release report. This report, commonly known as the Form R, covers releases and transfers of toxic chemicals to various facilities and environmental media. EPA maintains the data reported in a publically accessible database known as the Toxics Release Inventory (TRI).

All information submitted pursuant to EPCRA regulations is publicly accessible, unless protected by a trade secret claim.

EPA's RCRA, Superfund, and EPCRA Hotline, at (800) 535-0202, answers questions and distributes guidance regarding the emergency planning and community right-to-know regulations. Documents and resources can be obtained from the hotline's homepage at http://www.epa.gov/epaoswer/hotline. The EPCRA Hotline operates weekdays from 9:00 a.m. to 6:00 p.m., EST, excluding federal holidays.

Clean Air Act

The Clean Air Act (CAA) and its amendments are designed to "protect and enhance the nation's air resources so as to promote the public health and welfare and the productive capacity of the population." The CAA consists of six sections, known as Titles, which direct EPA to establish national standards for ambient air quality and for EPA and the states to implement, maintain, and enforce these standards through a variety of mechanisms. Under the CAA, many facilities are required to obtain operating permits that consolidate their air emission requirements. State and local governments oversee, manage, and enforce many of the requirements of the CAA. CAA regulations appear at 40 CFR Parts 50-99.

Pursuant to Title I of the CAA, EPA has established national ambient air quality standards (NAAQSs) to limit levels of "criteria pollutants," including carbon monoxide, lead, nitrogen dioxide, particulate matter, ozone, and sulfur dioxide. Geographic areas that meet NAAQSs for a given pollutant are designated as attainment areas; those that do not meet NAAQSs are designated as non-attainment areas. Under section 110 and other provisions of the CAA, each state must develop a State Implementation Plan (SIP) to identify sources of air pollution and to determine what reductions are required to meet federal air quality standards. Revised NAAQSs for particulates and ozone were finalized in 1997. However, these revised NAAQSs are currently being challenged before the U.S. Supreme Court.

Title I also authorizes EPA to establish New Source Performance Standards (NSPS), which are nationally uniform emission standards for new and modified stationary sources falling within particular industrial categories. The NSPSs are based on the pollution control technology available to that category of industrial source (*see* 40 CFR Part 60).

Under Title I, EPA establishes and enforces National Emission Standards for Hazardous Air Pollutants (NESHAPs), nationally uniform standards oriented toward controlling specific hazardous air pollutants (HAPs). Section 112(c) of the CAA further directs EPA to develop a list of sources that emit any of 188 HAPs and to develop regulations for these categories of sources. To date EPA has listed 185 source categories and developed a schedule for the establishment of emission standards. The emission standards are being developed for both new and existing sources based on "maximum achievable control technology" (MACT). The MACT is defined as the control technology achieving the maximum degree of reduction in the emission of the HAPs, taking into account cost and other factors.

Title II of the CAA pertains to mobile sources, such as cars, trucks, buses, and planes. Reformulated gasoline, automobile pollution control devices, and vapor recovery nozzles on gas pumps are a few of the mechanisms EPA uses to regulate mobile air emission sources.

Title IV-A establishes a sulfur dioxide and nitrogen oxides emissions program designed to reduce the formation of acid rain. Reduction of sulfur dioxide releases will be obtained by granting to certain sources limited emissions allowances that are set below previous levels of sulfur dioxide releases.

Title V of the CAA establishes an operating permit program for all "major sources" (and certain other sources) regulated under the CAA. One purpose of the operating permit is to include in a single document all air emissions requirements that apply to a given facility. States have developed the permit programs in accordance with guidance and regulations from EPA. Once a state program is approved by EPA, permits are issued and monitored by that state.

Title VI of the CAA is intended to protect stratospheric ozone by phasing out the manufacture of ozone-depleting chemicals and restrict their usage and distribution. Production of Class I substances, including 15 kinds of chlorofluorocarbons (CFCs), were phased out (except for essential uses) in 1996. Methyl bromide, a common pesticide, has been identified as a significant stratospheric ozone depleting chemical. The production and importation of methyl bromide, therefore, is currently being phased out in the United States and internationally. As specified in the Federal Register of June 1, 1999 (Volume 64, Number 104) and in 40 CFR Part 82, methyl bromide production and importation will be reduced from 1991 levels by 25% in 1999, by 50% in 2001, by 70% in 2003, and completely phased out by 2005. Some uses of methyl bromide, such the production, importation, and consumption of methyl bromide to fumigate commodities entering or leaving the United States or any state (or political subdivision thereof) for purposes of compliance with Animal and Plant Health Inspection Service requirements or with any international, federal, state, or local sanitation or food protection standard, will be exempt from this rule. After 2005, exceptions may also be made for critical agricultural uses. The United States EPA and the United Nations Environment Programme have identified alternatives to using methyl bromide in agriculture. Information on the methyl bromide phase-out, including alternatives, can be found at the EPA Methyl Bromide Phase-Out Web Site: (http://www.epa.gov/docs/ozone/mbr/mbrqa.html).

EPA's Clean Air Technology Center, at (919) 541-0800 and at the Center's homepage at http://www.epa.gov/ttn/catc, provides general assistance and information on CAA standards. The Stratospheric Ozone Information Hotline, at (800) 296-1996 and at http://www.epa.gov/ozone, provides general information about regulations promulgated under Title VI of the CAA; EPA's EPCRA Hotline, at (800) 535-0202 and at http://www.epa.gov/epaoswer/hotline, answers questions about accidental release prevention under CAA section 112(r); and information on air toxics can be accessed through the Unified Air Toxics website at http://www.epa.gov/ttn/uatw. In addition, the Clean Air Technology Center's website includes recent CAA rules, EPA guidance documents, and updates of EPA activities.

Toxic Substances Control Act

The Toxic Substances Control Act (TSCA) granted EPA authority to create a regulatory framework to collect data on chemicals in order to evaluate, assess, mitigate, and control risks which may be posed by their manufacture, processing, and use. TSCA provides a variety of control methods to prevent chemicals from posing unreasonable risk. It is important to note that pesticides as defined in FIFRA are not included in the definition of a "chemical substance" when manufactured, processed, or distributed in commerce for use as a pesticide.

TSCA standards may apply at any point during a chemical's life cycle. Under TSCA section 5, EPA established an inventory of chemical substances. If a chemical substance is not already on the inventory, and has not been excluded by TSCA, a premanufacture notice (PMN) must be submitted to EPA prior to manufacture or import. The PMN must identify the chemical and provide available information on health and environmental effects. If available data are not sufficient to evaluate the chemical's effects, EPA can impose restrictions pending the development of information on its health and environmental effects. EPA can also restrict significant new uses of chemicals based upon factors such as the projected volume and use of the chemical.

Under TSCA section 6, EPA can ban the manufacture or distribution in commerce, limit the use, require labeling, or place other restrictions on chemicals that pose unreasonable risks. Among the chemicals EPA regulates under section 6 authority are asbestos, chlorofluorocarbons (CFCs), lead, and polychlorinated biphenyls (PCBs).

Under TSCA section 8(e), EPA requires the producers and importers (and others) of chemicals to report information on a chemical's production, use, exposure, and risks. Companies producing and importing chemicals can be required to report unpublished health and safety studies on listed chemicals and to collect and record any allegations of adverse reactions or any information indicating that a substance may pose a substantial risk to humans or the environment.

EPA's TSCA Assistance Information Service, at 202 554-1404, answers questions and distributes guidance pertaining to Toxic Substances Control Act standards. The Service operates from 8:30 a.m. through 4:30 p.m., EST, excluding federal holidays.

Coastal Zone Management Act

The Coastal Zone Management Act (CZMA) encourages states/tribes to preserve, protect, develop, and where possible, restore or enhance valuable natural coastal resources such as wetlands, floodplains, estuaries, beaches, dunes, barrier islands, and coral reefs, as well as the fish and wildlife using those habitats. It includes areas bordering the Atlantic, Pacific, and Arctic Oceans, Gulf of Mexico, Long Island Sound, and Great Lakes. A unique feature of this law is that participation by states/tribes is voluntary.

In the Coastal Zone Management Act Reauthorization Amendments (CZARA) of 1990, Congress identified nonpoint source pollution as a major factor in the continuing degradation of coastal waters. Congress also recognized that effective solutions to nonpoint source pollution could be implemented at the state/tribe and local levels. In CZARA, Congress added section 6217 (16 U.S.C. section 1455b), which calls upon states/tribes with federally-approved coastal zone management programs to develop and implement coastal nonpoint pollution control programs. The section 6217 program is administered at the federal level jointly by EPA and the National

Oceanic and Atmospheric Agency (NOAA).

Section 6217(g) called for EPA, in consultation with other agencies, to develop guidance on "management measures" for sources of nonpoint source pollution in coastal waters. Under section 6217, EPA is responsible for developing technical guidance to assist states/tribes in designing coastal nonpoint pollution control programs. On January 19, 1993, EPA issued its *Guidance Specifying Management Measures For Sources of Nonpoint Pollution in Coastal Waters*, which addresses five major source categories of nonpoint pollution: (1) urban runoff, (2) agriculture runoff, (3) forestry runoff, (4) marinas and recreational boating, and (5) hydromodification.

Additional information on coastal zone management may be obtained from EPA's Office of Wetlands, Oceans, and Watersheds at http://www.epa.gov/owow or from the Watershed Information Network at http://www.epa.gov/win. The NOAA website at http://www.nos.noaa.gov/ocrm/czm/ also contains additional information on coastal zone management.

VI.B. Industry Specific Requirements

The agricultural chemical industry is affected by several major federal environmental statutes. In addition, the industry is subject to numerous laws and regulations from state and local governments designed to protect health, safety, and the environment. A summary of the major federal regulations affecting the agricultural chemical industry follows.

Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA)

Every regulation promulgated under FIFRA affects the agricultural chemical industry in some way. The FIFRA regulations are found in 40 CFR Parts 152 through 186. Each part and its title are listed below.

Part 152 -	Pesticide Registration and Classification Procedures
Part 153 -	Registration Policies and Interpretations
Part 154 -	Special Review Procedures
Part 155 -	Registration Standards
Part 156 -	Labeling Requirements for Pesticides and Devices
Part 157 -	Packaging Requirements for Pesticides and Devices
Part 158 -	Data Requirements for Registration
Part 160 -	Good Laboratory Practice Standards
Part 162 -	State Registration of Pesticide Products
Part 163 -	Certification of Usefulness of Pesticide Chemicals
Part 164 -	Rules of Practice Governing Hearings, Under FIFRA, Arising from Refusals to Register, Cancellations of Registrations, Changes of Classifications, Suspensions of Registrations and Other Hearings Called Pursuant to section 6 of the Act
Part 166 -	Exemption of Federal and State Agencies for Use of Pesticides Under Emergency Conditions
Part 167 -	Registration of Pesticide and Active Ingredient Producing Establishments, Submission of Pesticide Reports
Part 168 -	Statements of Enforcement Policies and Interpretations
Part 169 -	Books and Records of Pesticide Production and Distribution
Part 170 -	Worker Protection Standards
Part 171 -	Certification of Pesticide Applicators
Part 172 -	Experimental Use Permits
Part 173 -	Procedures Governing the Rescission of State Primary Enforcement Responsibility for Pesticide Use Violations
Part 177 -	Issuance of Food Additive Regulations

Part 178 - Objections and Requests for Hearings
Part 179 - Formal Evidentiary Public Hearing
Part 180 - Tolerances and Exemptions from Tolerances for Pesticide Chemicals in or on Raw Agricultural Commodities
Part 185 - Tolerances for Pesticides in Food
Part 186 - Pesticides in Animal Feed

Please refer to the general discussion of FIFRA in Section VI.A for additional requirements not discussed below.

Product Registration Data Requirements
EPA requires the citation or submission of extensive environmental, health, and/or safety data during the registration application process. The categories of data required include the product's chemistry; environmental fate; residue chemistry, hazards to humans, domestic animals, and nontarget organisms; spray drift characteristics; reentry protection requirements; and performance (40 CFR Part 158). Under the "product chemistry" category, applicants must supply technical information describing the product's active and inert ingredients, manufacturing or formulating processes and physical and chemical characteristics. Data from "environmental fate" studies are used to assess the effects of pesticide residues on the environment, including its toxicity to people through consumption or exposure to applied areas and its effect on nontarget organisms and their habitat. Residue chemistry information includes the expected frequency, amounts, and time of application, and test results of residue remaining on treated food or feed. Information under "hazards to humans, domestic animals, and non-target organisms" includes specific test data assessing acute, subchronic, and chronic toxicity. All studies required to be submitted must satisfy Good Laboratory Practice (GLP) regulations (40 CFR Part 160). Guidelines for studies of product chemistry, residue chemistry, environmental chemistry, hazard evaluation and occupational and residential exposure can be found in 40 CFR Part 158.

Registration of Establishments
Any person producing a pesticide or device, except a custom blender,[4] is subject to section 7 and 40 CFR. Part 167; and is required to register his

[4] A *custom blender* means any establishment which provides the service of mixing pesticides to a customer's specifications, usually a pesticide(s)-fertilizer(s), pesticide-pesticide, or a pesticide animal feed mixture, when: (1) The blend is prepared to the order of the customer and is not held in inventory by the blender; (2) the blend is to be used on the customer's property (including leased or rented property); (3) the pesticide(s) used in the blend bears end-use labeling directions which do not prohibit use of the product in such a blend; (4) the blend is prepared from registered pesticides; (b) the blend is delivered to the end-user along with a copy of the end-use labeling of each pesticide used in the blend and a statement specifying the composition of mixture; and (6) no other pesticide production activity is performed at the establishment.

establishment with EPA prior to beginning production. Foreign establishments also must register with EPA if they produce a pesticidal product for import to the United States. Establishments must be registered with EPA if they intend that a substance produced will be used as an active ingredient of a pesticide or if they have actual or constructive notice that the substance will be used as an active ingredient. If a pesticide is produced for export, whether registered or unregistered, or is produced under an experimental use permit, the producing establishment must be registered.

In order to register an establishment with EPA, contact the EPA Regional office where the establishment is located, or for a foreign establishment, the Washington, DC EPA office. The following information must be submitted on EPA Form 3540-1 when registering an establishment: (1) the name and address of the company; (2) the type of ownership; and (3) the name and address of each producing establishment for which registration is sought. Any changes to the information provided must be submitted to EPA within thirty days after such changes occur. Upon receiving a complete application, EPA will assign a registration number for each listed establishment. This number must appear on the label.

Establishment Reporting Requirements

Under section 7(c)and 40 CFR. section 167.85, each registered pesticide producing establishment must submit an annual production report to EPA by March 1 of each year. Domestic establishments submit their report to the EPA regional office where the company headquarters is located. Foreign establishment production reports are submitted to the Washington, DC EPA office. Custom blenders are exempt from this requirement.

The report must cover any pesticide, active ingredient, or device produced. The report, to be submitted on specific EPA forms, includes the following information: (1) the name and address of the establishment; (2) the amount of each pesticide produced, repackaged, or relabeled in the past year; (3) the amount of each pesticide sold, distributed, or exported in the past year; and (4) the amount of the pesticide estimated to be produced, repackaged, or relabeled in the current year. Foreign establishments only are required to submit a report on pesticides imported into the United States.

Maintenance of Records

All producers of pesticides, devices, or active ingredients used in producing any pesticide must maintain records concerning the production and shipment of each pesticide under 40 CFR Part 169. These records are independent of other required records, including in-plant maintenance, extermination, or sanitation programs. Each establishment must maintain these records for two years. In addition, records on disposal methods must be maintained for 20 years, as well as authorized human trials. Records containing research data must be maintained as long as the registration is valid and the producer is in business. All required records must be available if requested by an inspector.

Prior Informed Consent
As part of its participation in a voluntary international program known as the Prior Informed Consent procedure, EPA prepares the following lists of pesticides that are suspended, canceled or severely restricted. These lists were last updated by EPA in August of 1997.

A "Suspended or Canceled" pesticide is defined as a pesticide for which all registered uses have been prohibited by final government action, or for which all requests for registration or equivalent action for all uses have, for health or environmental reasons, not been granted.

- Suspended or Canceled

1. aldrin
2. benzene hexachloride [BHC] (voluntary cancellation)
3. 2,3,4,5-Bis(2-butylene)tetrahydro-2-furaldehyde [Repellent-11]
4. bromoxynil butyrate (voluntary cancellation)
5. cadmium compounds (voluntary cancellation)
6. calcium arsenate (voluntary cancellation)
7. captafol (voluntary cancellation)
8. carbon tetrachloride
9. chloranil (voluntary cancellation)
10. chlordane
11. chlordimeform (voluntary cancellation)
12. chlorinated camphene [Toxaphene] (voluntary cancellation)
13. chlorobenzilate (voluntary cancellation)
14. chloromethoxypropylmercuric acetate [CPMA]
15. copper arsenate (voluntary cancellation)
16. cyhexatin (voluntary cancellation)
17. DBCP
18. decachlorooctahydro-1,3,4-metheno-2H-cyclobuta(cd) pentalen-2-one[chlordecone]
19. DDT
20. dieldrin
21. dinoseb and salts
22. Di(phenylmercury)dodecenylsuccinate [PMDS] (voluntary cancellation)
23. EDB
24. endrin (voluntary cancellation)
25. EPN (voluntary cancellation)
26. ethyl hexyleneglycol [6-12] (voluntary cancellation)
27. hexachlorobenzene [HCB] (voluntary cancellation)
28. lead arsenate (voluntary cancellation)
29. leptophos (Never received initial registration)

30. mercurous chloride
31. mercuric chloride
32. mevinphos
33. mirex (voluntary cancellation)
34. monocrotophos (voluntary cancellation)
35. nitrofen (TOK) (voluntary cancellation)
36. OMPA (octamethylpyrophosphoramide)
37. phenylmercury acetate [PMA]
38. phenylmercuric oleate [PMO] (voluntary cancellation)
39. potassium 2,4,5-trichlorophenate [2,4,5-TCP]
40. pyriminil [Vacor] (voluntary cancellation)
41. safrole (voluntary cancellation)
42. silvex
43. sodium arsenite
44. TDE (voluntary cancellation)
45. Terpene polychlorinates [Strobane] (voluntary cancellation)
46. thallium sulfate
47. 2,4,5-Trichlorophenoxyacetic acid [2,4,5-T]
48. vinyl chloride

A "Severely Restricted" pesticide means a pesticide for which virtually all registered uses have been prohibited by final government regulatory action, but for which certain specific registered use or uses remain authorized.

- Severely Restricted

1. arsenic trioxide
2. azinphos methyl
3. carbofuran (voluntary cancellation)
4. daminozide (voluntary cancellation)
5. heptachlor
6. methyl parathion
7. sodium arsenate
8. tributyltin compounds

Federal Food, Drug, and Cosmetics Act

Under the Federal Food, Drug, and Cosmetics Act (FFDCA), EPA sets tolerances for pesticide residues in food. This authority originally belonged to the Food and Drug Administration (FDA), but was transferred when EPA was formed in 1970. FDA still has responsibility for enforcing compliance with the tolerances. An agricultural product is deemed unsafe under the FFDCA if it contains pesticide residues above the tolerance level established by EPA or if there is no tolerance, unless it is exempt from the requirement for tolerances.

The FFDCA also contains the Delaney Clause that bars the establishment of food additive regulations covering substances that induce cancer in humans or animals. Prior to the Food Quality Protection Act of 1996, this provision applied to certain pesticide residues in processed food. With the 1996 amendments, pesticide residues are now governed by a single safety clause set forth in section 408.

Toxic Substances Control Act (TSCA)

TSCA gives EPA comprehensive authority to regulate any chemical substance whose manufacture, processing, distribution in commerce, use, or disposal may present an unreasonable risk of injury to health or the environment. EPA keeps an inventory of existing chemicals regulated under TSCA (TSCA section 8(b)). Certain chemicals are specifically excluded from the TSCA inventory, such as pesticides, as defined when manufactured, processed, or distributed in commerce for use as a pesticide under FIFRA (40 CFR section 710.2(h)(2)). However, if a chemical has multiple uses, those uses not subject to FIFRA are regulated by TSCA. In addition, certain mixtures of chemicals are exempt from TSCA (40 CFR section 710.2(h)(1)) (Landfair, 1993).

Four sections are of primary importance to the remainder of the agricultural chemical industry. Section 5 mandates that chemical companies submit to EPA pre-manufacture notices that provide information on health and environmental effects for each new product and test existing products for these effects (40 CFR Part 720). Over 20,000 premanufacture notices have been filed. Section 4 authorizes EPA to require testing of certain substances (40 CFR Part 790). Section 6 gives EPA the authority to prohibit, limit, or ban the manufacture, process, and usage of chemicals (40 CFR Part 750). Among the chemicals EPA regulates under section 6 are asbestos, chlorofluorocarbons (CFCs), and polychlorinated biphenyls (PCBs). For certain chemicals, TSCA section 8 also imposes record-keeping and reporting requirements including substantial risk notification; record-keeping for data relative to adverse reactions; and periodic updates to the TSCA Inventory.

Resource Conservation and Recovery Act (RCRA)

The Resource Conservation and Recovery Act (RCRA) was enacted in 1976 to address problems related to hazardous and solid waste management. RCRA gives EPA the authority to establish a list of solid and hazardous wastes and to establish standards and regulations for the treatment, storage, and disposal of these wastes. Regulations in Subtitle C of RCRA address the identification, generation, transportation, treatment, storage, and disposal of hazardous wastes. These regulations are found in 40 CFR Part 124 and CFR Parts 260-279. Under RCRA, persons who generate waste must determine whether the waste is defined as solid waste or hazardous waste. Solid wastes are considered hazardous wastes if they are listed by EPA as hazardous or if they exhibit characteristics of a hazardous waste: toxicity, ignitability, corrosivity, or reactivity.

Products, intermediates, and off-specification products potentially generated at agricultural chemical facilities that are considered hazardous wastes are listed in 40 CFR Part 261. Some of the handling and treatment requirements for RCRA hazardous waste generators are covered under 40 CFR Part 262 and include the following: determining what constitutes a RCRA hazardous waste (Subpart A); manifesting (Subpart B); packaging, labeling, and accumulation time limits (Subpart C); and record keeping and reporting (Subpart D).

Many agricultural chemical facilities store some hazardous wastes at the facility beyond the accumulation time limits available to generators (e.g., 90 or 180 days). Such facilities are required to have a RCRA treatment, storage, and disposal facility (TSDF) permit (40 CFR Part 262.34). Some agricultural chemical facilities are considered TSDF facilities and are subject to a number of regulations, including but not limited to those covered under 40 CFR Part 264: contingency plans and emergency procedures (40 CFR Part 264 Subpart D); manifesting, record keeping, and reporting (40 CFR Part 264 Subpart E); use and management of containers (40 CFR Part 264 Subpart I); tank systems (40 CFR Part 264 Subpart J); surface impoundments (40 CFR Part 264 Subpart K); land treatment (40 CFR Part 264 Subpart M); corrective action of hazardous waste releases (40 CFR Part 264 Subpart S); air emissions standards for process vents of processes that process or generate hazardous wastes (40 CFR Part 264 Subpart AA); emissions standards for leaks in hazardous waste handling equipment (40 CFR Part 264 Subpart BB); and emissions standards for containers, tanks, and surface impoundments that contain hazardous wastes (40 CFR Part 264 Subpart CC).

Many agricultural chemical facilities are also subject to the underground storage tank (UST) program (40 CFR Part 280). The UST regulations apply to facilities that store either petroleum products or hazardous substances (except hazardous waste) identified under the Comprehensive Environmental Response, Compensation, and Liability Act. UST regulations address design standards, leak detection, operating practices, response to releases, financial responsibility for releases, and closure standards.

A number of RCRA wastes have been prohibited from land disposal unless treated to meet specific standards under the RCRA Land Disposal Restriction (LDR) program. The wastes covered by the RCRA LDRs are listed in 40 CFR Part 268 Subpart C and include a number of wastes that could potentially be generated at agricultural chemical facilities. Standards for the treatment and storage of restricted wastes are described in Subparts D and E, respectively.

The LDRs also apply to the use of fertilizers containing hazardous wastes. Therefore, fertilizers containing hazardous wastes that do not meet the applicable land disposal treatment standards cannot be spread on the land, with some exceptions. Specific exemptions to the use of certain recycled materials and hazardous wastes in fertilizers have been provided in 40 CFR Part 266, Subpart C - Recycled Materials Used in a Manner Constituting Disposal. Subpart C states that products containing recyclable materials are not subject to regulation under RCRA if the recyclables are physically inseparable from the product or if they meet the standards of 40 CFR Part 268, Subpart D "for each recyclable material (i.e., hazardous waste) that they contain." These standards include limits on heavy metals. Subpart C also states that zinc-containing fertilizers using hazardous waste K061 (emission control dust/sludge from the primary production of steel in electric furnaces) which is listed as hazardous due to its hexavalent chromium, lead, and cadmium content, are not subject to the land disposal requirements.

Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA) provide the basic legal framework for the federal "Superfund" program to clean up abandoned hazardous waste sites (40 CFR Part 300 et seq.). The 1986 SARA legislation extended CERCLA taxes for five years and adopted a new broad-based corporate environmental tax, applicable to the allied chemicals (SIC 28) industry, which includes the agricultural chemical industry. In 1990, Congress passed a simple reauthorization that did not substantially change the law but extended the program authority until 1994 and the taxing authority until the end of 1995. A comprehensive reauthorization was considered in 1994, but not passed. Since the expiration of the taxing authority on December 31, 1995, taxes for Superfund have been temporarily suspended. The taxes can only be reinstated by reauthorization of Superfund or an omnibus reconciliation act which could specifically reauthorize taxing authority. The allied chemical industry paid about $300 million a year in Superfund chemical feedstock taxes. Joint and several liability generally requires Potentially Responsible Parties (PRPs) to perform or pay for their fair share of cleanup costs.

Title III of the 1986 SARA amendments (also known as Emergency Response and Community Right-to-Know Act, EPCRA) requires all manufacturing facilities, including agricultural chemical facilities, to report annual information about stored toxic substances, as well as release of these substances into the environment, to local and state governments and to the public. This is known as the Toxic Release Inventory (TRI). EPCRA also establishes requirements for federal, state, and local governments regarding emergency planning. In 1994, over 300 more chemicals were added to the list of chemicals for which reporting is required.

Clean Air Act (CAA)

The original CAA authorized EPA to set limits on agricultural chemical facility emissions. The new source performance standards (NSPS) for fertilizer manufacturers can be found in 40 CFR Part 60:

Subpart G -	Standards of Performance for Nitric Acid Plants (40 CFR section 60.70 - 60.74)
Subpart T -	Standards of Performance for the Phosphate Fertilizer Industry: Wet Process Phosphoric Acid Plants (40 CFR section 60.200 - 60.204)
Subpart U -	Standards of Performance for the Phosphate Fertilizer Industry: Superphosphoric Acid Plants (40 CFR section 60.210 - 60.214)
Subpart V -	Standards of Performance for the Phosphate Fertilizer Industry: Diammonium Phosphate Plants (40 CFR section 60.220 - 60.224)
Subpart W -	Standards of Performance for the Phosphate Fertilizer Industry: Triple Superphosphate Plants (40 CFR section 60.230 - 60.234)
Subpart X -	Standards of Performance for the Phosphate Fertilizer Industry: Granular Triple Superphosphate Storage Facilities (40 CFR section 60.240 - 60.244)

These standards primarily consist of emission and monitoring standards for nitrogen oxides (Nitric Acid Plants) and fluorides (Phosphatic Fertilizer Industry) .

The Clean Air Act Amendments of 1990 set National Emission Standards for Hazardous Air Pollutants (NESHAP) from industrial sources for 41 hazardous air pollutants to be met by 1995 and for 148 other hazardous air pollutants to be reached by 2003. National emission standards for new and existing major sources in phosphoric acid manufacturing, phosphate fertilizers production and pesticide active ingredient production are listed in 40 CFR Parts 9 and 63. 40 CFR Parts 61 and 63 contains several provisions dealing with emissions sources potentially found at an agricultural chemical facility (e.g. equipment leaks, tanks, surface impoundments, separators, and waste treatment operations) may affect the agricultural chemical industry. A number of the chemicals used and produced at agricultural chemical manufacturing and formulating facilities are hazardous air pollutants under CAA.

Under section 112(r) of CAA, owners and operators of stationary sources who produce, process, handle, or store substances listed under CAA section 112(r)(3) or any other extremely hazardous substance have a "general duty" to initiate specific activities to prevent and mitigate accidental releases. Since the general duty requirements apply to stationary sources regardless of the quantity of substances managed at the facility, many agricultural chemical manufacturing and formulating facilities are subject. Activities such as identifying hazards which may result from accidental releases using appropriate hazard assessment techniques; designing, maintaining and operating a safe facility; and minimizing the consequences of accidental releases if they occur are considered essential activities to satisfy the general duty requirements. These statutory requirements have been in affect since the passage of the Clean Air Act in 1990. Although there is no list of "extremely hazardous substances," EPA's Chemical Emergency Preparedness and Prevention Office provides some guidance at its website: http://www.epa.gov/swercepp.html.

Also under section 112(r), EPA was required to develop a list of at least 100 substances that, in the event of an accidental release, could cause death, injury, or serious adverse effects to human health or the environment. The list promulgated by EPA is contained in 40 CFR section 68.130 and includes acutely toxic chemicals, flammable gases and volatile flammable liquids. Under section 112(r)(7), facilities handling more than a threshold quantity (ranging from 500 to 20,000 pounds) of these substances are subject to chemical accident prevention provisions including the development and implementation of a risk management program (40 CFR sections 68.150-68.220). The requirements in 40 CFR Part 68 begin to go into effect in June 1999. Many of the chemicals on the 112(r) list are commonly handled by agricultural chemical manufacturers and formulators in quantities greater than the threshold values. Ammonia held by farmers for use as an agricultural nutrient is exempt from the chemical accident prevention provisions.

Standards in 40 CFR Part 61 Subpart R - National Emission Standards for Radon Emissions from Phosphogypsum Stacks (40 CFR sections 61.200 - 61.210) deal specifically with the phosphatic fertilizer industry. The standards require monitoring and reporting of radon-222 emissions from the stacks and sets limits on the amounts of radon-222 that can be emitted into the air. EPA has also set standards for the maximum concentration of radium-226 allowed in phosphogypsum removed from stacks for use in agriculture.

Clean Water Act (CWA)

The Clean Water Act, first passed in 1972 and amended in 1977 and 1987, gives EPA the authority to regulate effluents from sewage treatment works, chemical plants, and other industrial sources into waters. The act sets standards for treatment of wastes for both direct and indirect (to a Publicly Owned Treatment Works (POTW)) discharges. EPA has set effluent guidelines for both the fertilizer manufacturing and formulating, and pesticide formulating, packaging and repackaging point source categories. The implementation of the guidelines is left primarily to the states who issue National Pollutant Discharge Elimination System (NPDES) permits for each facility (EPA has authorized 43 states to operate the NPDES program).

Effluent guidelines specific to the fertilizer manufacturing and formulating point source category are contained in 40 CFR Part 418 and are divided into product specific effluent guidelines as follows:

Subpart A - Phosphates (40 CFR section 418.10 - 418.17)

Subpart B - Ammonia (40 CFR section 418.20 - 418.27)

Subpart C - Urea (40 CFR section 418.30 - 418.36)

Subpart D - Ammonium Nitrate (40 CFR section 418.40 - 418.46)

Subpart E - Nitric Acid (40 CFR section 418.50 - 418.56)

Subpart F - Ammonium Sulfate (40 CFR section 418.60 - 418.67)

Subpart G - Mixed and Blend Fertilizer Production (40 CFR section 418.70 - 418.77)

In 1997, revised effluent guidelines were finalized for the Pesticide Formulating, Packaging and Repackaging Subcategory. These regulations replace the effluent guidelines established in 1978 for the Pesticide Formulating and Packaging Subcategory. The revised guidelines are contained in 40 CFR Part 455 and are divided into the following subcategories:

Subpart C - Pesticide Chemicals Formulating and Packaging Subcategory

Subpart E - Repackaging of Agricultural Pesticides Performed at Refilling Establishments

Each Subpart consists of effluent standards representing the amount of effluent reduction possible by using either best practicable control technologies (BPT), best conventional pollution technologies (BCT), or best available technologies (BAT). The states and EPA give effect to these standards through NPDES permits that they issue to direct dischargers. BCT standards limit the discharge of conventional pollutants, while BPT and BAT standards represent successive levels of control of priority pollutants and non-conventional pollutants.

For Subcategory C, EPA established effluent limitations and pretreatment standards which allow each facility a choice of meeting a zero discharge limitation or to comply with a pollution prevention alternative that authorizes the discharge of some pesticide active ingredients (AIs) and priority pollutants after various pollution prevention practices are followed and treatment is conducted as needed. For Subcategory E, EPA has established a zero discharge limitation and pretreatment standard.

The Storm Water Rule (40 CFR section 122.26) requires fertilizer manufacturing and formulating and pesticide formulating facilities discharging storm water associated with industrial activities (40 CFR section 122.26 (b)(14)(ii)) to apply for NPDES permits for those discharges.

Under 40 CFR 503 Subpart B - Land Application, EPA regulates the land application of sewerage treatment sludge, which includes fertilizers derived from sewerage treatment sludge. Subpart B regulations include specific limitations on heavy metal content, as well as general operational and management standards.

VI.C. State Regulation of Pesticides

All states have their own pesticide laws and many states have their own pesticide registration requirements. States have primary use enforcement authority if EPA has determined that the state has adequate pesticide use laws and has adopted adequate procedures to enforce those laws. The EPA may enter into a cooperative agreement with a state to carry out enforcement of state laws and train and certify applicators. The FIFRA allows states to administer their own EPA-approved applicator certifications program. Also, each state is allowed to regulate the sale and use of pesticides as long as the regulations are at least as stringent as EPA's and the regulations do not conflict or differ from EPA's labeling and packaging restrictions.

States typically require that fertilizer products be registered with the state and that claims made on fertilizer labels can be substantiated. States also regulate the efficacy of fertilizers through labeling requirements. State fertilizer labeling requirements typically require that the label indicate the product name, the brand and grade, the percentage of each nutrient (nitrogen, available phosphate, potassium, etc.), and the name and address of the registrant. Some states also require that the label indicate materials from which the nutrients are derived.

Additional information on specific state requirements can be obtained from *the Association of American Pesticide Control Officials, Inc. (AAPCO) at: http://aapco.ceris.purdue.edu/index.html. This website contains a list of state pesticide control officials that includes contact information.*

VI.D. Pending and Proposed Regulatory Requirements

FIFRA

Registration

- In order to reduce the potential for groundwater contamination from certain pesticides, EPA proposed the Ground Water Pesticide Management Plan Rule in June of 1996 (61 FR 33259). EPA is proposing to restrict the use of certain pesticides by providing states and tribes with the flexibility to protect the ground water in the most appropriate way for local conditions, through the development and use of Pesticide Management Plans (PMPs). When finalized, the regulations will likely give states and tribes the authority to develop management plans that specify risk reduction measures for the following four pesticides: atrazine, alachlor, simazine, and metolachlor. Without EPA-approved plans, use of these chemicals would be prohibited. A final rule is expected to be published in late 2000. (Contact: Arty Williams, United States EPA Office of Prevention, Pesticides and Toxic Substances, 703-305-5239)

- In response to the Food Quality Protection Act of 1996, EPA is planning to propose revisions to antimicrobial registration and classification procedures (40 CFR Part 152) that will reduce to the extent possible the review time for antimicrobial pesticides. Revisions to labeling requirements (40 CFR Part 156) and data requirements for antimicrobial registration (40 CFR Part 158) are also being proposed. The revisions are expected to be released in early 2001. This regulation would also implement some general provisions of FIFRA that pertain to all pesticides, including labeling requirements and notification procedures. (Contact: Jean Frane, United States EPA Office of Prevention, Pesticides, and Toxic Substances, 703-305-5944 and Paul Parsons, United States EPA Office of Prevention, Pesticides, and Toxic Substances, 703-308-9073)

- In order to evaluate the registrability of pesticide products, EPA is expected to propose revisions to the data requirements for FIFRA registration (40 CFR Part 158). These revisions would clarify all data requirements to reflect current practice and are expected to be published in 2001. (Contact: Jean Frane, United States EPA Office of Prevention, Pesticides, and Toxic Substances, 703-305-5944)

Use Restrictions

- In May of 1991, EPA proposed amendments to the existing Restricted Use Classification (RUC) regulations (40 CFR Part 152, Subpart I) to add criteria pertaining to the groundwater contamination potential of pesticides (56 FR 22076). The criteria would be used to determine which pesticides should be considered for restricted use classifications to protect groundwater. A policy statement is expected to be issued in late 2000. (Contact: Joseph Hogue, United States EPA Office of Prevention, Pesticides, and Toxic Substances, 703-308-9072)

Tolerances and Exemptions

- EPA expects to reassess pesticide tolerances and exemptions for raw and processed foods established prior to August 3, 1996 (40 CFR Part 180, 40 CFR Part 185, 40 CFR Part 186), to determine whether they meet the standard of the Federal Food, Drug and Cosmetic Act (FFDCA). FFDCA section 408 (q), as amended by the Food Quality Protection Act, requires that EPA conduct this reassessment on a phased 10-year schedule. For the current phased schedule, EPA is required to complete reassessments as follows: 33% by August 3, 1999, 66% by August 3, 2002, and 100% by August 3, 2006. Based on its reassessment, EPA will likely propose a series of regulatory actions to modify or revoke tolerances. (Contacts: Robert McNally, United States EPA, Office of Prevention, Pesticides and Toxic Substances, 703-308-8085 and Joseph Nevola, United States EPA Office of Prevention Pesticides and Toxic Substances, 703-308-8037)

- Regulations specifying policies and procedures under which the EPA can establish food tolerances associated with the use of pesticides under emergency exemptions (40 CFR Part 176) are expected to be finalized in late 2000. The EPA issues emergency exemptions for temporary use of pesticides where emergency conditions exist. Under FFDCA, as amended by the Food Quality Protection Act, EPA must establish time-limited tolerances for such pesticides if the use is likely to result in residues in food. (Contact: Joseph Hogue, United States EPA Office of Prevention, Pesticides, and Toxic Substances, 703-308-9072)

- EPA proposed a rule to adjust and update the fee structure and fee amounts for tolerance actions, which are required under FFDCA (40 CFR section 180.33). The rule is expected to finalized in late 2000. (Contact: Carol Peterson, United States EPA, Office of Prevention, Pesticides, and Toxic Substances, 703-305-6598)

- Revisions to regulations on emergency exemptions under section 18 of FIFRA, are expected to be issued in late 2001 (40 CFR Part 166). EPA is considering revisions in four areas: 1) Options for increased authority for states to administer certain aspects of the exemption process, and/or increased use by the EPA of multi-year exemptions; 2) the use of emergency exemptions to address pesticide resistance; 3) the possibility of granting exemptions based upon reduced risk considerations; and 4) definitions of emergency situation and significant economic loss, which would affect whether or not an exemption may be granted. (Contact: Joseph Hogue, United States EPA Office of Prevention, Pesticides, and Toxic Substances, 703-308-9072)

Pesticide Storage and Disposal

- In 1994, EPA proposed a rule, authorized under section 19 of FIFRA, to establish standards for pesticide containers and secondary containment relating to the distribution and sale of pesticides (59 FR 6712). Standards are expected to be developed for the removal of pesticides from containers, rinsing containers, container design, container labeling, container refilling, the containment of stationary bulk containers and for the containment of pesticide dispensing areas (40 CFR Part 165, 40 CFR Part 156). A final rule is expected to be published in late 2000. (Contact: Nancy Fitz, United States EPA, Office of Prevention, Pesticides and Toxic Substances, 703-305-7385)

Exports

- The Rotterdam Agreement, signed in 1998, requires that certain banned or severely restricted hazardous chemicals are subject to intensive information exchange procedures, and if an importing country decides against import, exporting countries are obligated to prohibit export to that country. Twenty-four pesticides are currently covered by the treaty. As a result of the United States signing of this treaty, EPA has drafted legislation that allows it in the future to propose revisions to its pesticide export policy. (Contact: Cathleen Barnes, United States EPA Office of Prevention, Pesticides and Toxic Substances, 703-305-7101)

Worker Protection

- EPA has proposed a change to the Worker Protection Standards (WPS) of FIFRA (40 CFR Part 170). Specifically, the glove requirements may be modified to allow glove liners to be worn inside chemically resistant gloves. The proposed rule will be finalized in 2001. (Contact: Kevin Keaney, United States EPA Office of Prevention, Pesticides and Toxic Substances, 703-305-5557)

VII. COMPLIANCE AND ENFORCEMENT HISTORY

Background

Until recently, EPA has focused much of its attention on measuring compliance with specific environmental statutes. This approach allows the Agency to track compliance with the Federal Insecticide, Fungicide, and Rodenticide Act, the Clean Air Act, the Resource Conservation and Recovery Act, the Clean Water Act, and other environmental statutes. Within the last several years, the Agency has begun to supplement single-media compliance indicators with facility-specific, multimedia indicators of compliance. In doing so, EPA is in a better position to track compliance with all statutes at the facility level, and within specific industrial sectors.

A major step in building the capacity to compile multimedia data for industrial sectors was the creation of EPA's Integrated Data for Enforcement Analysis (IDEA) system. IDEA has the capacity to "read into" the Agency's single-media databases, extract compliance records, and match the records to individual facilities. The IDEA system can match Air, Water, Waste, Toxics/Pesticides/EPCRA, TRI, and Enforcement Docket records for a given facility, and generate a list of historical permit, inspection, and enforcement activity. IDEA also has the capability to analyze data by geographic area and corporate holder. As the capacity to generate multimedia compliance data improves, EPA will make available more in-depth compliance and enforcement information. Additionally, sector-specific measures of success for compliance assistance efforts are under development.

Compliance and Enforcement Profile Description

Using inspection, violation and enforcement data from the IDEA system, this section provides information regarding the historical compliance and enforcement activity of this sector. In order to mirror the facility universe reported in the Toxic Chemical Profile, the data reported within this section consists of records only from the TRI reporting universe. With this decision, the selection criteria are consistent across sectors with certain exceptions. For the sectors that do not normally report to the TRI program, data have been provided from EPA's Facility Indexing System (FINDS) which tracks facilities in all media databases. Please note, in this section, EPA does not attempt to define the actual number of facilities that fall within each sector. Instead, the section portrays the records of a subset of facilities within the sector that are well defined within EPA databases.

As a check on the relative size of the full sector universe, most notebooks contain an estimated number of facilities within the sector according to the Bureau of Census (*See* Section II). With sectors dominated by small

businesses, such as metal finishers and printers, the reporting universe within the EPA databases may be small in comparison to Census data. However, the group selected for inclusion in this data analysis section should be consistent with this sector's general make-up.

Following this introduction is a list defining each data column presented within this section. These values represent a retrospective summary of inspections and enforcement actions, and reflect solely EPA, state, and local compliance assurance activities that have been entered into EPA databases. To identify any changes in trends, the EPA ran two data queries, one for the past five calendar years (April 1, 1992 to March 31, 1997) and the other for the most recent twelve-month period (April 1, 1996 to March 31, 1997). The five-year analysis gives an average level of activity for that period for comparison to the more recent activity.

Because most inspections focus on single-media requirements, the data queries presented in this section are taken from single media databases. These databases do not provide data on whether inspections are state/local or EPA-led. However, the table breaking down the universe of violations does give the reader a crude measurement of the EPA's and states' efforts within each media program. The presented data illustrate the variations across EPA regions for certain sectors.[5] This variation may be attributable to state/local data entry variations, specific geographic concentrations, proximity to population centers, sensitive ecosystems, highly toxic chemicals used in production, or historical noncompliance. Hence, the exhibited data do not rank regional performance or necessarily reflect which regions may have the most compliance problems.

Compliance and Enforcement Data Definitions

General Definitions

Facility Indexing System (FINDS) -- assigns a common facility number to EPA single-media permit records. The FINDS identification number allows EPA to compile and review all permit, compliance, enforcement, and pollutant release data for any given regulated facility.

Integrated Data for Enforcement Analysis (IDEA) -- is a data integration system that can retrieve information from the major EPA program office

[5] EPA Regions include the following states: I (CT, MA, ME, RI, NH, VT); II (NJ, NY, PR, VI); III (DC, DE, MD, PA, VA, WV); IV (AL, FL, GA, KY, MS, NC, SC, TN); V (IL, IN, MI, MN, OH, WI); VI (AR, LA, NM, OK, TX); VII (IA, KS, MO, NE); VIII (CO, MT, ND, SD, UT, WY); IX (AZ, CA, HI, NV, Pacific Trust Territories); X (AK, ID, OR, WA).

R0074217

databases. IDEA uses the FINDS identification number to link separate data records from EPA's databases. This allows retrieval of records from across media or statutes for any given facility, thus creating a "master list" of records for that facility. Some of the data systems accessible through IDEA are: AFS (Air Facility Indexing and Retrieval System, Office of Air and Radiation), PCS (Permit Compliance System, Office of Water), RCRIS (Resource Conservation and Recovery Information System, Office of Solid Waste), NCDB (National Compliance Data Base, Office of Prevention, Pesticides, and Toxic Substances), CERCLIS (Comprehensive Environmental and Liability Information System, Superfund), and TRIS (Toxic Release Inventory System). IDEA also contains information from outside sources such as Dun and Bradstreet and the Occupational Safety and Health Administration (OSHA). Most data queries displayed in notebook sections IV and VII were conducted using IDEA.

Data Table Column Heading Definitions

Facilities in Search -- are based on the universe of TRI reporters within the listed SIC code range. For industries not covered under TRI reporting requirements (metal mining, nonmetallic mineral mining, electric power generation, ground transportation, water transportation, and dry cleaning), or industries in which only a very small fraction of facilities report to TRI (e.g., printing), the notebook uses the FINDS universe for executing data queries. The SIC code range selected for each search is defined by each notebook's selected SIC code coverage described in section II.

Facilities Inspected --- indicates the level of EPA and state agency inspections for the facilities in this data search. These values show what percentage of the facility universe is inspected in a one-year or five-year period.

Number of Inspections -- measures the total number of inspections conducted in this sector. An inspection event is counted each time it is entered into a single media database.

Average Time Between Inspections -- provides an average length of time, expressed in months, between compliance inspections at a facility within the defined universe.

Facilities with One or More Enforcement Actions -- expresses the number of facilities that were the subject of at least one enforcement action within the defined time period. This category is broken down further into federal and state actions. Data are obtained for administrative, civil/judicial, and criminal enforcement actions. Administrative actions include Notices of Violation

(NOVs). A facility with multiple enforcement actions is only counted once in this column, e.g., a facility with 3 enforcement actions counts as 1 facility.

Total Enforcement Actions -- describes the total number of enforcement actions identified for an industrial sector across all environmental statutes. A facility with multiple enforcement actions is counted multiple times, e.g., a facility with 3 enforcement actions counts as 3.

State Lead Actions -- shows what percentage of the total enforcement actions are taken by state and local environmental agencies. Varying levels of usage by states of EPA data systems may limit the volume of actions recorded as state enforcement activity. Some states extensively report enforcement activities into EPA data systems, while other states may use their own data systems.

Federal Lead Actions -- shows what percentage of the total enforcement actions are taken by the United States Environmental Protection Agency. This value includes referrals from state agencies. Many of these actions result from coordinated or joint state/federal efforts.

Enforcement to Inspection Rate -- is a ratio of enforcement actions to inspections, and is presented for comparative purposes only. This ratio is a rough indicator of the relationship between inspections and enforcement. It relates the number of enforcement actions and the number of inspections that occurred within the one-year or five-year period. This ratio includes the inspections and enforcement actions reported under the Clean Water Act (CWA), the Clean Air Act (CAA) and the Resource Conservation and Recovery Act (RCRA). Inspections and actions from the TSCA/FIFRA/EPCRA database are not factored into this ratio because most of the actions taken under these programs are not the result of facility inspections. Also, this ratio does not account for enforcement actions arising from non-inspection compliance monitoring activities (e.g., self-reported water discharges) that can result in enforcement action within the CAA, CWA, and RCRA.

Facilities with One or More Violations Identified -- indicates the percentage of inspected facilities having a violation identified in one of the following data categories: In Violation or Significant Violation Status (CAA); Reportable Noncompliance, Current Year Noncompliance, Significant Noncompliance (CWA); Noncompliance and Significant Noncompliance (FIFRA, TSCA, and EPCRA); Unresolved Violation and Unresolved High Priority Violation (RCRA). The values presented for this column reflect the extent of noncompliance within the measured time frame, but do not distinguish between the severity of the noncompliance. Violation status may be a precursor to an enforcement action, but does not necessarily indicate that an enforcement action will occur.

Media Breakdown of Enforcement Actions and Inspections -- four columns identify the proportion of total inspections and enforcement actions within EPA Air, Water, Waste, and TSCA/FIFRA/EPCRA databases. Each column is a percentage of either the "Total Inspections," or the "Total Actions" column.

VII.A. Fertilizer, Pesticide, and Agricultural Chemical Industry Compliance History

Table 25 provides an overview of the reported compliance and enforcement data for the Fertilizer, Pesticide, and Agricultural Chemical Industry over five years from April 1992 to April 1997. These data are also broken out by EPA Regions thereby permitting geographical comparisons. A few points evident from the data are listed below.

- About 75 percent of agricultural chemical facility inspections and 73 percent of enforcement actions occurred in EPA Regions IV, V, VI, and VII.

- Region IX had the highest ratio of enforcement actions to inspections (0.13) and the longest average time between inspections (21 months). This indicates that fewer inspections were conducted in relation to the number of facilities in the Region, but that these inspections were more likely to result in an enforcement action than inspections conducted in other Regions.

- With the exception of Region I, in which no inspections or enforcement actions were carried out in between 1992 and 1997, Region VIII had the lowest enforcement to inspection rate (0.03).

Table 25: Five-Year Enforcement and Compliance Summary for the Fertilizer, Pesticide, and Agricultural Chemical Industry

R0074221

VII.B. Comparison of Enforcement Activity Between Selected Industries

Tables 26 and 27 allow the compliance history of the agricultural chemical sector to be compared to the other industries covered by the industry sector notebooks. Comparisons between Tables 26 and 27 permit the identification of trends in compliance and enforcement records of the various industries by comparing data covering five years (April 1992 to April 1997) to that of the last year for which data were available (April 1996 to April 1997). Some points evident from the data are listed below.

- The agricultural chemical sector was inspected more frequently than most of the sectors shown (12 months on average between inspections).

- Between 1992 and 1997, the industry had a higher enforcement to inspection rate than most sectors (0.08); however, in 1997 the ratio decreased to 0.05 which is lower than most sectors.

- The agricultural chemical sector had one of the highest percentages of facilities inspected with one or more violations (97 percent) in 1997, but one of the lowest percentages of facilities with one or more enforcement actions (5 percent).

Tables 28 and 29 provide a more in-depth comparison between the Fertilizer, Pesticide, and Agricultural Chemical Industry and other sectors by breaking out the compliance and enforcement data by environmental statute. As in the previous Tables (Tables 26 and 27), the data cover the years 1992 to 1997 (Table 28) and 1997 (Table 29) to facilitate the identification of recent trends. A few points evident from the data are listed below.

- The percent of inspections carried out under each environmental statute has changed only slightly between the average of the years 1992 to 1997 and that of the past year. The Clean Air Act accounted for the most inspections (43 percent) during this period. This increased to almost half of all agricultural chemical facility inspections (49 percent) in 1997.

- The percent of enforcement actions taken under each environmental statute changed significantly from the 1992 to 1997 period to the past year. Enforcement actions taken under the Clean Air Act increased from 39 percent to 55 percent and enforcement actions taken under RCRA increased from 30 percent to 36 percent. At the same time, the enforcement actions taken under the Clean Water Act went from 20 percent in 1992 to 1995 to no actions in 1997.
