

Phase III: Diazinon Criteria Report

Appendix D

Data summary sheets

Appendix D1: Acceptable data rated RR (p. D2-D70)

Appendix D2: Supplemental data rated RL, LR, or LL (p. D71-D236)

Appendix D3: Unused data rated N (p. D237-D484)

Abbreviations used in this appendix:

NA = Not Applicable

NC = Non Calculable

NR = Not Reported

Unused lines deleted from tables

Within each section, studies are listed in alphabetical order by species name, when there are multiple summaries for one species, they are listed in alphabetical order by author.

Chironomus dilutus (tentans)

Toxicity Data Summary

Study: Belden JB, Lydy MJ. 2000. Impact of atrazine on organophosphate insecticide toxicity. *Environ Toxicol Chem* 19: 2266-2274.

Notes: Study showed significant synergism between diazinon and atrazine. Only data for diazinon alone is shown here for use in criteria derivation, but synergism data is useful for consideration of mixtures.

Gammarus pseudolimnaeus

Toxicity Data Summary

Study: Hall LW Jr, Anderson RD. 2005. Acute toxicity of diazinon to the amphipod, *Gammarus pseudolimnaeus*: implications for water quality criteria. Bull Environ Contam Toxicol 74: 94-99.

Relevance

Score: 100

Rating: R

Reliability

Score: 85.5

Rating: R

This study has raw acute data that may be used with the ACE program to estimate chronic toxicity.

Study also includes a note indicating that the LC50 value of 0.2 µg/L reported for *G. fasciatus* by Johnson & Finley (1980) and Mayer and Ellersieck (1986) is not correct and should be 2 µg/L. Those tests were not accepted for chlorpyrifos criteria derivation and are not likely to meet quality requirements for diazinon criteria.

% of control at LOEC	Survival, technical: 63.4%; Weight, technical: 89.9%; Survival, Knox: 83.4%; Weight, Knox: 88.9%	

Other data:

Stock toxicant solutions were made using a saturator system; acute static tests were done weekly over an 11 week period to see if toxicity changed as solutions aged.

Water solubility of technical diazinon: 40 mg/L

Water solubility of Knox Out: 34 mg/L

$t_{1/2}$ = 30 d for technical grade; determined in static half-life studies using Lake Superior water separate from tox studies

$t_{1/2}$ = > 230 d for Knox Out

Text clearly says that embryo-larval exposures were started with larvae; doesn't make sense, but that's what it says.

LC50s for STATIC tests

Toxicity Data Summary

Carassius auratus

Study: Nishiuki Y, Hashimoto Y. 1967. Toxicity of pesticide ingredients to some fresh water organisms. Botyu-Kagaku 32: 5-11.

Only a summary of this study and tables are available in English so most details cannot be determined. The fish tests were 48 hours, thus are not long enough to be usable for criteria derivation. The USEPA (2005) did not use these data for criteria derivation, but judged them of high enough quality to use as supporting data. Thus the rating of LL is being assigned to this study.

Genus	<i>Caridina</i>	
Species	<i>laevis</i>	
Family in North America?	yes	
Age/size at start of test/growth phase	Juvenile shrimp average length 8–10 mm Adults were 15–20 mm.	
Source of organisms	laboratory culture	
Have organisms been exposed to contaminants?	no	
Animals acclimated and disease-free?	2 weeks	
Animals randomized?	NR	
Test vessels randomized?	NR	
Test duration	96 h	
Data for multiple times?	24 and 96 h	
Effect 1	mortality	
Control response 1	Not exceeded 10%	
Temperature	26–27 1C.	
Test type	Static	
Photoperiod/light intensity	12 h light:12 h dark	
Dilution water	De-chlorinated tap water	
pH	6.9–7.2	
Hardness	NR for test	
Alkalinity	NR	
Conductivity	NR	
Dissolved Oxygen	6.4–6.9	
Feeding	not fed	

Appendix D2: Supplemental data rated RL, LR, or LL

Sucahyo <i>et al.</i> 2008		<i>C. laevis</i>
Parameter	Value	Comment
Purity of test substance	600 g/L	
Concentrations measured?	No	
Measured is what % of nominal?	n/a	
Chemical method documented?	n/a	
Concentration of carrier (if any) in test solutions	None	
Concentrations Nom only (µg/L)	concentrations were spaced by a factor of 2. Seven test concentrations and a control were used	5 Reps and 20 per rep
Control	Water only	
LC ₅₀	For juveniles 24 h: 0.76 (0.67–0.87) µg/L 96 h: 0.59 (0.51–0.69) µg/L for adults 96 h: 1.32–1.58 mg/L	Method: Trimmed Spearman–Karber method

Other notes:

Reliability points subtracted 3.7:

Analytical methods (4), Nominal concentrations (3), Measured concentrations (3), Hardness (2), Alkalinity (2), Conductivity (2), pH (3), Photoperiod (3), Statistical significance (2), Significance level (2), Minimum significant difference (2), % of control at NOEC and/or LOEC (2)

Reliability points subtracted 3.8

Acceptable standard method (5), Chemical Purity (10), Measured concentrations within 20% of nominal (4), Concentrations do not exceed 2x water solubility (4), organisms were randomly assigned to test containers(1), Water hardness (2), Water Alkalinity (2), Conductivity (1), Random block (2), Hypothesis tests (3)

Toxicity Data Summary

% of control LOEC	0 survival & reproduction	

ACUTE DATA- 15 different tests

Test number	dilution water	Fed?	Conc. Meas?	Age at start	48hr LC50 µg/L	Rating, reliability score
1	DMW	Yes	Nom	< 24 h	0.57 (0.47 - 0.70)	LL, 68
2	LSW	Yes	Nom	< 24 h	0.66 (0.58 - 0.75)	LL, 67
3	RCW	Yes	Nom	< 24 h	0.57 (0.47 - 0.70)	LL, 68
Routine water chemistry not done or not reported for tests below (tests 4-14) These would lose 10.5 more points for missing parameters						
4	LSCW	No	Highest only	< 48 h	0.35 (0.31 - 0.45)	LL, 61.5
5	LSCW	No	Nom	< 48 h	0.35	LL, 61.5
6	LSCW	Yes	Nom	< 24 h	> 1.0	N
7	DMW	No	Nom	< 24 h	>0.6	N
8	LSCW	No	Stock only	< 6 h	0.25 (0.22-0.29)	LL, 63
9	LSCW	No	Nom	< 24 h	0.33 (0.29-0.38)	LL, 63
10	LSCW	No	Nom	< 48 h	0.35	LL, 61.5
11	LSCW	?	Nom	< 48 h	0.59	LL, 60
12	LSCW	?	Nom	< 48 h	0.43 (0.36-0.51)	LL, 60
13	LSCW	?	Nom	< 48 h	0.35	LL, 60
14	LSCW	?	Nom	< 48 h	0.36	LL, 60
Test 15 was the first 48 hr of the chronic test for which measure concentrations are reported as above						
15	DMW	Yes	Yes, all meas. Same conc's as chronic	< 6 h	0.66	RL, 66.5

-Acute test 6 & 7 did not determine a value would score 67.5 RELEVANCE (no Std Method, No Control Desc., no values) so N

-Acute tests also have various issues (which points were taken off for):

- Organisms > 24 old at start
- in some tests organisms were fed
- some tests did not determine an LC 50 , results is > X
- LSCW not acceptable dilution water

-Acute tests 1, 3 score (73 + 63)/2 =68

-Acute tests 2 score (73 + 61)/2 =67 (-2 for inappropriate dilution water)

Appendix D2: Supplemental data rated RL, LR, or LL

-Without water quality parameters, acute tests 4-14 (except 6 & 7) would have a reliability score of $68 - 10.5 = 62.5$ and rating of N. No measurements were reported for LSCW and reports stated that these were not monitored. - 1 for unacceptable dilution water = 61.5.

-Those that use a life stage older than 48 hours lose 3 pts /2 = 1.5, score 61, many of these also use LSCW water and score 60. These did not include feeding has more points (60 + (3/2)), and scores 61.5

-Acute test 15 has more points because measured concentrations are reported for the chronic test and rates 66.5 (L). Acute test 15 was the first 48hrs of the chronic test. Chronic test rates as 60 (L).

-Though done in an EPA lab, points were not given for standard method because the description of tests procedure does not follow EPA methods (i.e.: feeding in acute tests, organisms > 24 old at start, dilution water source (LSCW, LSW), water chemistry not monitored in many tests).

Acute Tests 1 & 3 - Reliability points taken off for:

Documentation: Analytical method (4), Nominal concentrations (3), Measured concentrations (3), Hardness (2), Alkalinity (2), Photoperiod (3), Hypothesis tests (8).

Acceptability: No standard method (5), Measured concentrations within 20% of nominal (4), Concentrations exceed 2x water solubility (4), Carrier solvent (4), Organism age (3), Organisms randomized (1), Hardness (2), Alkalinity (2), Photoperiod (2), Number of concentrations (3), Random design (2), Adequate replicates (2), Dilution factor (2), Hypothesis tests (3).

Acute Test 15 - Reliability points taken off for:

Documentation: Nominal concentrations (3), Hardness (2), Alkalinity (2), Dissolved oxygen (4), Conductivity (2), pH (3), Photoperiod (3), Hypothesis tests (8).

Acceptability: No standard method (5), Measured concentrations within 20% of nominal (4), Carrier solvent (4), Feeding (3), Organisms randomized (1), Hardness (2), Alkalinity (2), Dissolved oxygen (6), Temperature (3), Conductivity (1), pH (2), Photoperiod (2), Adequate replicates (2), Hypothesis tests (3).

Chronic - Reliability points taken off for:

Documentation: Nominal concentrations (3), Hardness (2), Alkalinity (2), Dissolved oxygen (4), Conductivity (2), pH (3), Photoperiod (3), Statistical methods (5), Minimum significant difference (2), % control of NOEC/LOEC (2), Point estimates (8).

Acceptability: No standard method (5), Measured concentrations within 20% of nominal (4), Carrier solvent (4), Organisms randomized (1), Hardness (2), Alkalinity (2), Dissolved oxygen (6), Temperature (3), Conductivity (1), pH (2), Photoperiod (2), Adequate replicates (2), Statistical method (2), Minimum significant difference (1), Point estimates (3).

Toxicity Data Summary

Chironomus tentans

Study: Schuler LJ, Trimble AJ, Belden JB, Lydy MJ. 2005. Joint toxicity of triazine herbicides and organophosphate insecticides to the midge *Chironomus tentans*. *Arch Environ Contam Toxicol* 49: 173-177.

Notes: Study includes a mixture component of triazine herbicides in combination with OPs. Simazine, cyanazine, hexazinone, atrazine, and deisopropylatrazine all synergized diazinon.

Relevance

Score: 82.5 (no control response, no std. method)

Rating: L

Reliability

Score: 73

Rating: L

Schuler et al. 2005		<i>C. tentans</i>
Parameter	Value	Comment
Test method cited	EPA 1994 cited for culturing procedures, but not for test	
Phylum	Arthropoda	
Class	Insecta	
Order	Diptera	
Family	Chironomidae	
Genus	<i>Chironomus</i>	
Species	<i>tentans</i>	
Found in	N. Amer.	
Age/size at start of test	4 th instar larvae	
Source of organisms	Lab culture	
Have organisms been exposed to contaminants?	No	
Animals acclimated and disease-free?	Yes	
Animals randomized?	NR	
Test vessels randomized?	NR	
Test duration	96 h	
Data for multiple times?	No	
Effect 1	Normal swimming motion	Linked to survival
Control response 1	NR	
Temperature	21 ± 1°C	
Test type	Static	
Photoperiod	16L:8D	
Dilution water	MHSFW	
pH	7.7-8.2	

Appendix D2: Supplemental data rated RL, LR, or LL

Schuler et al. 2005		<i>C. tentans</i>
Parameter	Value	Comment
Hardness	NR, but moderately hard	
Alkalinity	NR	
Conductivity	340-370 uS/cm	
Dissolved Oxygen	≥ 70%	
Feeding	None	
Purity of test substance	99.5%	
Concentrations measured?	No	Authors contend that concentrations are stable (>80% of initial level maintained), but that does not confirm initial levels
Measured is what % of nominal?	NA	
Chemical method documented?	NA	
Concentration of carrier (if any) in test solutions	100 uL/L acetone	
Concentration 1 Nom (µg/L)	5 concentrations; levels NR	Reps: 3 w/10 per
Control	Dilution water; solvent	Reps: 3 w/10 per
ECx (95% ci); ug/L	EC1: 8.0 (4.2-11.5) EC5: 11.9 (7.3-15.9) EC15: 17.1 (11.9-21.3) EC50: 31.3 (25.7-37.3) Slope: 3.92 Intercept: -0.86	Log-probit

Reliability points subtracted 3.7:

Analytical methods (4), Measured concentrations (3), Nominal concentrations (3), Measured concentrations (3), Hardness (2), Alkalinity (2), Photoperiod (3), Statistical significance (2), Significance level (2), Minimum significant difference (2), % of control at NOEC and/or LOEC (2)

Reliability points subtracted 3.8

Acceptable standard method (5), Control response within guideline (9), Measured concentrations within 20% of nominal (4), Concentrations do not exceed 2x water solubility (4), organisms were randomly assigned to test containers(1), Water hardness (2), Water Alkalinity (2), Random block (2), Adequate replication (2), Hypothesis tests (3)

Toxicity Data Summary

Cyprinus carpio

Study: Nishiuki Y, Hashimoto Y. 1967. Toxicity of pesticide ingredients to some fresh water organisms. Botyu-Kagaku 32: 5-11.

Only a summary of this study and tables are available in English so most details cannot be determined. The fish tests were 48 hours, thus are not long enough to be usable for criteria derivation. The USEPA (2005) did not use these data for criteria derivation, but judged them of high enough quality to use as supporting data. Thus the rating of LL is being assigned to this study.

Acute

Reliability points subtracted 3.7:

Analytical method (4), Nominal concentrations (3), Measured concentrations (3), Hardness (2), Alkalinity (2), Dissolved oxygen (4), Temperature (4), Conductivity (2), pH (3), Photoperiod not reported (3), Statistical significance (2), Significance level (2), Minimum significant difference (2), % of control at NOEC and/or LOEC (2),

Reliability points subtracted 3.8:

Measured concentrations within 20% of nominal (4), Hardness (2), Alkalinity (2), Dissolved oxygen (6), Temperature (6), Conductivity (1), pH (2), Photoperiod (2), Random block was not reported (2), Adequate replication (2), Appropriate spacing between concentrations (2), Minimum significant difference(MSD) upper bound acceptable (1), LOEC reasonable compared to control(1), NOEC reasonable compared to control (1)

Chronic

Reliability points subtracted 3.7:

Analytical method (4), Measured concentrations (3), Hardness (2), Alkalinity (2), Dissolved oxygen (4), Temperature (4), Conductivity (2), pH (3), Photoperiod not reported (3), Minimum significant difference (2), Point estimates (8)

Reliability points subtracted 3.8

Measured concentrations within 20% of nominal (4), Hardness (2), Alkalinity (2), Dissolved oxygen (6), Temperature (6), Conductivity (1), pH (2), Photoperiod (2), Random block was not reported (2), Adequate replication (2), Appropriate spacing between concentrations (2), Minimum significant difference(MSD) upper bound acceptable (1), LOEC reasonable compared to control(1)

Toxicity Data Summary

Daphnia magna

Study: Kikuchi M, Sasaki Y, Wakabayashi M. 2000. Screening of organophosphate insecticide pollution in water by using *Daphnia magna*. *Ecotox Environ Safety* 47: 239-245.

Diazinon results are from Kikuchi & Wakabayashi 1997 (in Japanese) conducted under same conditions reported in Kikuchi et al. 2000. Test details are taken from Kikuchi et al. 2000; EC50 value for diazinon is from data obtained in Kikuchi & Wakabayashi 1997, but was recalculated by Kikuchi et al. 2000.

Toxicity Data Summary

Daphnia magna

Study: Sánchez M, Ferrando MD, Sancho E, Andreu-Moliner E. 1998. Evaluation of a *Daphnia magna* renewal life-cycle test method with diazinon. J Environ Sci Health B33: 785-797.

As per USEPA diazinon criteria document (USEPA 2005), units reported in this study as ng/L should be µg/L.

Acute LC50 of 0.86 µg/L determined by Fernandez et al. 1995 may be used with these results to calculate an acute-to-chronic-ratio (same lab, same dilution water).

As per USEPA (2000) final diazinon criteria document, concentrations reported as ng/L in paper are supposed to be µg/L.

Points taken off for:

Documentation (3.7): Nominal concentrations (3), hardness (2), alkalinity (2), dissolved oxygen (4), temperature (4), conductivity (2), pH (2), photoperiod (3), Minimum significant difference (2).

Acceptability (3.8): Standard method (5), Measured concentrations within 20% of nominal (4), Organisms randomized (1), Hardness (2), alkalinity (2), dissolved oxygen (6), temperature (6), conductivity (1), pH (2), Photoperiod (2), random design (2), minimum significant difference (1).

Toxicity Data Summary

Daphnia magna

Vilkas AG. 1976. Acute toxicity of diazinon technical to the water flea *Daphnia magna* Straus, EPA guidelines No. 72-2, Agricultural Division, Ciba-Geigy Corporation, Greensboro, NC. EPA MRID 00109022.

Toxicity Data Summary

Daphnia pulex

Study: Nishiuki Y, Hashimoto Y. 1967. Toxicity of pesticide ingredients to some fresh water organisms. Botyu-Kagaku 32: 5-11.

Only a summary of this study and tables are available in English so most details cannot be determined. The cladoceran tests were 3 hours, thus are not long enough to be usable for criteria derivation. The USEPA (2005) did not use these data for criteria derivation, but judged them of high enough quality to use as supporting data. Thus the rating of LL is being assigned to this study.

Dilution water	Lake Superior water; as is, or with added hardness	
pH	7.4-8.5	

Appendix D2: Supplemental data rated RL, LR, or LL

Ankley & Collyard 1995		<i>H. azteca</i>
Parameter	Value	Comment
Hardness	42-47 mg/L as CaCO ₃	Hardness adjusted to 105 mg/L as CaCO ₃ , species unclear in the study
Alkalinity	39-46 mg/L as CaCO ₃	
Conductivity	NA	
Dissolved Oxygen	5.2-8.1 mg/L	
Feeding	Yeast Cerophyll-Trout Chow at test start	
Purity of test substance	≥ 95% pure	
Concentrations measured?	No	
Measured is what % of nominal?	NA	
Chemical method documented?	NA	
Concentration of carrier (if any) in test solutions	≤ 1.5% (15 mL/L, but shown to be non-toxic)	
Concentration 1 Nom/Meas (µg/L)	NR	Reps: 2-4 w/5-10 per
Concentration 2 Nom/Meas (µg/L)	NR	Reps: 2-4 w/5-10 per
Concentration 3 Nom/Meas (µg/L)	NR	Reps: 2-4 w/5-10 per
Concentration 4 Nom/Meas (µg/L)	NR	Reps: 2-4 w/5-10 per
Control	Methanol carrier at ≤ 1.5%	Reps: 2-4 w/5-10 per
LC50 (95% ci)	6.51 ug/L (4.90-8.66)	Trimmed Spearman-Karber

Reliability points subtracted 3.7:

Analytical method (4), Nominal concentrations (3), Measured concentrations (3), Conductivity (2), Statistical significance (2), Significance level (2), Minimum significant difference (2), % of control at NOEC and/or LOEC (2)

Reliability points subtracted 3.8:

Acceptable standard method (5), Response within test guidance (9), Measured concentrations within 20% of nominal (4), Concentrations do not exceed 2x of solubility (4), Carrier solvent (4), Organisms randomly assigned to test containers (1), Organisms not fed in acute tests (3), Conductivity (1), Random block was not reported (2), Adequate replication (2), Appropriate spacing between concentrations (2), Appropriate statistical method used (2), Minimum significant difference (MSD) upper bound acceptable (1), NOEC response reasonable compared to control(1), LOEC response reasonable compared to control(1)

Toxicity Data Summary

Hyalella azteca

Collyard SA, Ankley GT, Hoke RA, Goldenstein T. 1994. Influence of age on the relative sensitivity of *Hyalella azteca* to diazinon, alkylphenol ethoxylates, copper, cadmium, and zinc. *Arch Environ Contam Toxicol* 26: 110-113.

Toxicity Data Summary

Moina macrocopa

Study: Nishiuki Y, Hashimoto Y. 1967. Toxicity of pesticide ingredients to some fresh water organisms. Botyu-Kagaku 32: 5-11.

Only a summary of this study and tables are available in English so most details cannot be determined. The cladoceran tests were 3 hours, thus are not long enough to be usable for criteria derivation. The USEPA (2005) did not use these data for criteria derivation, but judged them of high enough quality to use as supporting data. Thus the rating of LL is being assigned to this study.

Toxicity Data Summary

Oryzias latipes

Study: Nishiuki Y, Hashimoto Y. 1967. Toxicity of pesticide ingredients to some fresh water organisms. Botyu-Kagaku 32: 5-11.

Only a summary of this study and tables are available in English so most details cannot be determined. The fish tests were 48 hours, thus are not long enough to be usable for criteria derivation. The USEPA (2005) did not use these data for criteria derivation, but judged them of high enough quality to use as supporting data. Thus the rating of LL is being assigned to this study.

Photoperiod/light intensity	NR	
Dilution water	Reconstituted from deionized water	
pH	7.2 – 7.5	
Hardness	162 ppm CaCO ₃	Tested in hard water
Alkalinity	30 – 35 mg/L	
Conductivity	NR	
Dissolved Oxygen	NR	
Feeding	Not Fed	
Purity of test substance	Technical grade	92%
Concentrations measured?	No	
Measured is what % of nominal?	NR	
Chemical method documented?	NR	
Concentration of carrier (if any) in test solutions	≤ 0.5 mL/L	
Concentration 1 Nom/Meas (µg/L)	At least 6 concentrations used; levels NR	At least 10 organisms used for each concentration
Control	NR	No reps reported, at least 10 organisms used
LC50; indicate calculation method	602 (400-906) µg/L	Litchfield & Wilcoxon (1949)

Reliability points subtracted 3.7: Control type (8), Analytical method (4), Nominal Concentrations (3), Measured concentrations (3), Dissolved oxygen (4), Conductivity (2), Photoperiod (3), Hypothesis tests (8).

Reliability points subtracted 3.8: Control Appropriate (6), Control response (9), Measured concentrations within 20% of nominal (4), Concentrations do not exceed 2x of nominal (4), Organisms randomly assigned to test containers (1), Dissolved oxygen (6), Conductivity (1), Photoperiod (2), Random block was not reported (2), Adequate replication (2), Appropriate spacing between concentrations (2), Hypothesis tests (3).

Toxicity Data Summary

Silurus glanis

Koprucu SS, Koprucu K, Ural MS, Ispir U, Pala M. 2006. Acute toxicity of organophosphorous pesticide diazinon and its effects on behavior and some hematological parameters of fingerling European catfish (*Silurus glanis* L.), *Pestic. Biochem. Physiol.* **86**, pp. 99–105.

Relevance - acute

Score Acute: 70 (63% purity, family not in NA)

Rating: L

Reliability

Score: 79

Rating: R

Relevance - chronic

Score: 55 (63% purity, family not in NA, endpoint)

Rating: N

Koprucu et al. 2006		<i>S. glanis</i>
Parameter	Value	Comment
Test method cited	APHA (American Public Health Association)	
Phylum	Chordata	
Class	Actinopterygii	
Order	Siluriformes	
Family	Siluridae	
Genus	<i>Silurus</i>	
Species	<i>glanis</i>	
Family in North America?	No, Europe, Asia	
Age/size at start of test/growth phase	12–14 g, 10–12 cm	
Source of organisms	Keban Fish Breeding Unit of State Hydraulic Works, Turkey	
Have organisms been exposed to contaminants?	Probably not	
Animals acclimated and disease-free?	7 days	
Animals randomized?	NR	
Test vessels randomized?	NR	
Test duration	96 h	
Data for multiple times?	24, 48, 72, and 96 h	
Effect 1	mortality	
Control response 1	No mortality	
Effect 2	Less activity, lost of equilibrium, abnormal swimming, rapid gill movement, and staying motionless on the aquarium bottom, color changes	
Control response 2	Effects not quantified	

Appendix D2: Supplemental data rated RL, LR, or LL

Koprucu et al. 2006		<i>S. glanis</i>
Parameter	Value	Comment
Effect 3	MCVD = (packed cell vol as %/RBC in millions) x10u3 MCHD = (Hb in g/RBC in millions) x 10 pg MCHCD = (Hb in g/packed cell vol) x100g per 100mL	
Control response 3	See notes and study	
Temperature	16 +/- 1 °C	
Test type	static	
Photoperiod/light intensity	12 hr light	
Dilution water	Dechlorinated tap	
pH	8.3 +/- 0.1	
Hardness	198.5 +/- 12 mg/ L as CaCO ₃ .	
Alkalinity	150.3 +/- 15	
Conductivity	NR	
Dissolved Oxygen	7.4 +/- 0.2mgL	
Feeding	no	
Purity of test substance	63%	
Concentrations measured?	no	
Concentration of carrier (if any) in test solutions	0.14mg/L	
Concentration 1 Nom (µg/L)	1000	5 Reps/20 per rep
Concentration 2 Nom (µg/L)	2000	5 Reps/20 per rep
Concentration 3 Nom (µg/L)	4000	5 Reps/20 per rep
Concentration 4 Nom (µg/L)	8000	5 Reps/20 per rep
Concentration 5 Nom (µg/L)	16000	5 Reps/20 per rep
Concentration 6 Nom (µg/L)	32000	5 Reps/20 per rep
Concentration 7 Nom (µg/L)	64000	5 Reps/20 per rep
Control	2 control groups had solvent	
LC50; indicate calculation method	1h: 14.597 (12.985–16.340), 24 h: 12.487 (11.079–14.471) 48h: 8.932 (7.907–10.348), 72h: 6.326 (no data <i>p</i> > 0.05) 96h: 4.142 (no data <i>p</i> > 0.05)	probit
NOEC; indicate calculation method, significance level (p-value) and minimum significant difference (MSD)	96 h: MCV (u3): 4 mg/L	Method: p: MSD:
LOEC; indicate calculation method	96 h: Erythrocyte (106): 1 mg/L (no NOEC) Leukocyte (104): 1 mg/L (no NOEC) Hemoglobin (g/100mL): 1 mg/L (no NOEC) Hematocrit (%): 1 mg/L (no NOEC) MCV (u3): 8 mg/L MCH (pg) : 1 mg/L (no NOEC) MCHC (%): 1 mg/L (no NOEC)	
MATC (GeoMean NOEC,LOEC)	MCV : 5.66 mg/L	

Appendix D2: Supplemental data rated RL, LR, or LL

Other notes: lots of data on blood parameters and significant changes recorded, but link to survival, growth, or reproduction not established from discussion in this paper. Also usable effects seen slight higher than LC50 (MCV MATC: 5.66 mg/L vs LC 50 of 4.14 mg/L) and otherwise paper not relevant.

Acute test - Reliability points taken off for:

Documentation: Analytical method (4), Measured concentrations (3), Conductivity (2), Hypothesis tests (8).

Acceptability: Chemical purity (10), Measured concentrations within 20% of nominal (4), Carrier solvent (4), Organisms randomized (1), Conductivity (1), Random design (2), Hypothesis tests (3).

Toxicity Data Summary

Simocephalus serrulatus

Study: Johnson, W.W. and M.T. Finley. 1980. Handbook of Acute Toxicity of Chemicals to Fish and Aquatic Invertebrates. Resource Publication 137. U.S. Fish and Wildlife Serv., Washington, DC.

And:

Mayer FL Jr, Ellersieck MR. 1986. Manual of acute toxicity: interpretation and data base for 410 chemicals and 66 species of freshwater animals. US Fish and Wildlife Service Resource Publication No. 160. US Department of the Interior, Washington, DC.

These two publications are complimentary; the test methods are detailed in Johnson & Finley (1980), but some additional results are included in Mayer & Ellersieck (1986). All of the studies are from the same database from the same lab.

Relevance

Toxicity Data Summary

Aedes aegypti

Study: Mitsuhashi J, Grace TDC, Waterhouse DF. 1970. Effects of insecticides on cultures of insect cells. *Entomol Exp Appl* 13:327-341.

Relevance

Score: 52.5 (No standard method, Chemical purity not reported, Toxicity value not calculable, Control response not reported)

Rating: N

Summary:

- Looks at effects of insecticides on the growth of insect cells cultivated in vitro.
- Results were evaluated by observing cell death and growth inhibition

Notes:

- Study looks at two organisms, *Antheraea eucalypti* (moth) and *Aedes aegypti* (mosquito), but only *Aedes aegypti* test is rated because it has a larval stage in freshwater, whereas *Antheraea eucalypti* lays eggs on leaves of food-plants

Toxicity Data Summary

Antheraea eucalypti

Study: Mitsuhashi J, Grace TDC, Waterhouse DF. 1970. Effects of insecticides on cultures of insect cells. Ent Exp Appl 13: 327-341.

Relevance

Score: 30 (No standard method; Endpoint not linked to survival, growth, reproduction; Species not in N. America; No valid toxicity values calculated/calculable—dilution factor of 10 is too high for MATC calculation; Controls not described or reported)

Rating: N

Appendix D3: Studies rated N, LN, or RN

Toxicity Data Evaluation

Aulosira fertilissima

Singh PK. 1973. Effect of Pesticides on Blue-Green Algae. *Arch Mikrobiol* 89:317-320.

Relevance

Score: 60 (No std. method, low chemical purity, no toxicity values)

Rating:N

Toxicity Data Summary

Planktonic algae (36 strains)

Study: Butler GL, Deason TR, O'Kelley JC. 1975b. Loss of five pesticides from cultures of twenty-one planktonic algae. *Bull Environ Contam Toxicol* 13:149-152.

Relevance

Score: 60 (No standard method, Endpoint not relevant, No toxicity values)

Rating: N

Explanation:

- Tests amount of Diazinon which can be broken down by strains of planktonic algae metabolism
- Evaluates results by measuring the amount of Diazinon left after a two week growth period for the culture

Notes:

- Does not analyze metabolites, or their toxicity
- Does not conclusively demonstrate metabolism of pesticides by the strains tested
- Does identify strains which might be useful to evaluate what types of metabolites are formed

Toxicity Data Summary

Various algae

Study: Clegg TJ, Koevenig JL. 1974. The effect of four chlorinated hydrocarbon pesticides and one organophosphate pesticide on ATP levels in three species of photosynthesizing freshwater algae. *Botanical Gazette* 135:368-372.

Relevance

Score: 60 (No standard method; Purity of compound not stated; ATP endpoint not linked to survival, growth, reproduction; No effect on cell density; No toxicity values determined)

Rating: N

Toxicity Data Summary

Brachionus calyciflorus

Study: Roex EWM, Van Gestel CAM, Van Wezel AP, Van Straalen NM. 2000. Ratios between acute toxicity and effects on population growth rates in relation to toxicant mode of action. *Environ Toxicol Chem* 19:685-693.

Study not rated because it is a review of other toxicity studies.

Explanation:

- Uses toxicological data from previous studies to compute the ACR and gather information on the Log LC50 and Log LOEC
- Does not conduct experimental analysis, only statistical analysis on past data

Notes:

- Parameters are specific to the studies used for statistical analysis, so none are noted
- Summary of statistical data given under “other data”

Data in study:

Log LC50 (uM)	Log LOEC (uM)	ACR	Study
1.98	1.21	5.89	55
2.01	1.63	2.40	19

Studies:

Toxicity Data Summary

Brachydanio rerio

Ansari BA, Kumar K. 1988. Diazinon toxicity: effect on protein and nucleic acid metabolism in the liver of zebrafish, *Brachydanio rerio* (Cyprinidae). *Sci Tot Environ* 76: 63-68.

Relevance

Score: 45 (No std. method, endpoint, purity, no toxicity values)

Rating: N

Toxicity Data Summary

Brachydanio rerio

Study: Devillers J, Neunier T, Chambon P. 1985. Usefulness of the dosage- effect-time relation in ecotoxicology for determination of different chemical classes of toxicants. *Techniques et Sciences Municipales* 80: 329-334 (in French with English abstract)

Article is in French. Without translation, many details cannot be determined. USEPA (2000) did not use these data in the final diazinon criteria document, describing it as a study “conducted without controls, with unacceptable control survival, or with too few test organisms.” The study did not report precise EC50 values; rather ranges of values were reported. Thus, it is not useful for criteria derivation. Since other *Brachydanio rerio* studies are available, this one was not pursued further.

Relevance

Score: ≤ 85

Rating: N, per explanation above

Toxicity Data Summary

Brachydanio rerio

Keizer J, D'Agostino G, Vittozzi L. 1991. The importance of biotransformation in the toxicity of xenobiotics to fish. I. Toxicity and bioaccumulation of diazinon in guppy (*Poecilia reticulata*) and zebra fish (*Brachydanio rerio*). *Aquat Toxicol* 21: 239-254.

Score: 60 (No standard method; 22.4% diazinon formulation; No toxicity values calculated/calculable)

Rating: N

Toxicity Data Summary

Bufo americanus americanus

Rana clamitans melanota

Rana pipiens

Study: Bishop CA, Mahony NA, Struger J, Ng P, Pettit KE. 1999. Anuran development, density and diversity in relation to agricultural activity in the Holland River watershed, Ontario Canada (1990-1992). *Environ Monitor Assess* 57:21-43.

Unacceptable

Explanation:

- Observational study in natural environment with many other known pesticides, including organophosphates, present for anuran exposure.
- No connection between exposure of diazinon and its effects can be made

Notes:

- Study of anuran species and abnormalities as a result of agricultural spraying and storm water run-off.
- Only trace amounts (< 2.2 ug/L) of diazinon found to be present in the water.

Toxicity Data Summary

Bufo bufo japonicus

Study: Hashimoto Y, Nishiuchi Y. 1981. Establishment of bioassay methods for the evaluation of acute toxicity of pesticides to aquatic organisms. *J Pest Sci* 6: 257-264.

Relevance

Score: ≥ 85 (Cannot determine if controls were used/reported)

Rating: L

This study was rated of good quality by USEPA (2005), but was not used for criteria derivation because the exposure periods were too short (3 h for daphnids; 48 h for fish, insects, mollusks). This will eliminate values from this study from being used for criteria derivation according to TenBrook & Tjeerdema (2006) as well. Since the study is in Japanese, no further evaluation was done.

Toxicity Data Summary

Daphnia magna

Study: Devillers J, Neunier T, Chambon P. 1985. Usefulness of the dosage- effect-time relation in ecotoxicology for determination of different chemical classes of toxicants. *Techniques et Sciences Municipales* 80: 329-334 (in French with English abstract)

Article is in French. Without translation, many details cannot be determined. USEPA (2000) did not use these data in the final diazinon criteria document, describing it as a study “conducted without controls, with unacceptable control survival, or with too few test organisms.” The study did not report precise EC50 values; rather ranges of values were reported. Thus, it is not useful for criteria derivation. Since many other *Daphnia magna* studies are available, this one was not pursued further.

Toxicity Data Summary

Daphnia magna

Study: Robinson PW. 1999. The toxicity of pesticides and organics to mysid shrimps can be predicted from *Daphnia* spp. toxicity data. *Wat Res* 33:1545-1549.

Explanation:

- Article is a summation of toxicology studies previously conducted, in order to extrapolate the findings of several aquatic species to that of the (mostly saltwater) mysid shrimp
- Does not conduct any actual experiment
- Creates correlations between data which exists for aquatic species to predict toxicity for mysid shrimp
- Conclusion of article is that mysid shrimps are at least as sensitive to pesticides and organics as are freshwater daphnids.

Notes:

Data Collected from Other Sources (and the citations given):

- 48 hr EC50 for *Daphnia* spp. = 0.8 ug/L (Reeves, 1994, personal communication)
- Mean EC50 for freshwater fish = 2.7 mg/L (Reeves, 1994, personal communication)

Score: 15

No new freshwater data

Toxicity Data Summary

Daphnia pulex

Study: Hashimoto Y, Nishiuchi Y. 1981. Establishment of bioassay methods for the evaluation of acute toxicity of pesticides to aquatic organisms. J Pest Sci 6: 257-264.

Relevance

Score: ≥ 85 (Cannot determine if controls were used/reported)

Rating:

This study was rated of good quality by USEPA (2005), but was not used for criteria derivation because the exposure periods were too short (3 h for daphnids; 48 h for fish, insects, mollusks). This will eliminate values from this study from being used for criteria derivation according to TenBrook & Tjeerdema (2006) as well. Since the study is in Japanese, no further evaluation was done.

Toxicity Data Summary

Daphnia pulex

Study: Sanders HO, Cope OB. 1966. Toxicities of several pesticides to two species of cladocerans. Trans Am Fish Soc 95: 165-169.

Relevance

Score: 60 (No standard method; Diazinon purity NR; Controls not described and not reported)

Rating: N

Note: USEPA (2005), CDFG (2000) and Menconi & Cox (1994) all accept this test and include statements regarding purity of diazinon used and controls that are not in the paper. USEPA (2005) indicates that 89% pure technical grade diazinon was used; CDFG (2000) and Menconi & Cox (1994) indicate that technical grade was used, but that the purity was not stated. Careful reading of the paper revealed no mention of diazinon grade or purity. Likewise, CDFG (2000) and Menconi & Cox (1994) report 100% control survival, but no such number is reported in the paper.

Toxicity Data Summary

Daphnia pulex

Study: Stark JD, Vargas RI. 2003. Demographic changes in *Daphnia pulex* (leydig) after exposure to the insecticides spinosad and diazinon. *Ecotox Environ Safety* 56: 334-338.

Score: 60 (No standard method; Endpoint not linked to survival, growth, reproduction; No toxicity value reported for diazinon)

Rating: N

In vitro exposure not useful for criteria derivation.

Toxicity Data Summary

Ictalurus punctatus

Study: Hogan JW, Knowles CO. 1972. Metabolism of diazinon by fish liver microsomes. *Bull Environ Contam Toxicol* 8: 61-64.

Metabolism study; no toxicity values.

- Metabolism of diazinon by channel catfish liver (divided into subcellular fractions) into diazoxon and water solubles measured as a result of time
- Shows effects of air, carbon monoxide, and nitrogen on metabolism by channel catfish liver
- Metabolism of diazinon increased throughout 2 hour incubation period, most rapid metabolism during first 30 minutes
- Only slight increase in water soluble diazinon metabolites by glutathione (GSH)
- Results indicate that carbon monoxide is a potent inhibitor of diazinon metabolism, and oxygen is required for metabolism
- Two major polar metabolites in addition to diazoxon found: diethyl phosphorothioic acid, and diethyl phosphoric acid (diethyl phosphorothioic acid: diethyl phosphoric acid = 3:1)
- Microsomal fraction of liver homogenate found to be most active in metabolism

Toxicity Data Summary

Misgurnus anguillicaudatus

Study: Hashimoto Y, Nishiuchi Y. 1981. Establishment of bioassay methods for the evaluation of acute toxicity of pesticides to aquatic organisms. J Pest Sci 6: 257-264.

Relevance

Score: ≥ 85 (Cannot determine if controls were used/reported)

Rating:

This study was rated of good quality by USEPA (2005), but was not used for criteria derivation because the exposure periods were too short (3 h for daphnids; 48 h for fish, insects, mollusks). This will eliminate values from this study from being used for criteria derivation according to TenBrook & Tjeerdema (2006) as well. Since the study is in Japanese, no further evaluation was done.

Toxicity Data Summary

Misgurnus anguillicaudatus

Oh HS, Lee SK, Kim Y-H, Roh JK. 1991. Mechanism of selective toxicity of diazinon to killifish (*Oryzias latipes*) and loach (*Misgurnus anguillicaudatus*). In: *Aquatic Toxicology and Risk Assessment: Fourteenth Edition, ASTM STP 1124*. Mayes MA, Barron MG, eds. American Society for Testing and Materials, Philadelphia, PA, pp. 343-353.

LC50 values are reported, but no test details are given. Following are results of sub-lethal exposures with acetylcholinesterase (AChE) inhibition as the endpoint.

Relevance

Score: 60 (no std. method, endpoint, controls not described or response reported)

Rating: N

Toxicity Data Summary

Oncorhynchus mykiss

Study: Bathe R, Sachsse K, Ullmann L, Hörmann WD, Zak F, Hess R. 1975. The evaluation of fish toxicity in the laboratory. *Proc Eur Soc Toxicol* 16: 113-124.

Relevance

Score: 60 (No standard method; 40% diazinon formulation; Controls not described or reported)

Rating: N

USEPA (2005) criteria document cites this study as giving a 96-h LC50 value of 3200 µg/L for rainbow trout using technical grade diazinon. However, a review of this study revealed that a 40% emulsifiable concentrate was used and a 96-h LC50 of 8000 µg/L was obtained for rainbow trout. This study included tests with 5 other species, but all with the diazinon formulation. It appears that the USEPA reference is incorrect and it is not clear where the value of 3200 µg/L came from.

Toxicity Data Summary

Oncorhynchus mykiss

Beauvais SL, Jones SB, Brewerand SK and Little EE. 2000. Physiological measures of neurotoxicity of diazinon and malathion to larval trout (*Oncorhynchus mykiss*) and their correlation with behavioral measures. *Environ Toxicol Chem* 19:1875-1880.

Swimming etc. endpoint

Notes:

- Diazinon exposure caused significant changes in all four swimming behaviors studied. No linkage to survival/growth/reproduction

Appendix D3: Studies rated N, LN, or RN

Toxicity Data Summary

Oncorhynchus mykiss

Study: Bisson M, Hontela A. 2002. Cytotoxic and endocrine-disrupting potential of atrazine, diazinon, endosulfan, and mancozeb in adrenocortical steroidogenic cells of rainbow trout exposed *in vitro*. *Toxicol Appl Pharm* 180:110-117.

This *in vitro* study is not useful for criteria derivation, or as supporting information, since it does not involve whole-body, water exposure.

Toxicity Data Summary

Photobacterium phosphoreum

Study: Curtis C, Lima A, Lozano SJ, Veith GD. Evaluation of a bacterial bioluminescence bioassay as a method for predicting acute toxicity of organic chemicals to fish. *Aquatic Toxicology and Hazard Assessment: Fifth Conference. ASTM STP 766*. Pearson JG, Foster RB, Bishop WE, eds. American Society for Testing and Materials. pp. 170-178.

Relevance

Score: 70 (Endpoint not linked to survival, growth, reproduction; Marine bacterium)

Rating: L

This study utilizes the Microtox system to determine EC50 values for organic chemicals. It is not possible to evaluate it against the same set of criteria as typical aquatic toxicity tests. The EC50 for diazinon of 9.8 mg/L (based on nominal concentrations) indicates that *P. phosphoreum* is relatively insensitive to diazinon. The study was not evaluated further as it cannot be used for criteria derivation (relevance rating = L) and will not be useful as supporting data.

Toxicity Data Summary

Physa acuta

Study: Hashimoto Y, Nishiuchi Y. 1981. Establishment of bioassay methods for the evaluation of acute toxicity of pesticides to aquatic organisms. J Pest Sci 6: 257-264.

Relevance

Score: ≥ 85 (Cannot determine if controls were used/reported)

Rating:

This study was rated of good quality by USEPA (2005), but was not used for criteria derivation because the exposure periods were too short (3 h for daphnids; 48 h for fish, insects, mollusks). This will eliminate values from this study from being used for criteria derivation according to TenBrook & Tjeerdema (2006) as well. Since the study is in Japanese, no further evaluation was done.

Toxicity Data Summary

Puntius javanicus Bleeker

Study: Kok LT. 1972. Toxicity of insecticides used for Asiatic rice borer control to tropical fish in rice paddies. In: *The Careless Technology: Ecology and International Development*. Farvar MT, Milton JP, eds. The Natural History Press, Garden City, NY. pp. 489-498.

Relevance

Score: 45 (No standard method; Diazinon purity NR; No toxicity values calculated; Controls not described or reported)

Rating: N

Appendix D3: Studies rated N, LN, or RN

Toxicity Data Summary

Rana boylei

Sparling DW, Fellers G. 2006. Comparative toxicity of chlorpyrifos, diazinon, malathion and their oxon derivatives to larval *Rana boylei*. *Environ Pollut* 147(3): 535 -539.

Relevance

Score: 82.5 (No Std. Method, No Control Response)

Rating: L

Reliability

Score: 55.5

Rating: N

Sparling & Fellers 2006		<i>R. boylei</i>
Parameter	Value	Comment
Test method cited	ASTM	
Phylum	Chordata	
Class	Amphibia	
Order	Anura	
Family	Ranidae	
Genus	<i>Rana</i>	
Species	<i>boylei</i>	foothill yellow-legged frog
Family in North America?	Yes	
Age/size at start of test/growth phase	Gosner 32 to Gosner 44	
Source of organisms	Coast Range stream, Fort Bragg, CA	
Have organisms been exposed to contaminants?	Probably not	
Animals acclimated and disease-free?	Yes, Weeks acc	
Animals randomized?	NR	
Test vessels randomized?	NR	
Test duration	96 h	
Data for multiple times?	yes	
Effect 1	mortality	
Control response 1	NR	
Effect 2	acetylcholinesterase inhibition	
Control response 2	100%	
Temperature	NR	
Test type	NR

Feeding	On first day	

Appendix D3: Studies rated N, LN, or RN

Sparling & Fellers 2006		<i>R. boyllii</i>
Parameter	Value	Comment
Purity of test substance	99%	
Concentrations measured?	no	
Concentration of carrier (if any) in test solutions	Acetone 0.29 ml/L	
Concentration 1 Nom/Meas (µg/L)	1,250	1 Rep and 9 per rep
Concentration 2 Nom/Meas (µg/L)	2,500	1 Rep and 9 per rep
Concentration 3 Nom/Meas (µg/L)	5,000	1 Rep and 9 per rep
Concentration 4 Nom/Meas (µg/L)	10,000	1 Rep and 7 per rep
Control	Solvent control and water only	
LC50; indicate calculation method	7.488 mg/L	Probit
NOEC; indicate calculation method, significance level (p-value) and minimum significant difference (MSD)	none	Method: ANOVA p: NR MSD: NR
LOEC; indicate calculation method	1,250 ug/L ace inhibition	
MATC (GeoMean NOEC,LOEC)	Can't calculate	
% control at NOEC	Can't calculate	
% of control LOEC	Can't calculate	

Other notes:

For diazinon, normalized cholinesterase values differed between controls and those exposed to 5 mg/L or higher (p = 0.0125). Controls had higher values than all other treatments except 0.025 mg/L (p < 0.0001).

Fig 1b

ACE inhibition approx - 40% at 1,250 ug/L to 55% at 10,000 ug/L

In this study the oxon derivatives of chlorpyrifos, malathion and diazinon were significantly more toxic than their respective parental forms.

Emailed for missing information Jul 2008. The authors mentioned that they did not want to share unpublished information and never sent info.

Rating: N

Toxicity Data Summary

Semisulcospira libertina

Study: Hashimoto Y, Nishiuchi Y. 1981. Establishment of bioassay methods for the evaluation of acute toxicity of pesticides to aquatic organisms. J Pest Sci 6: 257-264.

Relevance

Score: ≥ 85 (Cannot determine if controls were used/reported)

Rating:

This study was rated of good quality by USEPA (2005), but was not used for criteria derivation because the exposure periods were too short (3 h for daphnids; 48 h for fish, insects, mollusks). This will eliminate values from this study from being used for criteria derivation according to TenBrook & Tjeerdema (2006) as well. Since the study is in Japanese, no further evaluation was done.

Toxicity Data Summary

Simocephalus serrykatys

Study: Sanders HO, Cope OB. 1966. Toxicities of several pesticides to two species of cladocerans. Trans Am Fish Soc 95: 165-169.

Relevance

Score: 60 (No standard method; Diazinon purity NR; Controls not described and not reported)

Rating: N

Note: USEPA (2005), CDFG (2000) and Menconi & Cox (1994) all accept this test and include statements regarding purity of diazinon used and controls that are not in the paper. USEPA (2005) indicates that 89% pure technical grade diazinon was used; CDFG (2000) and Menconi & Cox (1994) indicate that technical grade was used, but that the purity was not stated. Careful reading of the paper revealed no mention of diazinon grade or purity. Likewise, CDFG (2000) and Menconi & Cox (1994) report 100% control survival, but no such number is reported in the paper.

Toxicity Data Summary

Simulium spp.
