

This figure illustrates the vegetation communities found at the project site. Table 2 provides additional plant community information. The information shown here was gathered by multiple site characterization surveys, a wetland delineation for USACE, and specific habitat mapping surveys for pickleweed (which is the preferred cover for SMHM and black rail). Locations of listed communities are shown. In particular, Mason's lilaepsis (*Lilaeopsis masonii*) is growing along the banks of the mouth of Peyton Slough and Peyton Slough No. 1, and two plants of Delta tulle pea (*Lathyrus jepsonii* var. *jepsonii*) are located just outside the project site in the transition zone between the railroad and Rhodia Marsh. Note how the much of the plant cover is thin or bare in the locations of identified AOCs.
