**Subject:** Suction Dredging

I have been doing suction dredging for years and can see no harmful affects to water quality. To me I think it improves the habitat for fish because it creates deeper areas for them to live and spon. Whil I have been dredging I have seen fish feeding on the insects and larva stirred up down stream by my dredge.Dredging just moves stream material around like a natural storm current and doesn't affect water quality. THANK YOU for listening to my opinion. Al Ferney coldroll22@hotmail.com
