---

New rivers of Naturally Desalinated water is (not like current desalination processes) expandable to meet the needs of nations without harming the environment. The added drought proof water from a consistently clean source. All of California's water issues like the "Sacrament delta", peripheral canal, central valley farmers' and LA's thirst for water would be addressed with new clean sources of endless water.

Skeptics' abound and this process needs the support of at least the state and/or the federal government.

Natural Desalination uses with current Reverse Osmosis' membrane and occur at about ½ mile under the ocean offshore on the sea floor and can use gravity conveyance to shore all while using ZERO energy. This is a cheap new eco-friendly source of water, just waiting for us to tap into it.

Can this be considered in the "California Ocean Plan" and recognized as a safe and effective way to solve most of California's water issues?

My goal is to solve California's Water issues, can I count on your help and support?
