

I am curious why with the increased focus on conserving water and improving waste water treatment, there seems to be no discussion on composting toilet systems.

I have recently purchased property in Tuolumne County. As a result I have been looking into making it as green as possible. Several things I have been looking at is grey water recycling as well as composting toilets. There are several composting toilet companies who have gone through extensive testing and qualifications by the NSF. One of these companies is Sun-Mar. They have an excellent system with very low water use with a main tank located in the garage or basement. This cuts down on the frequency and need of emptying the compost.

It seems it would be much more economical and more environmentally friendly to go this way.

Thank you in advance for your consideration of this matter.
